ENCYCLOPÆDIA LONDINENSIS;

OR,

UNIVERSAL DICTIONARY

OF

ARTS, SCIENCES, AND LITERATURE.

COMPREHENDING,

UNDER ONE GENERAL ALPHABETICAL ARRANGEMENT,

ALL THE WORDS AND SUBSTANCE OF

EVERY KIND OF DICTIONARY EXTANT IN THE ENGLISH LANGUAGE.

IN WHICH THE IMPROVED DEPARTMENTS OF

THE MECHANICAL ARTS, THE LIBERAL SCIENCES, THE HIGHER MATHEMATICS, AND THE SEVERAL BRANCHES OF POLITE LITERATURE,

ARE SELECTED FROM THE

ACTS, MEMOIRS, AND TRANSACTIONS, OF THE MOST EMINENT LITERARY SOCIETIES,

IN EUROPE, ASIA, AND AMERICA.

FORMING A COMPREHENSIVE VIEW OF THE RISE, PROGRESS, AND PRESENT STATE, OF HUMAN LEARNING IN EVERY PART OF THE WORLD.

EMBELLISHED BY A MOST

MAGNIFICENT SET OF COPPER-PLATE ENGRAVINGS,

ILLUSTRATING, AMONGST OTHER INTERESTING SUBJECTS,

THE MOST CURIOUS, RARE, AND ELEGANT, PRODUCTIONS OF NATURE, IN EVERY PART OF THE UNIVERSE;

AND ENRICHED

WITH PORTRAITS OF EMINENT AND LEARNED PERSONAGES, IN ALL AGES OF THE WORLD.

TOGETHER WITH

A COMPREHENSIVE SYSTEM OF HERALDRY,

FINELY ILLUMINATED, AND ENRICHED WITH THE ARMORIAL BEARINGS OF THE ROYAL FAMILY; OF THE ENGLISH, SCOTCH, AND IRISH, NOBILITY; OF THE BARONETS OF THE UNITED KINGDOM; AND OF NUMEROUS DISTINGUISHED FAMILIES, PATRONS OF THIS WORK.

COMPILED, DIGESTED, AND ARRANGED,

BY JOHN WILKES, OF MILLAND HOUSE, IN THE COUNTY OF SUSSEX, ESQUIRE;

ASSISTED BY EMINENT SCHOLARS OF THE ENGLISH, SCOTCH, AND IRISH, UNIVERSITIES.

VOLUME VI.

London:

PRINTED FOR THE PROPRIETORS, BY J. ADLARD, DUKE-STREET, WEST SMITHFIELD: SOLD AT THE ENCYCLOPÆDIA OFFICE, AVE-MARIA-LANE, ST. PAUL'S; BY J. WHITE, FLEET-STREET; AND CHAMPANTE AND WHITROW, JEWRY-STREET, ALDGATE.

1810.

Non audiendi sunt homines imperiti, qui humano ingenio majorem, vel inutilem, et rebus gerendis adverſam πολυμαθειαν criminantur. Eſt ſcilicet quædam Scientiarum cognatio et conciliatio; unde et Εγκυκλοπαιδειαν *vocant Græci; ut in unâ perfectus dici nequeat, qui cæteras non attigerit.*—Morhofi Polyhistor, l. i. c. i. s. i.

Those inexperienced perſons, who make it a charge of accuſation againſt variety and extenſive learning, that it exceeds the compaſs of human ability, or is uſeleſs, or that it is an impediment to tranſacting buſineſs, deſerve no attention. For there is between the Sciences a degree of natural and cloſe connexion; from which the Greeks uſe the term "Encyclopædia;" so that no one can be perfect in any one Science, who has not attained to ſome knowledge of the reſt.

DESCRIPTION OF THE FRONTISPIECE ILLUSTRATIVE OF ENGLAND.

BRITANNIA, IN AN ERECT POSTURE, ATTENDED BY HER TUTELARY LION, FIRMLY GRASPING THE ARMS OF THE UNITED KINGDOM, AND GROWLING DEFIANCE AT THE THREE FIGURES WHO APPEAR TO BE THREATENING HER, AS THE DÆMONS OF WAR, SEDITION, AND REBELLION, IS HOLDING OUT THE OLIVE-BRANCH, AS EMBLEMATIC OF PEACE, TO THE FOUR QUARTERS OF THE WORLD, WHO APPEAR IN THEIR PROPER COSTUMES, HUMBLY SUPPLICATING HER PROTECTION. AT A DISTANCE ARE SEEN HER MERCHANT SHIPS SAILING IN SAFETY, AND A FORTRESS WITH THE FLAG OF ENGLAND PROUDLY WAVING IN THE AIR.

ARTS, SCIENCES, and LITERATURE.

DOD'DER, *ſ.* in botany. See CUSCUTA.

DOD'DERED, *adj.* Overgrown with dodder; covered with ſupercreſcent plants:

The peaſants were enjoin'd
Sere-wood, and firs, and *dodder'd* oaks, to find. *Dryden.*

DOD'DRIDGE (Philip), an eminent Engliſh nonconformiſt divine and tutor, ſon of a reſpectable tradeſman in London, where he was born, in 1702. It was Mr. Doddridge's misfortune to be left an orphan when he was only thirteen years of age, and ſoon afterwards to loſe the whole of the property that was left him, by the miſmanagement of the perſon to whom the care of it was entruſted. In theſe circumſtances, Dr. Samuel Clark liberally furniſhed him with the means of continuing his claſſical ſtudies; and, finding him ſtrongly inclined to the work of the Chriſtian miniſtry, took him into his own houſe, under his perſonal inſtruction, where he was ſupplied with the moſt proper books for improvement, and had the ſentiments of virtue and piety, in which he was early initiated, confirmed and ſtrengthened in his mind. In 1725, he firſt fixed his reſidence at Market-Harborough, for the ſake of enjoying the inſtructive converſation and advice of the learned paſtor of a diſſenting congregation in that town, to whom he was choſen aſſiſtant; and with whom he continued until he opened his academy at Harborough, in the year 1729. He had not entered upon the office of a tutor many months, when a vacancy took place in a conſiderable congregation at Northampton, who had long admired him as a preacher, and who were now urgent with him to accept of the paſtoral charge of their ſociety. He therefore removed with his academy to Northampton, towards the cloſe of the year laſt mentioned. During the twenty-two years in which he ſuſtained the office of a tutor, he had about 200 young men under his care, of whom 120 entered upon the work of the miniſtry. His conduct in that character cannot be too highly commended for diligence, prudence, and conciliating manners; and of the excellent effects of the ſyſtem which he purſued, the many learned and reſpectable men who proceeded from his ſeminary, and who honourably diſtinguiſhed themſelves as miniſters, or in the departments of civil life, bear ample teſtimony. During the courſe of his active life he publiſhed, and prepared for the preſs, a variety of works which entitle him to no ſmall reputation as an author. In 1730, Mr. Doddridge publiſhed, Free Thoughts on the moſt probable Means of reviving the diſſenting Intereſt, in which his politeneſs and candour as a diſputant are pleaſingly exhibited. In 1732 he publiſhed a volume of Sermons on the Education of Children; and in 1735, a volume of Sermons to young Men; both of which were favourably received by the world, and have gone through many editions. In 1736, he publiſhed Ten Sermons on the Power and Grace of Chriſt; and The Evidences of his glorious Goſpel. During the ſame year the univerſity of Aberdeen conferred upon him the degree of doctor in divinity. In 1739, Dr. Doddridge gave to the public the firſt volume of his valuable work, The Family Expoſitor; or, a Paraphraſe and Verſion of the New Teſtament, with critical Notes, and a practical Improvement of each Section. The merits of this work are ſo generally known and acknowledged, that any farther notice of its character is entirely unneceſſary. The ſecond volume made its appearance in 1740. In the following year Dr. Doddridge publiſhed a volume of Practical Diſcourſes upon Regeneration; and, in 1742 and 1743, Three Letters to the Author of a Treatiſe, intitled, Chriſtianity not founded on Argument. In 1743, he publiſhed, The Principles of the Chriſtian Religion, in eaſy Verſe, for the Uſe of Children and Youth; alſo, The Riſe and Progreſs of Religion in the Soul; ſince tranſlated into the Dutch, German, Daniſh, and French, languages. In 1747, Dr. Doddridge publiſhed, Some remarkable Paſſages in the Life of the Hon. Colonel James Gardiner; and in 1748 appeared the third volume of The Family Expoſitor, and alſo the Expoſitory Works, and other remains, of archbiſhop Leighton, which were reviſed by Dr. Doddridge; and, together with his tranſlation of the archbiſhop's Latin Prelections, publiſhed at Edinburgh, in two vols. The laſt of Dr. Doddridge's works, publiſhed during his life-time, was intitled, A plain and ſerious Addreſs to the Maſter of a Family, on the important Subject of Family Religion. Of his grand work, The Family Expoſitor, three volumes were left unpubliſhed at the time of his death. He had, however, finiſhed the copy of the whole; ſo that in 1754 the fourth volume was publiſhed by Mr. Orton, and the fifth and ſixth in the year 1756. In 1755, Mr. Orton likewiſe publiſhed a collection of Dr. Doddridge's Hymns, founded on various Texts in the Holy Scriptures. The laſt work of Dr. Doddridge which was given to the public, was his Courſe of Lectures on the principal Subjects of Pneumatology, Ethics, and Divinity; with References to the moſt conſiderable Authors on each Subject. It appeared in 1763, in one volume quarto, under the care of the reverend Samuel

Clark of Birmingham, the ſon of the doctor's earlieſt benefactor, and at the time of his death his aſſiſtant in the academy. In 1794, a new and improved edition of it, in two volumes octavo, was publiſhed by the late Dr. Kippis, who had been a pupil under Dr. Doddridge. On the decline of his health he was adviſed to take a voyage to Liſbon, where he met with every friendly attention and medical aid. But his caſe was hopeleſs; and he died on the 26th of October, 1751. The character of this great and good man, is thus drawn by his biographer Dr. Kippis: "The prime and leading feature of his ſoul, was that of devotion. The greateſt pains were taken by him to keep up an habitual ſenſe of the Supreme Being; to maintain and increaſe the ardour of religion in his heart; and to furniſh himſelf, by devout exerciſes, for the important labours of his ſtation. Nor was it to his ſecret retirements that his piety was limited: it was manifeſted in every part of the day, and appeared in his uſual intercourſe with men. In the little vacancies of time which occur to the buſieſt of mankind, he was frequently lifting up his ſoul to God. When he lectured on philoſophy, hiſtory, anatomy, or other ſubjects not immediately theological, he would endeavour to graft ſome religious inſtructions upon them, that he might raiſe the minds of his pupils to devotion, as well as to knowledge; and in his viſits to his people, the Chriſtian friend and miniſter were united."

DODECADAC'TYLUS, *ſ.* [from δωδεκα, twelve, and δακτυλος, a finger.] The duodenum, a gut often ſo named, becauſe its length is about the breadth of twelve fingers. At the time this name was given, anatomy conſiſted in the diſſection of brutes; and the length was therefore probably adjudged from the gut of ſome animal, and not of man.

DODE'CAGON, *ſ.* [of δωδεκα, twelve, and γωνια, Gr. a corner.] In geometry, a regular polygon, conſiſting of twelve equal ſides and angles.

DODECAHE'DRON, *ſ.* [of δωδεκαεδρον, Gr.] A geometrical ſolid, bounded by twelve equal and equilateral pentagons. It is one of the five Platonic regular bodies. Its etymology ſignifies "that which has twelve ſeats, or bottoms."

DODECAN'DRIA, *ſ.* [δωδεκα, twelve, and ανηρ, a huſband.] In botany, the name of the eleventh claſs in Linnæus's artificial ſyſtem; comprehending all thoſe plants which have hermaphrodite flowers with from twelve to nineteen ſtamens incluſive. See BOTANY.

DODECAPHAR'MACUM, *ſ.* [from δωδεκα, twelve, and φαρμακον, a medicine.] An ointment conſiſting of twelve ingredients, for which reaſon it is called the ointment of the apoſtles.

DODE'CAS, *ſ.* [ſo called from the number *twelve* prevailing in the ſtamens.] In botany, a genus of the claſs dodecandria, order monogynia, natural order calycanthemæ. The generic characters are—Calyx: perianthium one-leafed, turbinate, permanent, half-four-cleft, ſuperior; diviſions ovate, ſpreading. Corolla: petals roundiſh, ſeſſile, inſerted into the calyx. Stamina: filaments twelve, capillary, ſhorter than the calyx, inſerted into the receptacle; antheræ oblong. Piſtillum: germ half-ſuperior; ſtyle filiform, longer than the ſtamens; ſtigma ſimple. Pericarpium: capſule ovate, one-celled, inferior, growing to a patulous calyx, within which the apex is naked and four-valved. Seeds: numerous, oblong, minute.—*Eſſential Character.* Corolla, five-petalled; calyx, half-four-cleft, bearing the corolla, ſuperior; capſule, one-celled, connate with the calyx.

Dodecas Surinamenſis, or Surinam dodecas, the only ſpecies known: a ſhrub, having the appearance of lycium barbarum, even ſomewhat four-cornered; the branches oppoſite, ſhort; leaves oppoſite, obovate-oblong, or wedge-ſhaped, ſubpetioled, even, obtuſe, quite entire. Native of Surinam. *Linn. Suppl.*

DODECATEMO'RION, or DODECATEMORY, *ſ.* [of δωδεκα, twelve, and μοιρα, Gr. a diviſion.] The twelfth part of a circle; the twelve ſigns of the zodiac, ſo called becauſe every one of them is a twelfth part of the zodiac:

'Tis *dodecatemorion* thus deſcribed:
Thrice ten degrees which every ſign contains,
Let twelve exhauſt that not one part remains;
It follows ſtraight that every twelfth confines
Two whole and one half portion of the ſigns. *Creech.*

DODECATHE'ON, *ſ.* [from δωδεκα, twelve, and θεοι, gods.] In botany, a genus of the claſs pentandria, order monogynia, natural order preciæ, (lyſimachiæ, *Juſſ.*) The generic characters are—Calyx: involuere many-leaved, many-flowered, very ſmall; perianthium one-leafed, half five-cleft, permanent: diviſions reflex, finally longer, permanent. Corolla: one petalled, five-parted; tube ſhorter than the calyx, naked at the throat; border reflex: diviſions very long, lanceolate. Stamina: filaments five, very ſhort, obtuſe, ſeated on the tube; antheræ ſagittate, converging into a beak. Piſtillum: germ conic; ſtyle filiform, longer than the ſtamens; ſtigma obtuſe. Pericarpium: capſule oblong, one-celled, gaping at the tip, (ſubeylindric, opening into five parts. *Gærtner.*) Seeds: very many, ſmall; receptacle free, ſmall.—*Eſſential Character.* Corolla, rotate, reflex; ſtamina, placed on the tube; capſule, one-celled, oblong.

Dodecatheon Meadia, Virginian cowſlip, or Meadia, is the only known ſpecies. Meadia has a yellow perennial root, from which come out in the ſpring ſeveral long ſmooth leaves, near ſix inches long, and two and a half broad; at firſt ſtanding erect, but afterwards ſpreading on the ground, eſpecially if it be much expoſed to the ſun: from among theſe leaves ariſe two, three, or four, flower-ſtalks, in proportion to the ſtrength of the roots, which riſe eight or nine inches high; they are ſmooth, naked, and terminated by an umbel of flowers, which are purple, inclining to a peach-bloſſom colour. Theſe appear at the end of April or the beginning of May; and the ſeeds ripen in July; ſoon after which the ſtalks and leaves decay, and the roots remain inactive till the following ſpring. Each flower has a long ſlender pedunele, which is recurved, ſo that the flowers hang down. It is a native of Virginia, and other parts of North America, whence it was ſent by Baniſter to biſhop Compton, in whoſe curious garden at Fulham Mr. Miller firſt ſaw it growing in the year 1709; after which this plant was loſt for ſeveral years in England, till it was again obtained from America by Mr. Cateſby, and cultivated in 1744, by Peter Collinſon, eſquire, ſince which it has been propagated in great plenty. Mark Cateſby named it *Meadia*, in honour of Dr. Richard Mead, who was a generous encourager of every branch of ſcience.

Propagation and Culture. This plant is propagated by offſets, which the roots put out pretty freely when they are in a looſe moiſt ſoil and a ſhady ſituation; the beſt time to remove the roots, and take away the offſets, is in Auguſt, after the leaves and ſtalks are decayed, that they may be fixed well in their new ſituation before the froſt comes on. It may alſo be propagated by ſeeds, which the plants generally produce in plenty; theſe ſhould be ſown in the autumn ſoon after they are ripe, either in a ſhady moiſt border, or in pots, which ſhould be placed in the ſhade; in the ſpring the plants will come up, and muſt then be kept clean from weeds, and if the ſeaſon proves dry, they muſt be frequently refreſhed with water; nor ſhould they be expoſed to the ſun, for while the plants are young, they are very impatient of heat. The young plants ſhould not be tranſplanted till their leaves are decayed, then they may be carefully taken up and planted in a ſhady border, where the ſoil is looſe and moiſt, at about eight inches diſtance from each other, which will be room enough for them to grow one year, by which time they will be ſtrong enough to produce flowers, and may then be tranſplanted into ſome ſhady borders in the flower garden, where they will appear very ornamental during the continuance of their flowers. At

the firſt many ſuppoſed this plant to be tender, and planted it in warm ſituations and nurſed it too much, whereby the plants were often killed; but by experience it is found to be ſo hardy, as not to be hurt by the ſevereſt cold of this country; but it will not thrive in a very dry ſoil, or where it is greatly expoſed to the ſun.

To DODGE, *v. n.* [probably corrupted from *dog*; to ſhift, and play ſly tricks, like a dog.] To uſe craft; to deal with tergiverſation; to play mean tricks; to uſe low ſhifts.—If in good offices and due retributions we may not be pinching and niggardly, it argues an earthly and ignoble mind, where we have apparently wronged, to higgle and *dodge* in the amends. *Hale.*—To ſhift place as another approaches:

For he had, any time this ten years full,
Dodg'd with him betwixt Cambridge and the Bull.
Milton.

To play faſt and looſe; to raiſe expectations and diſappoint them.—You know my paſſion for Martha, and what a dance ſhe has led me; ſhe *dodged* with me above thirty years. *Addiſon.*—This word, in all its ſenſes, is low and vulgar.

DOD'KIN, *ſ.* [*duythen*, Dut.] A doitkin or doit; a contemptuous name for a baſe coin. See DOIT.—I would not buy them for a *dodkin*. *Lily's Grammar conſtrued.*

DO'DÓ, *ſ.* in ornithology. See DIDUS.

DODO'ENS (Rembert), in Latin *Dodonæus* a phyſician and eminent botaniſt, born in 1518 at Staveren in Frieſeland. He ſtudied medicine at Louvain, and afterwards viſited the principal univerſities of France and Italy. He became phyſician to the emperors Maximilian II. and Rodolph II. and was a profeſſor at Leyden, where he died in 1585. His botanical works are: 1. *Hiſtoria Frugum*, Antw. 1552, 8vo. 2. *Herbarium Belgicum*, 1553, 1557; the figures of this are moſtly from Fuchs, the hiſtories and enumeration of qualities, brief: this work was tranſlated into French by L'Ecluſe, and into Engliſh by Lyte. 3. *De Stirpium Hiſtoria Comment. imagines*, 8vo. two vols. ſome of the figures of the firſt volume, and one hundred and thirty-three of the ſecond, are by Dodoens, and are ſuperior to thoſe of Fuchs. 4. *Frumentorum, Leguminum, Paluſtrium, & Aquatilium Herbarum Hiſtoria*, 1566, 1569, 8vo. of theſe the figures are for the moſt part new. 5. *Coronariarum Odoratarumque nonull. Herb. Hiſt.* 1568, 8vo. the figures of theſe are ſuperior to all that had hitherto appeared, except thoſe of Geſner. 6. *Purgantium, aliarumque eo facientium, &c. Hiſt.* 1574, 8vo. very valuable for its beautiful plates. 7. *Hiſtoria Vitis, Vinique, &c.* Colon. 1580, 8vo. 8. *Hiſtoriæ Stirpium pemptades vi. ſeu Libr.* xxx. Antw. 1583, folio; this is a collection of all the former. An improved edition of it, after the author's death, was publiſhed by Raphelengius, in Dutch. Dodoens alſo wrote a *Praxis Medica*, and a book of Medical Obſervations.

DODO'NA, anciently a town of Theſprotia in Epirus, or, according to others, in Theſſaly; famous for a celebrated oracle of Jupiter.

DODONÆ'A, *ſ.* [ſo named in honour of *Rembert Dodonæus* or *Dodoens*, profeſſor of medicine, a famous botaniſt of the ſixteenth century; author of *Frugum Hiſtoria*, &c.] In botany, a genus of the claſs octandria, order monogynia, natural order dumoſæ, (terebintaceæ, *Juſſ.*) The generic characters are—Calyx: perianthium four-leaved, flat; leaflets ovate, obtuſe, concave, deciduous. Corolla: none. Stamina: filaments eight, very ſhort; antheræ oblong, bowed, converging, length of the calyx. Piſtillum: germ three-ſided, length of the calyx; ſtyle cylindric, three furrowed, upright; ſtigma ſlightly three-cleft, a little acute. Pericarpium: capſule three-furrowed, inflated, three-celled; with large membranaceous corners. Seed: in couples, roundiſh.—*Eſſential Character.* Calyx, four-leaved; corolla, none; capſule, three-celled, inflated; ſeeds, in couples.

Species. 1. Dodonæa viſcoſa, or broad-leaved dodonæa: leaves oblong. This ſends up ſeveral ſtalks from the root, about the ſize of a man's arm, with ſeveral upright branches, covered with a light brown bark, which frequently ſeparates from the wood, and hangs looſe; leaves ſtiff, varying greatly in ſhape and ſize, ſome being four inches long, and an inch and a half broad; others not three inches long, and a quarter of an inch broad; they are ſpear-ſhaped, entire, and of a light green, growing with their points upward, and have very ſhort foot-ſtalks. The flowers are produced at the end of the branches in a ſort of raceme, each ſtanding upon a ſlender foot-ſtalk about an inch long. This upright branched ſhrub, ſays Jacquin, growing about five feet in height, is entirely viſcid and fetid; the younger branches are angular; leaves oblong, with a bluntiſh point, attenuated at the baſe, alternate, with ſcarcely any petiole on tender plants that come out in the firſt months, uſually repand or ſerrate; flowers in racemes, frequently varying much on the ſame branches; the natural number of leaflets in the calyx ſeems to be four; it is ſeldom found with five, and when it has only three, which is frequently the caſe, one of the leaflets is always larger than the reſt, and ſcored with a longitudinal groove; the piſtil is frequently deficient in one third part, and then the capſule has only two cells; ſometimes there are only ſeven ſtamens, and even ſix, but that happens very ſeldom; one ſeed in a cell is frequently abortive, and ſometimes both. According to Gærtner the ſeeds are roundiſh, turgidly lenticular, but very ſharp-edged towards the back, hard, ſmooth, black. Browne ſays that this ſlender ſhrub ſeldom riſes more than ſix or ſeven feet, (ten or twelve, *Sloane*;) both the trunk and branches are very flexile and tapering; the taſte of the whole plant is acerb and bitteriſh. In Jamaica it is called the *ſwitch-ſorrel*. Native of the countries between the tropics. In the Society iſles it is dioecous, in New Zealand hermaphrodite. Introduced in 1690, by Mr. Bentick.

2. Dodonæa anguſtifolia, or narrow-leaved dodonæa: leaves linear. This reſembles the foregoing, but the leaves are lanceolate-linear; the fructification is polygamous. Native of the Cape of Good Hope; flowers from May to Auguſt.

Propagation and Culture. The firſt is a plant propagated by ſeeds, which, if obtained freſh from abroad, will riſe eaſily upon a hot-bed: when the plants are fit to remove, they ſhould be each planted in a ſeparate ſmall pot filled with light loamy earth, and plunged into a hot-bed of tanners' bark, ſhading them from the ſun till they have taken new root; then they ſhould have free air admitted to them, every day, in proportion to the warmth of the ſeaſon, for they muſt not be drawn up weak, nor ſhould they have too much water. In the autumn the plants muſt be removed into the ſtove, where they ſhould have a temperate warmth in winter, but during that ſeaſon little water ſhould be given them; nor ſhould they have too much heat, for either of theſe will ſoon deſtroy them: as the plants obtain ſtrength, they will become more hardy, and may be ſet abroad in the open air for two or three months in the heat of ſummer, but it ſhould be in a ſheltered ſituation; in winter they muſt be placed in a ſtove, kept to a moderate temperature of warmth, for the plants will not live in a green-houſe here. This was formerly ſhewn for the tea-tree in many of the European gardens, where it many years paſſed for it among thoſe who knew no better. The ſecond ſort is leſs tender, and requires only the protection of a green-houſe or glaſs caſe.

DODO'NIDES, prieſteſſes who gave oracles in the temple of Jupiter in Dodona. According to ſome traditions the temple was originally inhabited by the ſeven daughters of Atlas, who nurſed Bacchus.

DO'DRANS, *ſ.* [*dodrantalis menſura*, Lat.] The ſpace between the end of the thumb and of the little finger, both extended. About nine Paris inches. This meaſure may be called in Engliſh the *long ſpan*, and *ſpithama* the ſhort ſpan.

DODS'LEY,

DODS'LEY (Robert), an author and bookſeller, born in 1703, at Mansfield, of parents in humble life. Without the advantage of a liberal education he acquired a taſte for literature, which brought him into notice, when in the ſtation of footman to a lady of faſhion. He at that time publiſhed by ſubſcription a collection of poems, under the title of The Muſe in Livery. His next performance was a dramatic piece called The Toyſhop, intended as a civil ſatire upon the prevailing follies of the time. This was ſhewn in manuſcript to Pope, who took the author under his protection; and by his influence it was brought upon the ſtage in 1735, where it met with ſucceſs. The profits which occurred from this and the former were by Dodſley prudently applied to ſettling himſelf in buſineſs. He opened a bookſeller's ſhop in Pall-Mall, which, through his own good conduct, and the encouragement of his patrons, ſoon roſe to diſtinction; and in a courſe of years, Dodſley became one of the moſt conſiderable perſons of his trade in the metropolis. Proceeding at the ſame time in his career as an author, he wrote the farce of The King and the Miller of Mansfield, with a ſequel to it, entitled, Sir John Cockle at Court. Theſe productions are leſs diſtinguiſhed by humour than by a vein of moral and ſentimental ſatire. His next work was in proſe, and obtained great celebrity; it was The Economy of Human Life, in a ſtyle intended to reſemble that of the Scriptures and other oriental writings. One book of a poem, in blank verſe, on the ſubject of Public Virtue, and an ode, entitled Melpomene, next exerciſed his poetical pen. In 1758 he ventured to riſe to tragedy, and compoſed Cleone, the fable of which is ſaid to have been ſuggeſted by a French work, the Legend of St. Genevieve. Though Garrick expreſſed a mean opinion of the play, and it was in conſequence taken to Covent Garden, it long drew full audiences, which was in part attributed to Mrs. Bellamy's acting of the heroine. An attempt to revive it by Mrs. Siddons did not ſucceed, owing, it is ſaid, to the exceſs of pathos which it acquired from her unequalled performance in ſcenes of maternal diſtreſs. In 1760 Dodſley publiſhed his Select Fables of Eſop and other Fabuliſts, in three books, of which the laſt contains original fables. He prefixed a ſenſible and ingenious Eſſay on Fable. He publiſhed, in 1774, A Collection of Plays by old Authors, in 12 vols. 12mo. of which a much-improved edition was given by Mr. Reid, in 1780. The Collection of Poems by different eminent Hands, 6 vols. 12mo. which bears his name, has reſcued from oblivion ſeveral pieces of merit, and may be reckoned one of the moſt valuable publications of the kind. He died upon a viſit at Durham, in 1764. His works have been ſince collected, in two volumes octavo. Dr. Anderſon, in his Britiſh Poets, ſpeaks of Dodſley in the following words: "His character was very amiable and reſpectable. As a tradeſman, he preſerved the greateſt integrity; as a writer, the moſt becoming humility. Mindful of the early encouragement which his own talents met with, he was ever ready to give the ſame opportunity of advancement to thoſe of others; and on many occaſions he was not only the publiſher, but the patron of genius. There was no circumſtance by which he was more diſtinguiſhed, than by the grateful remembrance which he retained, and always expreſſed, towards the memory of thoſe to whom he owed the obligation of being firſt taken notice of in life. Modeſt, ſenſible, and humane; he retained the virtues which firſt brought him into notice, after he had obtained wealth ſufficient to ſatisfy every wiſh which could ariſe from the poſſeſſion of it. He was a generous friend, an encourager of men of genius, and acquired the eſteem and reſpect of of all who were acquainted with him. It was his happineſs to paſs the greateſt part of his life in intimacy with men of the brighteſt abilities, whoſe names will be revered by poſterity; by moſt of whom he was loved as much for the virtues of his heart, as he was admired on account of his writings."

DOD'WELL (Henry), a learned controverſial writer, born at Dublin, but of Engliſh extraction, in 1641. He wrote an incredible number of religious tracts: but his ſervices were ſo little acknowledged, that biſhop Burnet and others accuſe him of doing more hurt than good to the cauſe of Chriſtianity, by his indiſcreet love of paradoxes and novelties, and thus expoſing himſelf to the ſcoffs of unbelievers. His pamphlet on the Immortality of the Soul, gave riſe to the well-known controverſy between Mr. Collins and Dr. Clark on that ſubject. He died in 1711.

DOE, *ſ.* [ðа, Sax. *daa*, Dan. *dama*, Lat.] A ſhe deer; the female of a buck.—Bucks have horns, *does* none. *Bacon.*

The fearful *doe*
And flying ſtag amidſt the greyhounds go. *Dryden.*

DOE, *ſ.* [from *to do.*] A feat; what one has to do; what one can perform:

No ſooner he does peep into
The world, but he has done his *doe*. *Hudibras.*

DOE'BELN, a town of Germany, in the circle of Leipſic, on the Mulda; with manufactures of cloth and hats: thirty miles ſouth-eaſt of Leipſic.

DO'EG, [דֹּאֵג Heb. careful.] The chief herdſman of king Saul. A man's name.

DO'EL, a town of Flanders, on the Scheldt, oppoſite Lillo.

DO'EN, a town of European Turkey, in the province of Bulgaria, on the Danube: fifty-ſix miles north-north-eaſt of Siliſtria.

DO'ER, *ſ.* One that does any thing good or bad:

So foul a thing, O! thou injuſtice art,
That tort'reſt both the *doer* and diſtreſt. *Daniel.*

Actor; agent.—Sith thus far we open the things that have been done, let not the principal *doers* themſelves be forgotten. *Hooker.*—Performer.—One judgeth the prize to the beſt *doer*, of which they are no leſs glad than great princes are of triumphs. *Sidney.*—An active, or buſy, or valiant, perſon:

Fear not, my lord, we will not ſtand to prate;
Talkers are no good *doers*: be aſſur'd,
We go to uſe our hands, and not our tongues. *Shakeſp.*

One that habitually performs or practiſes.—Be *doers* of the word, and not hearers only. *Common Prayer.*

DOES. The third perſon from *do*, for *doth.*—Though lending to foreigners, upon uſe, doth not at all alter the balance of trade between thoſe countries, yet it *does* alter the exchange between thoſe countries. *Locke.*

DO'ESBURG, a town of the Dutch States, in the county of Zutphen, rich and populous. The Hollanders made themſelves maſters of it in 1570; but, in the year 1583, the citizens called in the prince of Parma to their aid, and drove the Dutch away; but the earl of Leiceſter took it again in 1586, being the firſt conqueſt achieved by the Engliſh forces ſent by queen Elizabeth to the aſſiſtance of the States General. Francis de Mendoza, admiral of Arragon, retook it in 1598, but it ſoon after ſurrendered to prince Maurice of Naſſau, who conſiderably augmented the fortifications. The biſhop of Munſter took it in 1672, but relinquiſhed it ſoon after. Like the other towns of the province, it opened its gates to the French in 1672, who demoliſhed the fortifications, and abandoned it in 1674. It is eight miles ſouth-ſouth-weſt of Zutphen, and nine north-eaſt of Arnham. Lat. 52. 4. N. lon. 23. 34. E. Ferro.

DO'FAR, a town of Arabia, in the country of Hadramaut, on the weſt coaſt of the gulf to which it gives name: 180 miles ſouth-weſt of Haſſek, and 120 miles north of Cape Fartak.

To DOFF, *v. a.* [from *do off.*] To put off dreſs.—Alcides *doffs* the lion's tawny hide. *Rowe.*

You

You have deceiv'd our truſt,
And made us *doff* our eaſy robes of peace,
To cruſh our old limbs in ungentle ſteel. *Shakeſpeare.*

To ſtrip; to diveſt of any thing:

Why art thou troubled, Herod? what vain fear
Thy blood-revolving breaſt doth move?
Heav'n's king, who *doffs* himſelf our fleſh to wear,
Comes not to rule in wrath, but ſerve in love. *Craſhaw.*

To put away; to get rid of:

Your eye in Scotland
Would create ſoldiers, and make women fight,
To *doff* their dire diſtreſſes. *Shakeſpeare.*

To ſhift off; to delay; to refer to another time; to put off.—Every day thou *doff'ſt* me with ſome device, Iago; and rather keep'ſt from me all conveniency, than ſupplieſt me with the leaſt advantage of hope. *Shakeſpeare.*

Away, I will not have to do with you.—
—Canſt thou ſo *doff* me? *Shakeſpeare.*

This word is in all its ſenſes obſoletc, and ſcarcely uſed except by ruſtics; yet it is a pure and commodious word.

DOF'FIR, a town of Arabia, in the country of Yemen: twelve miles ſouth of Chamir.

DO'FRE, a town of Norway: thirty-ſix miles eaſt of Romſdael.

DOG, *ſ.* [*dogghe*, Dut. *canis*, Lat.] That domeſtic animal which is ſo ſubſervient to man, and no leſs remarkable for its fidelity and ſagacity, than for the variety of its ſpecies; compriſing the maſtiff, the ſpaniel, the pointer, the bulldog, the greyhound, the hound, the terrier, the cur, with many others. The larger ſort are uſed as a guard; the leſs for ſport:

Such ſmiling rogues as theſe ſooth every paſſion:
Renege, affirm, and turn their halcyon beaks
With ev'ry gale and vary of their maſters,
As knowing nought, like *dogs*, but following. *Shakeſpeare.*

A conſtellation called Sirius, or Canicula, riſing and ſetting with the ſun during the canicular days, or dog-days.—Among the ſouthern conſtellations, two there are who bear the name of the *dog*; the one in ſixteen degrees latitude, containing on the left thigh a ſtar of the firſt magnitude, uſually called Procyon, or Anticanus. *Brown.*

It parts the twins and crab, the *dog* divides,
And Argo's keel that broke the frothy tides. *Creech.*

An andiron. A reproachful name for a man.—Beware of *dogs*, beware of evil workers. *Phil.* ii. 2.—It is uſed as the term for the male of ſeveral genera of animals: as, the *dog* fox, the *dog* otter, &c.—If ever I thank any man, I'll thank you; but that they call compliments is like the encounter of two *dog* apes. *Shakeſpeare.*

The ſame ill taſte of ſenſe will ſerve to join
Dog foxes in the yoke, and ſheer the ſwine. *Dryden.*

Dog is a particle added to any thing, to mark degeneracy; as, *dog* roſe, &c.

To give or ſend to the DOGS; to throw away. *To go to the* DOGS; to be ruined, deſtroyed, or devoured:

Had whole Colepeper's wealth been hops and hogs,
Could he himſelf have ſent it to the *dogs?* *Pope.*

Naturaliſts have uſually aſſigned the gift of ſuperior intelligence, among brute creatures, to the horſe, the elephant, and the dog; but without diſparagement to the noble inſtincts and wonderful docility of the two former animals, we might juſtly give pre-eminence to the latter. The amazing ſagacity of the dog, his gratitude, his unſhaken fidelity, that acute ſenſe of ſhame which often betrays his faults, and that conſciouſneſs of good deſert with which he comes to claim the reward of his ſervices, are circumſtances of ſelf-conviction, of thought, or intelligence, very nearly reſembling that which we obſerve in the human character. Theſe qualities, together with his great utility for various purpoſes, have rendered him the early attendant and common favourite of man. Every anecdote therefore that tends to elucidate the nature and powers of this animal, muſt be particularly intereſting to the lovers of natural hiſtory. Thoſe that follow are completely authentic, which is, perhaps, one of the firſt recommendations to anecdotes of this nature.

M. la Valéc, in his Journey through the Departments of France, publiſhed in 1792, gives the following curious account of the manner in which the country people, in the neighbourhood of Peronne and Doulens, had trained their dogs to elude the vigilance of the officers of the revenue. At night, theſe animals were laden, each with a parcel of goods proportioned to its ſize; except one alone, who was their leader, went without any burden. A crack of a whip was the ſignal for them to ſet out. The leader travelled at a little diſtance before the reſt; and, if he perceived the traces of any ſtranger, he returned to the other dogs; theſe either took a different way, or, if the danger was preſſing, concealed themſelves behind the hedges, and lay cloſe till the patrol had paſſed. When they arrived at the habitation of their maſter's aſſociate, they hid themſelves in the neighbouring fields and hedges, while their leader went to the houſe, and ſcratched at the door, or barked, till he was admitted, when he lay quietly down, as at home: by this the ſmuggler knew that the caravan was come; and, if the coaſt was clear, he went out, when he gave a loud whiſtle, and the dogs came running to him from their ſeveral hiding-places!

Peltier, in his Annals of Paris, No. 164, for December 1798, records the following anecdote: At the beginning of the revolution, a dog went daily to the parade before the palace of the Thuilleries, thruſt himſelf between the legs of the muſicians, marched with them, halted with them, and, after the parade, diſappeared until the next morning; when he reſumed this occupation. The conſtant recurrence of this dog, and the pleaſure which he ſeemed to take in the muſic, made him a favourite with the band, who nick-named him *Parade*. One gave him food to-day, another to-morrow; and he underſtood, by a ſlight ſignal, and a word or two, whom he was to follow for his dinner: after which, faithful to his independence, the dog always withdrew, in ſpite of any careſſes or threats. Sometimes he went to the Opera, ſometimes to the Comedie Italienne, and ſometimes to the Théatre Feydeau; in each of which houſes, he found his way to the orcheſtra, and would lie down ſilently in one corner of it until the performance was over. "I know not (ſays Peltier) whether this dog be now alive: but I know many muſicians to whom his name, his figure, and the ſingularity of his habits, are perfectly familiar."

In Petit's Campaign of Italy, under the Chief Conſul Bonaparte, publiſhed in 1800, we have the following anecdote, which places this animal in the moſt engaging light: "In traverſing the Alps over the mountain Great St. Bernard, many people periſh among the almoſt inacceſſible rocks, whoſe ſummits are covered with eternal ſnow. At the time we croſſed them, the chapel of the monaſtery of St. Bernard was filled with dead bodies, which the dogs had diſcovered, ſuffocated and benumbed, under the ſnow. With what emotions of pleaſure did I careſs theſe dogs, ſo uſeful to travellers! how can one ſpeak of them without being moved by their charitable inſtinct! Notwithſtanding the paucity of our eatables, there was not a French ſoldier who did not manifeſt an eagerneſs to give them ſome biſcuit, ſome bread, and even a ſhare of their meat. Morning and evening theſe dogs go out on diſcovery; and if, in the midſt of their wandering courſes, the echo of ſome unfortunate creature ready to periſh reaches their attentive ears, they run towards thoſe who call out, expreſs their joy, and ſeem to bid the ſufferer take courage till they have been to procure aſſiſtance; in fact, they haſten back to the convent, and with an air of inquietude and ſadneſs, announce in a very diſcernible manner what they have ſeen. In that

caſe a ſmall baſket is faſtened round the dog's neck, filled with food proper for re-animating life almoſt exhauſted; and, by following the humane meſſenger, an unhappy creature is thus frequently ſnatched from impending deſtruction."

The following anecdote, publiſhed in the Monthly Magazine for April 1802, furniſhes an inſtance, in our own country, of that ſagacity and attachment which ſo juſtly contribute to make the dog our favourite. "Thoſe valleys, or *glens* as they are called, which interſect the Grampian mountains, in Scotland, are chiefly inhabited by ſhepherds. The paſtures, over which each flock is permitted to range, extend many miles in every direction. The ſhepherd never has a view of his whole flock at once, except when they are collected for the purpoſe of ſale or ſhearing. His occupation is to make daily excurſions to the different extremities of his paſtures in ſucceſſion; and to turn back, by means of his dog, any ſtragglers that may be approaching the boundaries of his neighbours. In one of theſe excurſions, a ſhepherd happened to carry along with him one of his children, an infant about three years old. After traverſing his paſtures for ſome time, attended by his dog, the ſhepherd found himſelf under the neceſſity of aſcending a ſummit at ſome diſtance, to have a more extenſive view of his range. As the aſcent was too fatiguing for the child, he left him on a ſmall plain at the bottom, with ſtrict injunctions not to ſtir from it till his return. Scarcely, however, had he gained the ſummit, when the horizon was ſuddenly darkened by one of thoſe impenetrable miſts which frequently obſcure thoſe mountains. The anxious father haſtened back to find his child; but unfortunately miſſed his way in the deſcent. After a fruitleſs ſearch of many hours amongſt the moraſſes and cataracts, he was at length overtaken by night. Still wandering on without knowing whither, he at length came to the verge of the miſt; and, by the light of the moon, diſcovered that he had reached the bottom of his valley, and was now within a ſhort diſtance of his cottage. To renew the ſearch that night was equally fruitleſs and dangerous. He was therefore obliged to return to his cottage, having loſt both his child, and his faithful dog, which had attended him for years. Next morning, by day-break, the ſhepherd, accompanied by a band of his neighbours, ſet out in ſearch of his child; but, after a day ſpent in fruitleſs fatigue, he was compelled by the approach of night to deſcend from the mountain. On returning to his cottage, he found that the dog, which he had loſt the day before, had been home, and on receiving his uſual allowance, a piece of oat-cake, had inſtantly gone off again. For ſeveral ſucceſſive days the ſhepherd renewed the ſearch for his child, and ſtill on returning home at evening diſappointed to his cottage, he found that the dog had been home, and, on receiving his uſual allowance of oat-cake, had inſtantly diſappeared. Struck with this ſingular circumſtance, he remained at home one day; and when the dog as uſual departed with his piece of cake, he reſolved to follow him, and find out the cauſe of his ſtrange procedure. The dog led the way to a cataract, at ſome diſtance from the ſpot where the ſhepherd had left his child. The banks of the cataract, almoſt joined at the top, yet ſeparated by an abyſs of prodigious depth, preſented that appearance which ſo often aſtoniſhes and appals the travellers that frequent the Grampian mountains; and indicates that theſe ſtupendous chaſms were not the ſilent work of time, but the ſudden effect of ſome violent convulſion of nature. Down one of theſe rugged and almoſt perpendicular deſcents, the dog began, without heſitation, to make his way, and at laſt diſappeared into a cave, the mouth of which was nearly upon a level with the torrent. The ſhepherd with difficulty followed; but on entering the cave, what were his emotions, when he beheld his infant eating with much ſatisfaction the cake which the dog had juſt brought him, while the faithful animal ſtood by, eyeing his young charge with the utmoſt complacence! From the ſituation in which the child was found, it appears that he had wandered to the brink of the precipice, and then either fallen or ſcrambled down till he reached the cave; which the dread of the torrent had afterwards prevented him from quitting. The dog, by means of his ſcent, had traced him to the ſpot; and afterwards prevented him from ſtarving by giving up to him his own daily allowance. He appears never to have quitted the child by night or day, except when it was neceſſary to go for its food; and then he was always ſeen running at full ſpeed to and from the cottage.—For the Natural Hiſtory of the Dog, and other ſtriking inſtances of the ſagacity, attachment, and intelligence, of this animal, ſee the article CANIS, vol. iii. p. 715. See alſo HOUND, POINTER, SPANIEL; and the articles GAME, HUNTING, and SHOOTING.

With reſpect to property in dogs, the law takes notice of a greyhound, maſtiff dog, ſpaniel, and tumbler; and trover will lie for them. *Cro. Eliz.* 125. A man hath a property in a maſtiff: and where a maſtiff falls on another dog, the owner of that dog cannot juſtify the killing the maſtiff; unleſs there was no other way to ſave his dog, as that he could not take off the maſtiff, &c. 3 *Salk.* 139. The owner of a dog is bound to muzzle him if miſchievous, but not otherwiſe: and if a man doth keep a dog, that uſeth to bite cattle, &c. if after notice given to him of it, or his knowing the dog is miſchievous, the creature ſhall do any hurt, the maſter ſhall be reſponſible for it. *Cro. Car.* 254. *Stra.* 1264. By 10 Geo. III. c. 18, if any perſon ſhall ſteal any dog or dogs, they ſhall be liable to forfeit for the firſt offence from thirty to twenty pounds, or be committed to gaol, for from twelve to ſix months, at the diſcretion of two juſtices; for the ſecond offence to forfeit from fifty to thirty pounds, or be impriſoned for from eighteen to twelve months, and alſo whipped. A puniſhment perhaps not too ſevere for notorious dog-ſtealers; but which may afford a dangerous handle for oppreſſion: and Burn, title *Dogs*, ſeems ſeriouſly to doubt whether the ſtatute extends to *bitches*; a queſtion that we believe has never yet been argued in a court of law.

"He who would hang his DOG, firſt gives out that he is mad." When a man is about to do an unhandſome thing by another, he ſeldom fails of finding out ſome plauſible pretence. The Spaniſh ſay, *Quién a ſu pérra quiére aquiàr, rabia le ha de levantar.*

"Hungry DOGS will eat dirty puddings." The Latins ſay, *Jejunus rarò ſtomachus vulgaria temnit.* The French, *Quand on a faim, on trouve toute choſe bonne.* (Hunger makes every thing taſte well.) The Germans ſay, *Wein kaſe und brod nicht ſchmerkt, der iſt nicht, hungrig.* (He who cannot eat bread and cheeſe muſt not be a hungry.) The French ſay likewiſe, *A un affamé tout eſt bon.* (To a hungry man every thing is reliſhable.) The proverbs all ſufficiently explain themſelves.

"He who has a mind to beat his DOG, will eaſily find a ſtick." This proverb is generally applied to ſuch perſons who out of prejudice and ill deſign, ſeek occaſion of blame and ſcandal againſt other perſons, and aggravate the moſt pardonable offences into flagrant crimes: it ſeems to be borrowed of the Latin; *Qui vult cædere canem, facile invenit fuſtem.* The Greeks ſay, Μικρα προφασις εστι τω πραξαι κακως; and the French, *A petite achoiſon, le loup prend le mouton.* The Latins ſay likewiſe, *Malefacere qui vult, numquam non cauſam inveniet.* We ſay alſo to the ſame purpoſe, *To him that wills, ways will not be wanting.*

To DOG, *v. a.* To hunt, as a dog, inſidiouſly and indefatigably.—I have been purſued, *dogged*, and way-laid, through ſeveral nations. *Pope.*—Hate *dogs* their riſe, and inſult mocks their fall. *Vanity of Human Wiſhes.*

I, his deſpiteful Juno, ſent him forth
From courtly friends, with camping foes to live,
Where death and danger *dog* the heels of worth. *Shakeſp.*

DOG's-BANE, *ſ.* in botany. See APOCYNUM.

DOG's-

DOG's-BERRY, *ſ.* in botany. See CORNUS.

DOG-BOLT, *ſ.* Of this word the meaning is uncertain, unleſs it be, that when meal or flour is ſifted or bolted to a certain degree, the coarſer part is called *dog-bolt*, or flour for dogs. *Johnſon.*

His only ſolace was, that now
His *dog-bolt* fortune was ſo low,
That either it muſt quickly end,
Or turn about again, and mend. *Hudibras.*

DOG-CHEAP, *adj.* Cheap as dogs meat; cheap as the offal bought for dogs.—Good ſtore of harlots, ſay you, and *dog-cheap? Dryden.*

DOG-DAYS, *ſ.* Certain days in July and Auguſt, commonly from the 24th of the firſt to the 28th of the latter, ſo called from the ſtar *Canis*, or dog-ſtar, which then riſes and ſets with the ſun, and greatly increaſes the heat, and is vulgarly reputed unwholeſome.—Nor was it more in his power to be without promotion and titles, than for a healthy man to ſit in the ſun, in the brighteſt *dog-days*, and remain without warmth. *Clarendon.*

DOG-DRAW, *ſ.* The manifeſt deprehenſion of an offender againſt veniſon in a foreſt, when he is found drawing after a deer, by the ſcent of a hound led in his hand: or where a perſon hath wounded a deer, and is caught with a dog drawing after him to recover the ſame. See the article GAME.

DOG's-EAR, *ſ.* The creaſe of a leaf in a book by being thumbed, or turned down.—Books of a lighter digeſtion have the *dog's ears. M. of Halifax.*

Under a tea-cup he might lie
Or creas'd like *dog's-ears* in a folio. *Gray's Long Story.*

DOG-FISH, *ſ.* Another name for a ſhark.—It is part of the jaw of a ſhark, or *dog-fiſh. Woodward.*

DOG-FLY, *ſ.* A fly which infeſts dogs:

Thump-buckler Mars began,
And at Minerva with a lance of braſs he headlong ran;
Theſe vile words uſhering his blows, Thou *dog-fly* what's the cauſe
Thou makeſt gods fight thus? *Chapman.*

DOG's-GRASS, *ſ.* in botany. See TRITICUM.

DOG's-HEAD, a cape on the weſt coaſt of Ireland, in the county of Galway. Lat. 53. 34. N. lon. 10. 8. W. Greenwich.

DOG-HEARTED, *adj.* Cruel; pitileſs; malicious:

His unkindneſs,
That ſtript her from his benediction, turn'd her
To foreign caſualties, gave her dear rights
To his *dog-hearted* daughters. *Shakeſpeare.*

DOG-HOLE, *ſ.* A vile hole; a mean habitation:

But, could you be content to bid adieu
To the dear playhouſe, and the players too,
Sweet country ſeats are purchas'd ev'ry where,
With lands and gardens, at leſs price than here
You hire a darkſome *dog-hole* by the year. *Dryden.*

DOG-HOUSE, *ſ.* A kennel for dogs.—Not only thoſe curs at the *dog-houſe*, but thoſe within the walls, are to ſerve in their places at their ſeveral huntings. *Overbury.*

DOG ISLAND, one of the ſmaller Virgin Iſlands, near the north-weſt coaſt of Virgin Gorda, and eaſt of Tortula.

DOG-KENNEL, *ſ.* A hut or houſe for dogs. See KENNEL.—A certain nobleman, beginning with a *dog-kennel*, never lived to finiſh the palace he had contrived. *Dryden.*

DOG's-MEAT, *ſ.* Refuſe; vile ſtuff; offal like the fleſh ſold to feed dogs.—His reverence bought of me the flower of all the market; theſe are but *dog's-meat* to 'em. *Dryden.*

DOG's-MERCURY, *ſ.* in botany. See MERCURIALIS.

DOG-ROSE, *ſ.* The flower of the hip. See ROSA.—Of the rough or hairy excreſcence, thoſe on the briar, or *dog-roſe*, are a good inſtance. *Derham.*

DOG-SLEEP, *ſ.* Pretended ſleep.—Juvenal mentions a drowſy huſband, who raiſed an eſtate by ſnoring; but then he is repreſented to have ſlept what the common people call *dog-ſleep. Addiſon.*

DOG-STAR, *ſ.* [*canicula*, Lat.] The ſtar which gives the name to the dog-days:

All ſhun the raging *dog-ſtar's* ſultry heat,
And from the half-unpeopled town retreat. *Addiſon.*

DOG's-TAIL GRASS, *ſ.* in botany. See CYNOSURUS.

DOG-TEETH, *ſ.* The teeth in the human head next to the grinders; the eye-teeth.—The beſt inſtruments for dividing of herbs are inciſor-teeth; for cracking of hard ſubſtances, as bones and nuts, grinders, or mill-teeth; for dividing of fleſh, ſharp-pointed or *dog-teeth. Arbuthnot.*

DOG's-TOOTH, *ſ.* in botany. See ERYTHRONIUM.

DOG-TRICK, *ſ.* An ill turn; ſurly or brutal treatment.—Learn better manners, or I ſhall ſerve you a *dog-trick*; I'll make you know your rider. *Dryden.*

DOG-TROT, *ſ.* A gentle trot like that of a dog:

This ſaid, they both advanc'd, and rode
A *dog-trot* through the bawling crowd. *Hudibras.*

DOG-WEARY, *adj.* Tired as a dog; exceſſively weary:

Oh, maſter, maſter, I have watch'd ſo long,
That I'm *dog-weary*. *Shakeſpeare.*

DOG-WHIP, *ſ.* A whip for whipping dogs with.—Let him blood with a *dog-whip. Beaumont and Fletcher.*

DOG-WOOD, *ſ.* in botany. See CORNUS.

DOGA'DO, that part of the Venetian States in which is the capital; it extends from the mouth of the Liſonzo to that of the Adige, between the country of Friuli, the Paduan, and the Poleſin-de-Rovigno, including the canals of Venice and the canals of Marano. The dogado of Venice is now properly the ſecond diviſion of Maritime Auſtria, the city itſelf with its lacunes and iſle forming the firſt.

DOGE, *ſ.* The chief magiſtrate in the republics of Venice and Genoa. The word properly ſignifies *duke*, being formed from the Latin *dux*; as *dogate*, and *dogado*, from *ducatus*, duchy. See the articles GENOA and VENICE.

DOG'GED, *adj.* Sullen; ſour; moroſe; ill-humoured; gloomy.—I'll fill theſe *dogged* ſpies with falſe reports. *Shakeſpeare.*

Few miles on horſeback had they jogged,
But fortune unto them turn'd *dogged*. *Hudibras.*

DOG'GEDLY, *adv.* Sullenly; gloomily; ſourly; moroſely.

DOG'GEDNESS, *ſ.* Gloom of mind; ſullenneſs; moroſeneſs.

DOG'GER, *ſ.* A fiſhing-veſſel, generally employed in the herring fiſhery; equipped with two maſts, and ſomewhat reſembling a ketch.

DOG'GER-BANK, a very extenſive ſand-bank in the German Ocean, between the coaſt of England and Germany.

DOG'GER-MEN, fiſhermen that belong to dogger-ſhips. 25 *Hen.* VIII. c. 2.

DOG'GEREL, *adj.* Looſed from the meaſures or rules of regular poetry; vile; deſpicable; mean: *uſed of verſes.*—It is a diſpute among the critics, whether burleſque poetry runs beſt in heroic verſe, like that of the Diſpenſary: or in *doggerel*, like that of Hudibras. *Addiſon.*

Then haſten Og and Doeg to rehearſe,
Two fools that crutch their feeble ſenſe on verſe;
Who by my muſe to all ſucceeding times
Shall live, in ſpite of their own *dogg'rel* rhymes. *Dryden.*

DOG'GEREL, *ſ.* Mean, deſpicable, worthleſs, verſes:

The hand and head were never loſt of thoſe
Who dealt in *dogg'rel*, or who pin'd in proſe. *Dryden.*

DOG'GESS, *ſ.* A bitch; a woman in contempt. *Clariſſa.*

DOG'GISH,

DOG'GISH, *adj.* Churliſh; brutal.

DO'GIEL (Matthew), a learned eccleſiaſtic of Lithuania, taught rhetoric, poetry, hiſtory, and philoſophy, in different ſchools, with great applauſe, and afterwards became rector at Wilda, where he eſtabliſhed a printing-office, which, in regard to works in the Latin language, excelled, according to the teſtimony of Janozki, all the printing-houſes in Poland. He was afterwards confeſſor to count Scipio de Campo, marſhal of the court in Lithuania, and ſuperintendant of the education of his ſon, whom, after his father's death, he accompanied to Leipſic, Straſburgh, and Paris, and with whom he afterwards reſided as chaplain. The period of his death is not known. His works are, 1. *Codex Diplomaticus Regni Poloniæ, & Magni Ducatus Lithuaniæ*, &c. &c. The plan of this important and extenſive work was formed by the author at Paris, and he afterwards carried it into execution under the patronage of Zaluſki, prince Jablonowſki, and other eminent men; and for that purpoſe he obtained acceſs to the archives of the kingdom at Cracow. According to the original plan it was to conſiſt of eight volumes in folio; but three only appeared, which were publiſhed at Wilda. 2. *Limites Regni Poloniæ & Magni Ducatus Lithuaniæ, ex Originalibus & Exemplis authendicis*, Wilda, 1758, 2 vols. quarto. 3. *Diſſertatio de Jure Regni Poloniæ in Sileſiam.*

DOGLIA'NI, a mountain of Boſnia: twelve miles north of Serajo.

DOG'MA, *ſ.* [from δοκεω, Gr. to ſuppoſe.] Eſtabliſhed principle; doctrinal notion.—Our poet was a ſtoic philoſopher, and all his moral ſentences are drawn from the *dogmas* of that ſect. *Dryden.*—The Latin plural is alſo uſed.—In ſuch a hiſtory what would be of the greateſt moment is not ſo much a minute detail of the *dogmata* of each ſect, as a juſt delineation of the ſpirit of the ſect. *Reid.*—[In canon law.] *Dogma* is that determination which conſiſts in, and has a relation to, ſome caſuiſtical point of doctrine, or ſome doctrinal part of the Chriſtian faith. *Ayliffe.*

DOGMA'TIC, or DOGMATICAL, *adj.* Authoritative; magiſterial; poſitive; in the manner of a philoſopher laying down the firſt principles of a ſect.—Learning gives us a diſcovery of our ignorance, and keeps us from being peremptory and *dogmatical* in our determinations. *Collier.*

DOGMA'TICALLY, *adv.* Magiſterially; poſitively.—I ſhall not preſume to interpoſe *dogmatically* in a controverſy, which I look never to ſee decided. *South.*

DOGMA'TICALNESS, *ſ.* The quality of being dogmatical; magiſterialneſs; mock authority.

DOG'MATISM, *ſ.* Dogmatical aſſertions.—They will not now alter it from a pious implicit faith in the *dogmatiſm* of philoſophers. *Burke.*

DOG'MATIST, *ſ.* [*dogmatiſte*, Fr.] A magiſterial teacher; a poſitive aſſerter; a bold advancer of principles.—A *dogmatiſt* in religion is not a great way off from a bigot, and is in high danger of growing up to be a bloody perſecutor. *Watts.*

DOG'MATISTS, or DOGMATICI, *ſ. pl.* A ſect of ancient phyſicians, of which Hippocrates was the firſt. They are alſo called *logici*; logicians, from their uſing the rules of logic in ſubjects of their profeſſion. They laid down definitions and diviſions; reducing diſeaſes to certain genera, and thoſe genera to ſpecies, and furniſhing remedies for them all; ſuppoſing principles, drawing concluſions, and applying thoſe principles and concluſions to particular diſeaſes under conſideration: in which ſenſe, the dogmatiſts ſtand contradiſtinguiſhed from empirics.

To DOG'MATIZE, *v. n.* To aſſert poſitively; to advance without diſtruſt; to teach magiſterially:

Theſe, with the pride of *dogmatizing* ſchools,
Impos'd on nature arbitrary rules;
Forc'd her their vain inventions to obey,
And move as learned frenzy trac'd the way. *Blackmore.*

DOG'MATIZER, *ſ.* An aſſerter; a magiſterial teacher; a bold advancer of opinions.—Such opinions, being not entered into the confeſſions of our church, are not properly chargeable either on papiſts or proteſtants, but on particular *dogmatizers* of both parties. *Hammond.*

DOGRIB'BED, *adj.* Ribbed like a dog; lean or bare of fleſh on the back and ribs.

DOGRIB'BED INDIANS, a tribe which inhabit round lake Edlande, in the north-weſt part of North America. They are often at war with the Arathapeſcow Indians. Both theſe tribes are among the moſt ſavage of the human race. They trade with the Hudſon-bay company's ſettlements. Edlande lake lies north of the Arathapeſcow ſea, or lake, and near the arctic circle.

DOGS (Iſle of), in the county of Middleſex, oppoſite Greenwich. Here Togodumnus, brother of Caractacus, was killed in a battle with the Romans, in the year 46.

DOGS. *ſ.* Irons uſed inſtead of a grate, for conſuming wood, and ſimilar fuel.

DOHALIZ', a town of Bohemia, in the circle of Konigingratz: four miles north-weſt of Konigingratz.

DOH'NA, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen, on the Muglitz, containing about one hundred houſes: nine miles ſouth-ſouth-eaſt of Dreſden.

DOIAGO'I, an iſland of Ruſſia, in the Frozen Sea, at the entrance of the Straits of Vagatſkoi. Lat. 70. 5. N. lon. 75. E. Ferro.

DO'JAR, a town of Arabia, in the country of Yemen: forty-four miles eaſt of Chamir.

DOI'LY, *ſ.* A woollen ſtuff; ſo called, it is ſuppoſed, from the name of the firſt maker.—We ſhould be as weary of one ſet of acquaintance, though never ſo good, as we are of one ſuit, though never ſo fine: a fool and a *doily* ſtuff, would now and then find days of grace, and be worn for variety. *Congreve.*—Linen made into a ſmall napkin.

DO'INGS, *ſ.* [from *to do*. This word has hardly any ſingular.] Things done; events; tranſactions:

I have but kill'd a fly.—
—But how if that fly had a father and mother?
How would he hang his ſlender gilded wings,
And buz lamented *doings* in the air! *Shakeſpeare.*

Feats; actions: good or bad:

If I'm traduc'd by tongues which neither know
My faculties nor perſon, yet will be
The chronicles of my *doing*, let me ſay
'Tis but the face of place, and the rough brake
That virtue muſt go through. *Shakeſpeare.*

Behaviour: conduct:

Never the earth on his round ſhoulders bare
A maid train'd up from high or low degree,
That in her *doings* better could compare
Mirth with reſpect, few words with curteſy. *Sidney.*

Conduct; diſpenſation.—Dangerous it were for the feeble brains of man to wade far into the *doings* of the Moſt High. *Hooker.*—Stir; buſtle; tumult.—Shall there be then, in the mean while, no *doings*? *Hooker.*—Feſtivity; merriment: as, jolly *doings*. This word is now only uſed in a ludicrous ſenſe, or in low mean language.—After ſuch miraculous *doings*, we are not yet in a condition of bringing France to our terms. *Swift.*

DOI'RON, a river of Savoy, which joins the Iſere near Mouſtiers, in the Tarentaiſe.

DOIT, *ſ.* [*duyt*, Dut. *doyght*, Erſe.] A ſmall piece of baſe money, prohibited by ſtat. 3 Hen. V. c. 1.—When they will not give a *doit* to relieve a lame beggar, they will lay out ten to ſee a dead Indian. *Shakeſpeare.*

In Anna's wars a ſoldier, poor and old,
Had dearly earn'd a little purſe of gold;
Tir'd with a tedious march, one luckleſs night
He ſlept, poor dog! and loſt it to a *doit*. *Pope.*

DO'KOWICHE,

DO'KOWICHE, a town of Poland, in the palatinate of Belcz: twenty-eight miles north-weſt of Belcz.

DOL, a town of France, and principal place of a diſtrict, in the department of the Ille and Vilaine, ſituated in a marſhy country, about a league from the ſea; before the revolution, the ſee of a biſhop, ſuffragan of Tours: the air is unhealthy, and the town thinly inhabited; it contains about 1200 houſes: ſix poſts north of Rennes, and twenty-ſeven weſt of Paris. Lat. 48. 33. N. lon. 15. 54. E. Ferro.

DOLABEL'LA (P. Corn.), a Roman, who married the daughter of Cicero. During the civil wars he warmly eſpouſed the intereſt of Julius Cæſar, whom he accompanied at the famous battles at Pharſalia, Africa, and Munda. He was made conſul by his patron, though Marc Antony, his colleague, oppoſed it. After the death of Julius Cæſar, he received the government of Syria as his province. Caſſius oppoſed his views, and Dolabella, for violence, and for the aſſaſſination of Trebonius, one of Cæſar's murderers, was declared an enemy to the republic of Rome. He was beſieged by Caſſius in Laodicea; and, when he ſaw that all was loſt, he killed himſelf in the twenty-ſeventh year of his age. He was of a ſmall ſtature, which gave occaſion to his father-in-law to aſk him, "Who had tied him ſo cleverly to his ſword?" The family of the Dolabellæ diſtinguiſhed themſelves at Rome, and one of them, L. Corn. conquered Luſitania, before Chriſt 69 years.

DOLALYC'ZE, a town of Lithuania, in the palatinate of Novogrodek: twelve miles north-north-eaſt of Novogrodek.

DO'LAN, a town of Bohemia, in the circle of Konigingratz: four miles weſt of Gitſchin.

DO'LANOVA, a river of Ruſſian Siberia, which runs into the Oka: twelve miles ſouth of Bratſkoi.

DOL'CE (Carlino), an admired painter, born at Florence in 1616, and ſtudied under Vignali. He diſtinguiſhed himſelf by his execution as early as his eleventh year. The ſtile of painting which he cultivated was the ſoft, tender, and highly-finiſhed, in which laſt quality he equalled the maſters of the Dutch and Flemiſh ſchool. His touch was extremely neat, his colouring tranſparent, his management of the chiaro-ſcuro very maſterly, ſo that his figures have a wonderful delicacy and relief. He is charged with the uncommon fault of beſtowing too much labour on his pictures; and his carnations are ſaid to have the appearance of ivory more than of fleſh. He chiefly painted divine ſubjects, to which he ſometimes gave a moſt celeſtial air and beauty. His pieces are few, and are found in particular collections. It is ſaid, that he was ſo chagrined on comparing his own ſlow manner of working with the rapidity of Luca Giordano, that it cauſed his death, which, however, did not take place till his ſeventieth year, in 1686.

DOL'CE (Ludovico), a very copious Italian writer, born at Venice in 1508. He was an hiſtorian, orator, poet, grammarian, philoſopher, editor, tranſlator, compiler, and commentator. He wrote in a pure, eaſy, and elegant, ſtile, and poſſeſſed equal facility in verſe and proſe. He was a great tranſlator from the ancients, and publiſhed verſions of Horace's Satires and Epiſtles, Ovid's Metamorphoſes, parts of Catullus, the tragedies of Seneca, ſome of thoſe of Euripides, ſeveral pieces of Cicero, Pliny's Letters, &c. He likewiſe compoſed ſome tragedies, of which his Marianna was acted with great applauſe before a noble audience, in the palace of Sebaſtian Erizzo; and was afterwards to have been repreſented in that of the duke of Ferrara, but the concourſe was ſo great as to prevent the acting. His heroic poems, in *ottava rima*, intitled *L'Achille e l'Enea*, are a ſingular work, conſiſting, in great part, of tranſlations from the Iliad and Eneid, with additions and retrenchments according to his fancy, ſo as to be neither two tranſlations, nor two new poems. His dialogue on painting, intitled *L'Aretino*, 1557, 8vo. is conſiderably eſteemed. Of his biographical works the principal is, A Life of the emperor Charles V. 1561, 4to. Dolce died about 1568.

DOL'CE AQUA, a town of Piedmont, in the county of Nice, ſituated on the Navia, the capital of a marquiſate, defended with a ſtrong caſtle and fortreſs. The land produces excellent wine, figs, almonds, filberts, apples, citrons, lemons, melons, legumes of all ſorts, and excellent oil: ſixteen miles eaſt-north-eaſt of Nice, and three and a half north-eaſt of Vintimiglia.

DOLE, a town of France, and principal place of a diſtrict, in the department of the Jura, ſituated on the north ſide of the Doubs, containing between 9000 and 10,000 inhabitants. It was once a ſtrong place, but the fortifications were deſtroyed by Louis XIV. twenty-five miles north of Lons le Saunier, and twenty-three weſt-ſouth-weſt of Beſançon.

DOLE, *ſ.* [from *deal*; dælan, Sax.] The act of diſtribution or dealing.—The perſonal fruition in any man cannot reach to feel great riches: there is a cuſtody of them, or a power of *dole* and donative of them, or a fame of them, but no ſolid uſe to the owner. *Bacon.*

At her general *dole*,
Each receives his ancient ſoul. *Cleaveland.*

Any thing dealt out or diſtributed:

Let us, that are unhurt and whole,
Fall on, and happy man be's *dole*. *Hudibras.*

Proviſions or money diſtributed in charity:

They had ſuch firm dependence on the day,
That need grew pamper'd, and forgot to pray;
So ſure the *dole*, ſo ready at their call,
They ſtood prepar'd to ſee the manna fall. *Dryden.*

Blows dealt out:

What if his eye-ſight, for to Iſrael's God
Nothing is hard, by miracle reſtor'd,
He now be dealing *dole* among his foes,
And over heaps of ſlaughter'd walk his way? *Milton.*

[From *dolor.*] Grief; ſorrow; miſery, *Obſolete.*—Yonder they lie; the poor old man, their father, making ſuch pitiful *dole* over them, that all beholders take his part with weeping. *Shakeſpeare.*

To DOLE, *v. a.* To deal; to diſtribute.

DOLE, *ſ.* Void ſpace left in tillage.

DOLE-FISH, *ſ.* Fiſh which the fiſhermen in the North Seas uſually receive for their allowance.

DOLE-ME'ADOW, *ſ.* One wherein divers perſons have a ſhare.

DO'LEFUL, *adj.* Sorrowful; diſmal; expreſſing grief; querulous:

Juſt then the hero caſt a *doleful* cry,
And in thoſe ardent flames began to fry:
The blind contagion rag'd within his veins. *Dryden.*

Melancholy; afflicted; feeling grief; ſorrowful:

How oft my *doleful* ſire cry'd to me, Tarry, ſon,
When firſt he ſpy'd my love. *Sidney.*

Diſmal; impreſſing ſorrow; dolorific.—It watereth the heart to the end it may fructify; maketh the virtuous, in trouble, full of magnanimity and courage; ſerveth as a moſt approved remedy againſt all *doleful* and heavy accidents, which befal men in this preſent life. *Hooker.*

Happy the mortal man, who now at laſt
Has through this *doleful* vale of mis'ry paſt;
Who to his deſtin'd ſtage has carried on
The tedious load, and laid his burden down. *Prior.*

DO'LEFULLY, *adv.* In a doleful manner; ſorrowfully; diſmally; querulouſly.

DO'LEFULNESS, *ſ.* Sorrow; melancholy. Querulouſneſs. Diſmalneſs.

DO'LESOME, *adj.* Melancholy; gloomy; diſmal; ſorrowful; doleful:

Hell-ward bending o'er the beach deſcry
The *doleſome* paſſage to th' infernal ſky. *Pope.*

DO'LESOMELY, *adv.* In a doleſome manner.

DO'LESOMENESS, *ſ.* Gloom; melancholy; diſmalneſs.

DO'LET (Stephen), a learned Frenchman, born at Orleans, about the year 1509. By ſome writers he is ſaid to have been a natural ſon of Francis I. but the report, for chronological as well as other reaſons, wants probability. By his labours the intereſts of literature were much benefited; the ſtudy of the Latin language in particular, in Ciceronian purity, was conſiderably promoted in France, and his native tongue improved and poliſhed. But he appears to have avowed lax notions reſpecting religion, and to have excited the hatred of the monks in that ſuperſtitious age, by expoſing and ridiculing their impoſtures. The conſequence was, that he was more than once arreſted and thrown into priſon; whence he was delivered, and preſerved for a time from a ſeverer fate, by the great intereſt which men of learning and rank exerted in his behalf. But his enemies, who were watchful to take advantage againſt him, obtained an order for his being again impriſoned, in 1544. After eſcaping from confinement, and taking refuge in Piedmont, he appears in a ſhort time to have returned into France; and was again arreſted, and ſent to Paris; where he was abandoned to the fury of the inquiſitors. In their unjuſt and mercileſs court he was convicted of atheiſm, and condemned to be burnt; which ſentence was carried into execution in 1546, when he was only thirty-ſeven years of age. The following are the titles of the moſt curious or important of his numerous works: 1. *Stephani Doleti Orationes duæ in Tholoſanos, &c.* 8vo. 2. *Dialogus de Imitatione Ciceroniana adverſus Deſiderium Eraſmum, &c.* 4to. 1535. 3. *Commentariorum Linguæ Latinæ, Tomi duo,* folio, 1536, 1538. 4. *De Re Navali Liber, &c.* 4to. 1537. 5. *Stephani Doleti Galli Aurelii Carminum, Libri quatuor,* 4to. 1538. 6. *Genethliacum Claudii Doleti, Stephani Filii, Liber Vitæ communi in primis utilis & neceſſarius, Autore Patre,* 4to. 1539. 7. *Formulæ Latinarum Locutionum Illuſtriorum, in tres Partes diviſæ, &c.* folio, 1539. 8. *Franciſci Valeſii, Gallorum Regis, Fatorum, Libri tres, Carminibus Latinis conſcripti,* 4to. 1539. 9. *Obſervationes in Terentii Andriam & Eunuchum,* 8vo. 1540. 10. *Liber de Imitatione Ciceroniana, adverſus Floridum Sabinum, &c.* 4to. 1540.

DOLGA'IA, a bay of Ruſſian Lapland, in the White Sea. Lat. 73. 25. N. lon. 38. E. Ferro.

DOLGANO'VA, a town of Ruſſian Siberia: thirty-two miles north-north-eaſt of Nertſchinſk.

DOLG'BOTE, *ſ.* [from the Sax. ꝺolg, a wound, and bote, a recompence.] A recompence for a wound or ſear.

DOL'GELLY, or DOLGETH, the chief and largeſt town of the county of Merioneth, in North Wales. It is ten miles eaſt of the port of Barmouth, forty ſouth of Caernarvon, thirty-five from Montgomery, and 205 from London. It is ſituated on the river Avon, at the bottom of that romantic hill called Kader-Iris, well known as one of the loftieſt mountains in Wales, and on a good road leading from Shrewſbury to Caernarvon and Holyhead. As it is ſurrounded with mountains, they are commonly called its walls: it has a ſteeple that grows in it, and its bell hangs in a yew-tree. About five miles from the town is the cataract of Dol y Myllyn, which falls thirty-five feet into a large baſon, and from thence twenty feet more, with a loud and awful roar. The markets are on Tueſdays and Saturdays; and there are ſeven fairs in the year. The tide flows within a mile of the town. Here is a large manufacture of what is called webbing, white plains, or Welſh flannel, chiefly for exportation.

DOLGENSE'E, a lake of Germany, in the circle of Upper Saxony, and Ucker Mark of Brandenburg, a little to the north of Templin.

DOLHINO'W, a town of Lithuania, in the palatinate of Wilna: eighty miles eaſt of Wilna.

DOLIC'ZA, a town of Poland, in the palatinate of Podolia: twenty-ſix miles north-weſt of Kaminiec.

DO'LICHOS, *ſ.* [from δολιχος, Gr. long, the pod or legume being generally lengthened out.] In botany, a genus of the claſs diadelphia, order decandria, natural order papilionaceæ, or leguminoſæ. The generic characters are—Calyx: perianthium one-leafed, very ſhort, four-toothed, equal; the ſuperior tooth emarginate. Corolla: papilionaceous; ſtandard roundiſh, large, emarginate, the whole reflex; two ealluſes oblong, parallel and longitudinal, growing to the ſtandard beneath towards the baſe, compreſſing the wings, not hollowed on the back; wings ovate, obtuſe, length of the keel; keel lunulate, compreſſed, beneath converging cloſely, length of the wings aſcending at the tip. Stamina: filaments diadelphous, (ſimple and nine-cleft,) the ſimple one curved at the baſe; Antheræ ſimple. Piſtillum: germ linear, compreſſed; ſtyle aſcending; ſtigma bearded, running on inwardly from the middle to the tip of the ſtyle, which on the fore part is callous, obtuſe. Pericarpium: legume acuminate, large, oblong, two-valved, two-celled. Seeds: ſeveral, elliptic, uſually compreſſed.—*Eſſential Character.* Two parallel oblong calluſes at the baſe of the ſtandard, compreſſing the wings underneath.

Species. I. Twining. 1. Dolichos Benghalenſis, or Bengal dolichos: ſhrubby, legumes ending in long dagger points. This is perennial, with a ſtem ſomewhat roughiſh to the touch, and ſcadent, as well as producing ſeveral branches; leaves roundiſh-ovate, ending in a point, furniſhed with a briſtle; ſtipules lanceolate; peduncles racemoſe, four or five inches long; flowers ſeated on very ſhort peduncles, uncertain as to number; ſnow-white, and lightly odorous. Legume oblong, pointed, compreſſed, firſt green, afterwards growing pale; ſeeds few, roundiſh-oblong, compreſſed, brown, with deeper coloured points, and with a long, protuberant, ſnow-white, hilum.

2. Dolichos lablab, or black-ſeeded dolichos: legumes ovate-ſabre-ſhaped; ſeeds ovate, with a bowed eye towards one end. Stems and branches round, ſcabrous backward. Dolichos enſiformis of Thunberg approaches nearer to this than to the dolichos enſiformis of Linnæus, from which it is certainly different. Alpinus ſays that this grows wild in Egypt. Haſſelquiſt, however, is certain that it does not grow wild in Lower Egypt, but is only cultivated there in gardens. The Egyptians call it *ful Frangi*, or European bean: hence we might conjecture that the Europeans firſt brought it into Egypt. The inhabitants make pleaſant arbours of it; they not only ſupport it with trellis-work, but faſten it with twine, by which means the leaves form an excellent covering, and an agreeable ſhade. Cultivated in 1714 by the ducheſs of Beaufort.

3. Dolichos Sinenſis, or Chineſe dolichos: legumes pendulous, cylindric, torulofe; peduncles erect, many-flowered. Stem annual, long, round, ſlender, twining, ſomewhat branched. Native of India, Amboyna, China, and Cochin-china.

4. Dolichos uncinatus, or hook-podded dolichos: legumes cylindric, hirſute, with a hooked ſubulate claw at the end; peduncles many-flowered; ſtem rough with hairs. This is removed by Browne and Swartz to a new genus, under the name of *teramnus*, becauſe it wants the calluſes at the baſe of the ſtandard in the corolla, and differs in other reſpects. See TERAMNUS. It is a native of Jamaica.

5. Dolichos luteolus, or yelloviſh dolichos: legumes in ſeveral cylindric heads; ſeeds rounded. Stem rather angular, branches round; a ſcandent plant; branches three or four cubits long. Native of the Society Iſles.

6. Dolichos unguiculatus, or bird's-foot dolichos: legumes in ſubcylindric heads, recurved, and concave at the

the tip. An annual ſmooth plant, with climbing ſtem; ſeed whitiſh, with a ſnow-white hilum. Native of the Weſt Indies. Loureiro ſays, it is a native of China, whence it was brought into Portugal.

7. Dolichos Tranquebaricus, or Tranquebar dolichos: legumes few, in cylindric heads, with a ſtraight dagger point. Extremely like dolichos unguiculatus, but flowers at a different time of the year, and is more climbing. The whole plant is very ſmooth; the vexillum, or ſtandard of the flowers, is pale yellow behind, and bluiſh red in front; the wings more blue, and the keel white. The legume differs from that of the unguiculatus merely in being ſlenderer.

8. Dolichos enſiformis, or horſe-bean: legumes gladiate, three-keeled at the back; ſeeds arilled. This is a native of Jamaica, and is diſtinguiſhed by its large falcated legume and white ſeeds, with a ſaffron-coloured hile. The ſtem is three or four feet high; the ſhoots run much farther; the legumes are between ten and fourteen inches in length, and generally contain ten or eleven ſeeds.

9. Dolichos tetragonolobus, or quadrangular dolichos: legumes quadrangular-membranaceous. Stem herbaceous, round, ſlender, ſcandent, long, branching; flowers pale blue, on long, lateral, few-flowered, peduncles; ſeeds about eight. Native of the Eaſt Indies, China, and Cochin-china.

10. Dolichos ſeſquipedalis, or long-podded dolichos: legumes ſubcylindric, even, very long. Appearance of a phaſeolus; ſtandard of the flower pale above, reddiſh within; legume more than a foot and a half in length, roundiſh, with a little obtuſe gibbous hook at the end. Native of the Weſt Indies.

11. Dolichos altiſſimus, or tall dolichos: legumes racemed, rough-haired, equal; ſeeds ſurrounded with a ſcar; leaves ſmooth on both ſides. This climbs the higheſt trees, whence hang elegant wreaths of flowers in cloſe racemes, on peduncles frequently more than twelve feet in length. Native of the iſland of Martinico.

12. Dolichos pruriens, or horſe-eye bean: legumes in racemes; valves ſomewhat keeled, rough-haired; peduncles by threes. Common in all parts of the Weſt Indies, and riſing to the top of the talleſt trees, or ſpreading wide among lower buſhes. A decoction of the roots is reckoned a powerful diuretic, and cleanſer of the kidneys. A vinous infuſion of the pods (twelve to a quart) is ſaid to be a certain remedy for the dropſy: the doſe half a pint, when made in beer. In the Windward Iſlands they make a ſyrup of the pods, which is ſaid to be very effectual againſt worms. Native of both Indies, according to Linnæus; and of Cochin-china, according to Loureiro.

13. Dolichos urens, or cow-itch dolichos: legumes in racemes, with furrows tranverſely lanceolate; the ſeeds ſurrounded with a ſcar. Stems round; proper peduncles one-flowered, in threes, placed cloſely at the end of the raceme, and hence forming a very elegant pendulous wreath of about eighteen flowers; theſe have no ſcent, are about two inches long, have a ferruginous calyx, and a yellow corolla, with the lower edge of the wings red. The ſeeds, from their reſemblance to an eye, are called by the French *yeux bourrique*, or aſs's eye; in our Weſt-India iſlands, for the ſame reaſon, they have the name of *ox-eye bean*. This alſo climbs to the top of the talleſt trees, throwing down its long ſlender flower-ſtalks to a moderate diſtance from the axils of the upper ribs, from whence they generally riſe: theſe are not above the thickneſs of a common packthread, but ſeldom under four or five feet in length, and bear the flowers in cluſters at their extremities. Jacquin, however, thinks it probable, that by this deſcription Browne may have confounded this ſpecies with the altiſſimus. Native of the Weſt Indies. This and the foregoing are perennial and ſhrubby; the ſurface alſo of the legumes are covered with prurient hairs.

14. Dolichos minimus, or ſmall dolichos: legumes in racemes, compreſſed, with four ſeeds in them; leaves rhomb-ſhaped. This climbs three or four feet in height, and has numerous branches. Browne calls it ſmall fetid dolichos; in Curaçoa it has the name of *vrattekruyt*, or wart-herb, the leaves bruiſed with ſalt being reputed to cure warts. Native of Jamaica; and, according to Jacquin, of all the Caribbee iſlands.

15. Dolichos lineatus, or lineated dolichos: legumes in racemes, oblong, three keeled. It differs from dolichos enſiformis in the leaves being ovate-oblong, not gibbous; obtuſe, not acute; thick, and marked with lines, not three-nerved; in having the legumes ſtraight at the back and oblong, not ſcymitar-ſhaped and curled. Native of Japan. Thunberg aſcribes the *reedſu* of Kæmpf. Amoen. 5. 836. to this ſpecies. See N° 32.

16. Dolichos Capenſis, or Cape dolichos: peduncles with one or two flowers; legumes elliptic, compreſſed; leaves ſmooth. Native of the Cape of Good Hope.

17. Dolichos ſcarabæoides, or ſilvery-leaved dolichos: leaves ovate, tomentoſe; flowers ſolitary; ſeeds two-horned. Flowers ſingle from the axis. The ſeeds have two proceſſes like the antennæ of a beetle, whence the name. Native of the Eaſt Indies.

18. Dolichos incurvus, or crooked dolichos: legumes ſolitary, incurved, three-keeled. It differs from dolichos enſiformis in having the flowers ſolitary from the axils; the leaves oblong, and not gibbous on one ſide; the legumes bent in, not ſcymitar-ſhaped, and bent back; and the peduncle bending round: from dolichos lineatus, in the leaves being broad at the baſe, gradually acuminate, three-nerved, thinner; the legume inflex, enſiform, acuminate, waved, ſolitary. Native of Japan.

19. Dolichos bulboſus, or bulbous dolichos: leaves ſmooth, many-angled, toothed. Stem perennial, ſuffruticoſe, long, round, ſmooth, branched, without any ſtipules. The root conſiſts of roundiſh, tailed, juicy, white tubers in bundles: theſe are eaten both raw and dreſſed, but not the ſeeds. Native of both Indies.

20. Dolichos trilobus, or trilobated dolichos: lateral leaflets gibbous on the outſide, the middle one three-lobed. The root is compoſed of a few long tubers in bundles, they are two feet long, ſubcylindric, fibroſe-fleſhy, of a pale colour, and eatable when boiled; but not the legumes. Loureiro doubts whether this be the plant of Plukenet and Burman, ſince theſe authors make no mention of the remarkable large tubers. Native of the Eaſt Indies; cultivated in China and Cochin-china.

21. Dolichos ariſtatus, or bearded dolichos: peduncles two-flowered, axillary; legumes linear, compreſſed, ending in a ſtraight awn. Native of America.

22. Dolichos filiformis, or cat's-claw dolichos: leaflets linear, obtuſe, mucronate, ſmooth, pubeſcent underneath. This grows among buſhes, but ſeldom ſtretches above three or four feet in length. It is uſed as a purgative ingredient in diet-drinks, and is ſaid to anſwer well in hydropic caſes. Native of Jamaica, where it is called cat's-claws.

23. Dolichos purpureus, or purple dolichos: ſtem ſmooth; petiole pubeſcent; wings of the corolla ſpreading. Native of both Indies; cultivated in China and Cochin-china. Loureiro has another ſort, which he calls dolichos albus, and is not very different from this, only more tender and ſapid. It is the cacara alba of Rumphius. The ſtem is ſmooth and white; the leaflets three-cornered-rounded, pubeſcent, ſoft, pale, on ſmooth petioles; ſtipules in pairs, acute, ſhort; flowers white, in ſhort ſubterminating racemes, with a very wide reflex ſtandard; legumes ſmooth, but tubercled on the back, and beaked. This is alſo cultivated in China and Cochin-china.

24. Dolichos regularis, or uniform dolichos: leaves ovate, obtuſe; peduncles many-flowered; petals equal in ſize and form. Native of Virginia.

25. Dolichos lignoſus, or woody dolichos: ſtem perennial;

rennial; peduncles forming a head; legumes ſtiff and ſtraight, linear. Root woody, perennial; flowers nodding a little, roſe-coloured with a purpliſh keel; ſeeds black. Native of the Eaſt Indies.

26. Dolichos polyſtachios, or many-ſpiked dolichos: ſtem perennial; racemes very long; pedicels in pairs; legumes acuminate, compreſſed. Stem becoming ſhrubby, often round, ſmooth, very long. Native of Japan, where it is frequently cultivated for arbours; alſo of Virginia.

27. Dolichos reticulatus, or netted-leaved dolichos: leaves ovate, acute, wrinkled, netted, villoſe; racemes few-flowered. Native of New South Wales. Introduced in 1781 by ſir Joſeph Banks, bart. Shrubby.

28. Dolichos luteus, or yellow dolichos: twining; flowers in a ſort of ſpike; legumes ſubcylindric, ſmooth; leaves roundiſh-rhombed, obtuſe, entire, ſmooth. Native of Jamaica.

29. Dolichos montanus, or mountain dolichos: ſtem ſhrubby, climbing; leaflets ovate-rhombed; five filaments with oblong antheræ; and five alternate, roundiſh. Native of the mountain woods of Cochin-china. This ſpecies is very nearly allied to dolichos bulboſus and trilobus, eſpecially in the tuberous root; linear legumes divided between the ſeeds; ſtyles and ſtigmas not pubeſcent. Had not Linnæus ranged theſe under dolichos, Loureiro would have ſuppoſed that all three belonged to another genus.

30. Dolichos haſtatus, or ſpear-leaved dolichos: ſtem procumbent; leaves ſubhaſtate; peduncles many-flowered, erect. Stem annual, long, round, branched; ſeeds ovate, pale, eſculent. Cultivated on the eaſtern coaſt of Africa.

31. Dolichos rotundifolius, or round-leaved dolichos: legumes racemed, compreſſed, ſomewhat hairy, ſword-ſhaped; leaflets oval-roundiſh, ſmooth. Dolichos altiſſimus differs from this in having the ealyxes and wings villoſe at the baſe.

II. Erect. 32. Dolichos enſiformis, or ſeymitar-podded dolichos: ſtem ſuberect; legumes ſcymitar-ſhaped, three-keeled; ſeeds arilled. Native of China and Cochin-china; cultivated for arbours, not for food. There is a variety, with legumes twice as long, and flatter, with blunter leaves, and other minute differences. Here are two ſpecies, this and N° 8. bearing the ſame name. They are, however, different; that probably from the Weſt, this from the Eaſt, Indies.

33. Dolichos ſoja, or ſoja dolichos: ſtems flexuoſe; racemes axillary, erect; legumes pendulous, hiſpid, containing about two ſeeds. Stem round at the bottom and ſmooth; above, ſtriated, very hirſute, a foot and more in height. Native of the Eaſt Indies, Ceylon, Japan, &c. The ſeeds, which are uſually called *miſo*, in Japan, are put into ſoups, and are the moſt common diſh there, inſomuch that the Japaneſe frequently eat them three times a day. The ſoja of the Japaneſe, which is preferred to the kitjap of the Chineſe, is prepared from theſe ſeeds, and is uſed in almoſt all their diſhes, inſtead of common ſalt. The Chineſe alſo have a favourite diſh made of theſe ſeeds, called *teu hu*, or *taú hu*, which looks like curd; and, though inſipid in itſelf, yet with proper ſeaſoning is agreeable and wholeſome.

34. Dolichos catiang, or Indian dolichos: legumes double, linear, ſomewhat erect. Stem annual, a foot and a half high, roundiſh, rugged, branched. There are ſeveral varieties, differing in the colour of the flower and ſeed, all which are much cultivated for food. Native of the Eaſt Indies.

35. Dolichos biflorus, or two-flowered dolichos: ſtem perennial, even; peduncles two-flowered; legumes erect. Stem ſuffruticoſe, a foot and a half high, erect, branched, hairy. Native of India and China.

36. Dolichos repens, or ſea-ſide dolichos: ſtem creeping; leaves pubeſcent, ovate; flowers racemed, in pairs; legumes linear, columnar. Common by the ſea-ſide in Jamaica. The root is a ſtrong purgative.

37. Dolichos roſeus, or roſe-coloured dolichos: ſtem creeping, aſcending; leaflets roundiſh, ſhining; flowers in racemes; legumes three-keeled at the back. Native of Jamaica.

38. Dolichos fabæformis, or bean-ſhaped dolichos: ſtem erect, angular; leaves villoſe, glaucous; legumes ſtiff and ſtraight, ſubquadrangular. Root annual; ſtem ſimple, with lines running down from the petiole, villoſe, rugged, herbaceous, a foot high, the thickneſs of a quill. Native of the Eaſt Indies.

Propagation and Culture. Moſt of the ſpecies, coming from the Eaſt and Weſt Indies, are tender, and ſeldom perfect their ſeeds in England. Being moſtly annual plants, they are frequently loſt in our ſtoves, and recovered again as the ſeeds are ſent over. The 12th and 13th are ſometimes preſerved in botanic gardens, eſpecially the latter, whoſe pods are cloſely covered with ſtinging hairs, commonly known by the title of *cow-itch*; but theſe are too tender to thrive in the open air in this country, ſo that whoever is deſirous to have the plants, ſhould ſow their ſeeds in a hot-bed in March; and, when the plants are come up, they ſhould be each planted in a ſeparate pot, and plunged into the hot-bed again, being careful to ſhade them till they have taken root; after which they muſt have freſh air every day admitted to them, in proportion to the warmth of the ſeaſon; and, when the plants are too tall to remain in the hot-bed, they ſhould be removed into the bark-ſtove, where, if they are allowed room to run, they will flower and perfect their ſeeds. Several ſpecies are cultivated in warm countries for the table, but in England ſeldom perfect their ſeeds; and, were they to thrive here as well as in the warm countries, they would be little eſteemed, becauſe we have much better ſorts in our gardens already; for the ſcarlet flowering kidney bean is preferable to all of them for eating, and deſerves our care to cultivate it more than any other. See GLYCINE TRILOBA.

DOLICHU'ROUS, *adj.* in poetry, having a ſyllable too much at the end. *Scott.*

DO'LIMAN, *ſ.* A long kind of veſt worn by the Turks. *Scott.*

DOLIOCAR'PUS, *ſ.* in botany; a genus of the claſs polyandria, order monogynia. The generic characters are—Calyx: perianthium five-leaved; leaflets oblong-rounded, concave, unequal, coloured, permanent. Corolla: petals three, roundiſh, concave, plaited. Stamina: filaments very many, inſerted into the receptacle, capillary; antheræ compreſſed. Piſtillum: germ globular; ſtyle long, incurved; ſtigma compreſſed, flat, ſubbifid. Pericarpium: berry globular, one-celled, crowned with the ſtyle. Seeds: two, arilled, oblong-rounded, flat on one ſide, convex on the other.—*Eſſential Character.* Calyx, five-leaved; corolla, three-petalled, plaited; ſtigma ſubbifid; berry globular, crowned with the ſtyle, one-celled, two-ſeeded.

Species. 1. Doliocarpus Rolandri, or Rolander's doliocarpus: ſtem ſtiff and ſtraight; leaves ovate-lanceolate, toothed; flowers terminating. This grows to a ſhrub; ſtem and branches upright; leaves hanging; of an oval-lanceolate ſhape, and dentated.

2. Doliocarpus major, or great doliocarpus: ſtem ſcandent; leaves ovate, toothed; peduncles lateral, one-flowered. The flowers are aromatic, but rather nauſeous; the berries of this plant are pernicious; ſtem ſlender and flexuoſe; branches at right angles; leaves ſpreading.

3. Doliocarpus calinea, or calinea doliocarpus: ſtem ſcandent; leaves ovate, quite entire; flowers axillary, in bundles. A ſhrub, with ſeveral knotty ſpreading twigs, ſcattering over the neighbouring trees; the branches are garniſhed with alternate, oval, ſhining green, leaves terminating in a point; the largeſt four inches long. The

flowers ſpring from the boſoms of the leaves on the branches, and are arranged alternately in little heaps. The corolla conſiſts of three white petals, which are large and rounded. Native of Guiana.

DOLL, *ſ.* A contraction of Dorothy.—*Doll* Tearſheet. *Shakeſpeare.*—A little girl's puppet or baby.

DOLL's POINT, a cape on the ſouth coaſt of the iſland of Jamaica, between Weſt Harbour and Peake Bay.

DOL'LAR, *ſ.* [*daler*, Dut.] A Dutch and German coin of different value, from about two ſhillings and ſixpence to four and ſixpence:

He diſburs'd
Ten thouſand *dollars* for our gen'ral uſe. *Shakeſpeare.*

DOL'LART BAY, a large bay or lake of Germany, in Eaſt Frieſeland, formed by an inundation of the ſea, in the year 1277, which at the ſame time is ſaid to have deſtroyed thirty-three villages: ſixteen miles weſt of Groningen, and ſix ſouth-weſt of Emden.

DOL'LENDORF, a town of Germany, in the circle of Weſtphalia, and county of Blankenheim: three miles ſouth-eaſt of Blankenheim.

DOL'LEREN, a river of France, in the department of the Upper Rhine, which runs into the Ille, about two miles north of Mulhauſen.

DOLL'STADT, a town of Pruſſia, in the province of Oberland: ſix miles north-weſt of Preuſchmark.

DOL'MAR, a mountain of Germany, in the circle of Franconia, and county of Henneberg: five miles ſouth of Schmalkalden.

DOLMATOV', a town of Ruſſia, in the province of Ekaterinburg, on the Iſet: eighty miles ſouth-eaſt of Ekaterinburg.

DOLMAYRAC', a town of France, in the department of the Lot and Garonne: three leagues north of Agen.

DOLN'STEIN, a town of Germany, in the circle of Franconia, and biſhopric of Aichſtat, on the Altmuhl: ſix miles weſt of Aichſtat.

DOLO, in Maritime Auſtria, a market town, well built, and ſituated on the Brenta and Brentone, which ſeparate above this place. Acroſs the latter the government has of late cauſed a remarkable ſtone bridge to be built by the architect Thomas Tomanza. The firſt ſluices are conſtructed on the ſpot where the Brenta ſeparates from the Brentone, and on both ſides of the river ſtand the moſt ſplendid palaces and gardens, to which the moſt opulent of the nobles reſort in the ſummer ſeaſon. The number of the inhabitants amounts to 3000, who carry on a good trade.

DO'LON, a Trojan, famous for his ſwiftneſs. Being ſent by Hector to ſpy the Grecian camp by night, he was ſeized by Diomedes and Ulyſſes, to whom he revealed the ſituation, ſchemes, and reſolutions, of his countrymen, with the hopes of eſcaping with his life. He was put to death by Diomedes, as a traitor. *Homer.*

DOLONOS'KOI, a fortreſs of Ruſſian Siberia, in the government of Kolivan, on the Irkutſch: ſixteen miles weſt of Semipolatnoi.

DOLO'PES, a people of Theſſaly, near mount Pindus. Peleus reigned there and ſent them to the Trojan war under Phœnix. They became maſters of Scyros, and, like the reſt of the ancient Greeks, were fond of migration. *Virgil.*

DOLORI'FIC, *adj.* [*dolorificus*, Lat.] That which cauſes grief or pain.—The pain returned, diſſipating that vapour which obſtructed the nerves, and giving the *dolorific* motion free paſſage again. *Ray.*—This, by the ſoftneſs and rarity of the fluid, is inſenſible, and not *dolorific*. *Arbuthnot.*

DO'LOROUS, *adj.* [from *dolor*, Lat.] Sorrowful; doleful; diſmal; gloomy; impreſſing ſorrow.—We are taught, by his example, that the preſence of *dolorous* and dreadful objects, even in minds moſt perfect, may, as clouds, overcaſt all ſeaſonable joy. *Hooker.*

Through many a dark and dreary vale
They paſs'd, and many a region *dolorous*,
O'er many a frozen, many a fiery alp,
Rocks, caves, lakes, fens, bogs, dens, and ſhades, of death.
Milton.

Painful.—Their diſpatch is quick, and leſs *dolorous* than the paw of the bear, or teeth of the lion. *More.*

DOLOS'ITY, *ſ.* [from the Lat. *doloſus*, deceitful.] Deceitfulneſs. *Scott.*

DO'LOUR, *ſ.* [*dolor*, Lat.] Grief; ſorrow:

I've words too few to take my leave of you,
When the tongue's office ſhould be prodigal,
To breathe th' abundant *dolour* of the heart. *Shakeſpeare.*

Lamentation; complaint. Pain; pang.—A mind fixed and bent upon ſomewhat that is good, doth avert the *dolours* of death. *Bacon.*

DOL'PHIN, *ſ.* in ichthyology. See DELPHINUS, vol. v. p. 684.

DOL'PHIN's ISLAND, an iſland in the Straits of Magellan. Lat. 53. 59. S. lon. 71. 41. W. Greenwich.

DOLPHINET', *ſ.* A ſmall dolphin, a female dolphin:

The lion choſe his mate, the turtle-dove
Her dear, the dolphin his own *dolphinet*. *Spenſer.*

DOLT, *ſ.* [*dol*, Teut.] A heavy ſtupid fellow; a blockhead; a thickſcull; a loggerhead:

Thou haſt not half that power to do me harm,
As I have to be hurt: oh gull, oh *dolt*,
As ignorant as dirt! *Shakeſpeare.*

To DOLT, *v. n.* To waſte time fooliſhly.—Than in theſe trifles to have *dolted* ſo much. *New Cuſtom.*

DOLT'ISH, *adj.* Stupid; mean; dull; blockiſh.—Dametas, the moſt arrant *doltiſh* clown that ever was without the privilege of a bauble. *Sidney.*

DOM'ABLE, *adj.* [*domabilis*, Lat.] Tameable.

DO'MAGE, *ſ.* [from *domare*, Lat.] Subjugation.—Every man naturally endeavours, as far as he dares, to extort a greater value from his contemners by *domage*. *Hobbes.*

DOMA'IN, *ſ.* [*domaine*, Fr. from *dominium*, Lat.] Dominion; empire.—Ocean trembles for his green *domain*. *Thomſon.*

Rome's great emperor, whoſe wide *domain*
Had ample territory, wealth, and pow'r. *Milton.*

Poſſeſſion; eſtate:

A Latian field, with fruitful plains,
And a large portion of the king's *domains*. *Dryden.*

The land about a manſion-houſe occupied by the lord.

DO'MAT (John), an eminent French lawyer, born at Clermont, in 1625. He ſtudied the law at Bourges, and pleaded with great reputation for ſeveral years. About his thirtieth year he obtained the office of king's advocate in the preſidial court of Clermont, which place he occupied for near thirty years. He was entruſted with many important affairs by the province, which he conducted with great ability. Perceiving the confuſion prevailing in the laws, he applied himſelf to the ſyſtematic development of their principles; which produced his work, intitled, *Les Loix Civiles dans leur Ordre naturel*, which appeared in 1694, in 3 vols. 4to. followed, after his death, by three more volumes on public law, &c. It is a performance highly eſteemed for the juſtneſs of its principles, and the clearneſs of its method, and has, perhaps, never been excelled as a ſcientific work. Domat died at Paris in 1696, in circumſtances much inferior to his deſerts. An improved edition of his work, with a ſupplement by M. de Jouy, appeared in 1777, folio.

DOMBA'CA, a ſmall iſland near the coaſt of Ava, in the bay of Bengal. Lat. 17. 32. N. lon. 94. 35. E. Greenwich.

DOM'BES, before the revolution, a principality and ſmall country of France, in Burgundy, about eight leagues

long, and ſeven broad, of which Trevoux was the capital. It is now part of the department of the Ain.

DOMBE'YA, *ſ.* [ſo named in memory of *Joſ. Dombey*, who travelled into Peru, Chili, &c.] In botany, a genus of the claſs dioecia, order monodelphia, natural order coniferæ. The generic characters are—I. Male. Calyx: ament ovate-cylindric, imbricate, with very many woody ſhort ſcales, each terminated by a lanceolate, acute, coriaceous, leaflet, concave at the bottom, narrower and recurved at the top. Perianthium and corolla: none. Stamina: filaments none, except the amentaceous ſcales; antheræ ten or twelve, heaped about each amentaceous ſcale, linear, grooved, the length of the ſcale, faſtened to the top of it, below the leaflet by the upper extremity, approximating and converging round the ſcale, ſeparating by the lower extremity when the ſcale is broken. II. Female. Calyx: ament large, roundiſh, ovate, cloſely imbricate, with very many germs, reſembling ſcales. Perianthium and corolla: none. Piſtillum: germ each wedge-form-oblong, ſubcompreſſed, contracted at the baſe into a point, with a broad, thick, callous, termination; ſtyle none; ſtigma bivalve, the valves unequal; the inner very ſmall, obtuſe; the outer very large, broad at the baſe, thick, curved inwards above the inner one, terminated by a linear, acute, ſlender, aſcending, ſtrap, almoſt the length of the germ, bent in at a right angle above the germ. Pericarpium: none. Seeds: very many, heaped into a roundiſh ſtrobile, imbricate; each oblong, ſubcylindric, towards the baſe obtuſely four-cornered, with a ſhort broad ſpatulate wing or ſtrap at the top, thickened at the edge, incurved, aſcending; the ſhell coriaceous, coloured, valveleſs; the kernel oblong, ſubangular at the baſe; receptacle naked, villoſe, here and there alveolate.—*Eſſential Character.* Male. Calyx of the ament ſcales terminated by a leaflet; corolla, none; antheræ, ten or twelve, without filaments. Female. Calyx, ament with many germs; corolla, none; ſtigma, bivalve, unequal; ſeeds, many, in a roundiſh ſtrobile.

Dombeya Chilenſis, or Chileſe Dombeya, a ſingle ſpecies: turbinate imbricate leaves, mucronated on one ſide; the branches quaternate and cruciate. This is a tree as yet very little known; a native of Chili, of a reſinous nature, in ſome reſpects allied to protea; and alſo to the pines in ſome particulars of its fructification. The trunk is ſtraight, and of conſiderable height; the wood white, ſolid, and clothed with a kind of double bark. The boughs are covered with very numerous leaves, ſeſſile, oval, very pointed, entire, ſmooth, and coriaceous; a little concave inwards, and convex outwards; they have a ſharp point, and are ranged on the branches in the manner of ſcales. The flowers are male and female, borne on different individuals, and hang in ſeſſile ſolitary catkins from the tops of the branches. See TOURRETTIA.

DOM'BOC, *ſ.* See DOME-BOOK.

DOMBROWAZ', a town of Poland, in the palatinate of Lemberg: ſixty miles ſouth-weſt of Lemberg.

DOMBROW'KEN, a town of Pruſſia, in the province of Natangen: ten miles eaſt of Nordenberg.

DOME, *ſ.* [*dome*, Fr. from *domus*, Lat.] A building; a houſe; a fabric. A hemiſpherical arch; a cupola. See ARCHITECTURE, vol. ii. p. 88.

Stranger! whoe'er thou art, ſecurely reſt
Affianc'd in my faith, a friendly gueſt;
Approach the *dome*, the ſocial banquet ſhare. *Pope.*

DOME, or DOOM, *ſ.* [from dom, Sax.] A judgment, ſentence, or decree. Several words end in *dom*; as, *kingdom*, *earldom*, *&c.* from whence they may be applied to the juriſdiction of a lord or a king. *Mon. Angl.* tom. i. p. 284.

DOME-BOOK, *ſ.* [Sax. *liber judicialis*] A book compoſed under the direction of Alfred the Great, containing the local cuſtoms of the ſeveral provinces of the kingdom. This book is ſaid to have been extant ſo late as the reign of Edward IV. but it is now loſt. It probably contained the principal maxims of the common law, the penalties for miſdemeanors, and the forms of judicial proceedings. Thus much at leaſt may be collected from the injunction to obſerve it, which is found in the laws of Edward the Elder, ſon of Alfred, c. 1. This book was compiled by Alfred for the uſe of the court-baron, hundred and county-court, the court-leet, and ſheriff's tourn. 1 *Comm.* 64.

DOMENICHI'NO, or DOMENICO ZAMPIERI, a painter of great excellence, born at Bologna in 1581. His extraordinary turn for drawing, cauſed him to be ſent to the ſchool firſt of Calvart, and afterwards of the Carracci. Though extremely young, he carried off all the academical prizes. He worked apart from the other pupils, and ſtudied while they indulged in pleaſure. He joined Albano at Rome, who lodged him in his houſe, and for two years defrayed his expences. Domenichino painted ſeveral pieces for his protector cardinal Aguechi. He frequently viſited Annibal Carracci, then employed in the Farneſe gallery. His Communion of St. Jerome, in the church della Carita, has been reckoned by great judges the next piece in merit to the Transfiguration of Raphael. Though he was a modeſt and inoffenſive man, his ſuperior merit perpetually raiſed him enemies who rendered his life uneaſy. He left Rome and went to Fano, and thence to his native city of Bologna, where he employed two years on his famous picture of the Roſary. He married there an amiable woman, who ſerved him for a model in all his ſubſequent works. He was afterwards re-called to Rome by Gregory XV. who created him his firſt painter, and architect of the Vatican. He died in 1641, at the age of ſixty, and was interred at the cathedral of Naples.

DO'MENZAIN, a town of France, in the department of the Lower Pyrenees, and chief place of a canton, in the diſtrict of Mauleon: ſeven miles north-north-weſt of Mauleon.

DOMES-MEN, *ſ.* Judges, or men appointed to doom and determine ſuits and controverſies; hence *æg deme*, I deem, or judge.

DO'MESDAY, or DOMESDAY-BOOK, *ſ.* [*liber judiciarius, vel cenſualis Angliæ.*] A moſt ancient record, made in the time of William I. called the Conqueror, and now remaining in the exchequer fair and legible, conſiſting of two volumes, a greater and a leſs; the greater containing a ſurvey of all the lands in England, except the counties of Northumberland, Cumberland, Weſtmoreland, Durham, and part of Lancaſhire, which it is ſaid were never ſurveyed; and, excepting Eſſex, Suffolk, and Norfolk; which three laſt are comprehended in the leſſer volume. There is alſo a third book, which differs from the others in form more than matter, made by the command of the ſame king. And there is a fourth book kept in the exchequer which is called *domeſday*; and, though a very large volume, is only an abridgment of the others. Likewiſe a fifth book is kept in the remembrancer's office in the exchequer, which has the name of *domeſday*, and is the very ſame with the fourth, before mentioned. Our anceſtors had many dome-books. King Alfred had a roll which he called *domeſday*; and the domeſday-book made by William I. referred to the time of Edward the Confeſſor, as that of king Alfred did to the time of Ethelred. The fourth book of domeſday having many pictures, and gilt letters in the beginning, relating to the time of king Edward the Confeſſor, this led him who made notes on Fitzherbert's Regiſter into a miſtake in page 14, where he tells us, that *liber* domeſday *factus fuit tempore regis Edwardi.*

The book of domeſday was begun by five juſtices, aſſigned for that purpoſe in each county, in the year 1081, and finiſhed anno 1086. And the queſtion whether lands are ancient demeſne, or not, is to be decided by the domeſday of William I. from whence there is no appeal: and it is a book of that authority, that even the Conque-

ror

ror himſelf ſubmitted ſome caſes, wherein he was concerned, to be determined by it. The addition of *day* to this dome-book was not meant with any alluſion to the final day of judgment, as many perſons have conceived; but was to ſtrengthen and confirm it, and ſignifies merely the judicial deciſive record or book of dooming judgment and juſtice. Camden calls this book *Gulielmi Libram Cenſualem*, the Tax-book of king William; and it was further called *Magna Rolla Winton*, as having been kept in the cathedral of Wincheſter. The dean and chapter of York have a regiſter ſtiled *doomſday*; ſo hath the biſhop of Worceſter; and there is an ancient roll in Cheſter caſtle, called *domeſday-roll. Blount.* A tranſcript of the domeſday-book of William I. has been made and publiſhed, by which the acceſs to it is rendered more familiar to our antiquaries and hiſtorians.

DOMES'TIC, or DOMESTICAL, *adj.* [*domeſticus*, Lat.] Belonging to the houſe; not relating to things public.—The practical knowledge of the *domeſtic* duties, is the principal glory of a woman. *Clariſſa.*—Private; done at home; not open.—In this their *domeſtical* celebration of the Paſſover, they divided ſupper into two courſes. *Hooker.*—Inhabiting the houſe; not wild.—The faithful prudent huſband is an honeſt, tractable, and *domeſtic*, animal. *Addiſon.*—Not foreign; inteſtine.—*Domeſtical* evils, for that we think we can maſter them at all times, are often permitted to run on forward, till it be too late to recall them. *Hooker.*

DOMES'TIC, *ſ.* One kept in the ſame houſe.—A ſervant dwells remote from all knowledge of his lord's purpoſes: he lives as a kind of foreigner under the ſame roof; a *domeſtic*, and yet a ſtranger too. *South.*

To DOMES'TICATE, *v. a.* To make domeſtic; to withdraw from the public. To make as familiar as if of the family.—*Domeſticate* yourſelf there, while you ſtay at Naples. *Cheſterfield.*

DOMES'TICALLY, *adv.* Relatively to domeſtic matters.—Make yourſelf familiarly and *domeſtically* uſeful to them, by offering yourſelf for all their little commiſſions, and aſſiſting in doing the honours of their houſes. *Cheſterfield.*

DOME'VRE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Ramberviller: two leagues north of Epinal.

DOME'VRE SOUS AVIERE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Epinal: one league north-weſt of Epinal.

DOMFRO'NT, a town of France, and principal place of a diſtrict, in the department of the Orne, ſituated on a mountain near the river Varenne, containing about 1700 inhabitants: ten leagues weſt-north-weſt of Alençon. Lat. 48. 35. N. lon. 17. 1. E. Ferro.

DOMESTI'CITY, *ſ.* The ſtate of being a ſervant, a ſervile condition. *Scott.*

DOMES'TICNESS, *ſ.* The ſtate of being domeſtic. *Scott.*

DOMICEL'LUS, *ſ.* an obſolete Latin word, anciently given as an appellation or addition to the king's natural ſons in France, and ſometimes to the eldeſt ſons of noblemen there; from whence we borrowed theſe additions: as ſeveral natural children of John of Gaunt, duke of Lancaſter, are ſtiled *domicelli* by the charter of legitimation. 20 *Rich.* II. But, according to Thorn, the *domicelli* were only the better ſorts of ſervants in monaſteries.

DOMICI'LIARY, *adj.* [from *domicile*, Fr.] Intruding into private houſes.—Superviſors of *domiciliary* viſitation. *Burke.*

DOMIDU'CUS, a god who preſided over marriage. Juno alſo was called *Domiduca*, from the power ſhe was ſuppoſed to have in marriages.

To DO'MIFY, *v. a.* [*domifico*, Lat.] To tame.

DO'MINA, *ſ.* A title given to honourable women, who anciently, in their own right of inheritance, held a barony.

DO'MINANT, *adj.* [*dominant*, Fr. *dominans*, Lat.] Predominant; preſiding; aſcendant.

To DO'MINATE, *v. a.* [*dominatus*, Lat.] To predominate; to prevail over the reſt:

I thus conclude my theme,
The *dominating* humour makes the dream. *Dryden.*

DOMINA'TION, *ſ.* [*dominatio*, Lat.] Power; dominion. Tyranny; inſolent authority:

Thou and thine uſurp
The *domination*, royalties, and rights,
Of this oppreſſed boy. *Shakeſpeare.*

One highly exalted in power; uſed of angelic beings:

Hear, all ye angels, progeny of light,
Thrones, *dominations*, princedoms, virtues, pow'rs. *Milton.*

DO'MINATIVE, *adj.* Imperious; inſolent.

DOMINA'TOR, *ſ.* [Lat.] The preſiding or predominant power or influence.—Jupiter and Mars are *dominators* for this north-weſt part of the world, which maketh the people impatient of ſervitude, lovers of liberty, martial, and courageous. *Camden.*

To DOMINE'ER, *v. n.* [*dominor*, Lat.] To rule with inſolence; to ſwell; to bluſter; to act without controul.—The voice of conſcience now is low and weak, chaſtiſing the paſſions, as old Eli did his luſtful *domineering* ſons. *South.*

Both would their little ends ſecure;
He ſighs for freedom, ſhe for pow'r;
His wiſhes tend abroad to roam,
And hers to *domineer* at home. *Prior.*

DOMIN'GO, or SAINT DOMINGO, once the principal city of the extenſive iſland of Hiſpaniola, in the Weſt Indies; which iſland has been lately deluged with human blood, in conſequence of a formidable and long-continued inſurrection of the negro ſlaves, mulattos, and men of colour: for particulars of which ſee the articles HISPANIOLA and SAINT DOMINGO.

DO'MINIC DE GUSMAN, a ſaint in the Roman calendar, and founder of the Dominican order of monks, born at Calaroga, in Old Caſtile, in 1170. He preached with great fury againſt the Albigenſes in Languedoc, when pope Innocent III. made a croiſade againſt that unhappy people; and was made inquiſitor in Languedoc, where he founded his order, and got it confirmed by the Lateran council in 1215. He died at Bologna in 1221, and was canonized fourteen years after his death, by pope Gregory IX. See DOMINICANS.

DOMIN'ICA, a daughter of Petronius, who married the emperor Valens.

DOMINI'CA, an iſland of the Weſt Indies, ſo named by Chriſtopher Columbus, from the circumſtance of diſcovering it on Sunday, (November 3, 1493,) ſituated between Guadaloupe and Martinico; about twenty-nine miles in length, and ſixteen in breadth, containing 186,436 acres of land, and divided into ten pariſhes. It contains many high and rugged mountains, among which are volcanoes, that frequently diſcharge eruptions. From ſome of theſe mountains iſſue ſprings of hot water, whoſe medicinal virtues are much commended. Dominica is well watered, there being upwards of thirty rivers in the iſland, beſides a great number of rivulets. The ſoil, in moſt of the interior country, is a light brown-coloured mould, and appears to have been waſhed from the mountains. Towards the ſea-coaſt, and in many of the valleys, it is a deep, black, and rich, native earth, and ſeems well adapted to the cultivation of all the articles of Weſt-Indian produce. The under ſtratum is, in ſome parts, a yellow or brick clay, in others a ſtiff terrace; but it is in moſt places very ſtony. In the woods of Dominica are innumerable ſwarms of bees, which hive in the trees, and produce great quantities of wax and honey, both of which are equal in goodneſs to any in Europe. Dominica was confirmed

onfirmed to Great Britain by the peace of Paris, in 1763, having been taken from the French in 1759. At the commencement of the American war, this iſland was in a flouriſhing ſtate. The port of Roſeau, having been declared a free port by act of parliament, was reſorted to by trading veſſels from moſt parts of the foreign Weſt Indies, as well as from America. The French and Spaniards purchaſed great numbers of negroes there for the ſupply of their ſettlements, together with vaſt quantities of the merchandize and manufactures of Great Britain; payment for all which was made chiefly in bullion, indigo, and cotton, and completed in mules and cattle; articles of prime neceſſity to the planter. Thus the iſland, though in itſelf certainly not ſo fertile as ſome others of leſs extent in its neighbourhood, was becoming very rapidly a colony of conſiderable importance; but unfortunately it wanted that protection which alone could give its poſſeſſions ſtability and value. On Monday, the 7th of September, 1778, a French armament, conſiſting of a forty-gun ſhip, three frigates, and about thirty ſail of armed ſloops and ſchooners, having on-board upwards of 2000 regular troops, and a banditti of volunteers, appeared off the iſland, under the command of the marquis de Bouille, governor of Martinico, and general of the French windward Weſt-Indian iſlands. The whole number of the militia in the iſland did not exceed 100. The ſmall force, however, that was collected, behaved with that ſpirit and gallantry, which give room to lament that they were not better ſupported. But gallantry was unavailing againſt ſuch ſuperiority of numbers; for about 2000 of the French having ſhortly after gained poſſeſſion of the heights above Roſeau, determined the fate of the iſland. The bravery of the inhabitants, however, obtained for them very honourable terms of capitulation. It was reſtored to Great Britain by the peace of 1783. The principal towns are Portſmouth, and Roſeau, or Charlotte's Town. The exports of the iſland, from January 5th, 1787, to January 5th, 1788, were 71,312 cwt. of ſugar, 63,392 gallons of rum, 16,803 gallons of molaſſes, 1194 cwt. of cocoa, 18,149 cwt. of coffee, 11,250 pounds of indigo, 970,816 pounds of cotton, 161 cwt. of ginger, with miſcellaneous articles to the value of 11,912l. 10s. 9d. The whole, according to the current prices in London, to the value of 302,987l. 15s. Lat. 15. 32. N. lon. 61. 23. W. Greenwich.

DOMINI'CA, or O-Heeva-Oa, one of the Marquis of Mendoza iſlands, in the South Pacific Ocean, mountainous, rocky, and apparently barren: about ſixteen leagues in circumference. Lat. 9. 41. S. lon. 139. 8. W. Greenwich.

DOMINI'CA (La), a town of the iſland of Cuba: forty-five miles weſt of Havanna.

DOMI'NICAL, *adj.* [*dominicalis*, Lat.] That which notes the Lord's day, or Sunday.—The cycle of the moon ſerves to ſhew the epacts, and that of the ſun the *dominical* letter, throughout all their variations. *Holder.*

DOMI'NICANS, an order of religious, called in ſome places *jacobins*; and in others, *predicants*, or *preaching friars*. The Dominicans take their name from their founder, Dominic de Guzman, a Spaniſh eccleſiaſtic, of Old Caſtile. He was made canon and archdeacon of Oſma; and preached with great zeal and vehemence againſt the Albigenſes in Languedoc, where he laid the firſt foundation of his order. It was approved of in 1215 by Innocent III. and confirmed in 1216 by a bull of Honorius III. under the title of *St. Auguſtin*; to which Dominic added ſeveral auſtere precepts and obſervances, obliging the brethren to take a vow of abſolute poverty, and to abandon entirely all their revenues and poſſeſſions; adopting alſo the title of *preaching friars*, becauſe public inſtruction was the main object of their inſtitution. Their firſt convent was founded at Thouloufe by the biſhop thereof and Simon de Montfort. Two years afterwards they had another at Paris, near the biſhop's houſe; and ſome time a third in the rue St. Jacques, whence the denomination of *jacobins*. Juſt before his death, Dominic ſent Gilbert de Freſney, with twelve of the brethren, into England; and they founded a monaſtery at Oxford in the year 1221. In 1276, the mayor and aldermen of London gave them two whole ſtreets, by the river Thames, where they erected a very commodious convent, whence that place is ſtill called *Black Friars*, then the name by which the Dominicans were called in England.

DOMIN'ICIDE, *ſ.* [from the Lat. *dominus*, maſter, and *cædo*, to kill.] The act of killing one's lord or maſter; one that kills his maſter or lord.

DOMIN'ICUM, *ſ.* [Lat.] The ſacrament of the Lord's ſupper; the place where the Lord's ſupper is adminiſtered, a church. *Mede.*—In law, a demeſne, lands occupied by the lord of a manor.

DOMI'NION, *ſ.* [*dominium*, Lat.] Sovereign authority; unlimited power:

> He gave us only over beaſt, fiſh, fowl,
> *Dominion* abſolute; that right we hold
> By his donation: but man over man
> He made not lord. *Milton.*

Power; right of poſſeſſion or uſe, without being accountable.—He could not have private *dominion* over that, which was under the private *dominion* of another. *Locke.*—Territory; region; diſtrict: conſidered as ſubject.—The donations of biſhoprics the kings of England did ever retain in all their *dominions*, when the popes uſurped authority was at the higheſt. *Davies.*—Predominance; aſcendant.—Objects placed foremoſt ought to be more finiſhed than thoſe caſt behind, and to have *dominion* over things confuſed and tranſient. *Dryden.*—An order of angels.—By him were all things created, viſible and inviſible, whether they be thrones or *dominions*, or principalities or powers. *Col.* i. 16.

DO'MINIS (Marc Antony de), a learned Italian prelate in the ſixteenth and beginning of the ſeventeenth century, deſcended from a family of rank at Arba, a town in what was formerly Venetian Dalmatia. After being educated in the Illyrian college at Loretto, he went to the univerſity of Padua, where he made diſtinguiſhed proficiency in the different branches of learning and ſcience. When young he entered into the ſociety of jeſuits; but he grew weary of the confinement and ſubordination which their regulations required. That he might quit their connection with honour, however, he obtained from the emperor Rodolph, a nomination to the biſhopric of Segni in Dalmatia. Finding, after ſome time, his ſituation in that ſee rendered unpleaſant by ſome quarrels with the clergy of his dioceſe, he ſolicited the ſenate of Venice to be appointed to the vacant archbiſhopric of Spalato, the capital of Dalmatia, and ſucceeded in his application. Some of his earlieſt labours in this new ſituation were conſecrated to the ſervice of his benefactors, whom, with much learning, ingenuity, and boldneſs, he defended in their diſpute with pope Paul V. who had iſſued an interdict againſt the republic. His writings on this ſubject were cenſured by the inquiſition; but he was ſafe from their power, and replied to their cenſures by a ſpirited kind of manifeſto, written in the Latin language. The diſguſt which on this occaſion he felt at the proceedings of the court of Rome, led him to break off his communion with the catholics, and to declare himſelf a proteſtant. He came to England with ſir Henry Wotton, ambaſſador to the republic of Venice, in the year 1616, and was received with great reſpect by all ranks; and he preached and wrote againſt the church of Rome with all the zeal of a new convert. Soon after his arrival he publiſhed an addreſs to all the biſhops of the Chriſtian church, explaining the reaſons which had compelled him to quit his dioceſe; which went through ſeveral editions, and was tranſlated into different languages. But the principal work

work which he publiſhed in this country, was intended to ſtrike a fatal blow at the foundations of the papal power and dominion, intitled, *M. Ant. de Dominis de Republica Eccleſiaſtica, Libri X.* in 3 vols. folio, which made their appearance in the years 1617 and 1620. It is a work of great erudition and ingenuity, and was received with much applauſe by the proteſtant world, while, as might be expected, it was ſtrongly condemned by the catholics. M. de Dominis is alſo ſaid to have been principally concerned in the publication of father Paul's Hiſtory of the Council of Trent, which appeared at London in 1619. In reward of his learning, and as ſome compenſation for the ſacrifices which he had made, he was preferred by king James to the maſterſhip of the Savoy, and the deanery of Windſor. But he is reported to have been diſappointed in the expectations which he had formed of higher preferments among the proteſtants. During this fit of chagrin, it is ſaid that count Gondemar, the Spaniſh ambaſſador, invited him in the name of pope Gregory XV. who had been formerly his friend and fellow ſtudent, to return to Rome, and abjure his hereſy, under ſolemn promiſes of a cardinal's hat. The ſnare was ſo artfully laid that he eaſily fell into it; and, after renouncing the proteſtant religion, he departed for Rome in 1622. In that city he ſolemnly abjured his heretical errors, and aſked pardon in a public conſiſtory for the apoſtacy of which he had been guilty. He alſo publiſhed an acknowledgment to the world at large of the criminality of his conduct in abandoning the catholic communion, and explained the motives which had again recalled him to it, in a treatiſe intitled, *Marcus Antoninus de Dominis Archiepiſcopus Spalatenſis ſui reditus ex Anglia concilium exponit.* But, though he was at firſt well received at Rome, he ſaw no proſpect of the advancement which he had been promiſed in the church. Theſe circumſtances are ſaid to have operated ſo powerfully upon his unſteady mind, that he was led to make uſe of expreſſions which excited a ſuſpicion of the ſincerity of his converſion; and letters are ſtated to have been intercepted, written by him to ſome of his connections in England, in which he declared his repentance for the ſtep he had recently taken. It was determined, however, that he ſhould not be indulged with another opportunity of joining the proteſtants; he was accordingly, by order of pope Urban VIII. committed priſoner to the caſtle of St. Angelo, where he is ſuppoſed to have died of poiſon, in 1625, in the ſixty-fourth year of his age. Some time after his death his body was taken out of his grave and burnt, together with his writings, by a decree of the inquiſition. Beſides the works already noticed, he was the author of *De Radiis Viſus & Lucis in Vitris perſpectivis & Iride Tractatus.* Sir Iſaac Newton, in his Optics, has complimented him as being the firſt perſon who explained the phenomenon of the colours of the rainbow upon juſt principles.

DO'MINO, *ſ.* A ſort of hood worn by the canons of a cathedral church; alſo the habit of a Venetian nobleman, very much in uſe as a dreſs for maſquerades.

DO'MINUS, *ſ.* in ancient times, when prefixed to a man's name, uſually denoted him a knight, or a clergyman; and ſometimes a gentleman, not a knight, eſpecially a lord of a manor.

DOMITEL'LUS, *ſ.* A title anciently given to the French king's natural ſons. See DOMITELLUS.

DOMI'TIA LEX DE RELIGIONE, *ſ.* was enacted by Domitius Ahenobarbus, the tribune, in the year of Rome 650. It transferred the right of electing prieſts from the college to the people.

DOMI'TIAN (Titus Flavius Domitianus), a Roman emperor, ſecond ſon of Veſpaſian, and the laſt of the twelve Cæſars: for his life and character, ſee ROME.

DO'MITROVSK, a town of Ruſſia, in the government of Orel: forty miles ſouth-weſt of Orel, and 484 ſouth-ſouth-eaſt of Peterſburg.

DO'MITURE, *ſ.* [from the Lat. *domo*, to tame.] The act of taming. *Scott.*

DO'MITZ, a town and fortreſs of Germany, in the circle of Lower Saxony, and duchy of Mecklenburg, at the conflux of the Elbe and the Elda: ſold by the elector of Brandenburg to the count of Schwerin in 1328, with the duties, and all the country on both ſides the Elbe, for 7500 marks: the town and duties returned again to the houſe of Brandenburg, but the fortreſs remains with the dukes of Mecklenburg, as heirs of the counts of Schwerin. It was taken by the Imperial troops in 1627; by the Swedes in 1631; by the Saxons and Imperialiſts in 1637; and again by the Swedes in 1643: thirty-four miles ſouth of Schwerin. Lat. 53. 10. N. lon. 29. 5. E. Ferro.

DOMMA'IGNE, a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of Vitre: ſeven miles weſt-ſouth-weſt of Vitre.

DOMMALAIN', a town of France, in the department of the Ille and Vilaine, and chief place of a canton, in the diſtrict of La Guerche: one league north of La Guerche.

DOM'MART LES PONTHIEU, a town of France, in the department of the Somme, and chief place of a canton, in the diſtrict of Doulens: four leagues north-weſt of Amiens.

DOM'ME, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Sarlat: two leagues ſouth of Sarlat.

DOM'MEL, a river of Brabant, which paſſes by Bois-le-Duc, where it receives the Aa, and, joining the Meuſe, forms, with that river and the Wahal, the iſland of Bommel.

DOM'MITSCH, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen: thirty-eight miles north-weſt of Meiſſen.

DOM'NAU, a town of Pruſſia, in the province of Natangen: nineteen miles ſouth-ſouth-eaſt of Konigſberg.

DO'MO REPARANDA, *ſ.* A writ that lay for one againſt his neighbour, by the fall of whoſe houſe he feared a damage and injury to his own. *Reg. Orig.* 153.

DOM'PAIRE, a town of France, in the department of the Voſges, and chief place of a canton, in the diſtrict of Mirecourt, formerly the reſidence of the kings of Auſtraſia, and dukes of Lorrain: three leagues weſt-north-weſt of Epinal.

DOMPIER'RE, a town of France, in the department of the Allier, and chief place of a canton, in the diſtrict of Donjon: fourteen miles eaſt-ſouth-eaſt of Moulins.

DOMPIER'RE, a town of France in the department of the Lower Charente, and chief place of a canton, in the diſtrict of Saintes: two leagues eaſt-ſouth-eaſt of Saintes.

DOM'REMY, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Commerce. The birth-place of the celebrated maid of Orleans, Jeanne d'Arc: three leagues and a half eaſt of Bar-le-Duc.

DOMRIAN'KA, a town of Ruſſia, in the government of Perm: forty miles north of Perm.

DO'MUS CONVERSORUM, *ſ.* An ancient houſe, built by order of Henry III. for ſuch Jews as were converted to the Chriſtian faith: but Edward III. who expelled the Jews from this kingdom, afterwards deputed the place for the cuſtody of the rolls and records of the chancery. See ROLLS.

DO'MUS DEI, *ſ.* [houſe of God.] The hoſpital of St. Julian in Southampton, ſo called. *Mon. Angl.* tom. ii. 440. It is a name applied to many ancient hoſpitals and religious houſes.

DON, or DOM, *ſ.* [*dominus*, Lat.] The Spaniſh title for a gentleman; as, *Don* Quixote. It is with us uſed ludicrouſly;

To the great *dons* of wit,
Phœbus gives them full privilege alone
To damn all others and cry up their own. *Dryden.*

To DON, *v. a.* [*To do on.*] To put on; to inveſt with; the contrary to *doff*. *Obſolete.*—What! ſhould I *don* this robe, and trouble you! *Shakeſpeare.*

The purple morning left her crimſon bed,
And *donn'd* her robes of pure vermilion hue. *Fairfax.*

DON, or the TANAIS, a river of Ruſſia, which riſes near Epiphan, in the government of Tula, and runs into the ſea of Azoph by two mouths, a little to the weſt of Azoph, after a courſe of about 800 miles.

DON, a river of England, in Yorkſhire, which runs into the Aire near Snaith.

DON, a river of Scotland, which riſes in the weſt part of the county of Aberdeen, and, croſſing the county, runs into the ſea a little below Old Aberdeen.

DON CHRISTOPHER's COVE, on the north coaſt of the iſland of Jamaica. Lat. 18. 58. N. lon. 77. 1. W. Greenwich. It gave ſhelter to the diſcoverer of America during a violent ſtorm in 1503; and is the ſcite of the ancient town of Sevilla de Nueva.

DON MARTIN MAYORGA, the name given by the Spaniards to a cluſter of iſlands in the South Sea, diſcovered on the 27th of February, 1781, by F. A. Maurelle, a celebrated pilot of that nation. In this archipelago Maurelle found a ſafe harbour, to which he gave the name of El Refugio; and which he places in ſouth lat. 18°. 36′. and weſt lon. 177°. 47′. 45″ of Greenwich.

DONAGHADE'E, a ſea-port of Ireland, in the county of Down, ſituated on the eaſt coaſt, at the entrance of the north channel, where packets are eſtabliſhed for the purpoſe of carrying the mails and paſſengers to Port Patrick, in Scotland, a diſtance not quite ſeven leagues: fifteen miles eaſt of Belfaſt. Lat. 54. 37. N. lon. 5. 25. W. Greenwich.

DONA'I, a province of Cochin-china, which forms the whole ſouthern diſtrict of that kingdom.

DONAIEC'Z, a river of Poland, which runs into the Viſtula twenty-five miles below Cracow.

DO'NARY, *ſ.* [*donarium*, Lat.] A thing given to ſacred uſes.

DONATEL'LO, or DONATO, one of the principal revivers of ſculpture in Italy, born of poor parents at Florence in 1383. He was patronized by a citizen named Martelli, who ſent him to learn deſign under Lorenzo de Bicci. Such was his application, that he acquired the principles which made him an excellent ſculptor, and alſo a maſter of perſpective and architecture. He attracted the notice of that eminent citizen, the great Coſmo de Medici, who employed him on a tomb for pope John XXIII. and in other works, public and private. Some of his moſt eſteemed works in Florence, which ſtill remain, are his group of Judith and Holofernes in bronze, his Annunciation, his St. George, and St. Mark, and his Zuccone. His St. Mark has the traditional honour of having been addreſſed by Michael Angelo, with "*Marco, perche non mi parli?*" "Mark, why do you not ſpeak to me." He died in 1466, at the age of eighty-three, and was buried, by his own directions, in the church of St. Lorenzo, adjoining to the ſepulchre of Coſmo, that, "as his ſoul had always been with him when living, their bodies might be near each other when dead." He had a brother, named Simon, who adopted his manner, and obtained reputation.

DONA'TIA, *ſ.* [ſo named by Forſter from *Vitaliano Donati* of Padua, profeſſor of botany at Turin. He travelled into Egypt and Arabia, and died in his journey.] In botany, a genus of the claſs triandria, order trigynia. The generic characters are—Calyx: perianthium three-leaved; leaflets awl-ſhaped, ſhort, remote. Corolla: petals eight to ten, linear-oblong, twice as long as the calyx, ſpreading. Stamina: filaments three, awl-ſhaped, the length of the calyx; antheræ ſubglobular, twin. Piſtillum: germ inferior; ſtyles three, filiform, a little longer than the ſtamens; ſtigmas bluntiſh.—*Eſſential Character.* Calyx, three-leaved; petals nine, twice as long as the calyx, linear-oblong; antheræ ſubglobular, twin.

Donatia faſcicularis, or congregated donatia; a ſingle ſpecies, is a ſimple undivided plant, a finger's length, with imbricate leaves. It differs from polycarpon in its habit, and having about nine petals to the corolla. See AVICENNIA.

DONA'TIO CAUSA MORTIS, *ſ.* in law, a death-bed diſpoſition of property, ſo called when a perſon in his laſt ſickneſs, apprehending his diſſolution near, delivers, or cauſes to be delivered, to another the poſſeſſion of any perſonal goods, (under which have been included bonds, and bills drawn by the deceaſed upon his banker,) to keep in caſe of his deceaſe. This gift, if the donor dies, needs not the aſſent of his executor; yet it ſhall not prevail againſt creditors; and is accompanied with this implied truſt, that, if the donor lives, the property thereof ſhall revert to himſelf, being only given in contemplation of death, or *mortis cauſâ*. 1 *P. Wms.* 404. 2 *Vez.* 431. *Ward* v. *Turner*. This latter caſe collects all the law on the ſubject of donations *cauſâ mortis*; and particularly conſiders what ſhall be a ſufficient delivery of different kinds of property to give effect to ſuch donations. There may be a *donatio cauſâ mortis* of bonds, bank-notes, and bills, payable to *bearer*; but not of other promiſſory notes or bills of exchange, theſe being choſes in action which do not paſs by delivery.

DONA'TION, *ſ.* [*donatio*, Lat.] The act of giving any thing; the act of beſtowing.—After *donation* there is an abſolute change and alienation made of the property of the thing given: which being ſo alienated, a man has no more to do with it than with a thing bought with another's money. *South.*—The grant by which any thing is given or conferred:

The kingdoms of the world to thee were giv'n,
Permitted rather, and by thee uſurp'd;
Other *donation* none thou canſt produce. *Milton.*

DO'NATISTS, *ſ.* Ancient ſchiſmatics in Africa, ſo denominated from their leader Donatus. They had their origin in 311, when, in the room of Menſurius, who died in that year on his return to Rome, Cæcilian was elected biſhop of Carthage, and conſecrated without the concurrence of the Numidian biſhops, by thoſe of Africa alone; whom the people refuſed to acknowledge, and to whom they oppoſed Majorinus; who, accordingly, was ordained by Donatus, biſhop of Caſæ Nigræ. They were condemned, in a council held at Rome, two years after their ſeparation; and afterwards in another at Arles, the year following; and again at Milan, before Conſtantine the Great, in 316, who deprived them of their churches, and ſent their ſeditious biſhops into baniſhment, and puniſhed ſome of them with death. Their cauſe was eſpouſed by another Donatus, called the *great*, the principal biſhop of that ſect, who, with numbers of his followers, was exiled by order of Conſtans. Many of them were puniſhed with great ſeverity. However, after the acceſſion of Julian to the throne, in 362, they were permitted to return, and reſtored to their former liberty. Gratian next publiſhed ſeveral edicts againſt them; and, in 377, deprived them of their churches, and prohibited all their aſſemblies. Their decline was alſo precipitated by the zealous oppoſition of St. Auguſtin, and by the violent meaſures which were purſued againſt them by order of the emperor Honorius.

DO'NATIVE, *ſ.* [*donatif*, Fr. from *donatus*, Lat.] A gift; a largeſs; a preſent; a dole of money diſtributed.—The Roman emperor's cuſtom was, at certain ſolemn times, to beſtow on his ſoldiers a *donative*; which *donative* they received wearing garlands upon their heads. *Hooker.*

DO'NATIVE, *ſ.* in law, a benefice merely given and diſpoſed

diſpoſed of by the patron to a man, without either preſentation to, or inſtitution by, the ordinary, or induction by his order. Donatives are ſo termed, becauſe they began only by the foundation and erection of the donor. The king might of ancient time found a church or chapel, and exempt it from the juriſdiction of the ordinary; ſo he may by his letters patent give licence to a common perſon to found ſuch a church or chapel, and make it donative, not preſentable; and that the incumbent or chaplain ſhall be deprived by the founder and his heirs, and not by the biſhop; which ſeems to be the original of donatives in England. 2 *Comm.* 22. When the king founds a church, &c. donative, it is of courſe exempted from the ordinary's juriſdiction, though no particular exemption is mentioned; and the lord chancellor ſhall viſit the ſame: and, where the king grants a licence to any common perſon to found a church or chapel, it may be donative, and exempted from the juriſdiction of the biſhop, ſo as to be viſited by the founder, &c. *Co. Litt.* 134. The reſignation of a donative muſt be to the donor or patron, and not to the ordinary; and donatives are not only free from all ordinary juriſdiction, but the patron and incumbent may charge the glebe to bind the ſucceſſor; and, if the clerk is diſturbed, the patron may bring *quare impedit*, &c. Alſo the patron of a donative may take the profits thereof when it is vacant. *Co. Lit.* 344. If the patron of a donative will not nominate a clerk, there can be no lapſe: but the biſhop may compel ſuch patron to nominate a clerk by eccleſiaſtical cenſures; for, though the church is exempt from the power of the ordinary, the patron is not exempted: and the clerk muſt be qualified like unto other clerks of churches; no perſon being capable of a donative, unleſs he be a prieſt lawfully ordained. 14 *Car.* II. c. 4.

There may be a donative of the king's gift with cure of ſouls, as the church of the Tower of London is: and, if ſuch donative be procured for money, it will be within the ſtatute of ſimony. A parochial church may be donative, and exempt from the ordinary's juriſdiction. *Godolph.* 262. The church of St. Mary-le-Bone, in Middleſex, is donative; and the incumbent being cited into the ſpiritual court, to take a licence from the biſhop to preach, pretending that it was a chapel, and that the parſon was a ſtipendiary; it was ruled in the king's-bench that it was a donative; and, if the biſhop viſit, the court will grant a prohibition. 1 *Nelſ. Abr.* 676. If a patron of a donative doth once preſent his clerk to the ordinary, and the clerk is admitted, inſtituted, and inducted, then the donative ceaſeth; and it becomes a church preſentative. *Co. Litt.* 344. But when a donative is created by letters patent, by which lands are ſettled upon the parſon and his ſucceſſors, and he is to come in by the donation of the king, and his ſucceſſors; in this caſe, though there may be a preſentation to the donative, and the incumbent come in by inſtitution and induction, yet that will not deſtroy the donative. 2 *Salk.* 541. All biſhoprics being of the foundation of the king, they were in ancient time donative. 3 *Rep.* 75. Donatives have two peculiar properties: one, that the preſentation does not devolve to the king, as in other livings, when the incumbent is made a biſhop. *Ca. Parl.* 184. The other, that a donative is within the ſtatute of pluralities, if it is the firſt living; but if a donative is the ſecond benefice taken without a diſpenſation, the firſt would not be void; for the words of the ſtatute are *inſtituted and inducted* to any other, which are not applicable to donatives. 1 *Woodd.* 330. And therefore it ſeems if donatives are taken laſt, they may be held with any other preferment.

DONA'TO (St.), a county of Maritime Auſtria, containing, beſides a few villages, the large borough of St. Dono di Piave, which carries on a conſiderable commerce.

DONA'TO (Bernardino), a learned Italian of the ſixteenth century, born at Zano in the Veroneſe. He was Greek profeſſor at Padua, and alſo taught at Parma, Ferrara, and Carpi; and died about the middle of the century in his own country. He is particularly known for his Latin verſion of the *Demonſtratio Evangelica* of Euſebius, which has ſeveral times been reprinted. He likewiſe tranſlated ſome works of Galen, Xenophon, and Ariſtotle. In 1541, he wrote a Latin dialogue on the difference between the Ariſtotelic and Platonic philoſophy. A Latin grammar, publiſhed at Venice in 1529, is aſcribed to him.

DONA'TO (Girolamo), a patrician of Venice, born about 1454. He was a perſon eminent for probity and talents, and was employed by his country in various important and difficult negociations. He commanded in Breſcia and Ferrara; and, in 1510, reconciled the republic to pope Julius II. He was at the ſame time one of the moſt learned men of the age, particularly in the Greek tongue. He tranſlated into Latin the commentary of Alexander Aphrodiſeus upon Ariſtotle on the ſoul, and a homily of St. John Chryſoſtom; alſo ſome pieces attributed to Dionyſius the Areopagite, and to John Damaſcenus. He wrote an apology for the pope's ſupremacy, againſt the Greek church, and a letter to cardinal Caraffa upon the ſame ſubject. Five of his epiſtles are extant, with thoſe of Angelo Poliziano, and Pico of Mirandula. He likewiſe drew up a long and forcible apology for the Venetians againſt Charles VIII. king of France. He died in 1511.

DO'NATORY, *ſ.* in Scots law, that perſon to whom the king beſtows his right to any forfeiture that has fallen to the crown.

DONA'TUS (Ælius), an ancient grammarian, flouriſhed in the time of Conſtantine, and was one of the preceptors of St. Jerom. He wrote commentaries upon Virgil and Terence; and compoſed ſome works on grammar, ſtill remaining, printed in the collection of ancient grammarians. The author of a life of Virgil, is ſuppoſed to have been Tiberius Claudius Donatus, a later writer.

DONA'TUS, biſhop of Caſæ Nigræ in Numidia, in the fourth century, gave name to the ſect of the Donatiſts in Africa. His party became exceedingly powerful and numerous, and for a long time ſupported their cauſe againſt their rival faction: but, finally, the ſentence of deprivation and excommunication was pronounced againſt him by the biſhop of Rome.

DONA'TUS, biſhop of Carthage, was elected to that office by the Donatiſt party, after the death of Majorinus, in 316. He was a perſon of conſiderable learning and abilities, whence he obtained among his ſect the ſurname of the Great, and acquired more influence in the management of their concerns than any other of their biſhops. By his perſuaſive eloquence he induced vaſt multitudes to join their communion; and by his writings confirmed them in a zealous adherence to their diſtinguiſhing principles. But he is ſaid to have been haughty, contentious, and intolerant; and, for the latter charge, the diſcriminating tenets of the Donatiſts, which he is conſidered as having ſyſtematiſed, afford too ſtrong evidence.

DONAUESCHIN'GEN, or DONESCHINGEN, a town of Germany, in the circle of Swabia, ſituated in the Black Foreſt, where the prince of Furſtenberg has a palace, near which is a ſpring, ſaid to be the ſource of the Danube: thirteen miles north-north-weſt of Schaffhauſen, and thirteen weſt of Duttlingen.

DONAVIT'Z, a town of Hungary; ſixteen miles north-north-weſt of Palotza.

DO'NAUSTAUFF, or DOMSTAUF, a town of Germany, in the circle of Bavaria, and biſhopric of Ratiſbon, on the Danube: ſix miles eaſt of Ratiſbon.

DONAWERT', a town of Germany, in Upper Bavaria, on the Wernitz, near its union with the Danube. It was formerly imperial, and in the circle of Swabia; but, being put under the ban of the empire, in 1607, was ſeized by the duke of Bavaria. It is fortified, and has a bridge acroſs the Danube. It has been taken ſeveral times in the wars of Germany, both by the French and the Swedes. On the 3d of July 1704, the elector of Bavaria,

varia, to prevent its falling into the hands of the allies, ordered his garriſon to ſet it on fire; but, the duke of Marlborough coming ſuddenly into the town, the Bavarian troops were compelled to a precipitate retreat, and the town was ſaved: thirty miles weſt of Ingoldſtadt, and eighteen north of Augſburg. Lat. 48. 39 N. lon. 28. 25. E. Ferro.

DO'NAX, *ſ.* in botany. See ARUNDO.

DO'NAX, *ſ.* A genus of ſhell-fiſh, belonging to the order of vermes teſtacea, commonly called the *flat-ſided cockle*. The animal is a tethys; ſhell bivalve, with generally a crenulate margin; the frontal margin very obtuſe: hinge with two teeth, and a ſingle marginal one placed a little behind. For the number of ſpecies, &c. ſee the article CONCHOLOGY, vol.v. p. 32.

DON'CASTER, a conſiderable manufacturing town of Yorkſhire, named from its ſituation on the river Don, over which it has two bridges; diſtant thirty-ſeven miles from York, eighteeen from Sheffield, and 162 from London. It is a place of great antiquity, as appears from the Itinerary of Antoninus, who tells us that the Criſpinian horſe were ſtationed here while the Romans were in Britain; and that the governor of the province generally reſided in the caſtle, that he might be near the great wall, in order to repel the incurſions of the Scots and Picts. This caſtle remained as a place of great ſtrength under the kings of Deira; but a dreadful fire breaking out, anno 759, not only the caſtle but the whole town was reduced to aſhes. The caſtle was never after rebuilt; and at preſent the place where it ſtood is ſcarcely known. But the town was not ſuffered to remain long in ruins, it being ſoon after rebuilt in a handſome manner, and it has continued to flouriſh from that time to the preſent. In the reign of Henry III. a convent was founded in it, with an hoſpital for lepers; but no remains of either are now left, only that there is a ſtone croſs ſtill ſtanding at one end of the town, which appears to have been erected in that age, and probably by the perſon who founded the convent. The ſituation of Doncaſter is exceedingly pleaſant, and is a great thoroughfare to York and other places in the north. It has two fairs annually for horſes, &c. and a weekly market on Saturdays. Proviſions of all kinds are plentiful, and the town is well ſupplied with water, which is conducted through pipes from the river. The principal manufactories eſtabliſhed here are for ſpinning wool, cotton, &c. The river is navigable up to the town; and here are the remains of a great Roman cauſeway. The government of Doncaſter is veſted in a mayor, recorder, aldermen, and common-council. The church is a very ancient ſtructure; and the ſteeple is greatly admired for its extraordinary workmanſhip. The manſion-houſe is a very ſpacious ſtone edifice; and it is to be remarked, that Doncaſter had a magnificent manſion-houſe, built by Paine, for its mayor, before either London or York. It has a free grammar-ſchool, an alms-houſe for aged perſons, and a diſpenſary for the relief of the ſick poor in the town and its neighbourhood.

Not far from Doncaſter is Coniſborough caſtle, called in Britiſh *Car Conan*, ſituate on a rock, where Matthew of Weſtminſter ſays, that Aurelius Ambroſius, a Britiſh prince, vanquiſhed Hengiſt, the Saxon general, and took him priſoner. Before the gate is an agger, ſaid to be the burying-place of Hengiſt. It is not only famous for its antiquity, but its ſituation alſo celebrious, upon a pleaſant aſcent, having in its neighbourhood ſix large market-towns, 120 villages, many large woods of oak, ſome beautifully cut through into walks; ſix iron-ſmelting furnaces, many mines of coal and iron, quarries of ſtone for building, nine large ſtone bridges, forty water-mills, ſix ſeats of noblemen, ſixty of gentlemen, fifty parks, and two navigable rivers. Contiguous to Coniſborough is Wentworth, the ſeat of the Wentworths, who have flouriſhed here ever ſince the Norman invaſion, and been poſſeſſed of the eſtate of Woodhouſe from the time of Henry III. It was rebuilt in a moſt elegant manner by the late marquis of Rockingham, and is now called Wentworth-houſe. It is ſituated in the midſt of a moſt beautiful country, and in a park that is one of the moſt exquiſite ſpots in the world. On entering the park, the proſpect which preſents itſelf is delicious, being diverſified by a noble range of hills, dales, lakes, and woods, with the houſe magnificently ſituated in the center of the whole. The eye naturally falls into the valley, through which the water winds in a noble ſtile. On the oppoſite ſide is a vaſt ſweep of riſing ſlopes, finely ſcattered with trees and ſhrubs, up to the houſe, which is here ſeen diſtinctly, and ſtands in the higheſt point of grandeur, from whence it commands all the ſurrounding country; the woods ſtretching away above, below, and to the right and left, with inconceivable magnificence. From the pyramid on one ſide, which riſes from the boſom of a great wood, extending quite round on the left, it there joins one of above an hundred acres, hanging on the ſide of a vaſt hill, and forming altogether an amphitheatrical proſpect, the beauties of which are much eaſier to be imagined than deſcribed. Upon the whole, Wentworth is in every reſpect conſidered as one of the fineſt ſeats in the kingdom. With ſome, the houſe is an object of curioſity; with others, the park is admired; the ornamental buildings give a general beauty to the whole, in which ſuperior taſte and elegance are united.

In the neighbourhood of this is the ancient Stainborough, now Wentworth-caſtle, a fine ſeat belonging to the earl of Strafford. But Wentworth-caſtle is more famous for the beauties of the ornamented environs, than for that of the houſe, though the front is ſuperior to many. The water and woods adjoining are ſketched with great taſte. The firſt extends through the park in a meandering courſe, and, wherever it is viewed, the terminations are no where ſeen, having every where the effect of a real and very beautiful river; the groves of oaks fill up the bends of the ſtream in a moſt beautiful manner, here advancing thick to the very banks of the water, there appearing at a diſtance, breaking away to a few ſcattered trees in ſome ſpots, and in others joining their branches into the moſt ſolemn ſhade. The water in many places is ſeen from the houſe, between the foliage of ſcattered clumps, moſt pictureſquely; in others it is quite loſt behind hills, and breaks every where upon the view, in a ſtile that cannot be ſufficiently admired. The lawn, which leads up to the caſtle, is truly elegant: there is a clump of lofty pines on one ſide of it, through which the diſtant proſpect is ſeen, and a ſtatue of Ceres is caught in the hollow of a dark grove, with the moſt pictureſque elegance, and is one among the few inſtances of ſtatues being employed in gardens with real taſte.

DON'CHERY, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Sedan, on the Meuſe; it is defended with walls and fortifications. Here is alſo a woollen manufacture: one league weſt of Sedan.

DONDAN'GA, a town of the duchy of Courland: twenty-four miles north-eaſt of Piltyn.

DON'DI (James de), a phyſician and mathematician, flouriſhed in Padua in the fourteenth century. He was known by the name of the *Aggregator*, on account of a work which he compoſed, intitled, *Promptuarium Medicinæ, in quo facultates medicamentorum ſimplicium & compoſitorum declarantur, &c.* firſt printed at Venice, 1481, folio. It is ſaid, in the preface, to have been written in 1355. It is a mere compilation from the ancient phyſicians. He alſo wrote a work, *De modo conficiendi ſalis ex aquis calidis Aponenſibus*, from which it appears, that he extracted a ſalt from the waters of Albano, in the proportion of one pound from one thouſand. This treatiſe, together with one *De fluxu & refluxu maris*, was printed at Venice in 1571. He likewiſe made himſelf celebrated for the conſtruction of a clock, which was one of the earlieſt erected in Italy. This was placed, in 1344, on the top

of a tower in the palace of Ubertino Carrara, lord of Pavia. It was a ſtriking clock, of twenty-four hours. A more famous machine, kept at Padua, repreſenting the motions of all the heavenly bodies, as well as pointing out the progreſs of the day and the year, has been uſually attributed to James de Dondi. But Tiraboſchi renders it probable that it was the work of his ſon John, a famous phyſician and aſtronomer, a philoſopher and poet, and an intimate friend of Petrarch. From this curious piece of machinery the family of Dondi acquired the ſurname of *de Horologio*.

DONE, *part. paſſ.* of the verb *To do*:

Another like fair tree eke grew thereby,
Whereof whoſo did eat, eftſoons did know
Both good and evil: O mournful memory!
That tree, through one man's fault, hath *done* us all to dye. *Spenſer.*

The old infinitive of *do*.—Ne to your lady will I ſervice *done*. *Spenſer*.—As maydens uſed to *done*. *Id.*

DONE, *a kind of interjection*. The word by which a wager is concluded: when a wager is offered, he that accepts it ſays *done*.—'Twas *done* and *done*, and the fox, by conſent, was to be the judge. *L'Eſtrange*.

One thing, ſweet-heart, I will aſk;
Take me for a new-faſhion'd maſk,
—*Done*: but my bargain ſhall be this,
I'll throw my maſk off when I kiſs. *Cleaveland.*

DONE'E, *ſ.* [from *dono*, Lat.] One to whom a gift is made.—Touching the parties unto deeds and charters, we are to conſider as well the donors and grantors, as the *donees* or grantees. *Spelman.*

DO'NEGAL, a town of Ireland, which gives name to the county, ſituated at the mouth of the river Eſk, on a large bay of the Atlantic, on the weſt coaſt of the iſland, called from the town, *The Bay of Donegal*: nine miles north-north-eaſt of Ballyſhannon.

DO'NEGAL, a county of Ireland, bounded on the weſt and north by the ſea, on the eaſt by the counties of Londonderry and Tyrone, and on the ſouth by the county of Fermanagh, and an arm of the ſea, called *The Bay of Donegal*, about ſeventy miles in length, and from ten to thirty in breadth: it is computed to contain only forty-two pariſhes, 23,531 houſes, 140,000 inhabitants. The ſurface is generally rugged and mountainous, in ſome parts boggy, with ſome rich vales between the mountains and by the ſides of the rivers. The chief town is Ballyſhannon. The principal rivers are the Finn, the Dale, and the Guibarra.

DO'NEGAL, the name of three townſhips of the American States, in Pennſylvania; the one in Lancaſter county, the other in that of Weſtmoreland, and the third in Waſhington county.

DO'NETSK, a town of Ruſſia, in the government of Ekaterinoſlav, on the river Donetz: 140 miles eaſt of Ekaterinoſlav. Lat. 48. 30. N. lon. 56. 15. E. Ferro.

DO'NETZ, a river of Ruſſia, which riſes near Bielgorod, in the government of Kurſk, and runs into the Don, near Kotchetovſkaia, in the country of the Coſſacks.

DON'GES, a town of France, in the department of the Lower Seine: ſeven leagues weſt-north-weſt of Nantes.

DON'GO. See ANGOLO.

DONGO'LA, a province of Nubia, to the north of the Nile, abounding in foreſts of acacia, full of paroquets.

DO'NI (Giambatiſta), a learned Italian writer, deſcended from a noble family in Florence, born in 1594. He had his early education in the jeſuits' college at Rome, where he greatly diſtinguiſhed himſelf by his ability and application. He afterwards ſtudied at Bourges, where he added the knowledge of juriſprudence to his other acquiſitions; and, on his return, he took his degree in law at Piſa. He ſtudied the oriental languages; and, making a ſecond viſit to France with the nuncio Corſino, in 1621, he cultivated an acquaintance with all the learned men, and examined the libraries of that country. He then began to make a very copious collection of inſcriptions, which, after remaining a century in manuſcript, was publiſhed in 1731 by the learned Gori. He was made profeſſor of eloquence in the univerſity of Florence, and was aggregated to the Florentine academy, and to that of La Cruſca. He continued to purſue his ſtudies with his uſual ardour, and to publiſh learned works, till his death in 1647. It is chiefly as a writer upon muſic that Doni has perpetuated his name; and his works on this ſubject were numerous. In 1635 he publiſhed, *Compendio del trattato de generi, e de' modi della Muſica, con un diſcorſo ſopra la perfettione de' concenti*; to this was added, *Diſcorſo ſopra la perfettione delle melodie*. In 1640 appeared his *Annotazioni ſopra il compendio de' generi e de' modi della Muſica*, accompanied with various tracts and diſcourſes. In 1647 he publiſhed, *De præſtantia Muſica veteris*, a dialogue compriſing a curious and learned diſquiſition on ancient and modern muſic, with arguments in favour of each, but ſtrongly inclining to the cauſe of antiquity.

DONI'FEROUS, *adj.* [from the Lat. *donum*, a gift, and *fero*, to bear.] Bringing gifts. *Scott.*

DON'JON, *ſ.* [now corrupted to *dungeon*, from *dominionum*, low Latin, according to *Menage*.] The higheſt and ſtrongeſt tower of the caſtle, in which priſoners were kept; as in *Chaucer*. It is now uſed of ſubterraneous priſons:

The grete toure, that was ſo thicke and ſtrong,
Which of the caſtle was the chief *dongeon*,
Wherein the knightes were in priſon. *Chaucer.*

DON'JON (Le), a town of France, and principal place of a diſtrict, in the department of the Allier: eight leagues ſouth-eaſt of Moulins. Lat. 46. 21. N. lon. 21. 28. E. Ferro.

DON'KEY, *ſ.* A young aſs.

DON'KOV, a town of Ruſſia, in the government of Riazan, ſituated near the ſource of the Don: ſixty miles ſouth of Riazan, and 480 ſouth-ſouth-eaſt of Peterſburg.

DONNE (John, D. D.), a poet and divine, ſon of a merchant in London, born in 1573. He was ſent to ſtudy at Oxford ſo early as his eleventh year, at which time we are told that he was a kind of prodigy of abilities. After a ſtay there of three years, he paſſed as many at Cambridge, and was then entered at Lincoln's-inn for the ſtudy of the law. This, however, he laid aſide for that of controverſial divinity; for his relations, being papiſts, had infuſed into his young mind the principles of their faith, and he now thought it time to fix his religious profeſſion by enquiring for himſelf. The reſult of his examination into the controverted points was, a firm deciſion in favour of proteſtantiſm. He attended the earl of Eſſex in 1596–97, on his expeditions againſt Cadiz and the Azores; and he afterwards paſſed ſome years in Italy and Spain. On his return he became ſecretary to lord-chancellor Egerton, and continued in that employment five years, when a clandeſtine marriage he contracted with a niece of the chancellor cauſed his diſmiſſion. The young couple ſtruggled with difficulties, which were in ſome degree alleviated by ſir Francis Wooley and ſir Robert Drury, who gave them apartments at his houſe in Drury-lane; and, in 1612, he accompanied that friend on his embaſſy to Paris. On his return, many of the nobility urged king James to confer upon him ſome civil employment; but his majeſty, who had ſecretly reſolved to make a divine of him, rejected their ſolicitations. He had already inſtigated Donne to draw up a treatiſe on the controverſy then depending concerning the oaths of allegiance and ſupremacy required from the Roman catholics; and the reſult was his work, intitled, *Pſeudo-Martyr*, printed in 1610. He was now ordained deacon and prieſt by the biſhop of London, and was preſented with the degree of doctor of divinity by the univerſity of Cambridge; after which he was made preacher of Lincoln's-

inn. In 1619, he accompanied Hay earl of Doncaſter, on an embaſſy to the German princes. After his return, the king conferred upon him the deanery of St. Paul's, with which he enjoyed the living of St. Dunſtan's in the Weſt, and another benefice. A dangerous illneſs with which he was affected, gave occaſion to his book of Devotions upon emergent Occaſions, in which the fervour of his ſoul is ſtrongly expreſſed. He recovered and lived in good health, till he was ſeized with a fever in 1630, after which he began to decline. He preached in his turn at court in Lent, 1631; and his diſcourſe, on this occaſion, was termed by the houſehold, "the doctor's own funeral ſermon." He died on March 31 of that year, and was buried in St. Paul's cathedral.

Dr. Donne was a writer both in proſe and verſe, but he is chiefly remembered as a poet; and in that capacity it is rather his name than his works which may be ſaid to ſurvive. He is, however, worthy of notice, as ſtanding almoſt at the head of a particular claſs, and uniting in a high degree its excellences and defects. This is the witty claſs, underſtanding the word *wit* to mean the faculty of aſſembling and aſſociating the moſt diſcordant images, and preſenting a thought under its remoteſt and moſt fanciful aſpects. The ſtrong ſenſe and wit of his ſatires induced Pope to employ himſelf in verſifying (as he juſtly called it) two of them, but they are not among that poet's moſt pleaſing productions. Dr. Donne was among thoſe Engliſh poets who wrote Latin verſe with elegance. A collection was publiſhed in 1633, intitled, *Faſciculus Poëmatum et Epigrammatum miſcellaneorum*, which contains a book of epigrams by him. Of his proſe works, one of the moſt remarkable is that intitled *Biathanatos*; or, a Declaration of that Paradox or Theſis, that Self-homicide is not ſo naturally a Sin, that it may not be otherwiſe. This ſeems to have been a juvenile ſport of the underſtanding, in ſupporting a nice argument with no other view than as an exerciſe of the faculties. Dr. Donne alſo wrote Eſſays on Divinity; Sermons, 3 vols. folio; Letters; and other pieces; many of which are conſigned to oblivion.

DONNEMARI'E, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the diſtrict of Provins: three leagues ſouth-weſt of Provins.

DONNERAI'LE, a town of Ireland, in the county of Cork: nineteen miles north of Cork, and twenty-ſix ſouth of Limerick

DON'NERSMARK, or CSOTORTOKHELY, or STWARTEK, a town of Hungary: ſeven miles north-north-weſt of Kapſdorf.

DON'NINGTON, or DUNNINGTON, a market town of Lincolnſhire, diſtant one hundred and ten miles from London, ten from Spalding, and eleven from Boſton. The market-day is Saturday; and there are two large fairs; one on the 25th of May, the other on the 17th of October. The town, which is very much improved within the laſt ten years, is noted for an extenſive trade in hemp and hemp-ſeed; it has a port for barges, by which goods are carried to and from Boſton and the Waſhes. A firm rampart of earth, of a conſiderable breadth, has lately been made from hence, through the fens, to Sempringham, in which the road has been rendered paſſable in winter, which before was attended with great danger. Here is a large free-ſchool, ſupported by a donation of about five hundred pounds a-year, given by lord Cowley.

DON'NOE, a ſmall iſland in the North Sea, near the coaſt of Norway. Lat. 66. 5. N. lon. 29. E. Ferro.

DO'NOR, *ſ.* [from *dono*, Lat.] A giver; a beſtower; one who gives any thing: the perſon receiving which is called the *donee*.—It is a mighty check to beneficent tempers to conſider how often good deſigns are fruſtrated and perverted to purpoſes, which, could the *donors* themſelves have foreſeen, they would have been very loth to promote. *Atterbury*.

DON'SHAL, a town of Egypt: ten miles north-weſt of Foua.

DO'NSHIP, *ſ.* Quality or rank of a gentleman or knight:

I'm none of thoſe,
Your boſom-friends, as you ſuppoſe;
But Ralph himſelf, your truſty ſquire,
Wh' has dragg'd your *donſhip* out o' th' mire. *Hudibras.*

DONSKA'IA, a town and fortreſs of Ruſſia, in the country of the Coſſacks, on the Don: 220 miles eaſt-north-eaſt of Azoph.

DONSKA'IA, a fortreſs of Ruſſia, in the government of Caucaſus: 116 miles weſt-north-weſt of Ekaterinograd.

DON'ZEL, *ſ.* [Ital.] A young attendant.—No, you ſhall ſpare his dowcets, my dear *donzels*. *Beaumont and Fletcher.*—He is eſquire to a knight-errant, *donzél* to the damſels. *Butler.*

DONZENAC', a town of France, in the department of the Correze, and chief place of a canton, in the diſtrict of Brive: three leagues and a half weſt-ſouth-weſt of Tulle.

DONZE'RE, a town of France, in the department of the Drome, and chief place of a canton, in the diſtrict of Montelimart: two leagues and a half ſouth of Montelimart.

DON'ZY, a town of France, in the department of Nievre, and chief place of a canton, in the diſtrict of Coſne: five leagues and a half ſouth-weſt of Clamecy.

DON'ZY, a town of France, in the department of the Rhone and Loire: five miles eaſt of Feurs.

DOO'AB, a province of Hindooſtan, between the river Ganges and Jumnah: belonging to the nabob of Oude.

DOO'BAUNT, or DOOBOUNT, a lake, about ſeventy miles long, and thirty broad: ſituated ſouth-eaſt of the head of Cheſterfield inlet, in New South Wales.

DOO'DLE, *ſ.* [a cant word, perhaps corrupted from *do little*.] A trifler; an idler.

DOOLE, *ſ.* [*deuil*, Fr.] Sorrow:

That angry foole
Which follow'd her, with curſed hands uncleane
Whipping her horſe, did with his ſmarting toole
Oft whip her dainty ſelfe, and much augment her *doole*.
Spenſer.

DOO'LY, *ſ.* [Indian.] A kind of open box, made of light wood, large enough for a perſon to lie at full length. It is uſually ſuſpended from poles of bamboo, and carried on the ſhoulders of four men. Moſt gentlemen in the army take one to the field for the double purpoſe of travelling, and uſing as a bed. They are alſo extremely convenient for removing the ſick and wounded. It is the *bier* of the Eaſt Indians.

To DOOM, *v. a.* [beman, Sax.] To judge:

Him through malice fall'n,
Father of mercy and grace! thou didſt not *doom*
So ſtrictly, but much more to pity incline. *Milton.*

To condemn to any puniſhment; to ſentence:

He may be *doom'd* to chains, to ſhame, to death,
While proud Hippolitus ſhall mount his throne. *Smith.*

To pronounce condemnation upon any:

Minos, the ſtrict inquiſitor, appears,
And lives and crimes, with his aſſeſſors, hears;
Round in his urn the blended balls he rowls,
Abſolves the juſt, and *dooms* the guilty ſouls. *Dryden.*

To command judicially or authoritatively:

Have I a tongue to *doom* my brother's death,
And ſhall that tongue give pardon to a ſlave? *Shakeſp.*

To deſtine; to command by uncontrollable authority:

I have no will but what your eyes ordain;
Deſtin'd to love, as they are *doom'd* to reign. *Granville.*

DOOM,

DOOM, *ſ.* [ðom, Sax. *doem*, Lat.] Judicial ſentence; judgment.—In the great day, wherein the ſecrets of all hearts ſhall be laid open, no one ſhall be made to anſwer for what he knows nothing of; but ſhall receive his *doom*, his conſcience accuſing or excuſing him. *Locke.*

And now, without redemption, all mankind
Muſt have been loſt, adjudg'd to death and hell
By *doom* ſevere. *Milton.*

The great and final judgment:

Search Windſor caſtle, elves, within and out:
Strew good luck, ouphes, on every ſacred room,
That it may ſtand till the perpetual *doom*. *Shakeſpeare.*

Condemnation; judicial ſentence:

Revoke thy *doom*,
Or whilſt I can vent clamour from my throat,
I'll tell thee thou doſt evil. *Shakeſpeare.*

Determination declared:

If friend or foe, let him be gently us'd.
—Revoke that *doom* of mercy, for 'tis Clifford. *Shakeſ.*

The ſtate to which one is deſtined:

By day the web and loom,
And homely houſehold taſk, ſhall be her *doom*. *Dryden.*

Ruin; deſtruction:

From the ſame foes, at laſt, both felt their *doom*;
And the ſame age ſaw learning fall, and Rome. *Pope.*

DOOMS'DAY, *ſ.* The day of final and univerſal judgment; the laſt, the great day:

Men, wives, and children ſtare, cry out, and run,
As it were *doomſday*. *Shakeſpeare.*

They may ſerve for any theme, and never be out of date until *doomſday*. *Brown.*

Our ſouls, not yet prepar'd for upper light,
Till *doomſday* wander in the ſhades of night:
This only holiday of all the year,
We privileg'd in ſunſhine may appear. *Dryden.*

The day of ſentence or condemnation.—All-ſouls day is my body's *doomſday*. *Shakeſpeare.*

DOOM'SDAY-BOOK. See DOMESDAY-BOOK.—The Danes alſo brought in a reckoning of money by ores, *per oras*, which is mentioned in *doomſday-book*. *Camden.*

DOON, a river of Scotland, which iſſues from Loch Doon, and taking a north-weſt direction, divides the diſtrict of Kyle from Carrick, the ſouthern diviſion of Ayrſhire, and falls into the frith of Clyde, about three miles ſouth of Ayr.

DOOR, *ſ.* [ðoꝛ, ðuꝛe, Saxon; *dorris*, Erſe.] The gate of a houſe; that which opens to yield entrance. *Door* is uſed of houſes, and *gates* of cities or public buildings; except in the licence of poetry.—For without rules there can be no art, any more than there can be a houſe without a *door* to conduct you in. *Dryden.*

All the caſtle quaked from the ground,
And every *door* of free-will open flew. *Spenſer.*

To the ſame end men ſev'ral paths may tread,
As many *doors* into one temple lead. *Denham.*

In familiar language, a houſe; often in the plural, *doors*.—Martin's office is now the ſecond *door* in the ſtreet, where he will ſee Parnel. *Arbuthnot.*—Lambs, though they are bred within *doors*, and never ſaw the actions of their own ſpecies, puſh at thoſe who approach them with their foreheads. *Addiſon.*—Entrance; portal:

The tender blades of graſs appear;
And buds, that yet the blaſt of Eurus fear,
Stand at the *door* of life, and doubt to clothe the year.
Dryden.

Paſſage; avenue; means of approach.—The indiſpenſable neceſſity of ſincere obedience, ſhuts the *door* againſt all temptations to carnal ſecurity. *Hammond.*—*Out of* DOOR, *or* DOORS. No more to be found; quite gone; fairly ſent away.—His imaginary title of fatherhood is *out of doors*, and Cain is no prince over his brother. *Locke.*

Should he, who was thy lord, command thee now,
With a harſh voice and ſupercilious brow,
To ſervile duties, thou would'ſt fear no more;
The gallows and the whip are *out of door*. *Dryden.*

At the DOOR *of any one.* Imputable; chargeable upon him.—In any of which parts if I have failed, the fault lies wholly *at my door*. *Dryden.*—*Next* DOOR *to.* Approaching to; near to; bordering upon.—A ſeditious word leads to a broil, and a riot unpuniſhed is but *next door to* a tumult. *L'Eſtrange.*

DOOR'CASE, *ſ.* The frame in which the door is fixed.—The making of frames for *doorcaſes*, is the framing of two pieces of wood athwart two other pieces. *Moxon.*

DOOR'KEEPER, *ſ.* Porter; one that keeps the entrance of a houſe.—He that hath given theſe aſſiſtances to thee, deſires to be even a *doorkeeper* in God's houſe, and to be a ſervant to the meaneſt of God's ſervants. *Taylor.*

DOPH'KAH, the ninth place of encampment of the Iſraelites, in their journey from Egypt to Canaan. *Numbers* xxxiii. 12.

DOPO'NEN, a town of Pruſſian Lithuania: four miles ſouth-ſouth-eaſt of Stalluponen.

DOP'PELMAIER (John Gabriel), a celebrated mathematician and profeſſor at Nuremberg, born in 1667 in that city, where his father was a merchant. Having gone through the uſual preparatory courſe of education, he ſtudied law at Altdorf, in 1696; but, at the ſame time, attended the lectures of the celebrated profeſſor Sturm on philoſophy and the mathematics. He came to England in 1701, where he formed an acquaintance with the moſt celebrated mathematicians, and particularly Flamſtead, the aſtronomer-royal at Greenwich. In 1702, he returned to his native city; and, in 1704, was made profeſſor of mathematics in the Egidian college at Nuremberg, which place he filled for forty years. In 1715, he was elected a fellow of the royal ſociety of London; and the imperial academy of Peterſburgh ſent him a diploma of aſſociate in 1741. Towards the latter part of his life he attracted great notice in the philoſophical world by his electrical experiments, and died on the 1ſt of December, 1750. His works are, 1. *Tabulæ Aſtronomicæ Thom. Streetii*, Norim. 1705, quarto, tranſlated into Latin from the Engliſh. 2. Bion on Mathematical Inſtruments, 1712, tranſlated into German from the French. 3. The Defence of Copernicus, by J. Wilkins, 1713, quarto, tranſlated into German from the Engliſh. 4. A ſhort Explanation of the Syſtem of Copernicus, 1707, quarto, written in German. 5. A fourth volume of Welper's Gnomonics, 1708, folio, written in German. 6. Introduction to Geography, for Homan's Atlas, 1714, 1716, folio, in German. 7. The ſame work in Latin, 1731. 8. A Continuation of Bion on Mathematical Inſtruments, 1717, quarto. 9. A Second Continuation of Bion, 1720. 10. General Method of tracing out large Sun-dials, 1719, folio, in German. 11. *Nova Methodus parandi Sciaterica Solaria*, 1720, quarto. 12. An Hiſtorical Account of the Mathematicians and Artiſts of Nuremberg, 1730, folio, in German. 13. *Phyſica Experimentis illuſtrata*, 1741, quarto. 14. *Atlas Cæleſtis, in quo XXX Tabulæ Aſtronomicæ æri inciſæ continentur*, 1742, folio. 14. The Phenomena of Electricity, &c. in German.

DOP'PER, *ſ.* [from *dop*, old Engliſh, for *dip*.] An anabaptiſt.—Ha' you *doppers?*—A world of *doppers*: but they are there as lunatic perſons, walkers only, that have leave only to hum and ha, not daring to prophecy, or ſtart up upon ſtools to raiſe doctrine. *B. Jonſon.*

DOR, a city of Paleſtine, of the half-tribe of Manaſſeh, in Galilee, ſituated near the ſea-ſide. *Joſh.* xvii. 11.

DO'RA, the name of a place. 1 *Mac.* xv. 13.

DO'RAC,

DO'RAC, a town of Perſia, in the province of Chuſiſtan: ſeventy-five miles ſouth of Suſa.

DORA'DO, *ſ.* in aſtronomy, a ſouthern conſtellation, not viſible in our latitude; it is alſo called *xiphias*. The ſtars of this conſtellation, in Sharp's catalogue, are ſix.

DORÆ'NA, *ſ.* In botany, a genus of the claſs pentandria, order monogynia. The generic characters are—Calyx: perianthium one-leafed, five-cleft, ſhorter than the corolla; diviſions ovate, concave. Corolla: one-petalled, ſubcylindric-wheel-ſhaped; border five-cleft, ſegments ovate, obtuſe, erect. Stamina: filaments very ſhort, ſo as to be ſcarcely any; inſerted into the tube of the corolla; antheræ oblong, ſubquadrangular, included. Piſtillum: germ conic, ſmooth, ſuperior; ſtyle filiform, the length of the corolla; ſtigma truncate, emarginate. Pericarpium: capſule ovate, acute, one-celled. Seeds: very many.—*Eſſential Character.* Corolla, five-cleft; ſtigma emarginate; capſule one-celled.

Doræna Japonica, or Japan dorena, the only ſpecies known, is a tree of about a fathom in height; branches alternate, round, aſh-coloured, ſmooth, divaricate; flowers in racemes, white, minute; racemes axillary, ſcarcely half an inch long; capſule the ſize of a pepper-corn. Native of Japan.

DO'RAN, an ancient city of Arabia, in the province of Yeman, ſituate on the declivity of a mountain, not far from the junction of roads between Sana and Damar. It is the reſidence of a ſchieck, and of ſeveral imams or princes: twenty-eight miles ſouth of Sana. Lat. 14. 55. N. lon. 44. 4. E. Ferro.

DO'RAT, a town of France, and principal place of a diſtrict, in the department of the Upper Vienne: eight leagues north of Limoges. Lat. 46. 13. N. lon. 18. 45. E. Ferro.

DO'RAT, or DAURAT, John (Latin *Auratus*), a man of letters and poet, born of an ancient family in the Limoſin, about the beginning of the ſixteenth century. He finiſhed his ſtudies at Paris, where he acquired ſuch a reputation for learning, that he was made royal profeſſor in the Greek language. He was in conſiderable favour with Charles IX. who took pleaſure in converſing with him; but it does not appear that he was much benefited by royal patronage, ſince he paſſed the latter part of life in great indigence. He poured forth a vaſt number of verſes, Greek, Latin, and French; and acquired the title of *poet-royal*. In the vigour of his powers he was thought inferior to none in lyric poetry. He alſo ranked high as a critic, and was accounted to excel in explaining the ſenſe of obſcure ancient authors. He married a ſecond time, in his old age, a handſome young woman; and when cenſured for the inequality of the connection, he replied, that he choſe rather to die by a bright ſword than a ruſty one. He ſurvived his eightieth year, and died in 1588.

DOR'CAS, [δορκας, Gr. a roebuck.] A proper name of women.

DOR'CHESTER, the county town of Dorſetſhire, diſtant 122 miles weſt of London, and eight from Weymouth. It is regularly built, on the elevated banks of the Frome, conſiſting of four ſtreets, correſponding to the four cardinal points, and has the river on its north ſide: it had originally four gates, one in the middle of each ſide, and was encompaſſed with a ſtrong wall and ditch. On the weſt ſide part of the old wall is ſtill ſtanding, which is twelve feet thick. The foundation of the Roman wall appears quite round the town; but eaſtward there is a ſtreet built upon it, called the Walls. Here are three churches, among which that dedicated to St. Peter is a handſome ſtructure. Here is an area of an old caſtle, out of whoſe ruins the monaſtery of the Grey Friars was built. The ſtreets are neatly paved, and the houſes generally built with ſtone. The corporation conſiſts of a mayor, recorder, two bailiffs, ſix aldermen, ſix capital burgeſſes, and twenty-four common-council men, by charter of 5 Charles I. Here are three alms-houſes, one of which is handſome and well endowed; there is alſo a good free-ſchool. In this town the county aſſizes are held, and the knights of the ſhire choſen. The town has ſent members to parliament ever ſince 23 Edward I. Dorcheſter had two mints for coining money in the time of the Saxons. It extends five furlongs from eaſt to weſt, and within the walls covers about eight acres. Here was a dreadful fire, Auguſt 6, 1613, which conſumed two of the churches, ſince rebuilt, and about 300 houſes, to the damage of 200,000l. but not a ſoul periſhed in it. Dorcheſter has conſiderable breweries, and carries on a great trade in beer, large quantities of which are ſold in London, and other parts of the kingdom. It has almoſt loſt the manufacture of broad-cloth, for which it was once famous; and its ſerge trade is not very conſiderable. It is computed that no leſs than 600,000 ſheep are conſtantly fed within ſix miles of this place: the ewes generally bringing two lambs, which is imputed to the wild thyme and other aromatic herbage which here grow upon the downs in great abundance. It has a market Wedneſdays and Saturdays; with four fairs, namely, on the 12th of February, for cattle and ſheep; on Trinity-Monday, and July 5, for ſheep, lambs, and all ſorts of cattle; and on the 5th of Auguſt, for cattle, ſheep, wool, and leather.

The ancient mounds and circumvallation called Pondbury, lie half a mile weſt of Dorcheſter; upon the ſide of the river ſtands an ancient fortification, of a ſquare form, with a high rampart; but the ditch is inconſiderable, except at the angle by the river: the chief entrance was by the ſouth ſide. It is ſuppoſed to have been originally a Roman camp. There is alſo on the down another Roman camp, called Maiden Caſtle, which Dr. Stukely imagines was the Æſtiva of the Dumovarian garriſon: it is of a vaſt extent, prodigiouſly ſtrong, and appears to have been formed in the inferior times of the empire. The amphitheatre is ſtill viſible. Fordington is a large village near Dorcheſter, to which it was formerly a ſuburb, and had a market on Tueſdays, and a fair. It has ſtill an officer choſen yearly called a *reeve*. This pariſh abounds with antiquities, and Roman coins are frequently dug up here. In 1747, on digging chalk, above 200 ſkeletons were diſcovered four or five feet deep. The pariſh church is large and ancient, ſtanding on a riſing ground, with a tower eighty feet high.

DOR'CHESTER, a townſhip of the American States, in Grafton county, New Hampſhire, incorporated in 1761: ſeventeen miles from Dartmouth College.

DOR'CHESTER, an ancient and thriving townſhip of the American States, in Norfolk county, Maſſachuſetts, ſettled as early as 1630. A number of towns have been peopled from it ſince its firſt ſettlement. It is ſituated two miles ſouth by eaſt of Boſton, and is now about ſix miles long and three and a half broad. The chief manufactures are paper, chocolate, ſnuff, leather, and ſhoes of various ſorts. It has a handſome church; and, by the cenſus 1722 inhabitants. This town and its vicinity ſuffered much during the early part of the American war.

DOR'CHESTER, a town of the American States, in Cumberland county, New Jerſey, ſituated on the eaſt ſide of Morris river, about five miles from its mouth, in the bay, and ſeventeen eaſtward of Fairfield.

DOR'CHESTER, a county of the American States, in Maryland, on the eaſt ſide of Cheſapeak bay, and the ſouth ſide of Choptank-river, which ſeparates it from Talbot county. It has ſeveral iſlands on its coaſt; the chief of theſe, from the mouth of Hudſon river, are, James, Taylor's, Barren, Hooper's, and Goldſborough's, which laſt lies between Hungary-river and Fiſhing-bay. The length in the county from eaſt to weſt is about thirty-three miles, and its breadth from north to ſouth twenty-ſeven miles. The number of its inhabitants 15,875. The lands in the northern parts are ſomewhat elevated, but in the ſouthern parts low and marſhy. The produce is chiefly wheat, corn, and lumber. Its chief town is Cambridge.

DOR'CHESTER,

DOR'CHESTER, a ſmall town of the American States, in Charleſtown diſtrict, South Carolina, ſeated on the north-eaſt bank of Aſhley river, eighteen miles weſt-north-weſt of Charleſtown city. This place was ſettled and named as early as 1700, by a colony from Dorcheſter and its vicinity in Maſſachuſetts.

DORDO'GNE, a river of France, which riſes about ſeven miles north-weſt from Beſſe, in the department of the Puy-de-Dome, paſſes by Bort, Argental, Beaulieu, Souillac, Limeuil, Bergerac, Caſtillon, Libourn, &c. and joins the Garonne, between Blaye and Bourdeaux.

DORDO'GNE, a department of France, part of the province of Perigord, bounded on the north-eaſt by the department of the Upper Vienne, on the eaſt by the departments of the Lot and Correze, on the ſouth by the department of the Lot and Garonne, on the weſt by the departments of the Gironde and the Lower Charente, and on the north-weſt by the department of the Charente. Perigueux is the capital.

DORE, a river of France, which riſes in the department of the Puy-de-Dome, and joins the Allier, near Cuſſet, in the department of the Allier.

DORE L'EGLISE, a town of France, in the department of the Puy-de-Dome: five leagues eaſt of Iſſoire.

DOREBAT', a city of Arabia, in the province of Yemen, and capital of the territories of Schiech Ibn Aklan, who reſides there. Its ſituation, on the ſummit of a hill, renders it naturally ſtrong: ten miles diſtant from Mocha.

DORE'E, or JOHN DOREE, *ſ.* in ichthyology. See ZEUS.

DO'RENBERG, or DUIRENBURG, a town of Germany, in the circle of Weſtphalia, and county of Ravenſberg: three miles north-weſt of Bielefield.

DO'RENHAGEN, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderburn: five miles ſouth-ſouth-eaſt of Paderburn.

DO'RENTHAL, or DOROTHEENTHAL, a town of Germany, in the circle of Upper Saxony, and circle of Erzgebirg: thirteen miles ſouth of Freyburg.

DORET'TE, a river of France, which runs into the Dive, near Troan, in the department of the Calvados.

DOR'FEN, a town of Germany, in Lower Bavaria, on the Iſen: twenty-ſeven miles eaſt-north-eaſt of Munich.

DORFF, a town of Germany, in the archduchy of Auſtria, on the Danube: eleven miles north-weſt of Bruck.

DORF'FLIS, a town of Germany, in the archduchy of Auſtria: ſeven miles ſouth of Ziſterſtorf.

DORF'MARK, a town of Germany, in the circle of Lower Saxony, and principality of Luneburg: twenty miles north-weſt of Zelle.

DOR'HEIM, a town of Germany, in the circle of the Upper Rhine, and county of Hanau Munzenberg: twelve miles north of Hanau.

DORHO'BUSS, a town of Poland, in the palatinate of Volhynia: ſixty miles eaſt of Lucko.

DO'RIA (Andrew), a gallant Genoeſe ſea-officer, born in 1466. He entered into the ſervice of Francis I. of France; but preſerved that true ſpirit of independence, which gained him univerſal admiration and regard. When the French attempted to render Savona, long the object of jealouſy to Genoa, its rival in trade, Doria remonſtrated againſt the meaſure in high terms; which bold action, repreſented by the malice of his courtiers in the moſt odious light, ſo much irritated Francis, that he ordered his admiral Barbeſieux to fail to Genoa, then in the hands of the French troops, to arreſt Doria, and to ſeize his galleys. This order being communicated ſecretly to Doria, he retired with all his galleys to a place of ſafety; and, while his reſentment was thus raiſed, he cloſed with the offers of the emperor Charles V. returned his commiſſion, with the collar of St. Michael, to Francis, and hoiſted the imperial colours upon all the ſhips of his ſquadron. To deliver his country, weary alike of the French and imperial yoke, from the dominion of foreigners, was now Doria's higheſt ambition; and the favourable moment offered. Genoa was afflicted with the peſtilence, the French garriſon was greatly reduced and ill-paid, and the inhabitants were ſufficiently diſpoſed to ſecond his views. He ſailed to the harbour with thirteen galleys, landed five hundred men, and made himſelf maſter of the gates and the palace with very little reſiſtance. The French governor with his feeble garriſon retired to the citadel, but was quickly forced to capitulate; when the people ran together, and levelled the citadel with the ground. It was now in Doria's power to have rendered himſelf the ſovereign of his country; but, with a magnanimity of which there are few examples, he aſſembled the people in the court before the palace, diſclaimed all pre-eminence, and recommended to them to ſettle that form of government they choſe to eſtabliſh. The people, animated by his ſpirit, forgot their factions, and fixed that form of government which has ſubſiſted ever ſince with little variation. This event happened in 1528. The Genoeſe, in gratitude to Doria, erected a ſtatue to him in the midſt of the great ſquare of their city; built for him a palace in the ſame place, which was for ever to be called by his name; ordained that himſelf and his poſterity ſhould be exempted from impoſts of all kinds; and were deſirous of erecting a fortreſs for him upon a ſpot which commanded every part of the city, that in caſe of any conſpiracy againſt his life, or inſurrection of the refractory inhabitants, he might retire in ſafety, till his friends and fellow-citizens could repair to his aſſiſtance. But to this he returned the following memorable anſwer: "God forbid, that to inſure the ſafety of the remainder of my life, my country ſhould be rendered obnoxious to ſlavery! This fortreſs, which you ſeem anxious to build, would only contribute, one day or other, in the hands of a deſpot, to reduce the republic to a ſtate of ſervitude. For remember, that neither men nor ſtates can preſerve their liberty by mere ramparts and garriſons; that ineſtimable bleſſing can only be perpetuated by the diſintereſtedneſs of the nobility, and the obedience of the people." Doria lived to the great age of ninety-two or ninety-four years, reſpected and beloved as a private citizen; and is ſtill celebrated in Genoa by the moſt honourable of all appellations, "The father of his country, and the reſtorer of its liberty."

DO'RIA, *ſ.* in botany. See SENECIO, SOLIDAGO, and OTHONNA.

DO'RIA BALTE'A, or GRAND DORIA, a river of Piedmont, which riſes in the Alps, on the borders of the Valais, and, after winding through the valley of Aoſta, &c. empties itſelf into the Po by two branches, between Chivazzo and Creſcentino.

DO'RIA RIPA'RIA, or LITTLE DORIA, a river of Piedmont, which riſes in the Alps, on the borders of France, paſſes through the valley of Suſa, &c. and runs into the Po a little to the north-eaſt of Turin.

DO'RIANS, a people from Egypt, who came into Greece, or Hellotia, under the name of Adorians; and from their ſimplicity of manners, and their little intercourſe with foreigners, preſerved the purity of their ancient tongue. The ancient hymns, ſung in the Prutaneia all over Greece, were Doric: ſo ſacred was their dialect eſteemed. As every colony, which went abroad, took to themſelves ſome ſacred title, from their particular mode of worſhip; this ſtiled themſelves accordingly Dorians. They were ſo named from the deity Adorus, who by a common aphæreſis was expreſſed *Dorus*. The country, when they arrived, was inhabited by a people of a different race; whom they termed, as they did all nations in contradiſtinction to themſelves, Βαρβαροι. With theſe original inhabitants they had many conflicts; of which we may ſee ſome traces in the hiſtory of the Heraclidæ: for the Dorians were the ſame as the Herculeans; and did not ſettle in Greece only; but in many parts of the world, whither the Amonians in general betook themſelves. Pauſanias imagines that the Dorians were comparatively of late date; yet he ſhews, from many evi-

dences in different parts of his antiquities, that they were high in the mythic age: and informs us of one curious particular, that all the ancient hymns of Greece, in every province, were in the dialect of this people. From this it would appear, in opposition to this learned antiquary, that they were as ancient as any branch of their family; that their language was the true Hellenic; and that it was once universally spoken. Their history is not to be confined to Greece; for they were to be found in Phenicia, Caria, Crete, and Etruria. They forced themselves into Laconia and Messenia; in the latter of which provinces the Dorian language was retained in the greatest purity: and from their history are to be obtained more ancient terms than can be elsewhere collected. We learn from almost every writer upon the subject, that the Dorians, like their brethren the Iönim, were not the first occupiers of Greece. They were colonies from Egypt: and Herodotus speaks of all the heads and leaders of this people as coming directly from thence. He takes his epocha from the supposed arrival of Perseus and Danaë; and says, that all the principal persons of the Dorian family upwards, were in a direct line from Egypt. But it was not Perseus, nor Iön, nor Dorus, who came into Greece; but a race of people stiled Iönians, Dorians, and Peresians. These were the Αιγυπτιοι ιθαγενεες; who went originally from Babylonia and Chaldea into Egypt, which countries in aftertimes were included under the general name of Assyria.

DO'RIC, *adj.* in architecture, the second of the five orders. For the description and figure, see ARCHITECTURE, vol. ii. p. 104.

DO'RIGNY (Louis), a French painter of eminence, born at Paris in 1654, the son of Michael Dorigny, a painter and engraver of merit. He began at an early age to practise design under his father; and after his death entered in the school of Le Brun. At the age of seventeen he contended for the prizes at the academy; and obtaining only the second when he thought he deserved the first, he quitted the academy. He at length settled at Verona, occasionally visiting the other towns of Italy as professional occupations called him. In 1711 prince Eugene sent for him to Vienna, and employed him above a year. Dorigny possessed great facility of composition, and the art of well managing large subjects. His pencil was animated, his colouring lively, his manner firm and correct, his stile heroical and sublime, but he was somewhat deficient in grace and dignity. He was a master in fresco, of which he gave several specimens. The most considerable of these is in the dome of the great church at Trent. Dorigni died at Verona in 1742, aged eighty-eight.

DO'RIGNY (Nicolas), younger brother of the preceding, attained great eminence as an engraver. He resided twenty-eight years in Italy, where he published prints from the works of the principal painters. He came to England, and engraved the famous cartoons at Hampton-court, for which he was knighted by George I. He was a member of the French academy of painting, and died at Paris in 1746, in his nineticth year.

DO'RING, or DARING, *f.* A term used to express a method of taking larks, by means of a clap-net and looking-glass. See the article BIRD-CATCHING, vol. iii. p. 50.

DO'RINGSTADT, or DURINSTATT, a town of Germany, in the circle of Franconia, and bishopric of Bamberg: fourteen miles north of Bamberg.

DO'RINK, or DORING, (Matthias), a learned German monk of the Franciscan order, born at Kiritz in 1415. He was profoundly skilled in the sacred scriptures, in philosophy, and in scholastic theology. In 1445 he was chosen to fill the divinity chair in the university of Magdeburg, and discharged the duties of his province with eminent reputation. Paul de Burgos having published a variety of strictures against the Postilles, or short Commentaries on the Scriptures, of Nicolas de Lyra, Dorink undertook their defence and farther illustration. The pieces which he wrote on these subjects were collected together, and inserted in an edition comprehending the works of both those authors, which was published at Paris, in 1590, in 6 vols. folio. Since that time they have undergone various impressions. Dorink is also generally supposed to have been the author of The Chronicle of Nuremberg, continued to the year 1493, which was published anonymously.

DO'RION, anciently a town of Thessaly, where Thamyras, the musician, challenged the Muses to a trial of skill. *Propertius.*

DO'RIS, in ancient geography, a country of Greece, between Phocis, Thessaly, and Acarnania. It received its name from Dorus the son of Deucalion, who made a settlement there. It was called *Tetrapolis*, from the four cities of Pindus or Dryopis, Erineum, Cytinium, and Borium, which it contained. To these four some add Lilæum and Carphia, and therefore call it *Hexapolis*. The name of Doris has been common to many parts of Greece. The Dorians, in the age of Deucalion, inhabited Phthiotis, which they exchanged for Histiæotis, in the age of Dorus. From thence they were driven by the Cadmeans, and came to settle near the town of Pindus. From thence they passed into Dryopis, and afterwards into Peloponnesus. Hercules having re-established Ægimius king of Phthiotis or Doris, who had been driven from his country by the Lapithæ, the grateful king appointed Hyllus, the son of his patron, to be his successor, and the Heraclidæ marched from that part of the country to go to recover Peloponnesus. The Dorians sent many colonies into different places, which bore the same name as their native country. The most famous of these is *Doris in Asia Minor*, of which Halicarnassus was once the capital. This part of Asia Minor was called Hexapolis, and afterwards Pentapolis after the exclusion of Halicarnassus. *Strabo.*

DO'RIS, in mythology, a goddess of the sea, daughter of Oceanus and Tethys. She married her brother Nereus, by whom she had fifty daughters called Nereides. Her name is often used to express the sea itself. *Hesiod.*

DO'RIS, *f.* [so called from the sea-goddess of that name.] In zoology, a genus belonging to the order of molusca; the characters of which are as follow: body creeping, oblong, and flat beneath: mouth placed below on the fore-part; vent behind on the back-part, furrounded with a radiated fringe: tentacula, or feelers, from two to four, seated on the upper part of the body in front, and retractile at pleasure within their proper receptacles. Twenty-four species have been ascertained, inhabitants of the Mediterranean, Atlantic Ocean, Indian, and European seas. Three species are found on the coasts of England, viz. the *argo*, *verrucosa*, and *bilamellata*. The most beautiful is the *argo*, commonly called the *sea lemon*; a figure of which is given in the engraving. It varies much in size and colour; some being found of a yellow, more or less deep; others of a rich citron, or bright orange; and others again of a dull red, or scarlet. In all these varieties the body is convex, marked with numerous spots or punctures, and the vent surrounded with elegant ramifications.

DOR'KIAN, a town of Asiatic Turkey, in the province of Natolia: forty-four miles west of Sinope.

DOR'KING. See DARKING.

DORKOW'KA, a town of Poland, in the palatinate of Braclaw: forty-four miles south-south-east of Braclaw.

DOR'LACH, a township of the American States, in Otsego county, New York. By the state census of 1796, 433 of its inhabitants are electors.

DOR'MANS, a town of France, in the department of the Marne, and chief place of a canton, in the district of Epernay, on the Marne: four leagues west of Epernay, and six south-west of Reims.

DOR'MANT, *adj.* [Fr.] Sleeping.—With this radius he is said to strike and kill his prey, for which he lies, as it were, *dormant*, till it swims within his reach. *Grew.*

—In

—In a ſleeping poſture. If a lion were the coat of Judah, yet were it not a lion rampant, but rather couchant and *dormant*. *Brown.*—Private; not public.—There were other *dormant* muſters of ſoldiers throughout all parts of the realm, that were put in readineſs, but not drawn together. *Bacon.*—Concealed; not divulged.—It would be prudent to reſerve theſe privileges *dormant*, never to be produced but upon great occaſions. *Swift.*—Belonging to a leaning roof:

Old *dormant* windows muſt confeſs
Her beams: their glimmering ſpectacles,
Struck with the ſplendor of her face,
Do th' office of her burning-glaſs. *Cleaveland.*

Theſe windows were probably called *dormant* from being ſupported by a beam formerly ſo named.

DOR'MANT, *ſ.* A large beam; a ſummer:

For in that place the Painims rear'd a poſt,
Which late had ſerv'd ſome gallant ſhip for maſt,
And over it another beam they eroſs'd,
Pointed with iron ſharp to it made faſt
With ropes, which, as men would, the *dormant* toſs'd
Now out, now in; now back, now forward caſt. *Fairfax.*

DOR'MANT-WRITING, *ſ.* A deed with a blank to put in the name of a perſon.

DOR'MAR, or DORMER, *ſ.* [the common name, perhaps by corruption, for] A dormant window. A beam.—In a parlour belonging to a farm-houſe there was a remarkably large *dormar* of cheſnut. *Clubb.*

DOR'MITIVE, *ſ.* [from *dormio*, Lat.] A medicine to promote ſleep.—Does any diſtreſs'd patient want an emetic, a ſudorific, an anti-hyp, a diuretic, a purge, or a *dormitive*. *Arbuthnot.*

DOR'MITORY, *ſ.* [*dormitorium*, Lat.] A place to ſleep in: uſed commonly for a room with many beds.—Rooms that have thorough lights are left for entertainment, and thoſe that have windows on one ſide for *dormitories*. *Mortimer.*—A burial place.—The places where dead bodies are buried, are in Latin called *cæmiteria*, and in Engliſh *dormitories*. *Ayliffe.*

DOR'MOUSE, *ſ.* [*dormio*, Lat. to ſleep, and *mouſe*.] A ſmall animal which paſſes a large part of the winter in ſleep. See MYOXUS.

Come, we all ſleep, and are mere *dormice* flies,
A little leſs than dead: more dulneſs hangs
On us than on the moon. *Ben Jonſon.*

DORN, *ſ.* [from *dorn*, Germ. a thorn.] The name of a fiſh; perhaps the ſame as the thornback.—The coaſt is ſtored both with ſhell-fiſh, as ſcallops and ſheathfiſh; and flat as turbots, *dorns*, and holybut. *Carew.*

DORNABAD', a town of Perſia, in the province of Choraſan: 150 miles north-weſt of Herat.

DOR'NACH, or DORNECK, a bailiwick of Swiſſerland, in the eanton of Soleure, which takes its name from a ſtrong caſtle, celebrated for a victory obtained by the Swiſs over the Auſtrians in 1499. The Swiſs had only 6000 men, the enemy amounted to 15,000, of whom 3000 were left dead on the field. This was almoſt deciſive of the Swiſs independence.

DORN'BERG, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: eight miles weſt-north-weſt of Darmſtadt.

DORNBEU'REN, a town of Germany, in the county of Bregentz: five miles ſouth of Bregentz.

DORN'BURG, a town of Germany, in the circle of Upper Saxony, and principality of Weimar: fourteen miles eaſt of Weimar.

DORN'BURG, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Zerbſt, near the Elbe: eight miles weſt-north-weſt of Zerbſt.

DOR'NE, a town of Franee, in the department of the Nyevre: three miles ſouth-ſouth-weſt of Deciſe.

DOR'NECY, a town of France, in the department of the Nyevre: two leagues eaſt of Clamecy.

DORN'HEIM, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: five miles weſt of Darmſtadt.

DOR'NIC, *ſ.* [of *Deornic* in Flanders; where firſt made.] A ſpecies of linen-cloth uſed in Scotland for the table.

DORN'KRELL D'EBERHERTZ (James), a German Lutheran divine, born at Lunenburg in 1643. After purſuing his ſtudies in the univerſities of Helmſtadt and Thiel, he was for ſome time ſettled in the paſtoral charge at Holdenſtadt. He was a man of conſiderable erudition, and publiſhed ſeveral works which were favourably received. The titles of the principal of them are: 1. *Specimen Bibliorum Harmonicorum.* 2. *Biblia hiſtorico-harmonica, ſive opus divinæ Conſonantiæ integrum.* 3. *Tractatus contra parum Utilitatis habentes conciones eccleſiaſticas.* 4. *Epiſtolæ Curioſæ*, publiſhed under the name of Polymuſus. He died in 1704.

DORN'NUM, a town of Germany, in the circle of Weſtphalia, and county of Eaſt Friſeland: ſix miles weſt-ſouth-weſt of Eſens.

DOR'NOCK, a ſea-port town of Scotland, ſituated on the ſouth-eaſt coaſt of the county of Sutherland, on a frith or arm of the German ſea, ealled the *Frith of Dornock*; formerly the reſidence of the biſhops of Caithneſs, but now much deeayed from its former grandeur. It is the county town. It was taken by the young chevalier in 1746: twenty-four miles north of Inverneſs. Lat. 57. 51. N. lon. 0. 44. W. Edinburgh.

DOR'NOLL, a river of Wales, which runs into the Wye, in the ſouthern part of the county of Montgomery.

DO'ROBOI, or DOROHOI, a town of European Turkey, in the province of Moldavia: ſixty-eight miles north-north-weſt of Jaſſi, and 142 north-weſt of Bender.

DO'ROG, a town of Hungary: ſix miles ſouth-eaſt of Nanas.

DOROGOBUZ', a town of Ruſſia, in the government of Smolenſk: forty miles eaſt-north-eaſt of Smolenſk, and 320 ſouth-ſouth-eaſt of Peterſburg.

DOROJKIEWIC'ZE, a town of Lithuania, in the palatinate of Brzeſc: ninety miles eaſt of Brzeſc.

DO'RON, *ſ.* [Gr.] A gift, a preſent; a meaſure in antiquity of about three inches. *Phillips.*

DORON'ICUM, *ſ.* [*Doronigi* or *Dorungi*; an Arabic name.] LEOPARD'S BANE; in botany, a genus of the claſs ſyngeneſia, order polygamia ſuperflua, natural order compoſitæ diſcoideæ, (corymbiferæ, *Juſſ.*) The generic characters are—Calyx: common with leaflets lance-ſubulate, about twenty in number, equal, upright, of a double ſeries, length generally of the ray of the corolla. Corolla: compound rayed; corollules hermaphrodite, tubular, numerous in the diſk; females ligulate, of the number of calycular leaves, in the ray; proper of the hermaphrodite funnel-form: border five-cleft, patulous; female ligulate, lanceolate, three-toothed. Stamina: in the hermaphrodites; filaments five, capillary, very ſhort; anther cylindrie, tubular. Piſtillum: in the hermaphrodites; germ oblong; ſtyle filiform, length of the ſtamens; ſtigma emarginate. In the females; germ oblong; ſtyle filiform, length of the hermaphrodite; ſtigmas two, reflex. Pericarpium: none; calyx ſlightly converging. Seeds: in the hermaphrodite ſolitary, obovate, furrowed, a little compreſſed; down hairy. In the females ſolitary, obovate, furrowed, a little compreſſed; down none. Receptaculum naked, flat.—*Eſſential Character.* Calyx, ſcales in two rows equal, longer than the diſk; ſeeds of the ray naked and deſtitute of down; down to thoſe of the diſk ſimple; receptaculum naked.

Species. 1. Doronicum pardalianches, or great leopard's bane: leaves eordate, obtuſe, toothletted; thoſe next the root petioled, on the ſtem embracing. Great leopard's bane has thick fleſhy roots, divided into many knots, ſending out ſtrong fleſhy fibres, which penetrate deep into the ground; root-leaves heart-ſhaped, hairy, petioled: among theſe ariſe the flower-ſtalks, which are channelled and hairy, near three feet high, putting out one

one or two ſmaller ſtalks from the ſide; theſe grow erect, and have one or two heart-ſhaped leaves cloſely embracing the ſtalk; this and each branch is terminated by one large yellow flower. Theſe appear in May; and the ſeeds ripen in July. The ſcales of the calyx are about twenty-ſix. The florets of the ray are ſtreaked with green lines, and are from twenty-two or twenty-four to thirty in number; in the diſk are about 178. Seeds of the ray nearly triangular, and ſtreaked with ten lines: thoſe of the diſk roundiſh, hairy, and crowned with a down which is ſlightly plumoſe; receptacle convex and hairy; from the burſting of the anthers to the ripening of the ſeeds takes up the ſpace of one month; the ſtem-leaves towards the baſe become narrower, and then again widen into ears claſping about the ſtem, ſo as to be in a manner appendicled. In the great ſmooth variety, *Doronicum radice ſcorpii*, they are obſcurely ſerrate, three or four inches broad, and near a ſpan in length; whereas in the ſmaller one they are ſcarcely half the length and breadth. Native of France, Swiſſerland, Germany, Auſtria, Carniola, Hungary, Savoy, and Piedmont. This is one of the plants which from the facility with which it propagates itſelf has lately eſcaped from the gardens to increaſe the Britiſh Flora. Mr. Lightfoot remarked it in Scotland, but always near houſes; and Dr. Stokes near Duplin houſe.

This plant has been ſtigmatiſed as poiſonous, ſeemingly without much reaſon. It had its name, *pardalianches*, (παρδαλις, a leopard, and αγχω, to ſtrangle,) from this ſuppoſed noxious quality. The famous Conrad Geſner however took two drachms of the root without injury. Others on the contrary would perſuade us that it is an antidote to poiſon, but they are ſtill farther from the truth. It is not uſed in the preſent practice. Dr. Stokes informs us that two drachms occaſioned a ſenſe of inflation in the ſtomach, and of general weakneſs, but that theſe ſymptoms were of ſhort duration. That it has been recommended in vertigo, epilepſy, and menſtrual obſtructions, but that theſe powers want the confirmation of a more accurate experiment.

As the Auſtrian plant, *Doronicum Auſtralis*, differs from the common one chiefly in having a more woody root that ſpreads but little, it is no more than a variety.

2. Doronicum plantagineum, or plantain-leaved leopard's bane: leaves ovate, acute, ſomewhat toothed; branches alternate. The leaves are indented on their edges towards their baſe, but their upper parts are entire; the ſtalks riſe about two feet high; each is terminated by a large yellow flower, like that of the preceding: they have two or three alternate embracing leaves, not ſo hairy as thoſe of the former ſort; it flowers about the ſame time; and grows naturally in Germany, France, Spain, and Portugal. Theſe were both cultivated in 1597 by Gerarde.

3. Doronicum bellidiaſtrum, or daiſy-leaved leopard's bane: ſtem naked, very ſimple, one-flowered. This has a perennial root, as well as the two preceding: the leaves are like thoſe of the common daiſy, but longer, and not ſo broad; the flower grows on a naked ſtalk near a foot long, and the root ſeldom ſends out more than one ſtalk; the ray of the flower is white, very like that of the common daiſy; the diſk yellow. Found on the Swiſs, Tyroleſe, and Italian, alps; in Auſtria, Carniola, Sileſia; Bois de Batie near Geneva, April 22, 1779, in flower; Haller found it in the lower alps with a deep red flower. Cultivated by Mr. Miller, in 1759; he received it from Verona.

Propagation and Culture. This plant multiplies very faſt by its ſpreading roots, and if the ſeeds are permitted to ſcatter, they will produce plants wherever they happen to fall, ſo that it becomes a weed where it is once eſtabliſhed: it loves a moiſt ſoil and a ſhady ſituation. The third ſort is propagated by parting the roots, for the ſeeds do not ripen well in England. It muſt have a ſhady ſituation and a moiſt ſoil. The flowers do not make a much better appearance than thoſe of the common daiſy, only they ſtand on much taller ſtalks. See ARNICA, RUDBECKIA, SENECIO, SEPTAS, and TUSSILAGO.

DORONIN'SK, a town of Ruſſia, in Siberia, and government of Irkutſch, on the Ingoda: 190 miles eaſt-ſouth-eaſt of Verch Udinſk, and 280 eaſt-ſouth-eaſt of Irkutſch.

DORON'K, a town of Egypt: two miles ſouth of Siut.

DOROSTAY', a town of Poland, in the palatinate of Volhynia: ſixteen miles ſouth-eaſt of Lucko.

DO'ROTHY, [Δωροθεα, Gr. *i. e.* the gift of God.] A proper name of women.

DORP, *ſ.* [*Dorff.* Dut.] A country town or village.

DORP AU'BEIT, a town of Arabia, in the country of Yemen: forty-four miles north of Chamir.

DOR'PAT, or DORPT, a town of Ruſſia, in the government of Riga; formerly the ſee of a biſhop, in the palatinate of Livonia. It was ſeized by the czar Iwan Baſilovitz, in 1558, and afterwards ceded to Poland: the Swedes took it in 1625. But Peter the Great finally annexed to it Ruſſia: 116 miles north-north-eaſt of Riga, and 132 ſouth-weſt of Peterſburg.

To DORR, *v. a.* [*tor*, ſtupid, Teut.] To deafen or ſtupify with noiſe. *Skinner.*

DORR, *ſ.* [ſo named probably from the noiſe which it makes.] The chafer, or common dorr-beetle. See the article SCARABÆUS.

DOR'RA, a town of Perſia, in the province of Segeſtan: eighteen miles eaſt-ſouth-eaſt of Kin.

DOR'SAL, *adj.* [from the Lat. *dorſum*, the back.] Belonging to the back, pertaining to thoſe diſeaſes which are ſuppoſed to have their ſeat in the back.

DOR'SANE (Antony), a French divine, born at Iſſoudun, in Lower Berry. He became doctor of the Sorbonne, chanter of the church of Paris, and grand vicar and official of that dioceſe, under the cardinal de Noailles. He died in 1728, leaving behind him a work extremely uſeful to eccleſiaſtical hiſtorians. It was publiſhed under the name of A Journal, and preſents us with the hiſtory, and the moſt intereſting circumſtances which took place at Rome and in France, during the celebrated negociation reſpecting the conſtitution, or bull, *Unigenitus*, in 2 vols. 4to. or in 6 vols. 12mo. The beſt edition is the ſecond, which was publiſhed in 1756.

DORSCH (Chriſtopher), ſon of an engraver on gems, born at Nuremberg in 1676. In his youth he was placed at the Latin ſchool; acquired ſome knowledge of geometry, attended the academy of painting, frequented profeſſor Heiſter's lectures on anatomy at Altdorf, and gradually attained to great perfection in the art of engraving on ſtones. As his father had been ſeveral years in a weak and infirm condition, he executed a great many pieces under his name, as he already begun to excel him in that art. His talents, however, did not long remain unknown, and his works ſoon began to be in great requeſt. He cut not only coats of arms, which were finiſhed with ſo much neatneſs, that all the figures, though exceedingly ſmall, could be plainly diſtinguiſhed, as well as the colours and metals expreſſed according to the uſual rules of heraldry; but alſo portraits, which he executed immediately from the life, without any previous drawing, and which bore a ſtriking reſemblance to the originals. Though his pieces were deeply cut, the figures on them, when held towards the light, appeared as if in relief. The heads of moſt of the heathen deities and eminent men, hieroglyphics, amulets, and hiſtories, given in both parts of Martin von Ebermayer's *Theſaurus Gemmarum*, and of which J. J. Bayer of Altdorf, and E. Reuſch of Helmſtadt, publiſhed a deſcription in 1720 and 1721, were cut by him on gems in ſo maſterly a manner, that they were perfect imitations of the antique models which he copied. In this manner he executed whole cabinets: ſuch as, 1. all the Roman emperors from Julius Cæſar to Charles VI. 2. the whole archducal houſe of Habſburg-Auſtria; 3. all the kings of France; 4. all the popes to Benedict XIII. 5. all the doges of Venice; 6. all the ducal and electoral houſe of Bavaria;

Neele sculp. Strand.

DORSETSHIRE.

Published as the Act directs. March 13. 1803. by J. Wilkes.

Bavaria; 7. all the czars and emperors of Ruſſia. He cut in agate, at the time of the jubilee in 1723, all the profeſſors of Altdorf, exceedingly like. Dorſch followed the antique ſtile ſo cloſely, that the public were frequently deceived by his works, which were purchaſed at a high price as real antiques. Some of them which he had ſold, were offered to him as antiques in Italy. Among thoſe who teſtified their high eſteem for him by letters was Peter the Great, who, by large offers, endeavoured to induce him to come to Peterſburgh, and to enter into his ſervice. He died on the 17th of October, 1732, at the age of fifty-ſix years.

DOR'SEL, or DORSER, *ſ.* [from *dorſum*, the back.] A pannier; a baſket or bag, one of which hangs on either ſide a beaſt of burthen, for the reception of things of ſmall bulk. It is corruptly ſpoken, and perhaps written, *doſſel*.

DOR'SET, a townſhip of the American States, in Bennington county, Vermont, having Rupert weſt, Manchester ſouth, and Danby north: twenty-ſeven miles north by eaſt of Bennington.

DOR'SETSHIRE, [from the Cambro-Britiſh *Darotriges*, and this from *dwr*, water, and *drig*, an inhabitant, *q. d.* a people on the ſea-coaſt.] A maritime county of England; bounded on the north by Somerſetſhire and Wiltſhire, on the eaſt by Hampſhire, on the ſouth by the Britiſh channel, and on the weſt by Devonſhire and Somerſetſhire. It gives the title of duke and earl to the family of Sackville; and, during the Saxon heptarchy, belonged to the kingdom of the Weſt Saxons. It is now in the province of Canterbury, dioceſe of Briſtol, and is included in the weſtern circuit. It is fifty-eight miles long, thirty-ſix broad, and 200 in circumference; containing 1250 ſquare miles, or 800,000 ſquare acres; containing five diſtricts, ſub-divided into ſixty liberties or hundreds, having 250 pariſhes, ſixty-eight vicarages, 1006 villages, and twenty-two market towns. It is every where irregular in form; its long northern ſide having a great angular projection in the middle, and its ſea-coaſt running out into points and head-lands. On the coaſt are Cheſil Bank, Portland Road and Iſle, Weymouth and Ringſtead Bays, St. Alban's Head, Durlſton Head, and Swanage Bay, Handfaſt Point, and Studland Bay, Pool Harbour, Furze, Green, and Round, Iſles, with Brankſea, Sandsfoot, and Portland, Caſtles. From the mildneſs of its air, and fertility of its ſoil, Dorſetſhire has been termed *the garden of England*. The moſt remarkable inland places are the Vale of Whitehart; Marſhwood Vale; Whitehart, Gillingham, and Holt, Foreſts; Cranborne Chace; Black Moor; Luckford Lake; and Fordington Moor. The northern parts of the country are generally level, and were formerly covered with wood; but now are chiefly converted into rich arable and paſture. Acroſs the middle runs a ridge of lofty chalk hills, upon which, and the beautiful downs declining with a ſouthern aſpect towards the ſea, feed innumerable flocks of ſheep, whoſe fine fleeces are the ſtaple of the country. The number of ſheep kept in this county is eſtimated at upwards of 800,000, of which 150,000 are annually ſold, and ſent out of the county. Great advantages are derived from the ſheep, not only from the fleece and carcaſe, but likewiſe from the manure. In one particular inſtance the ſheep-owners excel all other parts of the kingdom, which is, in providing ewes to yean at a remarkably early ſeaſon, in the midland counties, which ſupply the metropolis with fat lambs. The wool produced in this county is ſhort and fine, of a cloſe texture, and the quality of it is highly eſteemed in the manufacture of broad-cloth. From a due obſervation of the quality and number of ſheep bred and kept in the county, it may be ſuppoſed, with ſome degree of accuracy, that the produce of wool annually is 90,000 weys, or tods, of thirty-one pounds each. Among various articles of great import to the community in the county of Dorſet, may be reckoned the cultivation of hemp and flax, and their manufacture. In the neighbourhood of Bridport and Beminſter alone, all ſorts of twine, ſtring, packthread, netting, cordage, and ropes, are made; from the fineſt thread, uſed by ſadlers in lieu of ſilk, to the cable, which holds the firſt-rate man of war. The nets made for the fiſhery at Newfoundland, as well as for home uſe, and the ſails for ſhipping of every kind, are manufactured of the beſt quality, as well as ſacking for hammocs, &c. and all kinds of bags and tarpaulins; and, in addition to the great quantity of flax and hemp uſed here, not more than one-third of it is allowed by the manufacturers to be of Britiſh growth; the remaining two-thirds being imported from Ruſſia and America, as raw materials. The manufacture carried on at Beminſter employs upwards of 2000 people. At Bridport there are a great number of manufactures, and about 1800 people are ſaid to be employed in this town; and in its environs, as far as ſeven or eight miles round, upwards of 7000 people are in conſtant work. No ores of any kind have been found in this county, nor mines of coals; but quarries of excellent ſtone are found in the iſland of Purbeck, near the ſea, where upwards of 400 people are employed in digging and tooling the ſtone. The ſtone obtained at Purbeck is uſed for walling, floors, ſteps, foot-pavements, &c. About 50,000 tons are annually ſhipped at Swannage. The whole iſland of Portland ſeems to be one entire maſs of the moſt beautiful free-ſtone, of a calcareous nature, chiefly uſed in the metropolis, and elſewhere, for the moſt ſuperb buildings, and is univerſally admired for its whiteneſs, cloſe texture, and durability. To the north of the iſle is a ſafe road for ſhips; but its ſouthern point, called *the Race of Portland*, is one of the moſt dangerous places in the Engliſh channel. About a mile diſtant from Corf Caſtle, are found large quantities of pipe clay, which is in great eſtimation, and abſolutely neceſſary for the uſe of the potters in Staffordſhire and other places: about eleven thouſand tons are annually ſent from this place for that purpoſe, and about one hundred men are conſtantly employed in digging it. Some of the pits are not more than ten or twelve feet deep. The towns are Dorcheſter, Lyme, Shafteſbury, Pool, Bridport, Wareham, Corf-Caſtle, Weymouth, Melcomb-Regis, Sherborn, Blandford, Cranborn, Beminſter, Abbotſbury, Bere, Everſhot, Frampton, Milton-Abby, Stalbridge, Sturminſter, Cerne, and Winburn; of which the firſt nine are borough towns, and ſend two members each to the Britiſh parliament; making, with two for the county, twenty members in the whole. The number of inhabitants is eſtimated at eighty-nine thouſand. The principal rivers are the Stour, the Frome, and the Piddle. This was the county where the Saxons made their firſt ſettlement; and in it upwards of thirty Roman and Saxon camps are to be traced.

DORSI'FEROUS, or DORSIPAROUS, *adj.* [*dorſum* and *fero*, or *pario*, Lat.] Having the property of bearing or bringing forth on the back. It is uſed of plants that have their ſeeds on the back of their leaves, as fern; and may be properly uſed of the American frog, which brings forth young from her back.

DOR'SO, C. Fabius, a Roman, who, when Rome was in the poſſeſſion of the Gauls, iſſued from the capitol, which was then beſieged, to go and offer a ſacrifice, which was to be offered on mount Quirinalis. He dreſſed himſelf in ſacerdotal robes, and carrying on his ſhoulders the ſtatues of his country gods, paſſed through the guards of the enemy, without betraying the leaſt ſigns of fear. When he had finiſhed his ſacrifice, he returned to the capitol unmoleſted by the enemy, who were aſtoniſhed at his boldneſs, and did not obſtruct his paſſage or moleſt his ſacrifice. *Livy*.

DOR'STEN, a town of Germany, in the circle of the Lower Rhine, and county of Recklinghauſen, on the Lippe. It is ſtrong, though it was ſeveral times taken and retaken by the Swedes and Heſſians during the long war of Germany: thirty miles north of Duſſeldorp, and thirty-one ſouth-weſt of Munſter.

DORSTE'NIA, *ſ.* [ſo named by Plumier, from *Theo-*

dorus Dorſtenius, a German phyſician, who publiſhed a hiſtory of plants, or Botanicon, 1540.] In botany, a genus of the claſs tetrandria, order monogynia, natural order ſcabridæ, (urticæ, *Juſſ.*) The generic characters are—Calyx: receptacle-common one-leafed, flat, cornered, very large, covered by the receptacle, with very numerous floſcules inhabiting the diſk, very ſmall; perianthium-proper four-cornered, concave, imbedded in the receptacle and united with it. Corolla: none. Stamina: filaments four, filiform, very ſhort; antheræ roundiſh. Piſtillum: germ roundiſh; ſtyle ſimple; ſtigma obtuſe. Pericarpium: none; receptacle-common becoming fleſhy. Seeds: ſolitary, roundiſh, acuminate.—*Eſſential Character.* Receptacle-common one-leafed, fleſhy, in which ſolitary ſeeds neſtle. Thoſe who have opportunity of examining the living plant would do well to obſerve whether any other female floſcules are intermixed with the hermaphrodites, as in Parietaria; for Dorſtenia ſeems intermediate between Ficus and Parietaria, and as it were a fig expanded. Swartz obſerved monoecous flowers.

Species. 1. Dorſtenia Houſtoni, or Houſtoun's dorſtenia: ſcapes rooted; leaves heart-ſhaped, angled, acute; receptacles quadrangular. This ſort ſends out ſeveral angular heart-ſhaped leaves from the root, which have foot-ſtalks eight or nine inches in length and very ſlender; the leaves are about three inches and a half long, and almoſt four broad at their baſe, the two ears having two or three angles which are acute, and the middle of the leaves are extended, and end in acute points like a halbert; theſe are ſmooth and of a lucid green; the foot-ſtalk which ſuſtains the placenta is nine inches long, and about half an inch ſquare, and the upper ſurface cloſely ſet with ſmall flowers. Native of Campeachy, in South America; found there on rocky grounds by Dr. Houſtoun, and cultivated by Mr. Miller before 1733.

2. Dorſtenia contrajerva, or contrayerva: ſcapes rooted; leaves pinnatifid-palmate, ſerrate; receptacles quadrangular. Stalk near four inches high, upon which the fleſhy placenta is vertically placed; this is of an oval form, about one inch long, and three quarters broad. Upon the upper ſurface of this, the ſmall flowers are cloſely ſituated, the fleſhy part becoming an involucre to them; theſe are very ſmall, and ſcarce conſpicuous at a diſtance, being of an herbaceous colour. Native of New Spain, Mexico, Peru, the iſlands of Tobago and St. Vincent. Mr. Miller ſays that it was diſcovered by his ingenious friend Dr. William Houſtoun, near old Vera Cruz in New Spain.

3. Dorſtenia drakena, or irregular-leaved dorſtenia: ſcapes rooted; leaves pinnatifid-palmate, quite entire; receptacles oval. Leaves of different forms; ſome heart-ſhaped, having a few indentures on their edges, and ending in acute points, but the larger leaves are deeply cut like the fingers on a hand, into ſix or ſeven acute ſegments; theſe leaves are five inches long, and ſix broad in the middle; they are of a deep green, and ſtand upon long foot-ſtalks. Linnæus ſays it is a native of Vera Cruz; but Mr. Miller informs us that it was found in great plenty in the iſland of Tobago, by Mr. Robert Millar, ſurgeon. He alſo affirms, that the roots of all the three ſpecies are brought over indifferently, to be uſed in medicine and in dying; and that it was not known what the plant was, the roots of which were imported, and had been long uſed in medicine, until Dr. Houſtoun informed us; for although Plumier had diſcovered one ſpecies, and had given the name of Dorſtenia to it, yet he ſeems not to have known, that the contrayerva was the root of that plant.

4. Dorſtenia cauleſcens, or ſtemmed dorſtenia: peduncles on a ſtem. This appears to be a ſmall plant, with leaves proceeding irregularly from the ſtem, which is ſhort; they are ovate-acute, and pretty ſtrongly dentated at the edges. The male flowers are collected into little heads, and the females into a kind of ſharply-lobed or irregular flattiſh heads; the leaves ſtand on remarkably long foot-ſtalks.

5. Dorſtenia lucida, or ſhining dorſtenia: cauleſcent; leaves obliquely ovate, entire, even; peduncles in cymes axillary. 6. Dorſtenia pubeſcens, or pubeſcent dorſtenia: cauleſcent; leaves obliquely-ovate, ſerrate, pubeſcent; peduncles axillary, bearing heads. Theſe are natives of the Society Iſles. Forſter, ſuppoſing them to be of a different genus from this, named them *elatoſtema*, from ελατος, claſtic, and στημα, a ſtamen; becauſe the ſtamens are elaſtic.

7. Dorſtenia cordifolia, or cordate-leaved dorſtenia: ſcapes rooting; leaves cordate, ovate, toothletted; receptacles orbiculate. Native of Jamaica and St. Domingo.

8. Dorſtenia Chinenſis, or Chineſe dorſtenia: peduncles cauline; petioles three or five-leaved. Root fuſiform, three inches long, white within and without, fleſhy, aromatic. Native of China in the northern provinces; and called there *pechi* and *bach-chi*. The root is aromatic, and is uſed in medicine.

Propagation and Culture. It will be difficult to obtain theſe plants, becauſe the ſeeds are ſeldom to be found good; nor will they grow, if they are kept long out of the ground; ſo that the only ſure method to obtain them is, to have the roots taken up at the time when their leaves begin to decay, and planted pretty cloſe in boxes of earth, which may be brought very ſafe to England, provided they are preſerved from ſalt water, and are not over-watered with freſh water in their paſſage. When the plants arrive, they ſhould be tranſplanted each into a ſeparate pot filled with freſh earth, and plunged into the bark-ſtove, which ſhould be kept of a moderate heat; and the plants muſt be frequently refreſhed with water during the ſummer ſeaſon; but in winter, when the leaves are decayed, it ſhould be given to them more ſparingly. With this management theſe plants may not only be maintained, but may alſo be increaſed, by parting their roots in the ſpring, before the plants put out their leaves.

DORS'ZYCE, a town of Lithuania, in the palatinate of Minſk: forty-ſix miles north-north-eaſt of Minſk.

DORT, or DOR'DRECHT, a city of Holland, which holds the firſt rank in the aſſembly of the States; it is the capital of a ſmall territory called the *bailiwick of Dort*, and is ſituated on a ſmall iſland, formed by the waters of the Meuſe, the Merwe, the Rhine, and the Linge; ſeparated from the iſle of Iſſelmond by the Meuſe, and from the iſle of Beyerlandt by a canal. It was firſt detached from the main land November 17th, 1421, by an irruption of the rivers, which broke down the dikes, drowned one hundred thouſand perſons, and deſtroyed ſeventy-two villages: this dreadful calamity, it is ſaid, was owning to a peaſant, who, out of hatred wiſhing to drown his neighbour, opened the dyke between Gertrudenburg and Dort, not doubting of his being able to ſtop it again when the buſineſs was done; but the tide being aſſiſted by the wind, the waters poured in with ſuch fury that it carried all before it, men, cattle, and even houſes: they record the wonderful preſervation of a child which was borne in a cradle by the waters ſafe to Dort. Since that time the inhabitants have been very careful to preſerve their dykes, and keep them in repair, and moſt of the villages are rebuilt. In 1457, the city was nearly deſtroyed by fire, above two thouſand houſes being conſumed, together with the halls, the church of Notre Dame, and the town-houſe. The comtes of Holland held their court, and were inaugurated, at Dort, and granted many privileges to the inhabitants; the town is large and well peopled, not regularly fortified, but defended with ſeveral towers; its ſituation is very convenient for trade, eſpecially in wine, corn, wood, and other productions of Germany, and the countries connected with the Rhine and the Meuſe. In 1618 and 1619, was held a famous aſſembly of the clergy from all the proteſtant ſtates in Europe, called the Synod of Dort, to inquire into and ſettle the diſputes between the

Arminians

Arminians and Calviniſts called Gomariſts, otherwiſe called Remonſtrants and Anti-remonſtrants. The doctrines of Arminius were condemned; and Vorſtius, profeſſor at Leyden, the principal defender of thoſe tenets, with above a hundred miniſters and profeſſors, were baniſhed from the United States, becauſe they refuſed to ſubſcribe to the decree of the ſynod; John Olden Barnevelt was beheaded; the celebrated Hugo Grotius was ſentenced to perpetual impriſonment; and other learned men, favourers of that opinion, puniſhed. Among the public buildings are the town-houſe, the exchange, the hoſpitals, and the public library. The church of Notre Dame is a noble ſtructure, the tower lofty, and furniſhed with muſical chimes: there is another church dedicated to St. Nicholas, built in 1568; it had likewiſe, before the revolution, ſeveral religious houſes for monks and nuns, but they are all now applied to other uſes. It has two canals, by means of which veſſels loaded may enter the city. The company of tradeſmen, and ſome other communities, elect the magiſtrates, and name one part of the members of the council of the city: thirty-five miles ſouth of Amſterdam. Lat. 51. 48. N. lon. 22. 6. E. Ferro.

DORTMAN'NA, *ſ.* in botany. See LOBELIA.

DOR'TMUND, an imperial town of Germany, in the circle of Weſtphalia, and county of Mark, ſituated on the Embs; containing four Lutheran churches, and three convents. It has a ſeat and voice at the diets, and pays ninety-ſix florins for a Roman month, and is taxed one hundred and eight rix-dollars twenty kruitzers to the imperial chamber: forty miles weſt of Cologn, and twenty-five ſouth-ſouth-weſt of Munſter. Lat. 51. 35. N. lon. 24. 53. E. Ferro.

DOR"TURE, *ſ.* [contracted from *dormiture*; *dormitura*, Lat. *dortoir*, Fr.] A dormitory; a place to ſleep in.—He led us to a gallery like a *dorture*, where he ſhewed us along the one ſide ſeventeen cells, very neat. *Bacon.*

DO'RUS, a ſon of Hellen, or, according to others, of Deucalion, who left Phthiotis, where his father reigned, and went to make a ſettlement with ſome of his companions near mount Oſſa. The country was called Doris, and the inhabitants Dorians. *Herodotus.*—A city of Phœnicia, whoſe inhabitants are called Dorienſes. *Pauſanias.*

DO'RY, a town of Lithuania, in the palatinate of Wilna: ſixty-eight miles eaſt of Lida.

DORYAN'THES, *ſ.* in botany, a genus of plants, erected in 1802, by J. Correa de Serra, of the Linnæan ſociety. There is only one ſpecies, named *Dorianthes excelſa*, found among the plants of New Holland. Dr. de Serra deſcribes it as being nearly akin to the Agave of Linnæus; and may perhaps eventually prove to be a ſpecies of that ſuperb American plant.

DORYC'NIUM, *ſ.* in botany, ſee ANTHYLLIS, ASPALATHUS, CONVOLVULUS, CORONILLA, LOTUS, and PSORALEA.

DOSE, *ſ.* [δοσις, Gr.] So much of any medicine as is taken at one time.—In a vehement pain of the head he preſcribed the juice of the thapſia in warm water, without mentioning the *doſe*. *Arbuthnot.*

The too vig'rous *doſe* too fiercely wrought,
And added fury to the ſtrength it brought. *Dryden.*

Any thing nauſeous.—If you can tell an ignoramus in power and place that he has a wit and underſtanding above all the world, I dare undertake that, as fulſome a *doſe* as you give him, he ſhall readily take it down. *South.*—As much of any thing as falls to a man's lot. Ludicrouſly:

No ſooner does he peep into
The world, but he has done his doe;
Married his punctual *doſe* of wives,
Is cuckolded, and breaks, or thrives. *Hudibras.*

Quantity.—We pity or laugh at thoſe fatuous extravagants, while yet ourſelves have a conſiderable *doſe* of what makes them ſo. *Granville.*—It is often uſed of the utmoſt quantity of ſtrong liquor that a man can ſwallow. He has his *doſe*; that is, he can carry off no more.

To DOSE, *v. a.* To proportion a medicine properly to the patient or diſeaſe.—Plants ſeldom uſed in medicine, being eſteemed poiſonous, if corrected, and exactly *doſed*, may prove powerful medicines. *Derham.*—To give phyſic, or any thing nauſeous, to any man: in a ludicrous ſenſe.

DOSI'LOGY, or DOSOLOGY, *ſ.* [of δοσις and λογια.] A diſcourſe concerning the quantity or doſe of a medicine to be taken at a time. *Scott.*

DOSITHE'ANS, or DOSITHEI, *ſ.* An ancient ſect among the Samaritans in the firſt century of the Chriſtian era. Origen, Epiphanius, Jerom, and other Greek and Latin fathers, mention Doſitheus, as the chief of a faction among the Samaritans; but the learned are not agreed as to the time wherein he lived. St. Jerom, in his Dialogue againſt the Luciferians, places him before our Saviour; wherein he is followed by Druſius. But Scaliger places him poſterior to our Saviour's time: and Origen intimates him to have been contemporary with the apoſtles; where he obſerves, that he endeavoured to perſuade the Samaritans that he was the Meſſiah foretold by Moſes. He had many followers; and his ſect was ſubſiſting at Alexandria in the time of the patriarch Eulogius, as appears from a decree of that patriarch publiſhed by Photius. In that decree, Eulogius accuſes Doſitheus of injuriouſly treating the ancient patriarchs and prophets, and attributing to himſelf the ſpirit of prophecy. He makes him contemporary with Simon Magus; and accuſes him of corrupting the Pentateuch in divers places, and of compoſing ſeveral books directly contrary to the law of God. Archbiſhop Uſher takes Doſitheus to be the author of all the changes made in the Samaritan Pentateuch, which he argues from the authority of Eulogius. Epiphanius takes him to have been a Jew by birth, and to have abandoned the Jewiſh party for that of the Samaritans. He imagines him likewiſe to have been the author of the ſect of the Sadducees: which ſeems inconſiſtent with his being later than our Saviour; and yet the Jeſuit Serrarius makes Doſitheus the maſter of Sadoc, from whom the Sadducees are derived. Tertullian obſerves, that he was the firſt who dared to reject the authority of the prophets by denying their inſpiration. But he charges that as a crime peculiar to this whole ſect, who have never allowed any but the five books of Moſes for divine.

DOSITHE'US, the name of a man. 2 *Mac.* xii. 25.

DOS'MA DELGA'DO (Roderic), a learned Spaniſh divine, who flouriſhed in the ſixteenth century, born at Badajoz, in 1533. He was the author of ſeveral works, of which the moſt important are written in the Latin language, and conſiſt of illuſtrations of the Evangeliſts, the Pſalms, &c. and of a treatiſe intitled *De Auctoritate Sanctæ Scripturæ*, folio, 1534. He died in the year 1607.

DOS'SE, a river of Germany, in the circle of Upper Saxony, and marquiſate of Brandenburg, which runs into the Havel, eight miles eaſt-ſouth-eaſt of Havelberg.

DOS'SER, *ſ.* A ſort of baſket to be carried on the ſhoulders of men. It is uſed in carrying the overplus earth from one part of a fortification to another where it is wanted. A common panier for country uſe:

The milk-maids' cuts ſhall turn the wenches off,
And lay their *doſſers* tumbling in the duſt.
Merry Devil of Edmonton.

DOSSO'LA, a town of Piedmont, in the valley of Oſſola, defended by a fortreſs: fifty-one miles north-weſt of Milan, and ſeventy north-north-eaſt of Turin. Lat. 46. N. lon. 25. 48. E. Ferro.

DOST, [the ſecond perſon of *do*.]

Why then *doſt* treat me with rebukes, inſtead
Of kind condoling cares, and friendly ſorrow? *Addiſon.*

DOT, *ſ.* [this is derived by Skinner, from *dotter*, German, the white of an egg; and interpreted by him a grume of pus. It has now no ſuch ſignification, and ſeems rather

rather corrupted from *jot*, a point.] A ſmall point or ſpot made to mark any place in a writing.

To DOT, *v. a.* To mark with ſpecks.

To DOT, *v. n.* To make dots or ſpots.

DO'TAGE, *ſ.* Loſs of underſtanding; imbecility of mind; deliriouſneſs:

The ſoul in all hath one intelligence;
Though too much moiſture in an infant's brain,
And too much dryneſs in an old man's ſenſe,
Cannot the prints of outward things retain:
Then doth the ſoul want work, and idle ſit;
And this we childiſhneſs and *dotage* call. *Davies.*

Exceſſive fondneſs:

If on your head my fury does not turn,
Thank that fond *dotage* which ſo much you ſcorn. *Dryd.*

DO'TAL, *adj.* [*dotalis*, Lat.] Relating to the portion of a woman; conſtituting her portion; comprifed in her portion:

Shall I, of one poor *dotal* town poſſeſt,
My people thin, my wretched country waſte,
An exil'd prince, and on a ſhaking throne,
Or riſk my patron's ſubjects, or my own. *Garth.*

DO'TARD, *ſ.* A man whoſe age has impaired his intellects; a man in his ſecond childhood, called in ſome provinces a *twichild*:

The ſickly *dotard* wants a wife,
To draw off his laſt dregs of life. *Prior.*

DOTA'TION, *ſ.* [*dotatio*, Lat.] The act of giving a dowry or portion. Endowment in general.—As to eleemoſynary corporations, by the *dotation*, the founder and his heirs are of common right the legal viſiters. *Blackſtone.*

To DOTE, *v. n.* [*doten*, Dut. *radoter*, Fr.] To have the intellect impaired by age or paſſion; to be delirious.—A ſword is upon the liars, and they ſhall *dote:* a ſword is upon her mighty men, and they ſhall be diſmayed. *Jer.* l. 36.

Time has made you *dote*, and vainly tell
Of arms imagin'd in your lonely cell:
Go, be the temple and the gods your care;
Permit to men the thought of peace and war. *Dryden.*

To be in love to extremity.—I have long loved her, and beſtowed much on her, followed her with a *doting* obſervance. *Shakeſpeare.*

To DOTE *upon.* To regard with exceſſive fondneſs; to love to exceſs.—We *dote upon* this preſent world, and the enjoyment of it; and 'tis not without pain and fear, and reluctancy, that we are torn from them, as if our hopes lay all within the compaſs of this life. *Burnet.*

O death all eloquent! you only prove
What duſt we *dote on*, when 'tis man we love. *Prior.*

DO'TE ASSIGNAN'DA, *ſ.* in law, a writ that lay for a widow, where it was found by office, that the king's tenant was ſeiſed of lands in fee, or fee-tail, at the day of his death, and that he held of the king in chief, &c. In which caſe, the widow came into the chancery, and there made oath, that ſhe would not marry without the king's leave; whereupon ſhe had this writ to the eſcheator, to aſſign her dower. But it was uſual to make the aſſignment of the dower in the chancery, and to award a writ to the eſcheator, to deliver the lands aſſigned unto her. Stat. 15 *Edw.* IV. c. 4.

DOTE UNDE NIHIL HABET, in law, a writ of dower, that lies for the widow againſt the tenant who bought land of her huſband in his life-time, whereof he was ſolely ſeized in fee-ſimple or fee-tail, and of which ſhe is dowable. See the article DOWER.

DO'TED, *adj.* Stupid. *Not uſed:*

His ſenſeleſs ſpeech and *doted* ignorance
The prince had marked well. *Spenſer.*

DO'TER, *ſ.* One whoſe underſtanding is impaired by years; a dotard.—What ſhould a bald fellow do with a comb, a dumb *doter* with a pipe, or a blind man with a looking-glaſs. *Burton.*—A man fondly, weakly, and exceſſively, in love:

If in black my lady's brow be deckt,
It mourns that painting and uſurping hair
Should raviſh *doters* with a falſe aſpect;
And therefore is ſhe born to make black fair. *Shakeſpeare.*

DOTES, *ſ. pl.* [Lat.] Natural endowments.—I muſe a miſtreſs can be ſo ſilent to the *dotes* of ſuch a ſervant. *B. Jonſon.*

DO'THAN, [from the Hebrew, ſignifying cuſtom.] A town of Canaan, near Shechem, where Joſeph's brethren conſpired againſt his life, *Gen.* xxxvii. 17; and where the prophet Eliſha dwelt, when the king of Syria encompaſſed the city with intention to deſtroy him, 2 *Kings*, vi. 13.

DO'THAIM, the name of a place. *Jud.* iv. 6.

DO'TINGLY, *adv.* Fondly; by exceſſive fondneſs:

That he, to wedlock *dotingly* betray'd,
Should hope in this lewd town to find a maid! *Dryden.*

DOT'MATYN, a town of Hungary: ſix miles north-weſt of Podolicz.

DOT'TARD, *ſ.* This word ſeems to ſignify a tree kept low by cutting.—For great trees, we ſee almoſt all overgrown trees in church-yards, or near ancient buildings, and the like, are pollards and *dottards*, and not trees at their full height. *Bacon.*

DOT'TEREL, *ſ.* The name of a ſpecies of plover. See CHARADRIUS, vol. iv. p. 106.—We ſee how ready apes and monkeys are to imitate all motions of man; and in catching of *dotterels*, we ſee how the fooliſh bird playeth the ape in geſtures. *Bacon.*

DOUADIC', a town of France, in the department of the Indre: five miles north of La Blanc.

DO'VAIN, a town of Savoy, in the Chablais, celebrated for its vineyards: three miles eaſt-ſouth-eaſt of Hermance.

DOUAR'NENEZ, a ſea-port town of France, in the department of Finiſterre, and chief place of a canton, in the diſtrict of Pontcroix; ſituated on a large bay in the Engliſh Channel: three leagues and a half north-weſt of Quimper, and two and a quarter north-eaſt of Pontcroix.

DO'UAY, a city of France, and capital of the department of the North; large and ſtrong, ſituated on the Scarp, which is navigable for boats. It contains ſeven pariſhes, and 2735 fires. It has long been celebrated for its Engliſh colleges, whither the Roman catholics of this nation were generally ſent for education. Douay was taken by the allies, under the command of the duke of Marlborough and prince Eugene, in 1710. The ſiege laſted from the 5th of May to the 26th of June: the garriſon, which at the beginning conſiſted of 8000 men, was reduced to 4527; and the allies loſt 8000 men. It was retaken by the French in 1712: twenty-four poſts and three-quarters north of Paris. Lat. 50. 22. N. lon. 20. 45. E. Ferro.

DOU'AZIT, a town of France, in the department of the Landes: five miles ſouth of St. Sever.

DOU'BLE, *adj.* [*double*, Fr. *duplex*, Lat. *duple*, Erſe.] Two of a ſort; one correſponding to the other; in pairs.—All things are *double* one againſt another, and he hath made nothing imperfect. *Ecclus.* xlii. 24.—Twice as much; containing the ſame quantity repeated. It is ſometimes uſed with *to*, and ſometimes without.—This ſum of forty thouſand pounds is almoſt *double to* what is ſufficient. *Swift.*

Great honours are great burthens; but on whom
They are caſt with envy, he doth bear two loads:
His cares muſt ſtill be *double to* his joys,
In any dignity. *Ben Jonſon.*

Having one added to another; having more than one in the ſame order or parallel.—It is a curioſity alſo to make flowers *double*, which is effected by often removing them into

into new earth; as, on the contrary part, *double* flowers, by neglecting, and not removing, prove ſingle. *Bacon.*—Twofold; of two kinds:

Thus curſed ſteel, and more accurſed gold,
Gave miſchief birth, and made that miſchief bold,
And *double* death did wretched man invade,
By ſteel aſſaulted, and by gold betray'd. *Dryden.*

Two in number:

And if one power did not both ſee and hear,
Our ſights and ſounds would always *double* be. *Davies.*

Having twice the effect or influence; having the power of two. *Not uſed:*

The magnifico is much belov'd,
And hath in its effect a voice potential,
As *double* as the duke's. *Shakeſpeare.*

Deceitful; acting two parts, one openly, the other in ſecret.—Fifty thouſand could keep rank, that were not of *double* heart. 1 *Chron.* xii. 33.

I' th' preſence
He would ſay untruths, and be ever *double*
Both in his words and meaning. *Shakeſpeare.*

DO'UBLE, *adj.* Twice over.—I am not ſo old in proportion to them as I formerly was, which I can prove by arithmetic; for then I was *double* their age, which now I am not. *Swift.*

To DO'UBLE, *v. a.* To enlarge any quantity by addition of the ſame quantity.—This power of repeating or *doubling* any idea we have of any diſtance, and adding it to the former, as often as we will, without being ever able to come to any ſtop or ſtint, is that which gives us the idea of immenſity. *Locke.*

Rumour doth *double* voice and echo
The numbers of the fear'd. *Shakeſpeare.*

To contain twice the quantity:

Thus reinforc'd againſt the adverſe fleet,
Still *doubling* ours, brave Rupert leads the way. *Dryd.*

To repeat; to add:

He ſaw proud Arcite and fierce Palemon
In mortal battle *doubling* blow on blow;
Like lightning flam'd their falchions to and fro. *Dryd.*

To add one to another, in the ſame order or parallel.—Thou ſhalt *double* the curtain in the tabernacle. *Exodus.*—To fold:

He bought her ſermons, pſalms, and graces,
And *doubled* down the uſeful places. *Prior.*

To paſs round a headland.—Sailing along the coaſt, he *doubled* the promontory of Carthage, yet famous for the ruins of that proud city. *Knolles.*

To DO'UBLE, *v. n.* To increaſe to twice the quantity.—'Tis obſerved, in particular nations, that within the ſpace of three hundred years, notwithſtanding all caſualties, the number of men *double*. *Burnet.*—To enlarge the ſtake to twice the ſum in play:

Throw Egypt by, and offer in the ſtead;
Offer—the crown on Berenice's head:
I am reſolved to *double* till I win. *Dryden.*

To turn back, or wind in running.—Under the line the ſun croſſeth, and maketh two ſummers and two winters; but in the ſkirts of the torrid zone it *doubleth* and goeth back again, and ſo maketh one long ſummer. *Bacon.*

So keen thy hunters, and thy ſcent ſo ſtrong,
Thy turns and *doublings* cannot ſave thee long. *Swift.*

To play tricks; to uſe ſleights.

DO'UBLE, *ſ.* Twice the quantity or number.—If the thief be found, let him pay *double*. *Exodus.*—Strong beer; beer of twice the common ſtrength.—Here's a pot of good *double*, neighbour: drink, and fear not your man. *Shakeſpeare.*—A turn uſed to eſcape purſuit:

Man is frail,
Convulſions rack his nerves, and cares his breaſt;
His flying life is chas'd by rav'ning pains,
Through all his *doubles*, in the winding veins. *Blackm.*

A trick; a ſhift; an artifice.—Theſe men are too well acquainted with the chaſe, to be flung off by any falſe ſteps or *doubles*. *Addiſon.*—A fold; a duplicate.

DO'UBLE is much uſed in compoſition, generally for *doubly*, two ways; as, *double-edged*, having an edge on each ſide: or for twice the number or quantity; as, *double-died*, twice died.

DOU'BLE-BITING, *adj.* Biting or cutting on either ſide:

But moſt their looks on the black monarch bend,
His riſing muſcles and his brawn commend;
His *double-biting* ax, and beaming ſpear,
Each aſking a gigantic force to rear. *Dryden.*

DOU'BLE-BUTTONED, *adj.* Having two rows of buttons:

Others you ſee, when all the town's afloat,
Wrapt in th' embraces of a kerſey coat,
Or *double-button'd* frieze. *Gay.*

DOU'BLE-DEALER, *ſ.* A deceitful, ſubtle, inſidious fellow; one who acts two parts at the ſame time; one who ſays one thing and thinks another.—*Double-dealers* may paſs muſter for a while; but all parties waſh their hands of them in the concluſion. *L'Eſtrange.*

DOU'BLE-DEALING, *ſ.* Artifice; diſſimulation; low or wicked cunning; the action of one thing with the profeſſion of another.—Thou ſhalt not be the worſe for me; there's gold.—But that would be *double-dealing*, ſir. *Shakeſpeare.*—Our poets have joined together ſuch qualities as are by nature moſt compatable; valour with anger, meekneſs with piety, and prudence with diſſimulation: this laſt union was neceſſary for the goodneſs of Ulyſſes; for, without that, his diſſimulation might have degenerated into wickedneſs and *double-dealing*. *Broome.*

To DOU'BLE-DIE, *v. a.* To die twice over:

Yes, I'll to the royal bed,
Where firſt the myſteries of our love were acted,
And *double-die* it with imperial crimſon. *Dryden.*

DOU'BLE-FACED, *adj.* With two faces.—Fame, if not *double-fac'd*, is double-mouth'd. *Milton.*

DOU'BLE-FORM'ED, *adj.* Of mixed form:

Till firſt I know of thee,
What thing thou art, thus *double-form'd*. *Milton.*

DOU'BLE-FOUNTED, *adj.* Having two ſources:

Here the *double-founted* ſtream
Jordan, true limit eaſtward. *Milton.*

DOU'BLE-HANDED, *adj.* Having two hands.—All things being *double-handed*, and having the appearances both of truth and falſehood, where our affections have engaged us, we attend only to the former. *Glanville.*

DOU'BLE-HEAD'ED, *adj.* Having the flowers growing one to another.—The double rich ſcarlet nonſuch is a large *double-head* flower, of the richeſt ſcarlet colour. *Mortimer.*

DOU'BLE-ISLAND POINT, a cape on the north-eaſt coaſt of New Holland. Lat. 25. 58. S. lon. 153. 12. E. Greenwich.

To DOU'BLE-LOCK, *v. a.* To ſhoot the lock twice; to faſten with double ſecurity.—He immediately *double-locked* his door, and ſat down carefully to reading and comparing both his orders. *Tatler.*

DOU'BLE-MINDED, *adj.* Unſettled; undetermined.—A *double-minded* man is unſtable in all his ways. *James.*

DOU'BLE-MOUTHED, *adj.* With two different mouths.—See the example in DOUBLE-FACED.

DOU'BLE-PLEA, *ſ.* in law, is where a defendant allegeth for himſelf two ſeveral matters, in bar of the plaintiff's action, when one of them is ſufficient; which ſhall not be admitted: as if a man plead ſeveral things,

the one not depending upon the other, the plea is accounted double, and will not be allowed; but if they mutually depend on each other, and the party may not have the laſt plea without the firſt, then it ſhall be received. *Kitch.* 223. And where a double plea that is wrong, is pleaded; if the plaintiff reply thereto, and take iſſue of one matter; if that be found againſt him, he cannot afterwards move in arreſt of judgment; for by the replication it is allowed to be good. 18 *Ed.* IV. 17. If a man pleads two or more matters, when he is compelled to ſhew them, it makes not the plea double; ſo it is where two diſtinct things are pleaded, which require but one anſwer: and in caſe a man pleads two ſeveral matters or things, and only one is material, the other being ſurpluſage, and needing no anſwer, the plea is not double. *Hob.* 197. Where there are ſeveral inducements to a plea, they ſhall not make the plea double: and double pleas are allowable in aſſiſes of novel diſeiſin, &c. but not in other actions. *Jenk. Cent.* 75. By 4 Anne, c. 16, it ſhall be lawful for defendant or tenant in any action or ſuit, or for plaintiff in replevin, in any court of record, with the leave of the ſame court, to plead as many ſeveral matters thereto, as he ſhall think neceſſary for his defence. That is, in ſo many ſeparate and diſtinct pleas, and where there are more pleas than one. By virtue of this ſtatute, defendant is ſaid to plead double, by leave of the court.

DOU'BLE-QUARREL, *ſ.* in eccleſiaſtical law, is a complaint made to the archbiſhop of the province, againſt an inferior ordinary, for delaying or refuſing to do juſtice in ſome cauſe; as to give ſentence, inſtitute a clerk, &c. and ſeems to be termed a double quarrel, becauſe it is moſt commonly made againſt both the judge, and him at whoſe ſuit juſtice is denied or delayed: the effect whereof is, that the archbiſhop taking notice of the delay, directs his letters, under his authentical ſeal, to all clerks of his province, commanding them to admoniſh the ordinary within a certain number of days to do the juſtice required, or otherwiſe to appear before him or his official, and there allege the cauſe of his delay: and to ſignify to the ordinary, that if he neither perform the thing enjoined, nor appear and ſhew cauſe againſt it, he himſelf, in his court of audience, will forthwith proceed to do the juſtice that is due. *Cowel.*

DOU'BLE-SHI'NING, *adj.* Shining with double luſtre:

Among the reſt he there did take delight
To ſee the ſports of *double-ſhining* day. *Sidney.*

DOU'BLE-TON'GUED, *adj.* Deceitful; giving contrary accounts of the ſame thing.—The deacons muſt be grave, not *double-tongued*, not given to much wine, not greedy of filthy lucre. 1 *Tim.*

For much ſhe fear'd the Tyrians *double-tongu'd*,
And knew the town to Juno's care belong'd. *Dryden.*

DOU'BLENESS, *ſ.* The ſtate of being double.—If you think well to carry this as you may, the *doubleneſs* of the benefit defends the deceit from reproof. *Shakeſpeare.*

DOU'BLER, *ſ.* He that doubles any thing.

DOUB'LET, *ſ.* The inner garment of a man; the waiſtcoat: ſo called from being double for warmth, or becauſe it makes the dreſs double.—What a pretty thing a man is, when he goes in his *doublet* and hoſe, and leaves off his wit! *Shakeſpeare.*

They do but mimic ancient wits at beſt,
As apes our grandſires, in their *doublets* dreſt. *Pope.*

Two; a pair.—Thoſe *doublets* on the ſides of his tail ſeem to add ſtrength to the muſcles which move the tail fins. *Grew.*

DOUB'LETS, *ſ. pl.* The ſame number on both dice; thence alſo, a double meaning.—He commonly ſlurs every fourth or fifth word, and ſeldom fails to throw *doublets*. *Butler's Character of a Quibbler.*—Among antiquaries, two medals of the ſame ſort; alſo two books, &c. of the ſame ſort.

DOUB'LINGS, *ſ. pl.* Putting two files of ſoldiers into one. In heraldry, linings of robes, mantles of ſtate, or other garments. In hunting, the turnings of a hare to avoid the dogs.

DOUBLO'N, or DOUBLOON, *ſ.* [French.] A Spaniſh coin, containing the value of two piſtoles.

DOU'BLY, *adv.* In twice the quantity; to twice the degree:

Haply at night he does with horror ſhun
A widow'd daughter, or a dying ſon:
His neighbour's offſpring he to-morrow ſees,
And *doubly* feels his want in their increaſe. *Prior.*

DOUBS, or DOUX, a river of France, which riſes at the foot of mount Jura, paſſes by St. Hypolite, Clerval, Beſançon, Dole, &c. and loſes itſelf in the Saone, near Verdun.

DOUBS, a department of France, which takes its name from the river which paſſes through it; bounded on the north by the departments of the Upper Saone and Upper Rhine, on the eaſt by Swiſſerland, on the ſouth-weſt by the department of the Jura, and on the north-weſt by the department of the Upper Saone. Beſançon is the capital.

To DOUBT, *v. n.* [*doubter*, Fr. *dubito*, Lat.] To queſtion; to be in uncertainty.—Let no man, while he lives here in the world, *doubt* whether there is any hell or no, and thereupon live ſo, as if abſolutely there were none. *South.*—To queſtion any event, fearing the worſt:

Doubting things go ill, often hurts more
Than to be ſure they do. *Shakeſpeare.*

Sometimes with *of* in both the foregoing ſenſes:

Have I not manag'd my contrivance well,
To try your love, and make you *doubt of* mine? *Dryden.*

To fear; to be apprehenſive of ill.—If there were no fault in the title, I *doubt* there are too many in the body of the work. *Baker on Learning.*

I *doubt* there's deep reſentment in his mind,
For the late ſlight his honour ſuffer'd. *Otway.*

To ſuſpect; to have ſuſpicion:

The king did all his courage bend
Againſt thoſe four which now before him were,
Doubting not who behind him doth attend. *Daniel.*

To heſitate; to be in ſuſpenſe; to waver undetermined:

At firſt the tender blades of graſs appear,
And buds, that yet the blaſt of Eurus fear,
Stand at the door of life, and *doubt* to clothe the year. *Dryd.*

To DOUBT, *v. a.* To hold queſtionable; to think uncertain. To think endangered:

He from the terror of this arm ſo late
Doubted his empire. *Milton.*

To fear; to ſuſpect:

You that will be leſs fearful than diſcreet,
That love the fundamental part of ſtate,
More than you *doubt* the change of it, prefer
A noble life before a long. *Shakeſpeare.*

To diſtruſt; to hold ſuſpected:

To teach vain wits a ſcience little known,
T' admire ſuperior ſenſe, and *doubt* their own. *Pope.*

DOUBT, *ſ.* Uncertainty of mind; ſuſpenſe; undetermined ſtate of opinion.—Could any difficulty have been propoſed, the reſolution would have been as early as the propoſal; it could not have had time to ſettle into *doubt*. *South.*—Queſtion; point unſettled.—Hippocrates commends the fleſh of the wild ſow above the tame; and no *doubt* but the animal is more or leſs healthy, according to the air it lives in. *Arbuthnot.*—Scruple; perplexity; irreſolution:

Our *doubts* are traitors,
And make us loſe, by fearing to attempt,
The good we oft might win. *Shakeſpeare.*

Uncertainty of condition.—And thy life ſhall hang in *doubt* before thee; and thou ſhalt fear day and night, and ſhalt

ſhalt have no aſſurance of thy life. *Deut.*—Suſpicion; apprehenſion of ill.—I deſire to be preſent with you now, and to change my voice; for I ſtand in *doubt* of you. *Gal.* iv. 20.—Difficulty objected:

To every *doubt* your anſwer is the ſame,
It ſo fell out, and ſo by chance it came. *Blackmore.*

Peril:

However ſtrong and ſtout
They were, as well approv'd in many a *doubt*. *Spenſer.*

DOUBT'ER, *ſ.* One who entertains ſcruples; one who hangs in uncertainty.

DOUBT'FUL, *adj.* Dubious; not ſettled in opinion:

Methinks I ſhould know you, and know this man;
Yet I am *doubtful*. *Shakeſpeare.*

Ambiguous; not clear in its meaning: as, a *doubtful* expreſſion. That about which there is doubt, that which is not yet determined or decided; obſcure; queſtionable; uncertain.—In handling the right of a war, I am not willing to intermix matter *doubtful* with that which is out of doubt; for as in capital cauſes, wherein but one man's life is in queſtion, the evidence ought to be clear; ſo much more in a judgment upon a war, which is capital to thouſands. *Bacon.*—In *doubtful* caſes, reaſon ſtill determines for the ſafer ſide; eſpecially if the caſe be not only *doubtful*, but alſo highly concerning, and the venture be a ſoul, and an eternity. *South.*—Hazardous; of uncertain event:

We have ſuſtain'd one day in *doubtful* fight,
What heav'n's high Lord had pow'rfulleſt. *Milton.*

Not ſecure; not without ſuſpicion.—Our manner is always to caſt a *doubtful* and a more ſuſpicious eye towards that, over which we know we have leaſt power. *Hooker.*—Not confident; not without fear:

With *doubtful* feet, and wavering reſolution,
I come, ſtill dreading thy diſpleaſure. *Milton.*

Partaking different qualities:

Looks
Downcaſt and damp, yet ſuch wherein appear'd
Some glimpſe of joy, which on his count'nance caſt
Like *doubtful* hue. *Milton.*

DOUBT'FUL HARBOUR, a bay on the weſt coaſt of the ſouthernmoſt iſland of New Zealand, in the South Pacific Ocean. Lat. 45. 16. S. lon. 168. 50. W. Greenwich.

DOUBT'FUL ISLAND, an iſland in the South Pacific Ocean, ſeen by Monſ. Bougainville. Lat. 17. 20. S. lon. 141. 38. W. Greenwich.

DOUBT'FULLY, *adv.* Dubiouſly; irreſolutely. Ambiguouſly; with uncertainty of meaning.—Knowing how *doubtfully* all allegories may be conſtrued, and this book of mine being a continual allegory, I have thought good to diſcover the general intention. *Spenſer.*

Nor did the goddeſs *doubtfully* declare
Her alter'd mind, and alienated care. *Dryden.*

Fearfully:

With that ſhe waked, full of fearfull fright,
And *doubtfully* diſmay'd through that ſo uncouth ſight.
Spenſer.

DOUBT'FULNESS, *ſ.* Dubiouſneſs; ſuſpenſe; inſtability of opinion.—Though *doubtfulneſs* or uncertainty ſeems to be a medium between certain truth and certain falſehood in our minds, yet there is no ſuch medium in things themſelves. *Watts.*—Ambiguity; uncertainty of meaning.—In arguing, the opponent uſes as comprehenſive and equivocal terms as he can, to involve his adverſary in the *doubtfulneſs* of his expreſſions: and therefore the anſwerer, on his ſide, makes it his play to diſtinguiſh as much as he can. *Locke.*—Hazard; uncertainty of event or condition.

DOUBT'INGLY, *adv.* In a doubting manner; dubiouſly; without confidence.—Whatſoever a man imagineth *doubtingly*, or with fear, muſt needs do hurt, if imagination have any power at all; for a man repreſenteth that oftener that he feareth, than the contrary. *Bacon.*

DOUBT'LESS, *adj.* Free from fear; void of apprehenſion of danger:

Pretty child, ſleep *doubtleſs* and ſecure,
That Hubert, for the wealth of all the world,
Will not offend thee. *Shakeſpeare.*

DOUBT'LESS, *adv.* Without doubt; without queſtion; unqueſtionably.—*Doubtleſs* he would have made a noble knight. *Shakeſpeare.*

Doubtleſs, oh gueſt! great laud and praiſe were mine,
If, after ſocial rites and gifts beſtow'd,
I ſtain'd my hoſpitable hearth with blood. *Pope.*

DOU'CET, *ſ.* [*doucet*, Fr.] A cuſtard.

DOU'CIN (Louis), a French Jeſuit, native of Vernon in Normandy, died at Orleans in 1726. His abilities and zeal pointed him out as a proper perſon to be employed at Rome, while the buſineſs of the conſtitution Unigenitus was in agitation. He was the author of A Hiſtory of Neſtorianiſm, in quarto, 1698, which is ably written and held in much eſtimation. He alſo publiſhed, A ſhort Memoir illuſtrative of the State and Progreſs of Janſeniſm in Holland; and a multitude of pamphlets on the Janſeniſtical controverſy.

DOUCK'ER, *ſ.* [from *to douck*, corrupted from *to duck*.] The diver. See COLYMBUS, vol. iv. p. 838.—The colymbi, or *douckers*, or loons, are admirably conformed for diving, covered with thick plumage, and their feathers ſo ſlippery that water cannot moiſten them. *Ray.*

DOU'DEVILLE, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Cany; ſeven leagues north-north-weſt of Rouen.

DOVE, *ſ.* [from *duvo*, old Teut. *taub*, *daub*, Ger.] A ſpecies of wild pigeon. See COLUMBA, vol. iv. p. 815.—I have here a diſh of *doves*, that I will beſtow upon your worſhip. *Shakeſpeare.*

Not half ſo ſwift the trembling *doves* can fly,
When the fierce eagle cleaves the liquid ſky;
Not half ſo ſwiftly the fierce eagle moves,
When thro' the ſkies he drives the trembling *doves*. *Pope.*

The dove has always been eſteemed as one of the moſt pleaſing emblems of tenderneſs and affection. The dove and the rainbow have been rendered particularly intereſting, from the circumſtances of the deluge. Theſe were conſidered by the Hebrews as particularly favoured of heaven; whence the Samarim, or ſons of Cuſh, made the dove and the rainbow the ſacred ſtandard of the Deity. The patriarch Noah ſeems to have been the firſt who was in the gentile world typified under the emblem of a dove. He was a great prophet; and it was foretold at his birth, that he ſhould bring peace and comfort to mankind. The purport of his name is, *reſt from labour*. Hence the dove became the emblem of peace, as well as of the perſon through whom that bleſſing was to be derived to the earth. Thus the dove became a ſacred ſymbol, and was ſo acknowledged in the times of the pureſt worſhip. But the ſons of Ham perverted what was intended to be only typical, and at length made the dove the object of their idolatry. Under this name Juno was worſhipped by the Hetrurians. The firſt temple in memory of the ark was at Theba in Egypt; and as the dove was eſteemed the interpreter of the Deity, the prieſts of the temple were called *Iönah*, or doves. Thus the Iönic worſhip of the dove was brought into Greece, and temples every where erected for that purpoſe; the principal of which was at Dodona in Epirus. The women who officiated in theſe temples were called Πελειαι, and Πλειαδες; which the Latins rendered *columbæ*; whence Linnæus took his generic name for the dove. And as, among mariners, this bird was thought to be particularly auſpicious, they uſed anciently to let a dove or pigeon fly from their ſhips,

in order to judge, from its movements, of the ſucceſs of their voyage. The moſt favourable ſeaſon for ſetting ſail was ſuppoſed to be at the heliacal riſing of the ſeven ſtars near the head of Taurus, and they are in conſequence of it called *Pleiades*, or the doves.

With painters, the dove is an emblem of ſimplicity, innocence, purity, goodneſs, peace, and divine love, and repreſents the Holy Ghoſt. Having no gall, it is the ſymbol of a true and faithful Chriſtian, who forgives injuries, bears adverſity patiently, and ſuffers not the ſun to go down upon his anger.

DOVE, a river of England, in the county of Derby, which runs into the Trent, near Burton.

DOVE's-FOOT CRANE's-BILL. See GERANIUM.

DOUE', a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the diſtrict of Saumur, on the Loire: there are the remains of an amphitheatre, which are by ſome ſuppoſed to be Roman, while others ſuppoſe them the remains of a palace of the ancient kings of Aquitaine. It contains about 800 inhabitants, who are chiefly employed in a manufacture of druggets and tammies: nine miles ſouth-weſt of Saumur, and twenty ſouth of Angers.

DO'VECOT, *ſ.* A ſmall building in which pigeons are bred and kept.

DO'VEDRAWN, *part. adj.* Drawn by doves:

I met her deity,
Cutting the clouds tow'rds Paphos, and her ſon
Dovedrawn with her. *Shakeſpeare.*

DO'VEHOUSE, *ſ.* A houſe for pigeons.—The hawk ſets up for protector, and makes havock in the *dovehouſe*. *L'Eſtrange.*

DO'VEIN, a town of Egypt: ſeven miles ſouth-ſouth-eaſt of Siut.

DO'VELIKE, *adj.* Like a dove.—*Dovelike* ſatſt brooding on the vaſt abyſs. *Milton.*

DO'VER, [ᵹeoɼɲa, Sax. of *dufyrra*, C. Br. a ſteep place, from the ſteep rocks not far from thence.] An ancient ſea-port town in the eaſtern part of the county of Kent, ſeventy-two miles from London, ſixteen from Canterbury, twenty-two from Margate, eleven from Sandwich, and eight from Deal. It is placed in a pleaſant valley, and the only one about this coaſt where water is admitted inwards of the cliff, which is here very high, and has a beautiful picturеſque appearance. The hill on which the caſtle is ſituated riſes with a bold aſcent to the northward of the town; and the venerable and famous fortreſs ſtill ſeems to bid defiance to its Gallic neighbours, the total change in the art of war ſince its erection has reduced its conſequence as a fortified ſtation very much indeed. A ſmall river runs through the valley, which paſſes through great part of the town, and from thence empties itſelf into the ſea. The delightful ſituation of Dover, the ſalubrity of the air, the purity of the ſea, and the advantages of a fine beach, has cauſed it to be much frequented in the bathing-ſeaſon. The ancient Britiſh name of Dover was *Dour*, the Saxon *Doppa*, the Roman *Dubris*; and the Watling-ſtreet, one of the ancient Roman roads which croſſed the kingdom, commenced here, going ſtrait to Canterbury, over Barham-downs, where it is very perfect. Dover at preſent conſiſts of two parts, of nearly equal ſize, connected by a long narrow ſtreet; the upper and moſt ancient part is called the Town; the lower part, the Pier. Dover is one of the principal cinque-ports incorporated by Edward I. The charter endowed them with many and great privileges, equally conducive to national commerce and ſecurity. Dover was anciently walled in, and had originally ten gates, a proof of its primitive opulence and ſplendour; it was firſt fortified in 1525. Eaſtbrook-gate ſtood under the Eaſt Cliff, near Mansfield's-corner. St. Helen's-gate next the former, towards the ſouth-weſt. The Poſtern, or Fiſher's-gate, near the bridge. Butcher's-gate, which opened towards the ſouth. Snare-gate, towards the ſouth-weſt, the ſcite of which (now called the Bench) was converted into a pavement for the merchants' meeting; and over it was the cuſtom-houſe. Severus's-gate, ſouth-weſt towards the pier, ſaid to have been built by the Roman emperor Severus. Adrian's-gate, called Upwall, on the lower ſide of the hill, on the weſt part, above the laſt-mentioned gate. Common-gate, or Cow-gate, on the way leading to the common. St. Martin's, called alſo Monk's-gate, and Poſtern gate, leading towards the hill. Biggen-gate, which laſt took its name from the ſtreet which ends there: it was anciently called North-gate.

The paſſage from Dover to France being the neareſt and ſafeſt from England, there was a law formerly, that none ſhould go to the continent but from thence. Dover was in a flouriſhing condition in the reign of Edward the Confeſſor, who made this town a body corporate, by the ſtile of mayor and commonalty, and the townſmen were called burgeſſes; amongſt whom the mayor choſe aſſiſtants for the year, who, being ſworn to faithful ſervice, were called jurats; which name and office is now common to all the cinque-ports, and ſome of the towns their dependents. This charter was renewed in the reign of Edward III. The laſt charter of Dover was granted by Charles II. There were formerly ſeven churches in this town; but five of them have been long ſince demoliſhed. The two now exiſting, are St. Mary the Virgin, and St. James's. St. Mary's was built by the prior and convent of St. Martin; and it may be worthy of notice, that the tower of this church was lately diſcovered (in digging a vault) to have been built upon the remains of an ancient Roman bath. In this town was formerly a houſe belonging to the knights templars, before their ſuppreſſion by Edward II. made memorable by being the place where king John made his diſgraceful ſubmiſſion to the Roman pontiff, by ſetting his ſeal to a deed, whereby he acknowledged himſelf to hold the crown of England of the pope.

Dover caſtle has been famous through many ages, and was formerly eſteemed the lock and key of the whole kingdom; it is very extenſive, upwards of thirty-five acres are ſuppoſed to be contained within the walls. As it is frequently aſſerted in our old chronicles, and from them tranſcribed into more general hiſtories, that Dover caſtle was built by Julius Cæſar, many who have viſited it have been ſatisfied with this idle report; but the works ſtill remaining bear evident marks of its having been raiſed in different and very diſtant periods of our hiſtory. The three leading characteriſtical parts of ground-plans and buildings are Roman, Saxon, and Norman. The fortifications about the caſtle underwent ſeveral material alterations in 1796. Of the new works, the moſt uſeful part is a battery of thirty-two-pounders, on a level with the water's edge. From this battery, if neceſſary, the men can retreat into the caſtle, aſcending by a perpendicular ſhaft which has been made through the ſolid rock. Here the Romans, under Julius Cæſar, attempted their firſt landing; but they were fruſtrated, and obliged to ſail about eight miles farther, towards the north; and landed near the high ground where Richborough caſtle was afterwards built.

Dover is incorporated by the name of the mayor, jurats, and commonalty, of the town and port of Dover; and ſends two members to the imperial parliament. Here is a good free-ſchool, eſtabliſhed in 1771, endowed by John Trevanion, eſq. member for Dover, for fifty boys, the ſons of freemen. There is alſo a charity-ſchool for forty-five boys and thirty-five girls, ſupported by voluntary contribution. It has a market every Wedneſday and Saturday; and one annual fair, which begins on the 22d of November, and continues three market-days. The packet-veſſels with the mail ſail conſtantly from this port for Calais and Oſtend in time of peace.

The juriſdiction of the cinque-ports is veſted in the conſtable of Dover caſtle, who ſhall not hold plea of any foreign county within the caſtle gates, except it concern the keeping of the caſtle; nor ſhall he diſtrain the inhabitants

bitants of the ports, to plead elſewhere or otherwiſe than as they ought, according to the charters, &c. 28 *Edw.* I. c. 7. See the article CINQUE-PORTS, vol. iv. p. 606.

DO'VER STRAITS. See STRAITS.

DO'VER, a townſhip of the American States, in Norfolk county, Maſſachuſetts, incorporated anno 1650: fifteen miles ſouthward of Boſton.

DO'VER, a conſiderable townſhip of the American States, in Strafford county, New Hampſhire, and the ſhire town of the county; ſituated on the ſouthern ſide of Cochecho river, about four miles above its junction with Salmon-fall river, which together form the Piſcataqua; ten miles ſouth-by-eaſt of Rocheſter, ſix from Berwick in Maine, and fourteen north-weſt by north from Portſmouth. The Indians named it Winichahanat, and Cochecho; by the firſt ſettlers, it was called Northam. It was incorporated in 1633. In this townſhip is a high neck of land, between the main branch of Piſcataqua and Back river, about two miles long, and half a mile wide, riſing gently along a fine road, and declining on each ſide, like a ſhip's deck. It commands an extenſive and variegated proſpect of the rivers, bays, adjacent ſhores, and diſtant mountains. It has often been admired by travellers as an elegant ſituation for a city, and by military gentlemen for a fortreſs. The firſt ſettlers pitched here, but the trade has long ſince been removed to Cochecho-falls; and this beautiful ſpot is almoſt deſerted of inhabitants. Lat. 43. 11. N. lon. 70. 50. W.

DO'VER, a townſhip of the American States, in Monmouth county, New Jerſey, between Shrewſbury and New Stafford, and extends from the ſea to the county line. It has but one church, the property of a generous and benevolent individual; who gives liberty to miniſters of all denominations to preach in it whenever they pleaſe.

DO'VER, a town of the American States, the metropolis of Delaware ſtate, in Kent county, on the ſouth-weſt ſide of Jones's creek, about four miles and a half north-weſt from its mouth, in the Delaware; twelve miles from Duck creek, forty-eight from Wilmington, and ſeventy-ſix ſouth-ſouth-weſt of Philadelphia. It contains four ſtreets, which interſect each other at right angles, in the center of the town. The area included within theſe interſections extends into a ſpacious parade, on the eaſt ſide of which is an elegant ſtate-houſe. It has a conſiderable trade with Philadelphia, chiefly in flour. Lat. 39. 10. N. lon. 75. 34. W.

DO'VER, a town of the American States, in York county, Pennſylvania, on Fox Run, which falls into Conewago creek, near its mouth, in the Suſquehannah. It contains a German Lutheran and Calviniſt church, united.

DOVE'RA, a town of Italy, in the duchy of Milan: twenty-four miles weſt of Milan.

DO'VETAIL, *ſ.* A form of joining two bodies together, where that which is inſerted has the form of a dove's tail, or wedge reverſed, and therefore cannot fall out.

DOUGH, *ſ.* [ðah, Sax. *deegh*, Dut.] The paſte of bread, or pies unbaked:

You that from pliant paſte would fabrics ariſe,
Expecting thence to gain immortal praiſe,
Your knuckles try, and let your ſinews know,
Their power to knead, and give the form to *dough*. *King.*

My cake is DOUGH. My affair has miſcarried; my undertaking has never come to maturity:

My cake is dough, but I'll in among the reſt;
Out of hope of all, but my ſhare of the feaſt. *Shakeſpeare.*

DOUGHBA'KED, *adj.* Unfiniſhed; not hardened to perfection; ſoft:

For when, through taſteleſs flat humility,
In *doughbak'd* men ſome harmleſſneſs we ſee,
'Tis but his phlegm that's virtuous, and not he. *Donne.*

DO'UGHTY, *adj.* [ðohtiȝ, Sax. *deught*, virtue, Dut.] Brave; noble; illuſtrious; eminent. Uſed of men and things:

Such reſtleſs paſſion did all night torment
The flatt'ning courage of that fairy knight,
Deviſing how that *doughty* tournament
With greateſt honour he achieven might. *Spenſer.*

It is now ſeldom uſed but ironically, or in burleſque.—If this *doughty* hiſtorian hath any honour or conſcience left, he ought to be pardoned. *Stillingfleet.*

She ſmil'd to ſee the *doughty* hero ſlain;
But, at her ſmile, the beau reviv'd again. *Pope.*

DOUGH'TY-HAND'ED, *adj.* Powerful:

I thank you all,
For *doughty-handed* are you. *Shakeſpeare.*

DOUGH'Y, *adj.* Unſound; ſoft; unhardened.—Your ſon was miſled with a ſnipt taffata fellow there, whoſe villainous ſaffron would have made all the unbaked and *doughy* youth of a nation in his colour. *Shakeſpeare.*

DOUGIELIS'KI, a town of Lithuania, in the palatinate of Wilna: ſixteen miles north-north-eaſt of Wilna.

DOU'GLAS (Gawin), a Scotch prelate diſtinguiſhed for poetical talents, the third ſon of Archibald earl of Angus, born in 1474–5. He received a liberal education, firſt in his own country, and afterwards at the univerſity of Paris. On his return from his travels he entered into the church, and obtained the biſhopric of Dunkeld. Such was the violence of the times, that he was induced to retire into England; and as at that juncture war broke out between the two kingdoms, his enemies took advantage of his retreat to a hoſtile country, to repreſent him as a diſaffected perſon. A proſecution was commenced againſt him on this account, which ended in a ſentence of proſcription, and ſequeſtration of his epiſcopal revenues. He was reſpectfully received in England, and Henry VIII. granted him a liberal penſion, as a man of learning, and as a ſufferer for attachment to the Engliſh intereſt. He died of the plague at London in 1521, and was buried in the Savoy church. Biſhop Douglas has the merit of being a conſiderable improver of the language and verſification of his country, and Scottiſh poetry is indebted to him for a degree of elegance which, allowing for difference of dialect, places it on a level with the Engliſh of the time. In his youth he tranſlated Ovid *De Remedio Amoris*, not without a view, it is thought, to ſuggeſt to his own mind ſome defence againſt that importunate paſſion. But his greateſt work is a tranſlation of Virgil's Eneid, with the additional book of Mapheus Vegius, into Scottiſh heroic verſe. This is ſaid by Mr. Warton to have been the firſt metrical tranſlation of a claſſic in the language of Great Britain, unleſs one of Boethius can be called an exception. It was written about 1512, and was completed in the ſpace of ſixteen months. A new edition of this tranſlation was printed, with a gloſſary, at Edinburgh in 1710, ſmall folio. The biſhop likewiſe compoſed an original poem, intitled The Palice of Honour, which is a moral viſion in the manner of the Table of Cebes; and an allegorical poem called King Hart, firſt publiſhed in Mr. Pinkerton's Ancient Scottiſh Poems.

DOU'GLAS (James, M. D.) an able anatomiſt, born in Scotland in 1675. He ſettled in London, and made himſelf known by various writings. Haller, who was perſonally acquainted with him, calls him a learned and ſkilful man, and a very diligent diſſector. Beſides ſeveral papers in the Philoſophical Tranſactions, he wrote, 1. *Myographiæ Comparatæ Specimen*, or a Comparative Deſcription of all the Muſcles in a Man and a Quadruped, London, 1707, 12mo. which is the beſt myography extant down to his time, and is particularly accurate in the inſertions of the muſcles into the bones. 2. *Bibliographiæ Anatomicæ Specimen*, London, 1715, 8vo. a brief account, in Latin, of all anatomiſts from Hippocrates to Harvey, with their works and diſcoveries: of this an improved edition was publiſhed at Leyden in 1734. 3. A Deſcription of the Peritoneum, &c. London, 1730, 4to. an accurate and minute piece of anatomical examination. He alſo publiſhed, 4. A Hiſtory of the Lateral Operation for the Stone,

1726, 8vo. He had prepared a great work on hernias, for which he had made ſeveral figures, but he did not live to finiſh it. Dr. Douglas had the merit of patronizing the eminent anatomiſt Dr. John Hunter, who came from Scotland recommended to him in 1741. He died in 1742.

DOU'GLAS, a town of Scotland, in the county of Lanerk, on a ſmall river of the ſame name, which ſoon after runs into the Clyde, near which is Douglas Caſtle: eight miles ſouth of Lanerk.

DOU'GLAS, a ſea-port town of the Iſle of Man, ſituated in a large bay to which it gives name, in the Iriſh ſea, with a harbour for veſſels of tolerable burden; the trade and number of inhabitants have greatly increaſed within the laſt fifty years. Lat. 54. 9. N. lon. 4. 44. W. Greenwich.

DOU'GLAS, a townſhip of the American States, in Worceſter county, Maſſachuſetts, having the ſtate of Rhode Iſland on the ſouth, and that of Connecticut on the ſouth-weſt, and through it paſſes the middle road from Boſton to New York: ſixteen miles ſouth of Worceſter, and forty-ſeven ſouth-weſt of Boſton. It was incorporated anno 1746, and received its name in honour of William Douglas, M. D. of Boſton, a native of Scotland, and a conſiderable benefactor to the town.

DOU'GLAS, a townſhip of the American States, in Montgomery county, Pennſylvania.

DOUGLAS'SIA, *ſ.* [ſo named in honour of James Douglas, M. D.] In botany, a genus of the claſs polyadelphia, order polyandria. The generic characters are—Calyx: perianthium one-leafed, turbinate, half ſix-cleft, permanent; ſegments ovate, acute, coloured. Corolla: none; nectaries ſix, ovate on the outſide with two oblong pits, on the inſide convex, anther-bearing; terminated by two glands, convex without, concave within; ending at the bottom in a capillary pedicel, ſhorter than the calyx, inſerted at the baſe of the ſegments, with a villoſe gland on each ſide at the inſertion of it. Stamina: filaments none; antheræ very many, minute, one-celled, with the valve opening at the baſe. Piſtillum: germ ovate, ſuperior; ſtyle filiform, the length of the ſtamens; ſtigma ſix-cleft. Pericarpium: berry ovate, acute, one-celled. Seed: ſingle, with a brittle ſhell.—*Eſſential Character.* Calyx, half ſix-cleft; corolla, none; nectaries ſix; filaments none; germ ſuperior; ſtigma ſix-cleft; berry ovate, one-celled; ſeed, one, with a brittle ſhell. It is allied to Poroſtema; the fructification is extremely ſingular; the fruit aromatic.

Douglaſſia Guianenſis, or Guiana Douglaſſia; with alternate lanceolate leaves. This, the only ſpecies, is a middling ſized ſhrub, growing in Guiana; it is about five feet high, and branching at the top; its diameter five or ſix inches; the wood white and compact; the branches are ſubdivided into ſmaller ones; the flowers grow at their extremities in a kind of ſtraggling cluſters, and are ſmall and yelloviſh. See VOLKAMERIA.

DOU'GLEDY, a river of South Wales, which joins the Clethy, about three miles ſouth from Haverfordweſt, in the county of Pembroke.

DOU'LA BASSENDAR, a town of Aſia, in the country of Kemaoon: ſeventeen miles north of Lucknow.

DOU'LAINCOURT, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Joinville, ten miles ſouth-weſt of Joinville.

DOU'LENS, or DOURLENS, a town of France, and principal place of a diſtrict, in the department of the Somme: fifteen miles north of Amiens, and eighteen ſouth-weſt of Arras.

DOU'LEVENT, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Joinville: three leagues ſouth-weſt of Joinville.

DOU'LON, a river of France, which runs into the Allier near Brioude.

DOUR'DAN, a town of France, and principal place of a diſtrict, in the department of the Seine and Oiſe, on the Orge. The corn-market is large, and there are manufactures of worſted and ſilk-hoſe: twenty-five miles ſouth-weſt of Paris, and eight north of Eſtampes.

DOUR'GNE, a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Caſtres: three leagues ſouth of Caſtres.

DOUR'LERS, or DOULERS, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Aveſnes: two leagues ſouth of Mauberge.

DOU'SA (Janus), properly *John Vanderdoes*, lord of Noortwyk in Holland, born in 1545. He ſtudied at Lier, Louvain, and Paris. On his return he had various employments; and, in 1574 was entruſted by the prince of Orange with the government of Leyden. He defended that city during its famous ſiege by the Spaniards, and obtained great reputation for his valour and conduct. Upon the foundation of the univerſity there, he was nominated its firſt curator; and he diſtinguiſhed himſelf as much by his learning at the head of a literary inſtitution, as he had done in his former poſt by his military qualities. He died of the plague in 1604. Douſa was the author of a number of Latin poems, conſiſting of epodes, epigrams, ſatires, elegies, &c. and ſix books of the Annals of Holland in elegiac verſe. This laſt has been printed ſeparately, with a commentary by Grotius. His verſes deſerve the praiſe of elegance and purity. He left four ſons, all of them proficients in letters. Of theſe the moſt celebrated was

JANUS DOUSA, *the Younger*, born in 1572. His extraordinary acquiſitions at a very tender age have given him a place among thoſe who became celebrated for literature in their childhood. He was a poet, a critic, a mathematician, and philoſopher. He wrote commentaries upon Plautus, in his ſixteenth year; and upon ſeveral other authors, at the age of nineteen. He afterwards acquired the knowledge of juriſprudence and hiſtory, and had been juſt appointed preceptor of Henry-Frederic prince of Orange, and firſt librarian to the univerſity of Leyden, when he was cut off in his twenty-ſixth year. His poems were collected after his death, and publiſhed at Leyden in 1607.

DOU'SABEL, [*Douce-et-belle*, Fr. ſweet and fair.] A proper name of women.

To DOUSE, *v. a.* [δυσις; but probably it is a cant word formed from the ſound.] To put over head ſuddenly in the water.

To DOUSE, *v. n.* To fall ſuddenly into the water:

It is no jeſting, trivial matter,
To ſwing i'th' air, or *douſe* in water. *Hudibras.*

DOU'TREMERE, *adj.* [Fr.] Brought from beyond ſea; ſeafaring, travelling beyond ſea. *Obſolete.*

DOUW (Gerard), an eminent painter of the Dutch ſchool, born in 1613 at Leyden, where his father was a glazier. His early inclination for painting cauſed him to be placed firſt with Dolendo, an engraver, then with Peter Kouwhoorn, a painter on glaſs; and, for farther improvement, he was ſent to ſtudy under Rembrandt. From that great maſter he imbibed the true principles of colouring, and a perfect knowledge of the chiaro-ſcuro; but, in other reſpects, he formed to himſelf a manner totally different. Douw excelled all the artiſts in exquiſite delicacy of finiſh. He copied after nature, and was not contented without rendering every object, however inconſiderable, with an exactneſs of imitation that would bear the cloſeſt inſpection. As he worked in ſmall ſize, the patience and labour required for ſuch minute accuracy may be conceived, as it has given a laſting value to his performances. The prices his pictures bore even in his own time and country were extraordinary, and at this time they are highly valued all over Europe. He died at Leyden in 1674. His works are diſperſed through the different cabinets of Europe.

DOUX. See DOUBS.

DO'VY, or DOUYE, a river of Wales, which riſes in the ſouth-eaſt part of Merionethſhire, paſſes by Machynlleth,

lleth, &c. and runs into the ſea, about ſeven miles north of Aberiſtwith.

DOUZE, a river of France, which runs into the Adour, near Tartas.

DOUZE, a town of France, in the department of the Dordogne: ſeven miles ſouth-eaſt of Perigueux.

DOU'ZEPERE, *ſ.* [old Fr.] One of the twelve peers of France.—Big looking like a doughty *douzepere*. *Spenſer*.

DOU'ZY, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Sedan: four miles eaſt of Sedan.

DOW'ABLE, *adj.* Entitled to dower.—A ſeiſin in law of the huſband will be as effectual as a ſeiſin in deed, in order to render the wife *dowable*. *Blackſtone*.

DOW'AGER, *ſ.* [*douairiere*, Fr.] A widow with a jointure.—Widows have a greater intereſt in property than either maids or wives; ſo that it is as unnatural for a *dowager* as a freeholder to be an enemy to our conſtitution. *Addiſon*.

She lingers my deſires,
Like to a ſtepdame or a *dowager*,
Long wintering on a young man's revenue. *Shakeſpeare*.

The title given to princeſſes or ladies who ſurvive their huſbands:

Catharine no more
Shall be call'd queen; but princeſs *dowager*,
And widow to prince Arthur. *Shakeſpeare*.

DOW'AGER (queen), the widow of a king, and as ſuch enjoys in England moſt of the privileges belonging to her as queen conſort. But it is not high treaſon to conſpire her death, or violate her chaſtity; becauſe the ſucceſſion to the crown is not thereby endangered. But no man can marry her, without ſpecial licence from the king, on pain of forfeiting his lands and goods. 2 *Inſt.* 18. 1 *Comm.* 223.

DOW'CETS, *ſ. pl.* The *teſtes* of deer.—I gave them all the ſweet morſels, call'd tongue, ears, and *dowcets*. *Ben Jonſon*.

DOW'DY, *ſ.* An awkward, ill-dreſſed, inelegant, woman.—Laura, to his lady, was but a kitchen wench; Dido, a *dowdy*; Cleopatra, a gipſy; Helen and Hero, ſlidings and harlots. *Shakeſpeare*.

The bedlam train of lovers uſe
T' inhance the value, and the faults excuſe;
And therefore 'tis no wonder if we ſee
They doat on *dowdies* and deformity. *Dryden*.

DOW'DY, *adj.* Awkward:

No houſewifery the *dowdy* creature knew;
To ſum up all, her tongue confeſs'd the ſhrew. *Gay*.

DOW'ER, or DOWERY, *ſ.* [*douaire*, Fr.] That which the wife bringeth to her huſband in marriage:

His wife brought in *dow'r* Cilicia's crown,
And in herſelf a greater *dow'r* alone. *Dryden*.

Rich, though depriv'd of all her little ſtore,
For who can ſeize fair virtue's better *dow'r*? *Melmoth*.

That which the widow poſſeſſes.—His patrimonial territories of Flanders were in *dower* to his mother-in-law. *Bacon*.—The gifts of a huſband for a wife.—Aſk me never ſo much *dowery* and gift, and I will give according as you ſhall ſay unto me; but give me the damſel to wife. *Gen.* xxxiv. 12.—Endowment; gift:

What ſpreading virtue, what a ſparkling fire,
How great, how plentiful, how rich a *dow'r*,
Doſt thou within this dying fleſh inſpire! *Davies*.

DOW'ER, *ſ.* [*dotarium*, Lat.] In law, the portion which a widow hath of the lands of her huſband after his deceaſe, for the ſuſtenance of herſelf, and education of her children. 1 *Inſt.* 30. There were formerly five kinds of dower in this kingdom. 1. Dower by the common law; which is a third part of ſuch lands or tenements whereof the huſband was ſole ſeiſed in fee-ſimple, or fee-tail, during the coverture; and this the widow is to enjoy during her life. 2. Dower by cuſtom; which is that part of the eſtate to which the widow is entitled after the death of her huſband, by the cuſtom of any manor or place, ſo long as ſhe lives ſole and chaſte; and this is more than one-third part, for in ſome places ſhe ſhall have half the land, as by the cuſtom of gavelkind; and in divers manors the widow ſhall have the whole during her life, which is called her free-bench: but as cuſtom may enlarge, ſo it may abridge, dower to a fourth part. *Co. Litt.* 33. 3. *Dower ad oſtium eccleſiæ*; made by the huſband himſelf immediately after the marriage, who named ſuch particular lands of which his wife ſhould be endowed. *Co. Litt.* 34. 4. *Dower ex aſſenſu patris*, a ſpecies of the *dower ad oſtium eccleſiæ*; which was likewiſe of certain lands named by a ſon who was the huſband, with the conſent of his father then living, and put in writing as ſoon as the ſon was married. *Litt.* 40. 5. *Dower de la pluis belle*; which was where the wife was endowed with the faireſt part of her huſband's eſtate. But of all kinds of dower, the two firſt are now only in uſe.

A woman to be endowed muſt be the actual wife of the party at the time of his deceaſe. If ſhe be divorced *à vinculo matrimonii*, ſhe ſhall not be endowed; for *ubi nullum matrimonium, ibi nulla dos*. *Bract.* lib. ii. c. 39. But a divorce *à menſa et thoro* only, doth not deſtroy the dower, *Co. Litt.* 32. no, not even for adultery itſelf by the common law. Yet now, by ſtat. Weſtm. 2. 13 Edw. I. c. 34. if a woman voluntarily leaves (which the law calls eloping from) her huſband, and lives with an adulterer, ſhe ſhall loſe her dower, unleſs her huſband be voluntarily reconciled to her. And, in a caſe where John de Camoys had aſſigned his wife by deed, it was decided in parliament, that, notwithſtanding the pretended purgation of the adultery in the ſpiritual court, the wife was not entitled to dower. 2 *Inſt.* 435. If, however, after the elopement of a wife, her huſband and ſhe demean themſelve as huſband and wife, it is evidence of reconciliation. *Dyer* 106. Lady Powys's caſe, where the reconciliation was ſpecially pleaded and allowed. It was formerly held, that the wife of an ideot might be endowed, though the huſband of an ideot could not be tenant by the curteſy. *Co. Litt.* 31. But, as it ſeems to be at preſent agreed, upon principles of ſound ſenſe and reaſon, that an ideot cannot marry, being incapable of conſenting to any contract, this doctrine cannot now take place. By the ancient law the wife of a perſon attainted of treaſon or felony could not be endowed; to the intent, ſays Staundforde, b. 3. c. 3. that if the love of a man's own life cannot reſtrain him from ſuch atrocious acts, the love of his wife and children may: though Britton, c. 110. gives it another turn; viz. that it is preſumed the wife was privy to her huſband's crime. However, the ſtat. 1 Edw. VI. c. 12. abated the rigour of the common law in this particular, and allowed the wife her dower. But a ſubſequent ſtat. 5 & 6 Edw. VI. c. 11. revived the ſeverity againſt the widows of traitors, who are now barred of their dower; (except in the caſe of certain treaſons relating merely to the coin; 5 Eliz. c. 11. 18 Eliz. c. 1. 8 & 9 Will. III. c. 26. 15 & 16 Geo. II. c. 28.); but the widows of felons are not barred. An alien alſo cannot be endowed unleſs ſhe be queen conſort; for no alien is capable of holding lands. *Co. Litt.* 31.

The wife of a man who is baniſhed ſhall have dower in his life-time; it is held otherwiſe, if he is profeſſed in religion: and a jointreſs of a baniſhed huſband ſhall enjoy her jointure, in his life. *Co. Litt.* 133. If a woman be of the age of nine years at the death of her huſband, ſhe ſhall be endowed of whatſoever age he is; becauſe, after the death of the huſband, the marriage is adjudged lawful. *Co. Litt.* 33. The wife of a *felo de ſe* ſhall have dower. So if the huſband be outlawed in treſpaſs, or any civil action, for this works no corruption of blood or forfeiture of lands. *Perk.* 388. If a woman being a lunatic kill her huſband, yet ſhe ſhall be endowed, becauſe this cannot be felony in her who was deprived of her underſtanding by the act of God; ſo, though ſhe be of ſound mind, and

refuſe

refuſe to bring an appeal of his death, when he is killed by another, yet ſhe ſhall be endowed; for this is only a waver of that privilege the law has given her to be avenged of her huſband's murderer; ſo it ſeems if ſhe refuſe to viſit and aſſiſt her huſband in his ſickneſs, yet ſhe ſhall be endowed, for this is only undutifulneſs, which the law does not puniſh with the loſs of her entire ſubſiſtence. *Perk.* 364.

If a man take an alien to wife and dieth, ſhe ſhall not be endowed, except the wife of the king, who ſhall be endowed by the law of the crown. And if a Jew born in England marry a Jeweſs alſo born here, the huſband becomes a Chriſtian, purchaſes lands and dies; the wife, not being alſo a Chriſtian, ſhall not have dower. 1 *Inſt.* 31. *b.*

In Hargrave's edition of Co. Litt. the latter part of the above is confirmed; as to the former, there is the following remarkable note: Anciently a woman alien was not dowable; but, by ſpecial act of parliament not printed, Rot. Parl. 8 Hen. V. n. 15. all women aliens who from thenceforth ſhould be married to Engliſhmen by licence of the king, are enabled to demand their dower after the death of their huſbands, to whom they ſhould in time to come be married, in the ſame manner as Engliſh women. But this act did not extend to thoſe married before; and therefore, in Rot. Parl. 9 Hen. V. n. 9. there is a ſpecial act of parliament to enable Beatrice counteſs of Arundel, born in Portugal, to demand her dower. *Hal.* MSS. 9 *Vin.* 210.

A woman is now by law entitled to be endowed of all lands and tenements, of which her huſband was ſeiſed in fee-ſimple, or fee-tail general, at any time during the coverture; and of which any iſſue, which ſhe might have had, might by poſſibility have been heir. Therefore if a man, ſeiſed in fee-ſimple, has a ſon by his firſt wife, and afterwards marries a ſecond wife, ſhe ſhall be endowed of his lands; for her iſſue might by poſſibility have been heir, on the death of the ſon by the former wife. But, if there be a donee in ſpecial tail, who holds lands to him and the heirs of his body begotten on A. his wife; though A. may be endowed of theſe lands, yet if A. dies, and he marries a ſecond wife, that ſecond wife ſhall never be endowed of the lands entailed; for no iſſue, that ſhe could have, could by any poſſibility inherit them. *Litt.* 53. But in caſe land be given to the huſband and wife in tail, the remainder in tail to the huſband, and the firſt wife dying without iſſue, he marries another wife; this ſecond wife will be entitled to dower after his death. 40 *Edw.* III. c. 4. 2 *Shep. Abr.* 63. For here he hath an eſtate in tail. The wife of a tenant in common, but not a joint-tenant, ſhall have dower; and ſhe ſhall hold her part in common with the tenants in common. *Kitch.* 160.

A ſeiſin in law of the huſband will be as effectual as a ſeiſin in deed, in order to render the wife dowable; for it is not in the wife's power to bring the huſband's title to an actual ſeiſin, as it is in the huſband's power to do with regard to the wife's lands; which is one reaſon why he ſhall not be a tenant by the curteſy, but of ſuch lands whereof the wife, or he himſelf in her right, was actually ſeiſed in deed. *Co. Litt.* 31. The ſeiſin of the huſband, for a tranſitory inſtant only, when the ſame act which gives him the eſtate conveys it alſo out of him again, (as where by a fine land is granted to a man, and he immediately renders it back by the ſame fine,) will not entitle the wife to dower. *Cro. Jac.* 615. *Co. Litt.* 31. for the land was merely *in tranſitu*, and never veſted in the huſband, the grant and render being one continued act. But, if the land abide in him for the interval of but one ſingle moment, it ſeems that the wife ſhall be endowed thereof. And, in ſhort, a widow may be endowed of all her huſband's lands, tenements, and hereditaments, corporeal or incorporeal, under the reſtrictions before mentioned; unleſs there be ſome ſpecial reaſon to the contrary. Thus, a woman ſhall not be endowed of a caſtle, built for defence of the realm; nor of a common without ſtint; for, as the heir would then have one portion of this common, and the widow another, and both without ſtint, the common would be doubly ſtocked. Copyhold eſtates are alſo not liable to dower, being only eſtates at the lord's will, unleſs by the ſpecial cuſtom of the manor, in which caſe it is uſually called the *widow's free-bench.* 4 *Rep.* 22. But where dower is allowable, it matters not though the huſband alien the lands during the coverture; for he aliens them liable to dower. *Co. Litt.* 32.

It is now ſettled, that although the huſband may be tenant by the curteſy of a truſt eſtate of inheritance, the wife is not entitled to dower out of ſuch an eſtate. 3 *P. Wms.* 229. The reaſon aſſigned for this is, that the wife was not endowed of a uſe at common law. And from analogy to truſts, it has been determined that a wife ſhall not be endowed of an equity of redemption, where the eſtate was mortgaged in fee by the huſband previous to the marriage. 1 *Bro. C. R.* 326. If lands are exchanged by the huſband for other lands, the wife may be endowed of which lands ſhe will, as the huſband was ſeiſed of both; though ſhe may not be endowed of the lands given and taken in exchange. *Co. Lit.* 31.

Where the eſtate, which the huſband hath during the marriage, is ended, there the wife ſhall loſe her dower. *New Nat. Br.* 333. But of an eſtate-tail in lands determined, a woman ſhall be endowed; in like manner as a man may be tenant by the curteſy of her lands. *Co. Lit.* 31. And if a wife be endowed of her third part, and afterwards evicted by an elder title, ſhe ſhall have a new writ of dower, and be endowed of the other lands. 2 *Danv. Abr.* 670. Though this is, where it is the immediate eſtate deſcended to the heir; and not when it is the eſtate of an alienee. 9 *Rep.* 17. The wife is dowable where lands are recovered againſt the huſband by default or covin; and a woman deforced of her dower ſhall recover damages, viz. the value of her dower from her huſband's death. 13 *Edw.* I. 20 *Hen.* III. If the huſband doth not die ſeiſed, after demand and refuſal to aſſign dower to her, ſhe ſhall have damages from the time of the refuſal. *Jenk. Cent.* 45. She ſhall be endowed of a reverſion, expectant on a term of years; and of a rent reſerved thereon. *Lutw.* 729. If the huſband hath only an eſtate for life, remainder to another in tail, though the remainder over is to his heirs, the wife ſhall not be endowed. 2 *Danv.* 656. A woman ſhall not be endowed of the goods of her huſband; nor of a caſtle, or capital meſſuage; but of all other lands and tenements ſhe may. *Co. Lit.* 35.

A grantee of a rent in fee or tail, dies without heir, his wife ſhall be endowed; but not where the rent ariſes upon a reſervation to the donor and his heirs, on a gift in tail, and the donee dies without iſſue; for this is a collateral limitation. *Plowd.* 156. If during the coverture, the huſband doth extinguiſh rents by releaſe, &c. yet ſhe ſhall be endowed of them; for as to her dower in the eye of the law, they have continuance. *Co. Lit.* 32. And where a rent is deſcended to the huſband but he dies before any day of payment; notwithſtanding the wife ſhall be endowed of it. 1 *Hen.* VII. 17. If lands are given to the huſband and wife in tail, and after the death of the huſband, the wife diſagrees, ſhe may recover her dower; for by her waving her eſtate, her huſband in judgment of law was ſole ſeiſed *ab initio.* 3 *Rep.* 27. If lands are improved, the wife is to have one third according to the improved value. And if the ground delivered her be ſowed, ſhe ſhall have the corn. 2 *Inſt.* 81.

Dower is an inſeparable incident to an eſtate in tail or fee, and cannot be taken away by condition. If one ſeiſed in fee of lands make a gift in tail, on condition that the wife ſhall not have dower, the condition is void. 6 *Rep.* 41. If tenant in tail die without iſſue, ſo that the land reverts to the donor; or in caſe he covenants to ſtand ſeiſed to uſes, and dies, his wife will be endowed: and a deviſe of land by the huſband to his wife by will is no bar of her dower, but a benevolence. *Yelv.* 51. A perſon grants and conveys land to D. and his heirs, on condition, to re-demiſe the ſame back, &c. which afterwards

wards he does, and dies; here D's widow may nevertheleſs be endowed. *Abr. Caſ.* 217. A. is tenant in tail of lands, the remainder to B. in tail, remainder to A. in fee; if A. bargains and ſells the land to C. and his heirs, the wife of the bargainee ſhall have dower, determinable upon the death of the tenant in tail. 10 *Rep.* 96. And if a feoffment be made upon a condition to reinfeoff, and the feoffee take a wife, ſhe may have her dower till reinfeoffment, or an entry made for not doing it: and ſo it is of other defeaſible eſtates. *Perk.* 420. If one be diſſeiſed, and after doth marry, if he die before entry, his wife ſhall not have dower: and where a perſon recovers land in a real action, and before his entry or execution made he dieth, the wife ſhall not be endowed of this land. 2 *Rep.* 56. In theſe caſes the huſband was not actually ſeiſed; for, as before obſerved, where there is a ſeiſin in law, ſhe ſhall be endowed. So that theſe caſes depend on the conſtruction of what is, and what is not, a ſeiſin in law.

Although of copyhold lands a woman ſhall not be endowed, unleſs there be a ſpecial cuſtom for it; yet if there be a cuſtom to be endowed thereof, then ſhe ſhall have the aſſiſtance of ſuch laws as are made for the more ſpeedy recovery of dower in general, being within the ſame miſchief, and therefore ſhall recover damages within the ſtatute of Merton. 4 *Co.* 22. Of tithes women were not dowable till 32 Hen. VIII. c. 7; for before that ſtatute tithes were not a lay fee, but now they are dowable of them. *Style's P. R.* 122. 1 *Rol. Abr.* 682. Of an advowſon, be it appendant or in groſs, a woman ſhall be endowed; for this may be divided as to the fruit and profit of it, viz. to have the third preſentation. *Co. Litt.* 32. 3 *Leon.* 155.

By the old law, grounded on the feodal exactions, a woman could not be endowed without a fine paid to the lord: neither could ſhe marry again without his licence; leſt ſhe ſhould contract herſelf, and ſo convey part of the feud, to the lord's enemy. This licence the lord took care to be well paid for; and, as it ſeems, would ſometimes force the dowager to a ſecond marriage, in order to gain the fine. But to remedy theſe oppreſſions, it was provided, firſt by the famous charter of Hen. I. A. D. 1101, and afterwards by Magna Charta, that the widow ſhall pay nothing for her marriage, nor ſhall be diſtrained to marry afreſh, if ſhe chooſes to live without a huſband; but ſhall not, however, marry againſt the conſent of the lord; and farther, that nothing ſhall be taken for aſſignment of the widow's dower, but that ſhe ſhall remain in her huſband's capital manſion-houſe for forty days after his death, during which time her dower ſhall be aſſigned. Theſe forty days are called the widow's quarantine; a term made uſe of in law to ſignify the number of forty days, whether applied to this occaſion or any other. The particular lands, to be held in dower, muſt be aſſigned, by the heir of the huſband, or his guardian; not only for the ſake of notoriety, but alſo to entitle the lord of the fee to demand his ſervices of the heir, in reſpect of the land ſo holden. For the heir by this entry becomes tenant thereof to the lord, and the widow is immediate tenant to the heir, by a kind of ſub-infeudation, or under-tenancy, completed by this inveſtiture or aſſignment; which tenure may ſtill be created, notwithſtanding the ſtatute of *quia-emptores*, becauſe the heir parts, not with the fee-ſimple, but only with an eſtate for life. If the heir or his guardian do not aſſign her dower within the time of quarantine, or do aſſign it unfairly, ſhe has her remedy at law, and the ſheriff is appointed to aſſign. *Co. Litt.* 34, 5. Or if the heir (being under age) or his guardian, aſſign more than ſhe ought to have, it may be afterwards remedied by a writ of admeaſurement of dower. *Finch L.* 314. If the thing of which ſhe is endowed be diviſible, her dower muſt be ſet out by metes and bounds, but if it be indiviſible, ſhe muſt be endowed ſpecially; as of the third preſentation to a church, the third toll-diſh of a mill, the third part of the profits of an office, the third ſheaf of tithe, and the like. *Co. Litt.* 32.

The aſſignment of the lands is for the life of the woman; and if lands are aſſigned to a woman for years, in recompenſe of dower, this is no bar of dower; for it is not ſuch an eſtate therein as ſhe ſhould have. 2 *Danv. Abr.* 668. Alſo where other land is aſſigned to the woman, that is no part of the lands wherein ſhe claims dower; that aſſignment will not be good or binding: for there muſt be certainty in what is aſſigned; otherwiſe, though it be by agreement, it may be void. 1 *Inſt.* 34. If a wife accept and enter upon leſs land than the third of the whole, on the ſheriff's aſſignment, ſhe is barred to demand more. But if, where a wife is entitled to dower of the lands of her firſt huſband, her ſecond huſband accepts of this dower leſs than her third part, after his death ſhe may refuſe the ſame, and have her full third part. *Fitz. Dower*, 121.

If a wife, having right of dower in the land, accept of a leaſe for years thereof after the death of her huſband, it ſuſpends the dower; though not ſuch acceptance of a leaſe before the huſband's death; for then the wife has only a title to have dower, and not an immediate right of dower. *Jenk. Cent.* 15. A widow accepting of dower of the heir, againſt common right, ſhall hold it ſubject to the charges of her huſband; but otherwiſe it is if ſhe be endowed againſt common right by the ſheriff. 2 *Danv.* 672. By proviſion of law, the wife may take a third part of the huſband's lands, and hold them diſcharged. If dower be aſſigned a woman on condition, or with an exception, the condition and exception are void. *Cro. Eliz.* 541. Where there are three manors, one of them may be aſſigned to the wife in dower in lieu of dower in all three; though it is ſaid that a third part of every manor ought to be aſſigned. *Moor* 12, 47. The ſheriff may aſſign a rent out of the land in lieu of dower; and her acceptance of the rent will bar dower out of the ſame land, but not of other lands. 1 *Nelſ. Abr.* 680.

A woman entitled to dower cannot enter till it be aſſigned to her, and ſet out either by the heir, turtenant or ſheriff, in certainty. *Plowd.* 529. None can aſſign dower but thoſe who have a freehold, or againſt whom a writ of dower lies; therefore a tenant by ſtatute merchant, ſtatute ſtaple, or *elegit*, or leſſee for years, cannot aſſign dower, for none of theſe have an eſtate large enough to anſwer the plaintiff's demand. *Co. Litt.* 35. If a woman be dowable of land, meadow, paſture, wood, &c. and any of theſe be aſſigned in lieu of dower of all the reſt, it is good, though it be againſt common right, which gives her but the third part of each, for the heir's enjoyment of the reſidue ſufficiently accounts for her title to what ſhe has. 1 *Rol. Abr.* 683. If lands whereof a woman hath no right to be endowed, or a rent out of ſuch lands be aſſigned in lieu of her dower, this does not bar her demand of dower, for ſhe, having no manner of title to thoſe lands, cannot without livery and ſeiſin be any more than tenant at will, which is no ſufficient recompenſe for an eſtate for life, which her dower was to be. *Co. Litt.* 169. If the heir within age aſſign to the wife more land in dower than ſhe ought to have, he himſelf ſhall have a writ of admeaſurement of dower at full age by the common law. If the wife, after aſſignment of dower, improves the lands, ſo as thereby they become of greater value than the other two parts, no writ of admeaſurement lies; ſo if they be of greater value, by reaſon of mines open at the time of the aſſignment, no writ of admeaſurement lies, becauſe the land in quantity was no more than ſhe ought to have; and then it is lawful to work the mines, which were open at the time of ſuch aſſignment. 2 *Inſt.* 368. 5 *Co.* 12.

Upon preconcerted marriages, and in eſtates of conſiderable conſequence, tenancy in dower happens very ſeldom: for the claim of the wife to her dower at the common law, diffuſing itſelf ſo extenſively, it became a great clog to alienations, and was otherwiſe very inconvenient to families. Wherefore ſince the alteration of the ancient

law reſpecting dower *ad oſtium eccleſiæ*, which has occaſioned the entire diſuſe of that ſpecies of dower, jointures have been introduced in their ſtead, as a bar to the claim at common-law. A widow may be barred of her dower, not only by elopement, divorce, being an alien, the treaſon of her huſband, and other diſabilities beforementioned, but alſo by detaining the title deeds, or evidences of the eſtate from the heir, until ſhe reſtores them. Though if ſhe denies the detainer, and it is found againſt her, ſhe loſes her dower. By the ſtat. of Glouceſter, 6 Edw. I. c. 7, if a dowager aliens the land aſſigned her for dower, ſhe forfeits it *ipſo facto*, and the heir may recover it by action. A woman alſo may be barred of her dower, by levying a fine with her huſband, or ſuffering a recovery of the lands during her coverture. *Plowd.* 514. But the moſt uſual method of barring dower, is by jointures, as regulated by the ſtat. 27 Hen. VIII. c. 10.

A jointure, which, ſtrictly ſpeaking, ſignifies a joint-eſtate, limited to both huſband and wife, but in common acceptation extends alſo to a ſole eſtate, limited to the wife only, is thus defined by Coke, 1 *Inſt.* 36. "A competent livelihood of freehold for the wife, of lands and tenements; to take effect, in profit or poſſeſſion, preſently after the death of the huſband; for the life of the wife at leaſt." This deſcription is framed from the ſtat. 27 Hen. VIII. c. 10, commonly called the *ſtatute of Uſes*. Before the making of that ſtatute, the greateſt part of the land in England was conveyed to uſes; the property or poſſeſſion of the ſoil being veſted in one man, and the uſe, and profits thereof, in another; whoſe directions, with regard to the diſpoſition thereof, the former was in conſcience obliged to follow, and might be compelled by a court of equity to obſerve. Now, though a huſband had the uſe of lands in abſolute fee-ſimple, yet the wife was not entitled to any dower therein; he not being ſeiſed thereof: wherefore it became uſual, on marriage, to ſettle by expreſs deed ſome ſpecial eſtate to the uſe of the huſband and his wife, for their lives, in joint-tenancy, or jointure; which ſettlement would be a proviſion for the wife, in caſe ſhe ſurvived her huſband. At length the ſtatute of uſes ordained, that ſuch as had the uſe of lands, ſhould, to all intents and purpoſes, be reputed and taken to be abſolutely ſeiſed and poſſeſſed of the ſoil itſelf. In conſequence of which legal ſeiſin, all wives would have become dowable of ſuch lands as were held to the uſe of their huſbands, and alſo entitled at the ſame time to any ſpecial lands that might be ſettled in jointure: had not the ſame ſtatute provided, that upon making ſuch an eſtate in jointure to the wife before marriage, ſhe ſhall be for ever precluded from her dower. 4 *Rep.* 1. 2. But in this caſe, theſe four requiſites muſt be punctually obſerved.—1. The jointure muſt take effect immediately on the death of the huſband.—2. It muſt be for the life of the wife herſelf at leaſt, and not *pur auter vie*, or for any term of years, or other ſmaller eſtate.—3. It muſt be made to herſelf, and no other in truſt for her.—4. It muſt be made in ſatisfaction of her whole dower, and not of any particular part of it, and muſt be ſo expreſſed to be in the deed; or it may be averred to be ſo. 1 *Inſt.* 366.

If the jointure be made to her after marriage, ſhe has her election, after her huſband's death, as in dower *ad oſtium eccleſiæ*, and may either accept it, or refuſe it, and betake herſelf to her dower at common law, for ſhe was not capable of conſenting to it during coverture. So where a deviſe is expreſſed to be given in lieu and ſatisfaction of dower, or where that is the clear and manifeſt intention of the teſtator, the wife ſhall not have both, but ſhall have her choice. 1 *Inſt.* 366. If, by any fraud, or accident, a jointure made before marriage proves to be on a bad title, and the jointreſs is evicted, or turned out of poſſeſſion, ſhe ſhall then (by the proviſions of the ſame ſtat. 27 Hen. VIII. c. 10,) have her dower *pro tanto* at the common law. If a woman who is under age at the time of marriage, agrees to a jointure and ſettlement in bar of her dower, and of her diſtributive ſhare of her huſband's perſonal property, in caſe he dies inteſtate; ſhe cannot afterwards wave it; but is as much bound as if ſhe were of age at the time of the marriage. *Drury* v. *Drury*, (or *Buckingham* E. v. *Drury*,) 3 *Bro. P. C.* 492.

There are ſome advantages attending tenants in dower that do not extend to jointreſſes; and ſo *vice verſâ*, jointreſſes are in ſome reſpects more privileged than tenants in dower. Tenant in dower by the old common law, is ſubject to no tolls or taxes; and her's is almoſt the only eſtate on which, when derived from the king's debtor, the king cannot diſtrain for his debt, if contracted during the coverture. *Co. Litt.* 31 *a.* But on the other hand, a widow may enter at once, without any formal proceſs, on her jointure land, as ſhe alſo might have done on dower *ad oſtium eccleſiæ*, which a jointure in many points reſembles; and the reſemblance was ſtill greater, while that ſpecies of dower continued in its primitive ſtate; whereas no ſmall trouble, and a very tedious method of proceeding, is neceſſary to compel a legal aſſignment of dower. *Co. Litt.* 36. And what is more, though dower be forfeited by the treaſon of the huſband, yet lands ſettled in jointure remain unimpeached to the widow. Wherefore Coke very juſtly gives it the preference, as being more ſure and ſafe to the widow, than even dower *ad oſtium eccleſiæ*, the moſt eligible ſpecies of any. 2 *Comm.* 135. An additional advantage is, that a jointure is not forfeited by the adultery of the wife as dower; and Chancery will decree againſt the huſband a performance of marriage articles, though he alleges and proves that the wife lives ſeparate from him in adultery. 3 *P. Wms.* 269.

If a woman takes a leaſe for life of her huſband's lands after his death, ſhe ſhall have no dower, becauſe ſhe cannot demand it againſt herſelf; and if ſhe takes a leaſe for years only, yet ſhe ſhall not ſue to have dower during theſe years, becauſe it was her own act to ſuſpend the fruit and effect of her dower during that time. *Perk.* 350: If a recovery be had againſt the huſband by colluſion, this ſhall not bar the wife of dower; as if the recovery be by confeſſion or reddition, which are always underſtood to be by colluſion, the huſband always acting and concurring in obtaining of them; but it ſeems to have been a very great doubt, whether a recovery by default ſhould not be a bar: and the better opinion being that ſuch recovery was a bar at common law, therefore the ſtat. Wm. II. c. 4, was made, which ordains that notwithſtanding ſuch recovery by default, &c. pleaded, the tenant ſhall not cover in bar of the dower ſhew his right to the tenements recovered; and if it be found that he had no right, then ſhall the demandant recover her dower notwithſtanding ſuch recovery by default againſt her huſband. *Perk.* 376. By ſtat. Wm. II. c. 4, it appears, that if the recoveror had right, then the wife is barred; therefore if the heir of the diſſeiſor be in by deſcent, and the diſſeiſee enters upon him, and marries, and the heir of the diſſeiſor recovers by default, or reddition, in a writ of entry, in nature of an aſſize, and the huſband dies, his wife ſhall not have dower, becauſe he, who recovered, had right to the poſſeſſion by the deſcent; otherwiſe, if this diſſeiſin, deſcent, &c. were after marriage, becauſe the huſband was ſeiſed before of a rightful eſtate during the coverture, whereof his wife had title of dower, which cannot be defeated by the diſſeiſin, deſcent, and recovery, which all happened during the coverture. *Perk.* 379, 380.

If the huſband levy a fine with proclamation of his lands, and dies, his wife is bound to make her claim within five years after his death; otherwiſe ſhe ſhall be barred of her dower; for though her title of dower was not conſummate at the time of the fine levied; yet it being initiate by the marriage and ſeiſin of the huſband, the fine begins to work upon it preſently after the huſband's death; and if ſhe does not claim it within five years after, ſhe ſhall be barred. 2 *Co.* 93. 3 *Inſt.* 216.

The wife is, as ſoon as ſhe can after the deceaſe of her huſband, to demand her dower, leſt ſhe loſe the value from the time of his death: and in action of dower, the firſt proceſs is ſummons to appear: and if the tenant or

defendant

defendant do not appear, nor caſt an eſſoin, a grand *cape* lies to ſeize the lands, &c. By ſtat. 31 Eliz. c. 3. every ſummons on the land is to be made fourteen days before the return of the writ, and proclamation made at the church door on a Sunday, or elſe no grand *cape* to be awarded, but an *alias* and *pluries* ſummons till proclamation. But on the return of the writ of ſummons, the attorney for the tenant or defendant may enter with the filazer that the tenant appears, and prays view, &c. Then a writ of view goes out, whereby the ſheriff is to ſhew the tenant the land in queſtion; upon the return of which writ of view, the tenant's attorney takes a declaration, and puts in a plea; the moſt general one is, *ne unques ſeizie*, &c. viz. that the huſband was never ſeiſed of any eſtate whereof the wife can be endowed; and when iſſue is joined, trial proceeds, as in other actions: upon trial, the jury are to give damages for the meſne profits from the death of the huſband (if he die ſeiſed), for which, execution ſhall be made out; and then a writ to the ſheriff gives poſſeſſion of a third part of the lands. The ſheriff may give poſſeſſion or ſeiſin to the woman by a clod, or by graſs growing on the land, or by any beaſt being thereon. 40 *Edw.* 3. *Fitz. Dower* 48.

A widow may recover her dower with a *ceſſat executio*, in caſe there be any thing objected, precedent to the title of dower, till that is determined. 1 *Salk.* 291. Judgment in dower is to recover a third part of lands and tenements by metes and bounds. A wife may have her writ of dower againſt an heir, an alienee, a diſſeiſor, &c. or againſt any one that has power to aſſign dower; if the lord enters on the land for an eſcheat, ſhe may bring it againſt him, but to the king ſhe muſt ſue by petition. *Co. Litt.* 59. This writ was brought againſt eight perſons, feoffees of the huſband after marriage; two confeſſed the action, and the other ſix pleaded to iſſue; here the demandant had judgment to recover the third part of two parts of the land, in eight parts to be divided; and after the iſſue being found for the demandant againſt the other ſix, ſhe recovered againſt them the third part of the ſix parts of the ſame land as her dower. *Dyer* 187.

As to damages in dower, they are given by the ſtat. of Merton, c. 1; but that ſtatute extends only to the poſſeſſory action of dower *unde nihil habeat*, and not to the writ of right of dower, becauſe they are intended to be given for the detention of the poſſeſſion; and on writs of right, where the right itſelf is queſtionable, no damages are given, becauſe no wrong done till the right be determined; alſo that ſtatute extends only to lands, whereof the huſband died ſeiſed; and therefore judgment for the damages was reverſed, becauſe the jury did not find that the huſband died ſeiſed; for otherwiſe ſhe ſhall have no damages; as if the huſband aliens and takes back an eſtate for life, the wife ſhall recover dower, but no damages; becauſe this dying ſeiſed was only of an eſtate of freehold; but if he makes a leaſe for years only, rendering rent, ſhe ſhall recover a third part of the reverſion, with a third part of the rent and damages, becauſe there he died ſeiſed as the ſtatute ſpeaks. *Co. Litt.* 32. *Yelv.* 112.

Damages are given in dower from the death of the huſband and to the return of the writ of enquiry, though the writ of ſeiſin iſſued a year before, but was not executed. *Hardw.* 19. Where there are two joint-tenants in dower, and one dies after judgment for damages, and his heir and the other joint-tenant bring error, the value from the time of the judgment to the affirmance cannot be recovered againſt the ſurviving plaintiff in error only. 2 *Stra.* 271. On a writ of dower, damages cannot be awarded by 16 Car. II. without ſpeeding a writ of enquiry. *Hardw.* 51.

DOW'ERED, *adj.* Portioned; ſupplied with a portion:

Will you with thoſe infirmities ſhe owes,
Unfriended, new adapted to our hate,
Dower'd with our curſe, and ſtranger'd with our oath.
Take her, or leave her? *Shakeſpeare.*

DOW'ERLESS, *adj.* Wanting a fortune; unportioned:

Thy *dow'rleſs* daughter, king, thrown to my chance,
Is queen of us, of ours, and our fair France. *Shakeſpeare.*

DOWL, *ſ.* A downy particle of a feather.—As diminiſh one *dowl* that's in my plume. *Shakeſpeare.*

DOW'LAS, *ſ.* A coarſe kind of linen.—*Dowlas*, filthy *dowlas*; I have given them away to bakers wives, and they have made boulters of them. *Shakeſpeare.*

DOWLATABAD', a province of Hindooſtan, otherwiſe called AMEDNAGUR, or the land of proſperity, with a city of the ſame name.

DOWLATABAD, a town and fortreſs of Hindooſtan, which gives name to the above conſiderable province in the Deccan. It is the ſame city as the ancient Togara. The fortreſs is ſituated on a ſteep rock, not to be aſcended by a horſe or camel; the town is at the foot of the rock, and once very flouriſhing, but has been ruined by wars: nine miles north-weſt of Aurungabad, and ninety-two ſouth of Burhampour.

DOWN, *ſ.* [*duun*, Dan.] Soft feathers.—A tender weakly conſtitution is very much owing to the uſe of *down*-beds. *Locke.*

Virtue is the roughеſt way;
But proves at night a bed of *down*. *Wotton.*

Any thing that ſoothes or mollifies:

Thou boſom ſoftneſs! *down* of all my cares!
I could recline my thoughts upon this breaſt
To a forgetfulneſs of all my griefs,
And yet be happy. *Southern.*

Soft wool, or tender hair:

On thy chin the ſpringing beard began
To ſpread a doubtful *down*, and promiſe man. *Prior.*

The ſoft fibres of plants which wing the ſeeds.—Any light thing that moveth, when we find no wind, ſheweth a wind at hand; as when feathers, or *down* of thiſtles, fly to and fro in the air. *Bacon.*

Like ſcattered *down*, by howling Eurus blown
By rapid wlfirlwinds from his manſion thrown. *Sandys.*

DOWN, *ſ.* [ðun, Sax. *dune*, Erſe, a hill.] A large open plain; properly a flat on the top of an hill.—Hills afford pleaſant proſpects; as they muſt needs acknowledge who have been on the *downs* of Suſſex. *Ray.*

How Will-a-wiſp miſleads night-faring clowns
O'er hills, and ſinking bogs, and pathleſs *downs*. *Gay.*

DOWN, *prep.* [aðuna, Sax.] Along a deſcent; from a higher place to a lower.—Let go thy hold when a great wheel runs *down* hill, leſt it break thy neck with following it. *Shakeſpeare.*—A man falling *down* a precipice, though in motion, is not at liberty, becauſe he cannot ſtop that motion if he would. *Locke.*—Towards the mouth of a river.—Mahomet put his chief ſubſtance into certain boats, to be conveyed *down* the river, as purpoſing to fly. *Knolles.*

DOWN, *adv.* Not up. On the ground; from the height at which any thing was to a lower ſituation:

Down ſinks the giant with a thund'ring ſound,
His pond'rous limbs oppreſs the trembling ground. *Dryd.*

Tending towards the ground. From former to latter times: as, this has been the practice *down* from the conqueſt. Out of ſight; below the horizon:

How goes the night?
—The moon is *down*; I have not heard the clock,
And ſhe goes *down* at twelve. *Shakeſpeare.*

To a total ſubjection: uſed of men and things.—What remains of the ſubject, after the decoction, is continued to be boiled *down*, with the addition of freſh water, to a ſapid *fat*. *Arbuthnot.*—Into diſgrace; into declining reputation.—There is not a more melancholy object in the learned world, than a man who had written himſelf *down*. *Addiſon.*—[Anſwering to *up*.] Here and there.—Let them wander

wander *up* and *down* for meat, and grudge if they be not ſatisfied. *Pſalm* lix. 15.

DOWN, *interj.* An exhortation to deſtruction or demolition.—Go, ſome pull down the Savoy; others to the inns of court: *down* with them all. *Shakeſpeare.*—A contemptuous threat.—*Down, down* to hell, and ſay I ſent thee thither. *Shakeſpeare.*

DOWN, [*To go.*] To be digeſted; to be received.—If he be hungry more than wanton, bread alone will *down*; and if he be not hungry, 'tis not fit he ſhould eat. *Locke.*

To DOWN, *v. a.* To knock; to ſubdue; to ſuppreſs; to conquer:

The hidden beauties ſeem'd in wait to lie,
To *down* proud hearts that would not willing die. *Sidney.*

DOWN, or DOWN PATRICK, a city of Ireland, in the county of Down, and ſee of a biſhop, united with Connor, called the biſhop of Down and Connor: twenty-five miles eaſt of Newry. Lat. 54. 18. N. lon. 5. 37. W. Greenwich.

DOWN, a county of Ireland; bounded on the north by the county of Antrim and Belfaſt Lough, on the eaſt and ſouth by the Iriſh ſea, and on the weſt by the county of Armagh; about forty miles in length from north-eaſt to ſouth-weſt, and about twenty-five in breadth. The number of houſes is computed at 36,636, and of inhabitants 204,500. The ſurface is irregular, about the center mountainous, but moſt parts fertile. An irregularity of ground, well watered, abounding in bleach-greens, and full of neat and cleanly habitations, with an orchard to almoſt every cottage, afford a moſt cheerful and pleaſing proſpect of the comfort and opulence of the inhabitants, who are chiefly employed in the linen buſineſs. In the rougher parts of the country they breed a great number of horſes, with which the fairs of diſtant counties are ſupplied. This county derives equal advantages from its maritime ſituation, and its inland waters. A canal is continued from Newry to the South Bann, and ſo into Lough Neagh. From this lake to Belfaſt, another canal has been lately cut, at the expence of the marquis of Belfaſt; and the river Lagan, which ſeparates Down from Antrim, is alſo made navigable. Downpatrick, Bangor, Hillſborough, Killyleagh, Newtown, and Newry, are its principal towns.

DOWN-BED, *ſ.* Bed of down.—If he loved too much to lie upon his own *down-bed* of eaſe, his ſubjects had the pleaſure, during his reign, of lolling and ſtretching upon theirs. *Marquis of Halifax.*

DOWN-TROD, *part. adj.* Trodden down:

But I will lift the *down-trod* Mortimer
As high in th' air as this ungrateful king. *Shakeſpeare.*

DOWN'CAST, *adj.* Bent down; directed to the ground:

My wily nurſe by long experience found,
And firſt diſcover'd to my ſoul its wound;
'Tis love, ſaid ſhe; and then my *downcaſt* eyes,
And guilty dumbneſs, witneſs'd my ſurprize. *Dryden.*

DOWNE, or DOWNS, a townſhip of the American States, in Cumberland county, New Jerſey.

DOWN'FAL, *ſ.* Ruin; calamity; fall from rank or ſtate.—We have ſeen ſome, by the ways by which they had deſigned to riſe uncontroulably, to have directly procured their utter *downfal. South.*

Why doſt thou ſay king Richard is depos'd?
Dar'ſt thou, thou little better thing than earth,
Divine his *downfal?* *Shakeſpeare.*

A ſudden fall, or body of things falling:

Each *downfal* of a flood the mountains pour
From their rich bowels, rolls a ſilver ſtream. *Dryden.*

Deſtruction of fabrics:

Not more aghaſt the matrons of renown,
When tyrant Nero burn'd the imperial town,
Shriek'd for the *downfal* in a doleful cry,
For which their guiltleſs lords were doom'd to die. *Dryd.*

DOWN'FALLEN, *part. adj.* Ruined; fallen.—The land is now divorced by the *downfallen* ſteep cliffs on the farther ſide. *Carew.*

DOWN'GYRED, *adj.* Let down in circular wrinkles:

Lord Hamlet, with his ſtockings looſe,
Ungarter'd, and *downgyred* to his ancles. *Shakeſpeare.*

DOWN'HAM, a large town in the county of Norfolk, pleaſantly ſituated on the declivity of a hill, twelve miles from Lynn, thirteen from Wiſbeach, eighteen from Ely, and eighty-ſix from London. Here is an ancient ſtone-bridge over the river Ouze, which receives the Cam at Denver ſluice, (a noble piece of ſtone-work,) and the Neene at Salter's Load ſluice, and empties itſelf into an arm of the German ſea at Lynn. Hollingſhed ſays, that, in October 1568, there were taken at this bridge ſeventeen monſtrous fiſhes, from twenty to twenty-ſeven feet long. It has two markets weekly, on Mondays and Saturdays; and two fairs annually, on the 8th of May, and 13th of November. Downham has been long famous for its trade in butter. Formerly 2000 firkins have been brought to this market weekly; but now ſcarcely 500 are averaged. The butter-market is held by the water-ſide; the butter is ſent to London by way of Cambridge, and thus acquires the name of Cambridge butter.

DOWN'HAUL, *ſ.* [a ſea-term.] A rope tied to the upper corner of a ſail to pull it down.

To DOWN'HAUL, *v. a.* To pull down.

DOWN'HILL, *ſ.* Declivity; deſcent:

Heavy the third, and ſtiff, he ſinks apace;
And tho' 'tis *downhill* all, but creeps along the race. *Dryd.*

DOWN'HILL, *adj.* Declivous; deſcending.—And the firſt ſteps a *downhill* greenſward yields. *Congreve.*

DOWN'INGS, a poſt-town of the American States, Pennſylvania, Cheſter county, on the eaſt ſide of Brandywine creek: thirty-three miles weſt by north of Philadelphia, and near ſeven north-weſt of Weſtcheſter.

DOWN'LOOKED, *adj.* Having a dejected countenance; gloomy; ſullen; melancholy:

Jealouſy, ſuffus'd with jaundice in her eyes,
Diſcolouring all ſhe view'd, in tawney dreſs'd;
Downlook'd, and with a cuckoo on her fiſt. *Dryden.*

DOWN'LYING, *adj.* About to be in travail of childbirth.

DOWN'RIGHT, *adv.* Straight or right down; down perpendicularly:

A giant's ſlain in fight,
Or mow'd o'erthwart, or cleft *downright.* *Hudibras.*

In plain terms, without ceremony:

Elves, away!
We ſhall chide *downright* if I longer ſtay. *Shakeſpeare.*

Completely; without ſtopping ſhort.—This paper put Mrs. Bull in ſuch a paſſion, that ſhe fell *downright* into a fit. *Arbuthnot.*

DOWN'RIGHT, *adj.* Plain; open; apparent; undiſguiſed.—It is *downright* madneſs to ſtrike where we have no power to hurt. *L'Eſtrange.*—Directly tending to the point; plain; artleſs.—I would rather have a plain *downright* wiſdom, than a fooliſh and affected eloquence. *Ben Jonſon.*—Unceremonious; honeſtly ſurly.—When it came to the count to ſpeak, old Fact ſo ſtared him in the face, after his plain *downright* way, that the count was ſtruck dumb. *Addiſon.*—Plain; without palliation.—Religion ſeems not in danger from *downright* atheiſm, ſince rational men muſt reject that for want of proof. *Rogers.*

DOWNS, *ſ.* A bank or elevation of ſand, which the ſea gathers and forms along its ſhores; and which ſerves it as a barrier. The word is formed from the French *dune*, of the Celtic *dum*, a mountain. This name is particularly applied to a well-known road for ſhipping, in the Engliſh channel, oppoſite the eaſtern coaſt of the county of Kent, from Dover to the North Foreland; where both the outward and homeward-bound ſhips frequently

make ſome ſtay. It affords excellent anchorage; and is defended by the caſtles of Deal, Dover, and Sandwich.

DOWN'SITTING, *ſ.* Reſt; repoſe; the act of ſitting down, or going to reſt.—Thou knoweſt my *downſitting* and mine upriſing; thou underſtandeſt my thoughts afar off. *Pſalm* cxxxix. 2.

DOWN'TON, an ancient borough, in the county of Wilts, ſituated in a pleaſant vale between Saliſbury and Fordingbridge, on the eaſtern banks of the Avon: eighty-five miles from London, and ſix from Saliſbury; and is bounded on the ſouth by an ancient foſs, called Landſhire Ditch, from Hampſhire. The chief trade of the place is malting, paper-making, and tanning; and the poor are employed in a tick manufactory, and in making Bruſſels lace. Here are annually two fairs, one on the 23d of April for cattle, pedlary ware, &c. and the other on the 2d of October for ſheep and horſes. The profits of both theſe fairs are given to the maſter of the free-ſchool for inſtructing twelve boys in reading, writing, and arithmetic: firſt founded by Gyles Eyre, eſq. Downton returned members to the Britiſh parliament as early as the 23 Edw. I. and here king John had a caſtle, in which he ſometimes reſided; whoſe effigies, and alſo thoſe of one of his queens, erected in correſpondent niches, ſtill remain.

DOWN'WARD, or DOWNWARDS, *adv.* [ðunepeapð, Sax.] Towards the center.—As you lift up the glaſſes, the drop will aſcend ſlower and ſlower, and at length reſt, being carried *downward* by its weight as much as upwards by the attraction. *Newton.*—From a higher ſituation to a lower.—Hills are ornamental to the earth, affording pleaſant proſpects to them that look *downwards* from them upon the ſubjacent countries. *Ray.*

What would this man? Now upward will he ſoar,
And, little leſs than angel, would be more:
Now, looking *downwards*, juſt as griev'd appears
To want the ſtrength of bulls, the fur of bears. *Pope.*

In a courſe of ſucceſſive or lineal deſcent:

A ring the count does wear,
That *downward* hath ſucceeded in his houſe,
From ſon to ſon, ſome four or five deſcents. *Shakeſpeare.*

DOWN'WARD, *adj.* Moving on a declivity; tending towards the center; tending to the ground:

With *downward* force,
That drove the ſand along, he took his way,
And roll'd his yellow billows to the ſea. *Dryden.*

Declivous; bending:

When Aurora leaves our northern ſphere,
She lights the *downward* heav'n, and riſes there. *Dryden.*

Depreſſed; dejected.—At the loweſt of my *downward* thoughts, I pulled up my heart to remember, that nothing is achieved before it be thoroughly attempted, and that lying ſtill doth never go forward. *Sidney.*

DOWN'Y, *adj.* Covered with down or nap.—There be plants that have prickles, yet have *downy* or velvet rind upon their leaves, as ſtock-gilly-flowers and coltsfoot; which down or nap conſiſteth of a ſubtile ſpirit, in a ſoft ſubſtance. *Bacon.*

In her hand ſhe held
A bough of faireſt fruit, that *downy* ſmil'd,
New gather'd, and ambroſial ſmell diffus'd. *Milton.*

Made of down or ſoft feathers:

Belinda ſtill her *downy* pillow preſt,
Her guardian ſylph prolong'd the balmy reſt. *Pope.*

Soft; tender; ſoothing:

The night's companion kindly cheating them
Of all their cares, tam'd the rebellious eye
Of ſorrow with a ſoft and *downy* hand,
Sealing all breaſts in a Lethean band. *Craſhaw.*

DO'WRE, or DOWRY, *ſ.* [*douaire*, Fr.] A portion given with a wife. See DOWER.—I could marry this wench for this *dowre*. *Sidney.*—And aſk no other *dowry* but ſuch another jeſt. *Shakeſpeare.*—A reward paid for a wife. A gift; a fortune given:

Thine own hand
An hundred of the faithleſs foe ſhall ſlay,
And for a *dowre* a hundred foreſkins pay. *Cowley.*

DOXO'LOGY, *ſ.* [δοξα, glory; and λογος, to proclaim.] A form of giving praiſe and glory to God.—David breaks forth into theſe triumphant praiſes and *doxologies*, Bleſſed be the Lord God of Iſrael, who has kept me this day from ſhedding blood, and from avenging myſelf with my own hand. *South.*

DOX'Y, *ſ.* [perhaps of *dochen*, Dut. to yield willingly.] A wench; a wanton woman:

When daffodils begin to pure,
With heigh! the *doxy* over the dale. *Shakeſpeare.*

DOYAYA'CE, a town of Poland, in the palatinate of Lemberg: thirty-ſix miles eaſt-ſouth-eaſt of Lemberg.

DO'YET, a town of France, in the department of the Allier, and chief place of a canton, in the diſtrict of Montmarault: ſeven miles weſt of Montmarault.

DOYLS'TOWN, a town of the American States, in Bucks county, Penſylvania; ten miles ſouth-weſt of Howell's ferry, on Delaware river, fifteen north-weſt of Newton, and thirty-three weſt by north of Philadelphia.

DO'ZARY, a town of Lithuania, in the palatinate of Minſk: thirty-ſix miles north-north-eaſt of Minſk.

To DOZE, *v. n.* [ðpæȝ, Sax. *daes*, Dut.] To ſlumber; to ſleep lightly.—There was no ſleeping under his roof: if he happened to *doze* a little, the jolly cobler waked him. *L'Eſtrange.*—To live in a ſtate of drouſineſs; to be half aſleep.—It has happened to young men of the greateſt wit to waſte their ſpirits with anxiety and pain, ſo far, as to *doze* upon their work with too much eagerneſs of doing well. *Dryden.*

Chiefleſs armies *doz'd* out the campaign,
And navies yawn'd for orders on the main. *Pope.*

To DOZE, *v. a.* To ſtupify; to dull.—He was now much decayed in his parts, and with immoderate drinking *dozed* in his underſtanding. *Clarendon.*

Two ſatyrs on the ground,
Stretch'd at his eaſe, their ſire Silenus found
Doz'd with his fumes, and heavy with his load. *Dryden.*

DO'ZEN, *ſ.* [*douzaine*, Fr.] The number of twelve. It is ſeldom uſed but on light occaſions.—By putting twelve units together, we have the complex idea of a *dozen*. *Locke.*

DO'ZINESS, *ſ.* Sleepineſs; drouſineſs.—A man, by a violent fit of the gout in his limbs, finds a *dozineſs* in his head, or a want of appetite. *Locke.*

DO'ZING, *ſ.* Sluggiſhneſs.—Six, or at moſt ſeven hours ſleep is, for a conſtancy, as much as any body can want: more is only lazineſs and *dozing*. *Cheſterfield.*

DO'ZY, *adj.* Sleepy; drouſy; ſluggiſh:

The yawning youth, ſcarce half awake, eſſays
His lazy limbs and *dozy* head to raiſe. *Dryden.*

DRA'ABURG, or OBER TRAABURG, a town of Germany, in the duchy of Stiria: fifty-ſix miles eaſt of Clagenfurt, and forty-two eaſt-north-eaſt of Brixen. Lat. 46. 48. N. lon. 30. 35. E Ferro.

DRA'ABURG, or UNTER TRAABURG, a town of Germany, in the duchy of Carinthia: 112 miles ſouth-ſouth-weſt of Vienna, and forty-eight weſt-north-weſt of Pettaw.

DRAB, *ſ.* [ðpabbe, Sax. lees.] A ſtrumpet; a trull.—If your worſhip will take order for the *drabs* and the knaves, you need not fear the bawds. *Shakeſpeare.*

Curs'd be the wretch ſo venal and ſo vain,
Paltry and proud as *drabs* in Drury-lane. *Pope.*

DRA'BA, *ſ.* [from δρακω, acrid.] WHITLOW-GRASS;

in botany, a genus of the claſs tetradynamia, order ſiliculoſa, natural order ſiliquoſæ or cruciformes, (cruciferæ, *Juſſ.*) The generic characters are—Calyx: perianthium four-leaved; leaflets ovate, concave, from erect ſpreading; deciduous. Corolla: four-petalled, cruciform; petals oblong, ſomewhat ſpreading; with very ſmall claws. Stamina: filaments ſix, length of the calyx: of theſe the four oppoſite ones ſomewhat longer, from erect ſpreading; antheræ ſimple. Piſtillum: germ ovate; ſtyle ſcarce any; ſtigma headed, flat. Pericarpium: ſilicle elliptic-oblong, compreſſed, entire, deſtitute of ſtyle, two-celled; diſſepiment parallel with the valves; valves plano-concave. Seeds: ſeveral, ſmall, roundiſh.—*Eſſential Character.* Silicle, entire, oval-oblong; valves, flattiſh, parallel to the diſſepiment; ſtyle, none. Hence it is eaſily diſtinguiſhed from Alyſſum, Subularia, and Lunaria.

Species. 1. Draba aizoides, or hairy-leaved alpine whitlow-graſs: ſcape naked, ſimple; leaves enſiform, keeled, ciliate. It very much reſembles D. alpina, from which however it differs, in the leaves being even, linear, keeled, ciliate; not oval-oblong, rough-haired, without any keel. It differs from D. ciliaris in having the root-leaves forming a cloſe tuft, giving it the air of a Sedum; the keel even; not alternate leaves on the branches ſpreading, and a ciliate keel. The flowers alſo are yellow, as in D. alpina, not white. Root perennial; ſtem three inches high; petals entire; ſilicle hairy, rough, ovate, ſharp at both ends, ending in a long ſtyle, four lines in length; the cells having ſix to eight ſeeds, which are round and flatted. It is well adapted to rockwork, and is a pretty plant with a pleaſant ſmell. Native of the mountains of France, Swiſſerland, Savoy, Auſtria, Carniola, Sileſia, &c. ſeen on mount Saleve near Geneva, April 13, 1779; in our gardens it flowers ſo early as February.

2. Draba ciliaris, or ciliate-leaved whitlow-graſs: ſtem almoſt naked, leaves linear, ciliate about the edge and along the keel; petals entire. It differs from the foregoing, in the leaves being narrower and ſmooth, and the petals not in the leaſt emarginate. In a ſtate of cultivation it branches out with remote leaves. Native of Provence, in dry rocky places.

3. Draba alpina, or alpine whitlow-graſs: ſcape naked, ſimple; leaves lanceolate, quite entire; petals emarginate. Stem leafleſs, with a few hairs ſcattered about it; not one-leaſed or ſmooth. Gouan thus diſtinguiſhes this from the firſt ſort. It has fewer leaves, ovate, a little longer, very often toothed towards the end, and rough with hair; ſtem often naked, but ſometimes it has a leaf or two on it; this alſo is rough with hairs; flowers ſubracemed, at firſt corymbed; calyx hairy; the leaflets membranaceous and coloured at the edge, as in D. aizoides. Native of the Alps of Europe.

4. Draba verna, common or ſpring whitlow-graſs: ſcapes naked, leaves ſomewhat ſerrate, often very entire; petals divided. Root annual; ſtems about three inches high, one to five or more from the ſame root in a rich ſoil; ſmooth after flowering, but hairy when young; ſeeds ovate, brown, fixed to the edge of the partition; from three to ſix in a cell according to Scopoli, but ſometimes as many as twenty-four. By theſe it propagates itſelf prodigiouſly, and is a weed hardly to be eradicated in dry paſtures, gravel-walks of gardens, &c. Linnæus obſerves that the flowers hang down in the night and in wet weather: that in Smoland they ſow rye when this plant is in bloſſom; and that in dry ſoils whole fields are covered with the flowers early in the ſpring. With us it is common on walls, dry banks, fields, and paſtures, flowering in March and April, or earlier if the weather be mild. In ſome countries abundance of this little plant is ſuppoſed to prognoſticate dearneſs of corn; which may have ſome foundation, as a wet ſeaſon produces a great crop of this little weed, which according to ſome is agreeable to ſheep. Gerarde calls it whiteblowe, or whitlowe-graſſe, or naile woort. This ſmall plant may ſerve as an index of the difference of climates; for in Sweden it flowers in the month of April; in Germany a month earlier; in England, Holland, and France, in February; whilſt in Sicily it flowers all the winter.

5. Draba pyrenaica, or pyrenean whitlow-graſs; ſcape naked; leaves wedge-ſhaped, palmate, three-lobed. This is a perennial plant, ſeldom more than two inches high; it has a ſhrubby ſtalk, dividing into many ſmall heads; leaves ſmall, the lower ones have five ſhort narrow lobes, the upper have but three; the flowers come out in cluſters, ſitting cloſe to the leaves: they are of a bright purple colour, and appear early in the ſpring. Native of the mountains of Swiſſerland, in the canton of Appenzel, Provence, Carniola, Auſtria, and Piedmont; flowering in May.

6. Draba muralis, or wall whitlow-graſs: ſtem branched; leaves ovate, ſeſſile, toothed. It riſes with an upright branching ſtalk about ten inches high, terminated by looſe ſpikes of white flowers, which appear the beginning of May. Native of Sweden, Swiſſerland, Germany, ſouth of France, Italy, in fiſſures of rocks; Mr. Ray found it near Montpellier, and between Lucca and Piſa, in hedges; with us, in Derbyſhire, Yorkſhire, and Weſtmoreland; common about Malham. The wood variety *D. nemoroſa*, being ſowed with the *muralis* in a garden, they became ſo alike as not to be diſtinguiſhed by any means, the yellow flowers becoming white.

7. Draba hirta, or rough-leaved whitlow-graſs: ſcape one-leafed; leaves ſubhirſute; ſilicles oblique, pedicelled. Reſembles D. incana very much, but the ſtem is naked with a ſingle lanceolate leaf in the middle of it. Silicles ſmooth, like thoſe of D. verna, but narrower, terminated by the ſhort ſtyle with a headed ſtigma. Native of Lapland, Denmark, Provence, Swiſſerland, Sileſia, Auſtria, Piedmont, in the fiſſures of rocks: flowering in May. Mr. Dickſon found the *D. ſtellata*, or *hirta* of Jacquin, in Scotland, on Ben Lawers. Jacquin, in his *Obſervationes*, ſays that his *ſtellata* is the *hirta* of Linnæus, but that in the Auſtrian plants the ſilicles are uſually ſtraight, very ſeldom oblique. Though he gave up his *ſtellata* as a ſpecies, yet it ſeems to be different from Linnæus's *hirta*.

8. Draba ſladnizenſis, or ſcentleſs whitlow-graſs: ſcape two-leaved; leaves ſmooth, ciliate; ſilicles ſtraight, pedicelled. Native of Carinthia.

9. Draba incana, or hoary whitlow-graſs: ſtem-leaves numerous, hoary; ſilicles oblong, oblique, ſubſeſſile. Root biennial; root-leaves very numerous, ſpreading like the flower of a roſe, lanceolate, tomentoſe and ſomewhat hairy, entire, acute; ſtem a hand in height, ſtiff, hoary, clothed with many leaves (frequently more than thirty), very like the root-leaves, but ſhorter, ſo that the uppermoſt are ovate, ſeſſile, and have a few teeth; on the lower part of the ſtem they are more crowded. Native of Lapland, Sweden, Denmark, Norway, Britain, as in Weſtmoreland, Yorkſhire about Settle, and near the ſummit of Ingleborough; Scotland, as in Iſla, Skye, &c. Wales in Caernarvonſhire. It flowers in May and June.

Propagation and Culture. Theſe plants are eaſily propagated by parting the heads in autumn; for they ſhoot up to flower very early in the ſpring. They will thrive and flower annually, in a moiſt ſoil, and ſhady ſituation; and require no other culture but to be kept clean from weeds. Some of the ſpecies are proper to adorn rock-work, and they all proſper beſt in that ſituation. See ARABIS, COCHLEARIA, IBERIS, LEPIDIUM, LOBELIA, and SISYMBRIUM.

DRAB'BING, *ſ.* Aſſociating with drabs.—Drinking, fencing, ſwearing, quarrelling, *drabbing. Shakeſpeare.*

DRA'BOWICE, a town of Poland, in the palatinate of Kiov: thirty-ſix miles ſouth-weſt of Czerkaſy.

DRAC, a river of France, which runs into the Iſere, near Grenoble.

DRACÆ'NA, *ſ.* [δρακαινα, the female of δρακων, a dragon.] In botany, a genus of the claſs hexandria, order

der monogynia, natural order ſarmentaceæ, (aſparagi, *Juſſ.*) The generic characters are—Calyx: none. Corolla: petals ſix, oblong, ſomewhat upright, equal, cohering by the claws. Stamina: filaments ſix, inſerted into the claws, ſubulate, thicker in the middle, membranaceous at the baſe, length ſcarcely of the corolla; antheræ oblong, incumbent. Piſtillum: germ ovate, ſix-ſtriated; ſtyle filiform, length of the ſtamens; ſtigma three-cleft, obtuſe. Pericarpium: berry ovate; ſix-furrowed, three-celled. Seeds: ſolitary, ovate-oblong, incurved at the tip. The character is almoſt that of aſparagus, the habit different.—*Eſſential Character.* Corolla: ſix-parted, erect; filaments ſomewhat thicker in the middle; berry three-celled, one-ſeeded.

Species. 1. Dracæna draco, or dragon tree: arboreous: leaves ſomewhat fleſhy, with a thorny end. This riſes with a thick trunk nearly equal in ſize the whole length; the inner part very pithy, next to this a circle of ſtrong fibres, and the outſide ſoft; height twelve or fourteen feet, nearly of the ſame diameter the whole length, which is rarely more than eight or ten inches; circular marks or rings are left the whole length, where the leaves have fallen off. The top ſuſtains a large head of theſe, coming out ſingly all round it; they are ſhaped like thoſe of the common iris, but are much longer, being often four or five feet in length, and an inch and half broad at their baſe, where they embrace the trunk; they leſſen gradually and terminate in a point: theſe leaves are pliable, and hang down; they are entire, of a deep green, ſmooth on both ſurfaces: it has the habit of the palms; the peduncles are furniſhed with a joint. Crantz has made two genera out of this ſpecies, under the names of Oedera and Störckia. Native of the Eaſt Indies. Mr. Miller received a plant of it from the Cape Verd iſlands, and ſeeds from Madeira. It is called *dragon-tree*, becauſe the inſpiſſated juice becomes a red powder, very like the eaſtern dragon's blood. Cultivated in 1640, by Parkinſon; who ſowed the ſeeds, but they did not abide the winter.

2. Dracæna ferrea, or purple dracæna: arboreous: leaves lanceolate, acute. Stem ſhrubby, almoſt ſimple, eight feet high, erect, round, with cloſe protuberant rings from the fallen leaves; theſe are quite entire, a foot and half in length, erect, ſmooth, on ſtem-claſping petioles, and of a duſky-red colour; flowers red-purple, corolla bell-ſhaped, ſix-parted, inferior; ſegments oblong, obtuſe, ſpreading; antheræ ſagittate, ſharp, and bifid at the end; ſtyle awl-ſhaped, thick, trifid, equal to the ſtamens; berry red; the ſeed is uſually abortive. It ſeems to approach the palms. In Chineſe it is called *tat-ſio* or *tſiet-tſao*; and is planted in gardens both there and in Cochin-china. Native of China; flowers in March and April.

3. Dracæna ſtriata, or ſtriated dracæna: fruteſcent; cauleſcent; erect; leaves lanceolate, obliquely ſickle-form, ſtriated; ſtem flexuoſe. Found at the Cape of Good Hope, by Thunberg.

4. Dracæna terminalis, or canna-leaved dracæna: herbaceous; cauleſcent; leaves lanceolate. Native of the Eaſt Indies, and the Society iſles.

5. Dracæna enſifolia, or ſword-leaved dracæna: herbaceous; ſubcauleſcent; leaves enſiform. This ſpecies perhaps more properly belongs to the genus Medeola, for it differs remarkably from D. draco in the fruit. Native of the Eaſt Indies, and Cochin-china. Loureiro ſays, that if he had followed his own opinion, he ſhould rather have referred this plant to the genus Ornithogalum.

6. Dracæna undulata, or undulated dracæna: herbaceous; cauleſcent; erect; leaves ovate, acute, many-nerved; flowers axillary, peduncled. 7. Dracæna medeoloides, or medeola dracæna: herbaceous; twining; leaves ovate, nerved. 8. Dracæna erecta, or upright dracæna: herbaceous; cauleſcent erect; leaves lanceolate, ſubulate, ſeſſile. 9. Dracæna volubilis, or twining dracæna: herbaceous; twining; leaves lanceolate. Found at the Cape of Good Hope by Thunberg. Dracæna medeoloides and Medeola aſparagoides are probably one and the ſame plant.

10. Dracæna graminifolia, or graſs-leaved dracæna: herbaceous; ſtemleſs; leaves linear. Leaves like thoſe of graſs, very much ſtreaked, a ſpan in length. Native of Aſia.

11. Dracæna marginata, or aloe-leaved dracæna: ſhrubby; leaves tooth-ſpiny; racemes axillary; berries many-ſeeded. Native of the iſland of Bourbon; flowers in April.

12. Dracæna borealis, or oval-leaved dracæna: herbaceous; ſubcauleſcent; leaves elliptic. Native of Newfoundland, Hudſon's Bay, and Canada; flowers in June.

13. Dracæna indiviſa, or entire dracæna: arboreous; leaves enſiform, acute; raceme compound. Native of New Zealand, in woods on the coaſt of Duſky bay. Trunk round, full of ſmall chinks, undivided, leafy at top, from ſix to nine feet high; leaves half-ſtem-claſping, imbricate at the baſe, quite entire, ſpreading, ſtriated, bright green, two feet long and a hand broad; berry globular, blue, marked above with three hollow dots, mucronate with the permanent ſtyle, having about ſeven ſeeds in each cell, involved in an aril or membrane, ſo as to appear only one; they are black, ſmooth, ſemilunar and three-ſided. The generic character conſtructed from the firſt ſpecies does not agree very well with this or D. terminalis, which have many ſeeds in their berries. Perhaps the berry of the firſt alſo may be involved in an aril, and this may conſtitute the eſſential difference between aſparagus and dracæna. The berries of this ſpecies are eaten by the natives; they are ripe in May, that is, at the beginning of their winter. The young leaves, or rather the hybernacle concealed among them, is an excellent ſalad; and this, together with Areca oleracea and ſapida, Apium graveolens or ſmallage, Tetragonia halimifolia, Lepidium oleraceum and piſcidium, and Sonchus oleraceus or ſowthiſtle, was found to be of great ſervice to our circumnavigators in reſiſting the putrid ſcurvy.

14. Dracæna auſtralis, or New Zealand dracæna: arboreous; leaves enſiform, acute; raceme terminating, erect, ſuperdecompound. Native of New Zealand. Propagation and Culture, ſee Palms.

DRACH'ENFELS, a town of Germany, in the circle of the Lower Rhine, and capital of a diſtrict, in the electorate of Cologn, with a citadel: four miles ſouth-eaſt of Bonn, and ſeven north-north-weſt of Linz.

DRACHM, *ſ.* among the Greeks, a coin of the value of ſeven-pence three-farthings; alſo a weight, which they divided into ſix oboli.

DRACH'MA, *ſ.* [δραχμη, from δραττομαι, to graſp, it being about a handful; or rather from דרכמין *drachmin*, Heb.] A drachm. The eighth part of an ounce, containing three ſcruples or ſixty grains.

DRACH'MON, *ſ.* [Heb.] An Hebrew gold coin, in value twenty-five ſhillings.

DRA'CIA, a river of Boſnia, which runs into the Drin, five miles north-eaſt of Orach.

DRAC'KEMBURG, or Drakemburg, a town of Germany, in the county of Hoya, on the Weſer, where a bloody battle was fought in 1547, between the Imperialiſts and the Saxons: two leagues north of Nienburg.

DRA'CO, the firſt legiſlator of the Athenians, B. C. 624. The accounts of him, which have come down to modern times, are ſuperficial and trifling; it is only certain that his laws were extremely ſevere, ſo that they are ſaid to have been "written in blood." Death was the penalty for every kind of offence; for which he is ſaid to have given as a reaſon, that "ſmall faults ſeemed to him worthy of death, and he could find no higher puniſhment for the greateſt crimes." We are told, however, that he ſo much abhorred the crime of taking away life, as to direct that even inanimate things, which had been the inſtruments of ſuch an action, ſhould be proſecuted; ſo that a ſtatue, which by falling had killed a man,

a man, was to be ſentenced to baniſhment. Theſe inconſiſtencies and puerilities denote a very rude ſtate of legiſlation, if, indeed, they have not been aggravated by popular tradition. Draco was advanced in years when he gave laws, and had acquired much authority from his virtue and patriotiſm. The Athenians, however, became ſo diſpleaſed with his rigour, that he thought proper to withdraw to the iſland of Ægina. There, according to a ſtory which appears ridiculous, he was received at the public theatre with an applauſe which proved fatal to him; for its expreſſion conſiſted in heaping upon him the cloaks and hats of the audience, by which he was ſuffocated. The laws of Draco, in the thirty-ninth Olympiad, are conſidered as the moſt ancient writing to which we can ſecurely appeal. It is ſaid that he was addicted to poetry, whence ſome have thought that he could not have been ſo harſh and rigid as has been repreſented; but there are too many authentic examples of the union of a cruel diſpoſition, with a taſte for elegant literature. All the laws of Draco were aboliſhed by Solon, except ſuch as related to murder.

DRA'CO, *ſ.* the DRAGON, in aſtronomy, a conſtellation of the northern hemiſphere; whoſe ſtars, according to Ptolemy, are eighty-one; according to Tycho, thirty-two; according to Hevelius, forty; according to Bayer, thirty-three; and according to Mr. Flamſteed, eighty. See ASTRONOMY.

DRA'CO, *ſ.* the DRAGON, in zoology, a genus belonging to the order of amphibia reptilia; the characters of which are theſe: it has four legs, a cylindrical tail, and two membranaceous wings, radiated like the fins of a fiſh, by which it is enabled to fly, but not to any great diſtance at a time. There are two ſpecies enumerated by Linnæus and Gmelin, as follow:

1. Draco volans, the flying dragon; native of Africa and India, and found abundantly in the iſland of Ceylon. It is diſtinguiſhed from the lizard tribe only by having broad lateral membranes, ſtrengthened by radii or bony proceſſes like the fins of fiſh, and of a leathery ſubſtance; in this reſpect reſembling the wings of the bat, flying fiſh, flying ſquirrel, &c. The body is aſh-coloured grey, covered with minute ſcales, clouded and varied with brown: beneath the gula or throat is a large pouch, membranaceous, and pointed; tail long and ſlender, annulated with light brown. It preys upon inſects of almoſt every kind; in purſuit of which it lurks among the foliage of trees, ſhrubs, and plants. It is a ſmall animal, meaſuring only nine inches from the point of the noſe to the tip of the tail. It ſprings from bough to bough, and from tree to tree, by means of its alar membranes, chirping as it goes. In this ſpecies the fore-legs are diſtinct from the wings; and, though very ſmall, it is the largeſt of the genus: a correct figure of it is given in the engraving, by Albertus Seba.

2. Draco præpos, the flying dragon of America. In this the alar membranes are very ſmall, ferruginous, with bars of deep brown running in an oblique direction round the edges of the wings. The body is covered with minute ſcales, of a dull cinereous colour. The tail is beſet with ſharp prickles for ſome diſtance from its baſe; it is very ſlender, and marked with obſcure ſpots of brown. In this ſpecies the wings are faſtened to the fore-feet, but not to the hind; the whole animal is very ſlender, and only ſeven inches long: modern naturaliſts conſider it as a ſmaller variety of the preceding, having preciſely the ſame form and habits, and uſing the ſame food.

The late Mr. Pennant, in his "Outlines of the Globe," after deſcribing this, among the other amphibia of Ceylon, remarks, "that the animal which bears the dreadful name of *dragon*, is no more than an innocent little lizard, quite harmleſs, and perfectly inoffenſive: yet it is the only creature known, that really bears the form and make of that all-devouring and deſtructive monſter feigned by the poets and writers of ancient romance. See the article DRAGON.

DRA'CO AR'BOR, *ſ.* in botany. See DRACÆNA and PTEROCARPUS.

DRA'CO CE'PHALOS, *ſ.* in botany. See CHELONE.

DRA'CO HER'BA, *ſ.* in botany. See ARTEMISIA.

DRACOCE'PHALUM, *ſ.* [from δρακων, a dragon, and κεφαλη, a head; the form of the flowers being ringent, or like a gaping mouth.] DRAGON'S HEAD; in botany, a genus of the claſs didynamia, order gymnoſpermia, natural order verticillatæ, (ſcropulariæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, tubular, permanent, very ſhort. Corolla: one-petalled, ringent; tube length of the calyx; throat very large, oblong, inflated, gaping, a little compreſſed on the back; lip ſuperior ſtraight, arched, complicated, obtuſe; lip inferior three-cleft; lateral diviſions upright, as it were the ſegments of the throat; the intermediate one hanging down, ſmall, prominent forwards at the baſe, roundiſh, emarginate. Stamina: filaments four, ſubulate, hid beneath the upper lip of the corolla, of which two are a little ſhorter; antheræ ſomewhat cordate. Piſtillum: germ four-parted; ſtyle filiform, in the ſituation of the ſtamens; ſtigma two cleft, ſharp, ſlender, reflex. Pericarpium: none; calyx cheriſhing the ſeeds in its bottom. Seeds: four, ovate-oblong, three-ſided.—*Eſſential Character.* Corolla, throat inflated, upper lip concave.

Species. I. In ſpikes. 1. Dracocephalum Virginianum, or Virginian dragon's-head: flowers crowded, leaves linear-lanceolate, ſerrate. This riſes with an upright ſtalk, near three feet high. Leaves about three inches long, and half an inch broad, ſeſſile; they are uſually in pairs at each joint, but ſometimes there are three together. The flowers are purple, in terminating ſpikes, and make a pretty variety among other hardy plants. It is perennial, and flowers from July to September. Native of North America, in woods, and by the ſides of rivers.

2. Dracocephalum denticulatum, or denticulated dragon's-head: flowers remote, leaves obovate-lanceolate, denticulate above. Allied to the firſt; but inferior in point of beauty. It ſpreads more on the ground; its flowering-ſtems are not altogether ſo upright, nor ſo tall; the leaves are broader, and the flowers in the ſpikes leſs numerous. It flowers in Auguſt and September. Mr. Curtis received ſeeds of it from Philadelphia, collected at a conſiderable diſtance from that city, about the year 1786. And Mr. Watſon, nurſeryman at Iſlington, obtained the plant from Carolina, about the ſame period.

3. Dracocephalum Canarienſe, or Canary dragon's-head: leaves compound. This is a perennial plant, riſing with ſeveral ſtalks to the height of three feet or more, becoming woody at the lower part. Leaves at each joint, having three or five oblong, pointed, ſerrate, leaflets. The flowers come out in ſhort thick ſpikes on the top of the ſtalks; they are of a pale blue colour, and are produced from July to September. Native of the Canary iſlands, whence it was brought to Europe, by the name of *permento de Tana*; the old writers call it *camphoroſma* and *cedronella*; and we, *balm of Gilead*, from its rich odour, on being gently rubbed. It was deſcribed by Moriſon in 1690, and was cultivated in 1697, by the ducheſs of Beaufort.

4. Dracocephalum pinnatum, or pinnate-leaved dragon's-head: leaves cordate, pinnate-ſinuate. Native of Jerkatſch, in Siberia.

5. Dracocephalum peregrinum, or prickly-leaved dragon's-head: flowers ſomewhat ſpiked, ſtem-leaves ovate-oblong, gaſhed, bractes linear-lanceolate, denticulate-ſpiny. Native of Siberia.

6. Dracocephalum Auſtriacum, or Auſtrian dragon's-head: leaves and bractes linear, parted, ſpiny. This is a beautiful plant, and grows in Auſtria and Hungary, where it was firſt obſerved by Cluſius. It varies according to its ſoil in point of number of ſtems, &c. The ſtems are annual, ſquariſh, and villoſe: the leaves oppoſite; hoary below, ſmooth and green above, and are deeply lobed or cut in a pinnatifid manner. The flowers

are

are axillary on the upper part of the plant, commonly in pairs, ſometimes in threes; and are of a violet-purple colour, paler without.

7. Dracocephalum Ruyſchiana, or hyſſop-leaved dragon's-head: leaves and bractes lanceolate, undivided, awnleſs. Stems about two feet high, with two ſmooth linear leaves at each joint, about an inch long, and one-eighth of an inch broad, with a deep furrow along the middle. The flowers appear in June, and are of a fine blue colour. Native of Norway, Sweden, Swiſſerland, and Siberia. This and the foregoing ſpecies were ſeparated by Boerhaave, and made a diſtinct genus, under the name of *Ruyſchiana*, in honour of Dr. Ruyſch, who was profeſſor of anatomy and botany at Amſterdam.

II. In whorls. 8. Dracocephalum Sibiricum, or Siberian dragon's-head: flowers ſubverticilled; peduncles bifid, pointing one way; leaves cordate-oblong, acuminate, naked. The ſtalks of this do not grow erect, like the preceding, but ſpread nearer to an horizontal poſition; they divide into ſeveral branches, which have a pair of large leaves at each joint, and four ſmaller, two on each ſide; they are ſmooth, have ſharp indentures on their edges, and ſtand erect. The flowers come out from the ſide of the ſtalks at the baſe of the leaves, two or three together on each ſide; calyx purple, corolla of a paler blue. Native of Siberia. This, and all the foregoing ſpecies, are perennial. The third is marked in the Kew catalogue as biennial.

9. Dracocephalum Moldavica, or Moldavian dragon's-head or balm: leaves dotted underneath; bractes lanceolate, the ſerratures capillaceous. This is an annual plant, riſing with branching ſtalks a foot and a half high, with oblong leaves, deeply ſerrate on their edges. The flowers come out in whorls round the ſtalks at every joint; they are blue, and appear in July, continuing to the middle of Auguſt. The ſeeds ripen in September. The plant has a ſtrong balſamic odour, which to ſome perſons is very agreeable. Native of Moldavia. Cultivated in 1596, by Gerarde.

10. Dracocephalum caneſcens, or hoary dragon's-head: bractes oblong, with ſpiny ſerratures; leaves ſubtomentoſe. This has hoary ſtalks, a foot and a half high putting out two or three ſide branches, with hoary leaves near two inches long, and half an inch broad, a little indented on their edges; they are placed juſt under the whorls of flowers, which ſit cloſe to the ſtalk; the corolla is large, of a fine blue colour, and makes a pretty appearance among the hoary leaves. It flowers and ſeeds about the ſame time as the foregoing ſort, and is generally treated as an annual, but the roots will live two years in a dry ſoil. There is a variety, with white flowers. Diſcovered by Tournefort in the Levant.

11. Dracocephalum peltatum, or willow-leaved dragon's-head: bractes orbiculate, ſerrate-ciliate. This is an annual plant, about a foot high, ſending out two ſmall branches from the lower part. Flowers ſmall, purpliſh, coming out at the ſame time with the two foregoing. Native of the Levant, whence Tournefort ſent the ſeeds to the royal garden at Paris.

12. Dracocephalum grandiflorum, or great-flowered dragon's-head; leaves crenate; root-leaves cordate; ſtem-leaves orbiculate, ſeſſile; bractes acuminate-toothed. Native of Siberia. That deſcribed in the *Species Plantarum* is a variety of this.

13. Dracocephalum nutans, or nodding dragon's-head: bractes oblong, ovate, quite entire; corollas rather large, nodding. This alſo is annual. Stalks many, weak, about nine inches high, having at the bottom ovate-lanceolate leaves about two inches long, and an inch and a quarter broad, crenate, and on pretty long foot-ſtalks. The flowers are of a deep blue colour; the ſeeds ripen in autumn. Native of Siberia.

14. Dracocephalum thymiflorum, or ſmall-flowered dragon's-head: bractes oblong, quite entire; corollas ſcarcely larger than the calyx. Stalks a foot and a half high; lower leaves like thoſe of betony, upon very long foot-ſtalks; upper leaves ſmall, and cloſer to the ſtalks. The flowers come out in whorls at every joint, they are of a pale purple or blue colour, and being ſmall make little appearance. Seeds ſmall, ovate-oblong, ſlightly convex on one ſide, angular on the other, dark cheſnut colour. Native of Siberia.

15. Dracocephalum Cochin-chinenſe, or dragon's-head of Cochin-china: flowers in ſpikes; bractes roundiſh, acute; leaves ovate-lanceolate, quite entire. Stem herbaceous, ten inches high, erect, grooved, villoſe. Flowers violet-coloured. Native of Cochin-china.

Propagation and Culture. 1, 2. Theſe will live in the open air, but require a moiſt ſoil, or ſhould be duly watered in dry weather, otherwiſe the leaves will ſhrink, and the flowers make little appearance.

3. Balm of Gilead is uſually kept in the green-houſe; but in mild winters the plants will live abroad in warm borders; and thoſe which are kept in pots will thrive much better when ſheltered under a frame than in a green-houſe, where the plants are apt to draw up weak; for they ſhould have as much free air as poſſible in mild weather, and only require to be ſheltered from ſevere froſt. This may be propagated by ſeeds, which, if ſown in autumn, will more certainly grow than thoſe which are ſown in the ſpring; but, if ſown in pots, they muſt be ſheltered under a frame in the winter, and, if the plants do not come up the ſame autumn, they will riſe in the ſpring; but if the ſeeds are ſown in the full ground, it ſhould be in a warm border; and in hard froſt they ſhould be ſheltered, otherwiſe the young plants will be deſtroyed. The plants may alſo be propagated by cuttings; which, if planted in a ſhady border any time in the ſummer, will very ſoon take root, and furniſh plenty of rooted plants.

6, 7, 8. Theſe plants are propagated by ſeed, which ſhould be ſown the latter end of March, in a bed of freſh light earth in an open expoſure, and in about five or ſix weeks after, the plants will appear, when they ſhould be carefully cleared from weeds; and if the ſeaſon ſhould prove dry, they muſt be refreſhed now and then with water, which will greatly promote their growth. When the plants are about two inches high, they ſhould be carefully tranſplanted into a bed or border of freſh, light, undunged earth, obſerving to ſhade them from the ſun until they have taken root, as alſo to refreſh them with water until they are well eſtabliſhed in this bed; after which time they will require no further care, but to keep them conſtantly clear from weeds till Michaelmas, when they are to be removed into the places where they are deſigned to remain for good. At Michaelmas, when the plants are tranſplanted for good, they ſhould be carefully taken up with balls of earth to their roots; and they muſt be planted in the middle of the borders in the pleaſure garden, in freſh light earth, intermixing them with other hardy plants of the ſame growth, where they will make a pretty appearance when they are in flower, and will continue three or four years; and in ſome poor ſtony ſoils the roots will live ſix or ſeven years, but theſe do not produce ſo large ſpikes of flowers as the younger and more vigorous plants. Therefore, as theſe plants do not continue many years, it will be proper to raiſe a ſupply of young plants to ſucceed them, for the old plants will produce ſeeds plentifully, which are ripe the latter end of Auguſt or the beginning of September, when they ſhould be gathered in dry weather, and kept in a warm dry room till the time for ſowing them.

9–14. All theſe ſorts may be propagated by ſeeds, which may be ſown either in the ſpring or autumn, in ſmall patches, upon the borders where they are to remain. When the plants come up, they ſhould be thinned where they grow too near together, and kept clear from weeds.

DRACONA'RIUS, *ſ.* in antiquity, DRAGON-BEARER. Several nations, as the Perſians, Parthians, Scythians, &c. bore dragons or ſerpents on their ſtandards; whence the

ſtandards were called *dracones*. The Romans borrowed the cuſtom from the Parthians; or, as Caſaubon informs us, from the Dacæ; or, as Codin, from the Aſſyrians. The ſoldier who bore the dragon or ſtandard was called by the Romans *draconarius*; and by the Greeks δρακοναριος and δρακοντειοφορος.

DRACONI'TES (John), a learned German Lutheran divine and biſhop, born at Carlſtadt in Franconia, in 1494. By his learning, abilities, and prudence, he acquired ſo high a reputation, that he was employed in ſeveral eccleſiaſtical negociations of conſiderable importance, and was ſucceſſively appointed to the biſhoprics of Marpurg and Roſtoch, and Samelande in the Pruſſian dominions. He was the author of Commentaries on ſome of the prophets; and Commentaries on the Goſpels for Sundays, written in Latin, folio; and other works, in which his erudition and critical ſkill were advantageouſly diſplayed. He alſo commenced the preparation of a grand work, being A Polyglot of the Bible, in five languages, in imitation of that of Origen, and of the Complutenſian edition, which he did not live to finiſh. He died in 1566.

DRACON'TIC MONTH, *ſ.* The time of one revolution of the moon from her aſcending node, called *caput draconis*, to her return to the ſame point, or place.

DRACON'TIUM, *ſ.* [from δρακων, a dragon.] In botany, a genus of the claſs gynandria, order polyandria, (heptandria monogynia, *Schreber*,) natural order piperitæ, (aroideæ, *Juſſ.*) The generic characters are—Calyx: ſpathe boat-form, leathery, one-valved, very large; ſpadix extremely ſimple, cylindric, very ſhort, coated on all ſides with fructifications diſpoſed into a head, of each of which the perianthium proper none, unleſs you call the corolla ſo. Corolla: proper five-petalled, concave; petals ovate, obtuſe, ſomewhat equal, coloured. Stamina: in each filaments ſeven, linear, depreſſed, upright, equal, longer than the corollet; antheræ four-cornered, twin, oblong, obtuſe, upright. Piſtillum: germ ſomewhat ovate; ſtyle columnar, ſtraight, length of the ſtamens; ſtigma obſcure, three-ſided. Pericarpium: in each a roundiſh berry. Seeds: very many.—*Eſſential Character.* Spathe, boat-form; ſpadix, covered; calyx, none; petals, five; berries, many-ſeeded.

Species. 1. Dracontium polyphyllum, or many-leaved dragon: ſcape very ſhort; petiole rooted, torn, leaflets three-parted; diviſions pinnatifid. This has a large knobbed irregular root, covered with a rugged brown ſkin; the ſtalk riſes about a foot high, is ſmooth, and of a purple colour, full of ſharp protuberances of different colours, ſhining like the ſkin of a ſerpent; it is naked to the top, where it has a tuft of leaves, which are divided into many parts. The flower-ſtalk riſes immediately from the root, and is ſeldom more than three inches high; having an oblong ſwelling hood, or ſpathe, at top, which opens lengthwiſe, ſhewing the ſhort thick pointed ſtyle within, upon which the flowers are cloſely ranged. It grows naturally in ſeveral of the iſlands of America; alſo in Surinam, and Japan, where they prepare a medicine from the acrid roots, which they call *konjakf*, and eſteem as a great emmenagogue; diſſolute women uſe it there to procure abortion. In the Society iſles, it is cultivated for the ſake of the roots, which are eaten in a ſcarcity of the bread-fruit, notwithſtanding their extreme acrimony.

2. Dracontium ſpinoſum, or prickly dragon: leaves ſagittate; peduncles and petioles prickly. It grows naturally in the iſland of Ceylon, and in ſeveral parts of India.

3. Dracontium fœtidum, fetid dragon, or ſcunk-weed: leaves roundiſh. The flowers appear firſt; after they are arrived to a ſtate of perfection, the leaves come out at a ſmall diſtance in a conic form, very cloſely rolled together; they are nearly ovate when expanded, and petioled; the plant has no ſtem; the globe of flowers is nearly the colour of the ſpathe, which is beautifully variegated with ſcarlet and yellow; the corolla has four erect, very thick, narrow, obtruncated, petals; the ſtamens have four flattiſh filaments riſing from the receptacle, longer than the corolla; ſtyle rather longer than the ſtamens; ſtigma bifid; ſeeds large, roundiſh, ſingle, incloſed within the receptacle. Native of North America, in ſwamps and borders of meadows; flowers in April and May. The vulgar names of ſcunk cabbage and ſcunk weed are taken from its rank ſmell, nearly reſembling that of a ſcunk or polecat. The roots dried and powdered are an excellent remedy in aſthmatic caſes. It may be given with ſafety, to children, in doſes of four, five, or ſix, grains, and to adults, in doſes of twenty grains and upwards. It appears to be antiſpaſmodic, and bids fair to be uſeful in many diſorders. In collecting the roots, particular care ought to be taken that the white hellebore, or poke-root, which ſome call ſcunk weed, be not miſtaken for this. There is an obvious diſtinction, the former has a ſtalk, but this has none. Cattle do not touch it during the ſummer. The Swedes ſettled in North America call it *byorn-blad*, or *byorn-retter* (bear's leaf or bear's root), becauſe the bears, when they leave their winter habitations in the ſpring, are very fond of it.

4. Dracontium Camſchatcenſe, or Kamtſcatka dragon: leaves lanceolate. This has roots like the common arum, and the leaves come out each on a ſeparate foot-ſtalk, immediately from the root, as in that plant; it has not flowered in England; Siberia is its native country.

5. Dracontium pertuſum, or perforate-leaved dragon: leaves perforated; ſtem climbing. This has ſlender jointed ſtalks, which put out roots at every joint, that faſten to the trunks of trees, walls, or any ſupport which is near them, and thereby riſe to the height of twenty-five or thirty feet; the leaves are placed alternately, ſtanding upon long foot-ſtalks; they are four or five inches long, and two and a half broad, having ſeveral oblong holes in each, ſo that on the firſt view they appear as if eaten by inſects. The flowers are produced at the top of the ſtalk, which always ſwells to a larger ſize in that part than in any other; theſe are covered with an oblong ſpatha (or hood) of a whitiſh green colour, which opens longitudinally on one ſide, and ſhews the ſpadix cloſely covered with flowers, of a pale yellow inclining to white. When this plant begins to flower, it ſeldom advances farther in height, ſo that theſe ſeldom are more than ſeven or eight feet high; but the leaves are much larger on theſe, than thoſe of the plants which ramble much farther. It grows naturally in moſt of the iſlands in the Weſt Indies, and in the iſland of Tanna in the South Seas; and was cultivated by Mr. Miller in 1752.

Propagation and Culture. The firſt and ſecond ſorts being tender, require a warm ſtove to preſerve them in England. The roots muſt be planted in pots filled with light kitchen-garden earth, and plunged into the tan-bed in the ſtove, where they ſhould conſtantly remain; in the winter they muſt be watered very ſparingly, but in warm weather, when the plants are in vigour, they muſt be often refreſhed, but it ſhould not be given them in too great quantities; with this management the plants will flower, but their roots do not increaſe here. The fourth ſpecies requires a ſhady ſituation, and will bear the greateſt cold of this country. The fifth is eaſily propagated by cuttings, which, if planted in pots filled with poor ſandy earth, and plunged into a hot-bed, will ſoon put out roots, if they had none before; but there are few of the joints which have not roots: the plants being tender, will not live in the open air in England, therefore the pots ſhould be placed near the walls of the hot-houſe, againſt which the plants will climb, and faſten their roots into the wall, and thereby ſupport the ſtalks. They ſhould have but little water given them in the winter, but in warm weather it muſt be given them three or four times a-week, and in the ſummer the free air ſhould be admitted to them in plenty. The plants have no particular ſeaſon of flowering, for they ſometimes flower in autumn, and at other times in the ſpring, but they do not ripen their ſeeds in England. Theſe plants are preſerved in the gardens of the curious in England and Holland,

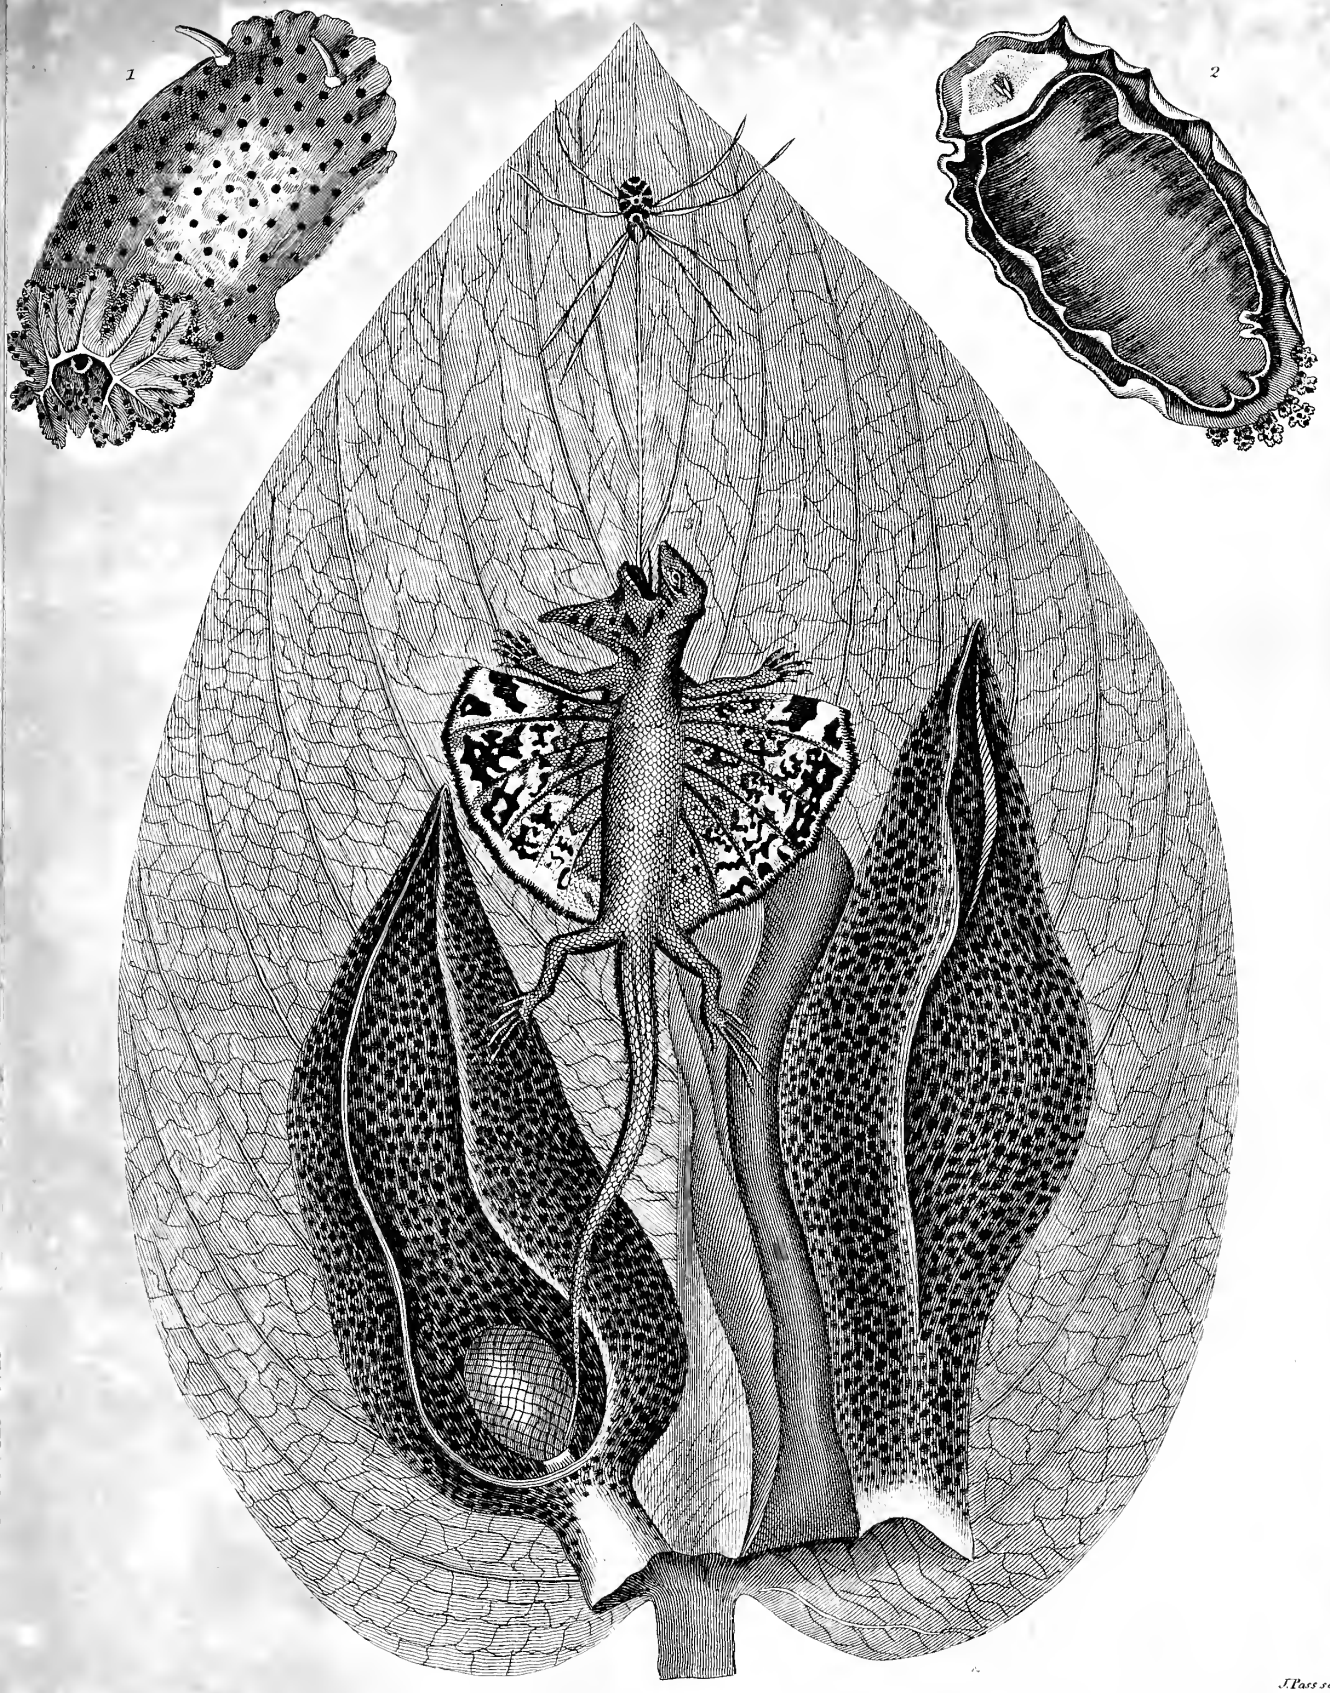
DORIS, DRACO, AND DRACONTIUM.



J. Pass sculp.

1. The Doris Argo, or Sea Lemon. 2. Under part of the same. 3. The Draco Volans, or flying Dragon, upon the Dracontium foetidum or Skunkweed.

London. Published as the Act directs July 30 1803 by J. Wilkes.

more for the ſake of variety than for beauty; for, except the fifth ſort, there is not any of them which make much appearance; that indeed may be ſuffered to have a place againſt the wall of the ſtove, over which it will ſpread, and cover the nakedneſs of the wall; and the leaves, which are ſo remarkably perforated, remaining all the year, make a ſingular appearance.

All the other ſorts of dragon being tender plants, will not live in this country, unleſs they are preſerved in the warmeſt ſtoves; the ſeveral American ſorts grow naturally in the woods in Jamaica, and other hot parts of America; the climbing ſorts twiſt themſelves round the trunks of trees, into which they faſten their roots, which are ſent forth from their joints, and riſe to the height of thirty or forty feet. Theſe climbing ſorts are eaſily propagated by cuttings, which, being very ſucculent, may be brought over to England in a box of dry hay, if they are packed up ſeparate, ſo as not to injure each other by the moiſture, which is apt to flow out at the part where they are cut off, which may occaſion a fermentation, and thereby rot the cuttings. When the cuttings arrive, they ſhould be planted in ſmall pots filled with light freſh earth, and plunged into a hot-bed of tanner's bark, being very careful not to let them have too much moiſture until they have taken root, leſt it rot them: when they have taken root, they muſt be frequently refreſhed with water; and when they are grown pretty large, they ſhould be placed in the bark-bed in the ſtove, where they muſt be placed near ſome ſtrong plants, to which they may faſten themſelves, otherwiſe they will not thrive; for though they will ſend forth roots at their joints, which will faſten to the mortar of the ſtove, when placed againſt the wall, yet they will not thrive near ſo well as againſt a ſtrong plant, which will afford them nouriſhment.

The other ſorts are propagated by offsets from their roots; theſe may be procured from the countries of their growth, and ſhould be planted in tubs of earth, about a month before they are put on-board the ſhip to tranſport them; theſe tubs ſhould be placed in a ſhady ſituation until they have taken root. In their paſſage, great care ſhould be had to keep them from ſalt water, as alſo not to let them have too much water given them; for if they have a little water once or twice a-week while they are in a hot climate, and when they are come into a cooler climate once in a-fortnight, this will be ſufficient for them; and it ſhould be done ſparingly, leſt it rot them; for if the tops of the plants ſhould decay for want of water in their paſſage, if the roots are not rotted, they will ſoon recover with proper care. Theſe plants will riſe to the height of three, four, or five, feet, and will afford a very agreeable variety amongſt other tender exotic plants in the ſtove. See ARUM and POTHOS.

DRACUNCULO'IDES, *ſ.* in botany. See HÆMANTHUS.

DRACUN'CULUS, *ſ.* in botany. See ACHILLEA, ARTEMISIA, ARUM CALLA, POTHOS, and RUDBECKIA.

DRACUN'CULUS, *ſ.* [from δρακων, Gr. a ſerpent.] The GUINEA WORM, called alſo *ſolitary worm*. The Arabians call it *Medinenſis*, or *medena vena*. They ſtyled it *vena*, becauſe they doubted its being a living animal, and *Medinenſis*, from the frequency of its appearance at Medina. Hence Avicenna treats of it among abſceſſes. Dr. Frend ſays, that Ætius is the firſt who gives an account of theſe worms; but Plutarch quotes Agatharchides for an account of them, who wrote long before Ætius. Plutarch calls them δρακοντια μακρα. They are common in both the Indies, in moſt parts of Africa, particularly in Guinea, from which they derived their trivial name; in Swiſſerland, Genoa, and many other hot countries. It is the *filaria medinenſis* of Gmelin's Linnæus. See FILARIA. This worm is commonly found in the legs, but ſometimes it is in the muſcular part of the arms. While they move under the ſkin they create no trouble; but in length of time the place near the dracunculus ſuppurates, and the animal puts forth its head. If it be drawn, it excites conſiderable uneaſineſs, eſpecially if drawn ſo forcibly as to break it; for the part left within creates intolerable pain. *Ætius*, ii. *c.* 85. Paulus Ægineta mentions them as being always ſeated in the muſcular parts of the thighs, legs, and arms; and he ſays, that ſometimes they are met with in the ſides of children. In the ſixth volume of the Edinburgh Medical Eſſays, mention is made of one that was three yards and a half in length. In ſome inſtances, beſides the pain which it occaſions, a fever is alſo a conſequence. Theſe worms are ſaid to be frequent in the morning dew, from whence they enter the naked feet of the negroes, and bury themſelves under the cuticle.

Dr. Towne, in his Treatiſe on the Diſeaſes of the Weſt Indies, deſcribes this worm as being long, white, round, and reſembling ſmall round bobbing. This deſcription is juſt. Nothing need be done until a tumor comes on; and then the beſt method is to promote ſuppuration: as ſoon as the tumor is open, the head of the worm appears, which, being tied by a thread, may be ſecured on a roll of linen ſpread with ſticking-plaiſter, and as the worm appears, it may be rolled round this linen, until the whole is extracted; after which, the treatment will be only as in common caſes. During the time that this worm is coming out, the greateſt care is neceſſary that it may not be broken, for the conſequence of ſuch an accident are tedious ulcers in the whole length of that part which is poſſeſſed of the remaining worm. A daily uſe of aloes, or of any other anthelmintic, is convenient, during the extraction of the worm, as ſuch means are obſerved to haſten its expulſion. Dr. Iſert, phyſician-general to the Daniſh ſettlement in Africa, on his return from the Piton mountains, found his ancle very much ſwelled and inflamed; and, on examination, diſcovered that it was occaſioned by a dracunculus, which he gradually extracted: it was near five feet in length, and about the thickneſs of a ſtraw. He imagines that he brought it from Guinea; and if ſo, he muſt have had it for eight months about him before it produced any inconvenience. See his Voyage to Guinea, Dordt, 1790.

DRA'CUT, a townſhip of the American States, in the northernmoſt part of Middleſex county, on the bank of Merrimack river, oppoſite Patucket falls: thirty miles north by weſt of Boſton, and twenty-eight ſouth-weſt of Exeter, in New Hampſhire.

DRAD, *adj.* [for *dread*, or the part. paſſ. of *To dread.*] Terrible; formidable; dreaded:

Th' utmoſt ſand-breach they ſhortly fetch,
Whilſt the *drad* danger does behind remain. *Spenſer.*

DRAFF, *ſ.* [ðrop, Sax. dirty; *draf*, Dut. the ſediment of ale.] Refuſe; lees; dregs: properly ſomething fluid.—You would think I had a hundred and fifty tattered prodigals lately come from ſwinekeeping, from eating *draff* and huſks. *Shakeſpeare.*

'Twere ſimple fury, ſtill thyſelf to waſte
On ſuch as have no taſte;
To offer them a ſurfeit of pure bread
Whoſe appetite is dead!
No, give them grains their fill;
Huſks, *draff*, to drink and ſwill. *Ben Jonſon.*

Refuſe; ſweepings. Perhaps improper.—Younger brothers but the *draff* of nature. *Dryden.*

DRAFFY, *adj.* Worthleſs; dreggy.

DRAFT, *adj.* [corrupt for *draught.*] Employed to draw.—Ulyſſes and old Neſtor yoke you like *draft* oxen, and make you plough up the wair. *Shakeſpeare.*

DRAFT, *ſ.* An order in writing to receive money. See BILL of EXCHANGE, vol. iii. p. 29.

To DRAG, *v. a.* [ðnaʒan, Sax.] To pull along the ground by main force; to draw heavily along:

Such his aſpect, when, ſoil'd with bloody duſt,
Dragg'd by the cords which thro' his feet were thruſt.
Denham.

To

To draw any thing burthenſome, any thing from which one cannot diſengage one's ſelf:

Can I, who lov'd ſo well,
To part with all my bliſs to ſave my lover,
Oh! can I *drag* a wretched life without him? *Smith.*

To draw contemptuouſly along, as a thing unworthy to be carried.—He triumphs in St. Auſtin's opinion; and is not only content to *drag* me at his chariot-wheels, but he makes a ſhew of me. *Stillingfleet.*—To pull about with violence and ignominy:

They ſhall ſurpriſe
The ſerpent, prince of air, and *drag* in chains
Thro' all his realm, and there confounded leave. *Milton.*

To pull roughly and forcibly:

To fall, that's juſtice;
But then, to *drag* him after! For to die
And yet in death to conquer, is my wiſh. *Dryden.*

To DRAG, *v. n.* To hang ſo low as to trail or grate upon the ground.—A door is ſaid to *drag*, when, by its ill hanging on its hinges, the bottom edge of the door rides in its ſweep upon the floor. *Moxon.*

From hence are heard the groans of ghoſts, the pains
Of ſounding laſhes, and of *dragging* chains. *Dryden.*

DRAG, *ſ.* A net drawn along the bottom of the water:

Caſting-nets were ſpread in ſhallow brooks,
Drags in the deep, and baits were hung on hooks. *Dryden.*

An inſtrument with hooks to catch hold of things under water.—You may in the morning find it near to ſome fixed place, and then take it up with a *drag*-hook, or otherwiſe. *Walton.*—A kind of car drawn by the hand.—The *drag* is made ſomewhat like a low car: it is uſed for the carriage of timber, and then is drawn by the handle by two or more men. *Moxon.*—In huſbandry, an implement to break the clods, and tear the ground; a large harrow. A raft to carry any thing down a river; that which hangs over a ſhip, and prevents her ſailing.

DRAGE, a town of Germany, in the duchy of Holſtein: four miles north of Itzehoa.

DRAGE, a river of Germany, in the circle of Upper Saxony, which runs into the Netza, ſix miles eaſt-north-eaſt of Drieſen, in the New Mark of Brandenburg.

DRA'GEMEL, a town of Germany, in the duchy of Carniola, on the Save: ſix miles north of Laubach.

To DRAG'GLE, *v. a.* To make dirty by dragging on the ground:

You'll ſee a *draggled* damſel, here and there,
From Billingſgate her fiſhy traffic bear. *Gay.*

To DRAG'GLE, *v. n.* To grow dirty by being drawn along the ground:

His *draggling* tail hung in the dirt,
Which on his rider he would flirt. *Hudibras.*

DRAG'MA, *ſ.* [Gr.] A handful, a gripe. With apothecaries, a handful of herbs.

DRAG'MIS, *ſ.* in pharmacy, as much as may be taken up with three fingers.

DRAG'NET, *ſ.* A net which is drawn along the bottom of the water.—Whatſoever old Time, with his huge *dragnet*, has conveyed down to us along the ſtream of ages, whether it be ſhells or ſhellfiſh, jewels or pebbles, ſticks or ſtraws, ſeaweeds or mud, theſe are the ancients, theſe are the fathers. *Watts.*

Dragnets were made to fiſh within the deep,
And caſting-nets did rivers bottoms ſweep. *May.*

DRA'GOMAN, a town of European Turkey, in the province of Bulgaria: twenty-two miles weſt-north-weſt of Sofia.

DRA'GOMAN, or DROGMAN, *ſ.* A term in the Eaſt for an interpreter, whoſe office is to facilitate commerce between the natives and foreigners.

DRAGOMES'TRO, a town of European Turkey, in Livadia; taken by the Venetians in 1684, but abandoned ſoon after: forty-four miles weſt-north-weſt of Lepanto.

DRAGOMIR'NA, a town of European Turkey, in Moldavia: eight miles north of Suczava.

DRA'GON, *ſ.* [*draco*, Lat. of δρακων, Gr.] A reptile of the lizard kind, furniſhed with wings like a bat. See the article DRACO. An imaginary and terrific monſter, much celebrated in the romances of remote ages; and uſed ſymbolically in many paſſages of the holy ſcriptures, wherein it is frequently applied to deſignate the malignity of Satan, the ſpiritual enemy of man, and to convey to the mind an idea of the monſtrous ſhapes and deplorable condition of the fallen angels, as a puniſhment for their rebellion againſt God. Notions of the real exiſtence of wide-waſting animals of this deſcription, with wings, and ſcales, and forked tongues, alſo breathing fire and ſmoke, have too long embarraſſed the apprehenſions of weak minds, and uninformed readers. A late writer, therefore, inveſtigating the various accounts we have of the dragon, with a view to remove theſe vague and ſuperſtitious impreſſions, is led to believe that he has diſcovered the origin of this feigned monſter, among the hieroglyphics of ancient Egypt. "Before the Egyptians were become acquainted with the exact time of the periodical overflowing of the Nile, they frequently found their harveſts deſtroyed by the then unlooked-for inundation. They therefore regarded that river as the enemy of agriculture or huſbandry. Agriculture or huſbandry was ſymbolized as a child, the ſon of Oſiris and Iſis, or the ſun and earth; and, thus perſonified, was denominated Horus. The Nile was characterized by a crocodile, &c. The character of a crocodile was hence conſidered as the ſymbol of any enemy. In commemorating the general deluge, they alſo ſymbolized that event by a water-monſter killing Oſiris, or the ſun. Hence the water-monſter, the crocodile, or dragon, became the repreſentation of the enemy of the ſun. The ſun the Egyptians confounded with Ham, and Ham they confounded with the Almighty: hence thoſe ſigns became indicative of the enemy of the Almighty, or of the evil principle, or the devil. Moſes, we are told, was learned in all the wiſdom of the Egyptians; and almoſt every page of the pentateuch reminds us of the idolatry of the Iſraelites. And mention is expreſsly made by the prophet Amos, v. 25, 26, and from him by St. Stephen, Acts ii. 43, 47. of the images, the types, or ſymbols, which they brought out of Egypt. The convertible uſe of the terms, *Ob*, *Peten*, *Python*, *Typhon*, &c. ſo often made, both by the ſacred and prophane writers, corroborates this idea. The words Satan and devil (Διαβολος) alſo ſignifying an enemy, accuſer, or adverſary, and ſo frequently occurring in the ſcriptures, and which are applied even to men, 2 *Sam.* xix. 22; and *John* vi. 7; 2 *Tim.* iii. 3, &c. add ſtrength to the conjecture.

"The crocodile was peculiarly deſcriptive of the Nile; and was, therefore, more generally and longer adopted as the repreſentative of that river, the original foe. The emblem of the winds was, a bird; or, in compound ſymbols, the wings of one. When the Egyptians had at length aſcertained the annual inundation of the Nile, they exhibited to the public view, the ſymbol of a crocodile with wings upon his back, in order to indicate to the people, that the Eteſian winds had ſet in, and that, in conſequence, the Nile was about to overflow. The crocodile with wings, ſtrongly agrees with the repreſentation of the dragon; and the crocodile is evidently the tannim, the leviathan, &c. of the ſcriptures. The name of the leviathan has alluſion to its ſcales: now the whale (as the word is frequently rendered) has no ſcales; but the ſcales of the crocodile are proverbial. "A flame goeth out of his mouth," ſays Job. The crocodile, from long repreſſion of breath in the water, is remarked by naturaliſts, as emitting it ſo as to reſemble ſmoke: and is not the dragon of romance repreſented as belching out fire? The tannim

nim of Ezekiel too has feet; and ſo, it ſhould ſeem, had the leviathan of Job, xli. 30. The feet of the crocodile reſemble thoſe of the imaginary dragon; but whales have no feet. Again, the tannim of Ezekiel are deſcribed as being in "the river of Egypt," where whales are not known, but crocodiles are proverbially numerous. Eve, Heva, Chavah, the name of the firſt woman, ſignified in ſeveral of the oriental languages, a ſerpent: it alſo ſignified *life*, or to *cauſe to live*; and ſo Moſes himſelf interprets: "And he called her name Eve, becauſe ſhe was the mother of all living." Hence the Moſaic allegory of the fall. The ſerpent became the ſymbol of the tempter, or enemy of man. It had before been conſidered as the emblem of life: but Moſes, in order to counteract ſuch idolatry, repreſented it as the introducer or author of death. Thus the ſerpent was confounded with the dragon; and hence we find the terms tannim, nachaſh, and leviathan, uſed often for each other (compare *Gen.* iii. 1; *Ex.* vii. 9, 10, 15, &c.) and equally tranſlated in the Septuagint by that of Δρακοντων. See *Pſalm* lxxiv. 13, 14; *Ezek.* xxxii. 2; *Job*, xli. 1; *Iſaiah*, xxvii. 1; *Job*, xxvi. 13; *Amos*, ix. 3, &c."

The learned Dr. Bryant traces the origin of the dragon, and its introduction into fable and romance, from a ſimilar ſource, and from the ſame country. According to this author, "towers were erected on artificial mounds, in Egypt and Syria, as places of ſafety, and as repoſitories for riches and treaſure. Being generally royal edifices, and very ſtrong, they were termed *trachon*. There were two hills with towers of this denomination near Damaſcus, from whence undoubtedly the Regio Traconitis received its name. The Greeks, who brought their arts and mythology out of Egypt, ſophiſticated this term by calling ſuch places Δρακων; from whence in a great meaſure aroſe the notion of virgins and treaſures being guarded by ſleepleſs dragons. When the Greeks underſtood that in theſe temples idols were worſhipped under the form of a ſerpent, they concluded that *trachon* was a ſerpent; and hence came the word *draco* to be appropriated to ſuch an animal: for the draco was always conſidered as an imaginary being. Hence in romances we often read of pious virgins cruelly expoſed to dragons and ſea-monſters; and of dragons which laid waſte whole countries or provinces, till they were encountered and ſlain by ſome hero of eminent proweſs. All the poetical accounts of knights and heroes engaging with dragons, ſeem therefore to have ariſen from fables or miſconceptions about theſe towers or temples, which thoſe perſons either founded, or took in war: or if they were deities, of whom ſuch ſtory is told, theſe temples were erected to their honour. But the Greeks made no diſtinction: they were fond of heroiſm: and no colony could ſettle any were, and erect ſuch a temple, but there was ſuppoſed to have been a contention between a hero and a dragon." See HYDRA.

DRA'GON, *ſ.* in botany. See ARUM and DRACONTIUM.

DRA'GON's BLOOD, *ſ.* A red-coloured, inodorous, and inſipid reſin, inſoluble in water, ſoluble in ſpirit of wine and in oils, to both which liquors it communicates a red colour. By fire it is fuſible, inflammable, and it emits an acid vapour, like that of benzoin. It is obtained principally from the *calamus dioicus*, or dioecous rattan, of Linnæus. A ſolution of dragon's blood in ſpirit of wine is uſed for ſtaining marble, to which it gives a red tinge, which penetrates more or leſs deeply according to the heat of the marble during the application. But as it ſpreads at the ſame that it ſinks deep, for fine deſigns the marble ſhould be cold. Mr. Du Fay ſays, that, by adding pitch to this ſolution, the colour may be rendered deeper. The Dutch often adulterate this reſin with mixtures of gum arabic, Braſil wood, alum, &c. but theſe are diſcovered by their diſſolving in water, or by their crackling and not burning in the fire. It is not much uſed as a medicine, and Cullen thinks it ought to be expunged from the Materia Medica; though it is recommended as a gentle incraſſant, deſiccative, and reſtringent.

DRA'GON-FLY, *ſ.* See LIBELLULA.

DRA'GON's HEAD, *ſ.* in botany. See DRACOCEPHALUM.

DRA'GON's HEAD AND TAIL, *ſ.* [*caput & cauda draconis.*] The nodes of the planets; or the two points wherein the ecliptic is interſected by the orbits of the planets, and particularly that of the moon; making with it angles of five degrees and eighteen minutes. One of theſe points looks northward; the moon beginning then to have north latitude, and the other ſouthward, where ſhe commences ſouth. Thus her deviation from the ecliptic ſeems (according to the fancy of ſome) to deſcribe a figure like that of a dragon, whoſe belly is where ſhe has the greateſt latitude; the interſection repreſenting the head and tail, from which imaginary reſemblance this denomination has ariſen, to ſignify the moon's nodes. See ASTRONOMY, vol. ii. p. 326.

DRA'GON-TREE, *ſ.* in botany. See DRACÆNA.

DRAGO'NERA, a town of Italy, in the kingdom of Naples, and province of Capitanata: fifteen miles north of Volturara.

DRAGO'NERA, a ſmall uncultivated iſland in the Mediterranean, not above a mile from the weſt coaſt of the iſland of Majorca. Lat. 39. 35. N. lon. 19. E. Peak of Teneriffe.

DRA'GONET, or DRAGON-FISH, in ichthyology. See CALLIONYMUS, vol. iii. p. 627.

DRA'GONISH, *adj.* Having the form of a dragon; dragonlike. *An arbitrary word:*

Sometimes we ſee a cloud that's *dragoniſh*;
A vapour ſometimes like a bear or lion. *Shakeſpeare.*

DRA'GONLIKE, *adj.* Furious; fiery:

He fights *dragonlike*, and does achieve
As ſoon as draw his ſword. *Shakeſpeare.*

DRAGOON', *ſ.* [from *dragen*, Germ. to carry.] A ſoldier that ſerves indifferently either on foot or horſeback.—Two regiments of *dragoons* ſuffered much in the late action. *Tatler.*

To DRAGOON', *v. a.* To perſecute by abandoning a place to the rage of ſoldiers; to harraſs:

In politics I hear you're ſtaunch,
Directly bent againſt the French;
Deny to have your free-born foe
Dragoon'd into a wooden ſhoe. *Prior.*

DRAGO'T, a town of European Turkey, in Albania, on the Crevaſta: thirty-ſix miles ſouth-ſouth-eaſt of Durazzo.

DRAGUIGNAN', a town of France, and principal place of a diſtrict, in the department of the Var, containing about 9000 inhabitants: four leagues and a half north-weſt of Frejus, and nine and a half weſt of Antibes. Lat. 44. 34. N. lon. 24. 8. E. Ferro.

DRAGUSZA'NI, a town of European Turkey, in Moldavia: forty-eight miles eaſt of Jaſſi.

DRA'HEIM, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania: twenty miles ſouth-weſt of New Stettin.

To DRAIN, *v. a.* [*trainer*, Fr.] To draw off gradually.—The fountains *drain* the water from the ground adjacent, and leave but ſufficient moiſture to breed moſs.—Whilſt a foreign war devoured our ſtrength, and *drained* our treaſures, luxury and expences increaſed at home. *Atterbury.*—To empty, by drawing gradually away what it contains:

Sinking waters, the firſt land to *drain*,
Fill'd the capacious deep, and form'd the main. *Roſcom.*

To make quite dry.—When wine is to be bottled, waſh your bottles, but do not *drain* them. *Swift.*

DRAIN, *ſ.* The channel through which liquids are gradually drawn; a watercourſe; a ſink.—If your *drains* be deep, that you fear cattle falling into them, cover them. *Mortimer.*

Why ſhould I tell of ponds and *drains*,
What carps we met with for our pains?

DRAIN'ING, *ſ.* in huſbandry, the art of carrying off the ſurcharge of water from wet, marſhy, or ſwampy, land, and thereby laying it ſufficiently dry for the purpoſes of agriculture. This art has been purſued for a long ſeries of years, with a degree of induſtry and perſeverance equal to the importance of the object, though without the deſired ſucceſs. But it has recently approached very near perfection, through the ingenuity of Mr. Joſeph Elkington, a gentleman farmer of Princethorp, in the county of Warwick, who ſucceſsfully adopted a plan of tapping or boring the ſubjacent ſprings, ſo as to let off thoſe waters which are the conſtant ſupply of bogs, moraſſes, and ſwamps. This valuable diſcovery not only detects the latent cauſe of water oozing over the ſurface of the ſoil, but points out a method of draining by which the evil is effectually removed.

Draining is, without doubt, the firſt ſtep towards the improvement of all wet land; and, according to the principles laid down by Mr. Elkington, it depends upon three points: 1. Upon finding out the main ſpring, or cauſe of the miſchief, without which nothing effectual can be done. 2. Upon taking the level of that ſpring, and aſcertaining its ſubterraneous bearings; for, if the drain is cut a yard beyond the line of the ſpring, we can never reach the water that iſſues from it, but by aſcertaining that line by means of levelling, we may cut off the ſpring effectually, and conſequently drain the land in the cheapeſt and moſt eligible manner. 3. By making uſe of the auger to reach or tap the ſpring, when the depth of the drain is not ſufficient for that purpoſe.

In regard to the uſe of the auger, though it appears that Mr. Elkington was led to employ that inſtrument from an accidental circumſtance, yet there is no doubt that others have hit upon the ſame idea many years, perhaps ages, ago, though without applying it in the advantageous manner which this operator has done. It is ſaid, that in attempting to diſcover mines by means of an auger, ſprings have been tapped, and the adjacent wet ground thereby drained, either by letting the water down, or giving it vent to the ſurface. The auger has alſo been made uſe of in bringing water into wells, by boring in the bottom of them, to ſave the expence of digging, eſpecially in Italy, where it is probable that the practice is very ancient.

Buffon ſtates, "That, in the city of Modena, and four miles round, whatever part is dug, when we reach the depth of ſixty-three feet, and bore five feet deeper with an auger, the water ſprings out with ſuch force, that the well is filled in a very ſhort ſpace of time. This water flows continually, and neither diminiſhes nor increaſes by the rain or drought." Mentioning the different ſtrata that are met with to this depth, he adds, "Theſe ſucceſſive beds of fenny or marſhy earth and chalk, are always found in the ſame order wherever we dig; and very often the auger meets with large trunks of trees, which it bores through, but which give great trouble to the workmen; bones, coals, flint, and pieces of iron, are alſo found.

The ancient mode of draining was well known to the Romans, as appears from many of their writers. Cato, Palladius, Columella, and Pliny, mention them particularly. Upon ſtrong tenacious land, where the water could only be received at top, they preferred open drains; on other ſoils, where the water could be drawn equally from both ſides, or could riſe from the bottom, they uſed covered ones. They knew the propriety of directing them obliquely acroſs the ſlope of the field; a point in which modern drainers have often been erroneous. Their general depth was from three to four feet, filled half-way up with ſmall ſtones; for want of theſe, with willow or alder poles, and even with the ſpray of wood twiſted into a rope, which is one of the lateſt practices with ſtraw that has take place with modern drainers in England. Of that material, alſo, the Roman farmers availed themſelves, when others were wanting. The ends of their drains they were careful in fortifying with larger ſtones, in form of bridges, and the mouths, or outlets, were laid in maſonry. From the depth, it appears that their drains were deſigned to carry off the water of ſprings, as well as that cauſed by rain on a flat or retentive ſurface; for both which they were, in ſome caſes, equally well-adapted. To the proper direction of water-furrows in their huſbandry, in order to convey all ſurface water into the drains, and to the clearing and cleaning out of the ditches round the fields, they paid particular attention. Theſe circumſtances are ſufficient to ſhow that the Romans brought the buſineſs of common draining into Britain with them; and that our beſt cultivated counties had little to boaſt in this reſpect, in ſuperiority to the ancients, till Mr. Elkington made the diſcovery of the preſent method, with which they certainly appear to have been wholly unacquainted.

This modern principle of draining, by tapping ſprings, or by perforating with an auger through a retentive into an abſorbent or porous ſtratum, being aſcertained, its application in theory is obvious; though it requires ſome judgement to direct its practice. The method of performing it has been moſt laudably inveſtigated by the board of agriculture in England, and the Highland ſociety in Scotland; to whom it deciſively appeared, that barren moraſſes might, by this art, be converted into rich meadow and fertile arable fields; that cold wet four grounds might, by the ſame means, be made equally productive, and that thus an aſtoniſhing proportion of the worſt lands in Great Britain and Ireland might be redeemed from the curſe of infertility. It appears likewiſe, by thus collecting the large ſupplies of water pent up in ſoils to which it is highly injurious, that what now operates as an evil, might be converted into a permanent good, by making theſe waters ſubſervient to the purpoſes of irrigation, of ſupplying ponds, or reſervoirs, or houſes, or directed in aid of turning mills. To reward ſo uſeful an invention, and to purchaſe it for the benefit of the public, the board of agriculture, highly to its honour, obtained to Mr. Elkington a grant from parliament of one thouſand pounds ſterling. Mr. John Johnſtone, land ſurveyor, at Edinburgh, has ſince publiſhed the method at large, illuſtrated by explanatory engravings, whereby the practical farmer, or gentlemen, who wiſhes to improve his land, might have recourſe to it, under his own direction, without difficulty or impoſition; and from the above work, which we earneſtly recommend to the peruſal of all men, we have extracted the following outline of the principles and applications of this new mode of draining.

Wetneſs in land proceeds from two cauſes, as different in themſelves as the effects which they produce. It proceeds either from rain-water ſtagnant on the ſurface, or from the water of ſprings iſſuing over, or confined under it. On clay ſoils, that have no natural deſcent, wetneſs is commonly produced by the firſt of theſe cauſes; but, in a variety of ſituations, it proceeds from the latter. From the perforations made in quarries, wells, and other ſubterraneous pits, the earth is known to be compoſed of various ſtrata, which, being in their nature of oppoſite conſiſtence, are here diſtinguiſhed by the names of porous, and impervious. Thoſe ſtrata, which, from their more open compoſition, are porous, and capable of receiving the rain water that falls on them, include ſandy-rock, gravel, ſand, and ſuch marles as are of an abſorbent quality. Clay, and a certain kind of gravel having a proportion of clay in its compoſition, which, by binding and cementing the ſmall ſtones together, renders it equally cloſe and tenacious as clay itſelf; with ſuch rock as is of a cloſe and compact nature, without any fiſſures in it, are the principal ſtrata that reſiſt the water, and that are capable of unholding or retaining it on their ſurface, and are termed impervious. Springs, therefore, commonly

monly originate from rain-water falling upon ſuch porous and abſorbent ſurfaces, and ſubſiding downwards through ſuch, till, in its paſſage, it meets a body of clay or other impenetrable ſubſtance, which obſtructs its farther deſcent, and here, forming a reſervoir or conſiderable collection of water, it is forced either to filtrate along ſuch body, or riſe up to ſome looſe part of the ſurface, where it oozes out in all thoſe different appearances that are ſo frequently met with. This hypotheſis is evident from the immediate diſappearance of the rain-water, as it falls, on ſome parts of the ground, while it remains ſtagnant on others, till carried off by evaporation; and from the ſtrength of theſe land ſprings being greater in wet than in dry ſeaſons. Hence, after inceſſant rains, they are obſerved to break out in higher ſituations, and, as the weather becomes drier, ceaſe running, unleſs at their loweſt outlets. The ſtrength of theſe ſprings alſo, or quantity of water which they iſſue, depends chiefly on the extent of high ground that receives and retains the rain, forming large reſervoirs, which affords them a more conſtant ſupply. Hence bog-ſprings, or thoſe that riſe in valleys and low ſituations, are much ſtronger, and have a more regular diſcharge, than thoſe which break out on higher ground, or on the ſides of hills. Independent of theſe, there are certainly immenſe ſprings contained in the bowels of the earth; otherwiſe, how could the many rivers that interſect it be ſupplied with ſuch vaſt quantities of water as they diſcharge, the rains falling on its ſurface, or the dews that deſcend, not being adequate for that purpoſe? But, as this may be conſidered among thoſe arcana of nature which we have not yet explored, and lying at too great a depth to affect the ſurface, it comes not within the limits of the preſent enquiry.

Where ſprings break out in the manner above deſcribed, running over a flat ſurface of clay, and cannot get off with ſufficient rapidity, or are not confined to a narrow channel; the ſuper-abundance of water muſt cauſe the diſſolution of all the coarſe vegetables it produces, which, together with part of the natural ſoil itſelf, is formed into a peat earth, every year increaſing in depth; and the extent of ſuch bog or moraſs is according to the quantity of water, and to that of the flat ground on which it is formed. The great object of Mr. Elkington's ſyſtem is, that of draining ſuch bogs, by cutting off entirely the ſource of the ſprings or ſubterraneous waters that cauſe the wetneſs. If the ſprings have a natural outlet, the object of the drain is, to lower and enlarge it, which, by giving the water a more free and eaſy channel, will ſooner diſcharge and draw it off, or will reduce it to a level ſo far below the ſurface, as to prevent its overflowing. Where the ſprings have no apparent outlet, but are either confined ſo far below the ſurface, as to injure it by conſtant moiſture, or by oozing out imperceptibly through any ſmall pores of the upper ſoil; the object of the drain is, to give a proper vent to that water, and to extract more quickly and more effectually what has before been pent up in the boſom of the ſoil. The application of the auger now becomes neceſſary, which is ſimply to reach or tap the ſpring, and to give vent to the water thus pent up, when the depth of the drain does not reach it, or where the level of the outlet will not admit its being cut to that depth, and where the expence of cutting ſo deep would be very great, and the execution of it very difficult. As the whole depends upon the ſituation of the ground to be drained, and the nature and inclination of the ſtrata of which the adjacent country is compoſed; as much knowledge as poſſible ſhould be obtained of theſe, before the proper courſe of a drain can be aſcertained, or any ſpecific rules given for its direction or execution.

The firſt thing to be obſerved is, carefully to examine the adjoining high grounds, and what ſtrata they are compoſed of, in order to judge at what place the level of the ſpring comes neareſt to the ſpot where the water is intended to be diſcharged. The beſt time for aſcertaining the true direction of drains, and likewiſe for executing the work, is, when the ground is in paſture, becauſe then the ruſhes make their appearance on the wet part of the ſurface: or, when the ground is in fallow, becauſe the water is then ſeen oozing up in the furrows, along the line in which the drain ſhould be cut. It is of material conſequence to aſcertain which of the different outlets of water that may appear on the ſurface is the main ſpring, or that from which the other outlets are ſupplied; for, by cutting off that, the others become dry, and is therefore the principal circumſtance upon which the true direction of the drain depends. If, on the bank or ſloping ſurface from whence the ſprings proceed, they be found to break out at different levels, according to the wetneſs of the ſeaſon; and if thoſe loweſt down continue running while thoſe above be dry, it is a ſure ſign that all the different outlets are connected with, and proceed from, the ſame ſpring; therefore, along the level of this the line of the drain ſhould be directed, which, if properly executed, all thoſe above would afterwards continue dry. This is called the main ſpring, and thoſe above, the overflowings of it. If the drain was to be cut along the line of the *uppermoſt* of theſe outlets, and the depth of it not reaching the level of thoſe *below*, the overflowings would only be carried off; and the main ſpring, ſtill continuing to flow, would injure the ground below the bottom of the drain, as having a natural vent lower. Such has been the practice of draining ground in this ſituation, before Mr. Elkington's method was underſtood; and which was reckoned the moſt effectual and approved mode. Wherever the uppermoſt ſprings made their appearance, there a trench was cut, between the wet and the dry, as it is termed, which not being ſufficiently deep to intereept the water, others of the ſame kind were cut, one below another, the whole way down the declivity; and being filled with looſe ſtones nearly to the top, each carried off a portion of *ſurface* water only, without ever affecting the main ſpring that cauſed the miſchief. The conſequence of ſuch drains is, that they render the ſurface drier while they continue to run; but ſoon choaking up, and burſting out in different parts, the ground becomes worſe than before they were made. It frequently happens that the uppermoſt (if the ſtrongeſt outlets) are the main ſprings, and thoſe below only leakages. Therefore the ſame caution is neceſſary to aſcertain this, before proceeding to mark out the drain, becauſe from the main ſpring only the level ought to be taken.

When the main ſpring riſes in a ſteep bank or hill, a conſiderable height above the level of the brook, or place where the drain is to diſcharge itſelf, it is unneceſſary to cut a deep trench, or to lay a covered drain all the way from the brook up to it; for the deſcent being too rapid, and if deep cut, by croſſing veins of ſand that are always met with in ſuch ſituations, the materials with which the ſough or conduit of the drain is laid, would be undermined by the rapidity of the current, which would alſo carry down a great quantity of the looſe ſand; but it ſhould be begun only ſo far down the bank, as, by cutting in level, the drain may be ſix or ſeven feet lower than the outlet of the ſpring, or whatever depth is neceſſary for drawing down the water to ſuch a level, as it may diſcharge itſelf without riſing to the ſurface, or injuring the ground adjoining it. If the expanſe of the valley or bog lie betwixt two banks, ſo narrow that the ſtratum of rock or ſand containing the ſprings unites within reach of the auger, below the clay, one trench up the middle, with auger holes, will do the buſineſs, without any croſs drains whatever. See this plan projected in fig. 1, of the annexed engraving, where all the ſprings and ſurface-water draw into the main ſpring in the center, down which the drain is laid.

Although ſprings that injure ground in this ſituation often break out of hills all round, nearly on the ſame level, yet the reſervoir from whence they proceed may

poſſibly be found in the middle of the lower ground or valley, by boring through the ſuperincumbent body of clay, which forces the water to riſe and ooze out along the upper edge of it, at its junction with the lighter porous ground. The drain being cut below, and the ſpring bored into, it is evident, that the depth of the drain being ſo much lower than the natural outlet of the ſprings, the preſſure of water above that level will force that which lies under the trench through the auger holes; or even, for ſome time, until the water ſubſide, it might be made to riſe higher than the level of its natural outlet. The conſequence of this will be, that the water of the ſpring having found, by means of the drain and boring, a new and eaſier channel, will ſoon abandon its former outlets, and ceaſe to overflow the ground that formerly lay below it. In a valley belonging to Mr. Eccleſton, of Scariſbrick, in Lancaſhire, Mr. Elkington has executed a very remarkable drainage of the above kind. The ground was a mere bog, ſo ſoft that neither horſe nor man could walk over it. It contained ſixty acres, which, after the drainage, gave thirty pounds of additional yearly rent; and the expence of executing the drains did not much exceed that ſum. An account of this drainage has been communicated to the Board of Agriculture, by Mr. Eccleſton himſelf. Where a bog of this nature, between two hills, is of great extent, it may be requiſite to have three different drains; one on each ſide, and one in the middle. This laſt muſt be an open drain, to receive all ſurface water, as well as to cut off any ſprings that may ariſe in that part of the bog. In all caſes of this kind, where there is any difficulty of diſcovering from whence the principal ſprings proceed, or what is the nature and inclination of the ſubſtrata, the auger muſt be applied.

The next thing to be conſidered, is the conducting of the drain, after the levels have been taken, and the true line of it fixed; and whether it ſhould be covered, or open. If the land be to be incloſed, and as the line of the trench may ſerve as a proper diviſion of the ground, it may be made an open cut, or ſunk fence; if not, a covered drain: but it is firſt neceſſary to aſcertain which, as the depth, width, and other circumſtances, may be regulated accordingly. After finding the neareſt outlet where the water collected in the drain can be diſcharged, from that a trench muſt be brought up to the croſs one that is to be carried along the line of the ſpring; allowing a fall of a few inches, in every ten yards, for the water to run.

If, in cutting the trench along the foot of the hill, the level of the orifice will not admit of its being cut ſo deep as to touch the rock; then the clay, or impervious ſtratum that lies immediately above it, muſt be bored through, when the water will flow up through the fiſſures of the ſtone, and through the auger holes, into the ſough; but it is preferable, in caſes where the level will admit, to dig the drain through the clay, and ſo far into the rock as will furniſh ſtones for laying the ſough; and then the water will meet with leſs reſiſtance, and have a freer iſſue, than if the ſtone had not been opened nor broken. This will increaſe the expence of cutting the drain, but leſſen that of quarrying the ſtones elſewhere, and of carrying them to the place where the drain is to be made.

If the drain be to paſs through a ſoft boggy ſoil, it is better to be open than covered, eſpecially where it may receive other water than that collected from below, and can at the ſame time ſerve as the ſide of an incloſure, or diviſion betwixt the upland and low grounds. Stones laid in ſuch drains are ſoon apt to ſink, owing to the ſoftneſs of the bottom; and the ſough may alſo be ſoon choaked up. The width of a covered drain may be from three to four feet at top, and one and a half or two feet wide at bottom, thus allowing ſix or nine inches for each ſide-ſtone, and ſix inches between, for the paſſage of the water, forming a ſquare conduit called the *ſough*, commonly pronounced *ſurf*, ſix or nine inches in height. Or, when the quantity of water collected, or to be conveyed in the drain, is ſmall, the ſtones may only be coupled at bottom. This is a conſiderable ſaving, both in materials and labour, requiring fewer ſtones, and leſs time to lay them. It is equally ſecure when the bottom is ſolid, the ſtones good and properly laid, and well packed at the ſides, to prevent them from ſhifting. It is alſo a ſaving in cutting the drain, as it requires leſs width at bottom for this manner of laying the ſtones, than it does for a ſquare conduit. The depth is regulated by the level of the place where the drain is to empty itſelf, and the nature of the ground through which it is to be cut, commonly four or five feet, and never leſs than three. When the drain is only to act as a conducter for the water brought up by the borer, where the ſoil is all clay, its depth may only be three feet, which will be ſufficient to allow a proper depth of earth above the ſtones laid for the drain at bottom, which need not exceed, nor ſhould ever be leſs, than one and a half or two feet. In ſoft boggy ſoils, it is often neceſſary (if the drain be to be covered) to cut to a much greater depth, in order to have a ſecure foundation for the ſtones. The moſt difficult part of the work is laying the ſough in running ſands, where it is neceſſary to have the ſides of the trench ſupported with flat boards and props, which are to be removed forwards as the work proceeds, and which keep the ſides from falling in, and the looſe ſand from falling amongſt the ſtones with which the conduit is laid. If the ſough or conduit be laid with brick, a ſmall aperture ſhould be left betwixt each, to admit the water from the ſides of the drain, and thin turfs muſt be laid above, graſs-ſide downwards, to prevent the mould from getting through the openings. In quick or running ſands, turfs muſt alſo be laid in the bottom of the drain, under the ſough, to prevent the looſe ſand from flowing up, and to render the foundation of the brick or ſtone more ſecure, in caſe of their ſinking.

Before boring, it is proper to lay the ſide ſtones of the conduit; after which the holes may be bored down, at the diſtance of every four or ſix yards. But if the water, on withdrawing the auger, ruſh up with violence, and continue to have a boiling appearance, it indicates a ſtrong body of water confined below, and therefore requires a greater number of openings to give it a ſpeedy and ſufficient vent. When the force of the water is great, the width of the holes enlarges, and conſequently the diſcharge is increaſed. By a careful examination of the adjoining ground, it is ſometimes poſſible to ſay at what depth the ſtratum containing the ſpring lies, and conſequently how deep the holes ſhould be made; but the general rule is, to go down till the water riſe immediately on withdrawing the auger. Mr. Elkington has bored thirty feet, before the water flowed plentifully: but from ten to fifteen feet is about the average. He bored a hole thirty feet deep, near Tamſworth, in Staffordſhire, through which water iſſued, equal to three hogſheads in a minute, and drained a great extent of wet ground in the neighbourhood. In quick-ſands, it is better to dig a little into the ſides of the trench, off the line of the ſough, where the auger is to be uſed, and, after boring, to cover the places in the ſame manner as the reſt of the ſough, leaving out a ſide-ſtone oppoſite the hole, as the ſand thrown up by the ſpring can thus be more eaſily taken out with the hand till it ſubſide and give over running, and is likewiſe remote from the current running down the center or main drain. This is ſhewn upon the croſs drains of the plan fig. 2, in the engraving.

When the circumference of the auger-holes is not ſufficient to let up the quantity of water which the ſpring would iſſue, holes muſt be dug down to the ſpring, and theſe holes filled up with looſe ſtones, firſt putting down a round pole in the middle, which, after the ſtones are filled

DRAINING.

filled in, muſt be drawn out, and this leaves an opening for the water to flow up. No apprehenſion need be entertained of the holes made by the auger being choaked, whether the drain be open or covered, provided no other water is admitted; for, ſuch is often the force of the ſpring, that it will throw up any earth that may accidentally get into it, and can be injured only by the admiſſion of great quantities of ſurface or flood water coming upon it at once. The mouth of the drain ſhould be carefully railed in, or otherwiſe guarded, to prevent cattle from trampling and choaking it up: and where any defect of this kind happens, it ſhould immediately be remedied. The firſt ſymptoms of the drain having taken effect, when the ſpring is properly tapped, are, that all the ſurface drains that may have formerly been made, and alſo any adjacent pits, ditches, or places to which it may have backed up, immediately become dry, and remain ſo afterwards. In Mr. Elkington's practice there are many inſtances where, by a few auger-holes hitting on the particular ſpot where the loweſt part of the main ſpring lay, a conſiderable extent of ground with which his drain had ſeemingly little connection, has been laid dry, to the aſtoniſhment of thoſe who have ſeen it, and furniſhing a ſubject of incredibility to many who have not. At Odſtone-hall, in Leiceſterſhire, a very remarkable inſtance may be ſeen. A conſiderable tract of wet marſhy ground, of very little value, divided in the middle by a ſmall river, he ſo completely drained, by making a trench on one ſide, and by boring in it, that the part of the marſh on the oppoſite ſide of the rivulet, which was at a conſiderable diſtance from the drain, became in a ſhort time equally dry with that where the cut was made, has continued ſo ever ſince; and, from being formerly of little or no value, is now converted into excellent water-meadow, producing, without manure, abundant crops of graſs. At Madely, near Newcaſtle in Staffordſhire, there was a bog of ſome hundred acres, the draining of which was always deemed impracticable, being of ſo wet and ſoft a nature that no cattle could paſs over it, till Mr. Elkington, having obtained a leaſe of it for a number of years, has, by means of very little cutting and expence, ſo effectually drained it, that it may now be conſidered not only as one of the moſt wonderful undertakings of the kind ſo eaſily accompliſhed, but is alſo, from the other improvements making on it, likely to become one of the moſt productive farms in that part of the country. At Woburn, in Bedfordſhire, he has lately accompliſhed the drainage of two extenſive bogs, belonging to his grace the duke of Bedford, in a manner attended with little expence, although they were formerly reckoned irreclaimable. It is alſo remarkable, that by ſome of his drains, pits and wells at a great diſtance have been laid dry, and diſtant ſprings have abandoned their former courſe.

In hilly countries, where ſheep are the ſtaple produce, leſs attention is paid to the drainage of ſuch parts of their walk as are wet and unproductive, than to that of arable ground, although the effects in the one caſe are equally beneficial with thoſe in the other. This neglect is often attended with conſiderable loſs, from that almoſt incurable malady the rot, to which ſo many thouſands of valuable animals fall a ſacrifice. For this, draining is the moſt infallible preventative; and in ſuch ſituations it is attended with little expence, as the drains may, for the moſt part, be left open, with here and there covered paſſages, over which the ſheep may croſs with ſafety. And here, in all caſes where the depth of the cut does not reach the ſpring, the auger muſt be applied, whether the drains be open or cloſed. From the irregular diſpoſition of the component ſtrata, the ſides of hills are often covered with alternate patches of wet and dry ſoil. By the appearance of the ſurface, and by the vegetables it produces along the declivity, the internal ſtrata may often be aſcertained with ſuch a degree of preciſion as to guide the direction of a drain without inveſtigating below the ſurface. If the rock lies in a horizontal direction, all the different outlets, or ſprings, that appear on the ſurface, may proceed from, or be connected with, the ſame body of water, and may all be dried up, by cutting off, or letting out, the main body of water that ſupplies them, at the lower part of the reſervoir, or place where the water would of itſelf run off, if it was not confined under an impervious body of clay. But, where the rock lies in a perpendicular manner, and contains only partial collections of water amongſt the more open fiſſures of the ſtone, which empty themſelves at numberleſs outlets unconnected with one another, it would be abſurd to attempt cutting them off by one drain, or by tapping, without a drain being cut into each. In many hills compoſed of alternate ſtrata of rock, ſand, and clay, the ſurface of the latter is commonly wet and ſwampy, while that of the former is dry and productive, and therefore requires as many cuts to drain it completely as there are diviſions of wet and dry ſoil. To drain a hill-ſide of this deſcription, it is neceſſary to begin by making a trench along the upper ſide of the uppermoſt ruſhy ſoil, which will have the effect of cutting off the higheſt ſpring; but, as the rain falling on the next porous ſoil ſubſides to the loweſt part of it, and forms another ſpring, and as it may likewiſe be partly ſupplied from ſome internal ſource, a ſecond cut is neceſſary there, to prevent that water from injuring the ſurface of the next clay bed. Thus, ſimilar cuts will be requiſite lower down the deſcent, ſo far as the ſame ſprings and appearances are obſerved to injure the ground; all of which are directed into the central or principal drain, which conducts the water to the brook below. See this method projected in the plan fig. 2, in the abovementioned engraving.

The reſervoir from whence the ſpring or outlet of water is ſupplied, being confined, and pent up between two impervious ſtrata, and the upper part of it extending perhaps to a conſiderable height and diſtance in the high ground, it is evident that, if a perforation is made through the ſuperincumbent ſtratum into the loweſt part of the ſpring, the water may be raiſed, by confining it, nearly as high as the level of the head of the reſervoir. Of this there are ſeveral inſtances in Mr. Elkington's practice, particularly near Warwick, where he raiſed the water procured from draining a low meadow, into a mill-ſtream a conſiderable height above the level of the drain. The drain is cloſely built with brick, and puddled above with clay, to prevent the water from oozing through the joints. It then riſes through a perpendicular brick chimney to the height of the mill-ſtream, by means of its own preſſure in the higher ground.

Conſiderable tracts of land often lie waſte and uncultivated, owing to wetneſs in a particular ſituation, which proceeds neither from ſprings under the ſurface, nor from the overflowings of any in the adjoining higher grounds; but ariſe from the accumulation of rain water, ſtagnating on a retentive body of clay, through which the water can have no deſcent; and being alſo ſurrounded with higher ground of the ſame impervious nature, the water of itſelf can find no natural outlet. Such are commonly called landlocked bogs. The drainage of theſe bogs is effected in a manner different from that of ſpring bogs, the cauſe of both not being the ſame. In the following manner it may be done at leaſt expence: The firſt and principal drain muſt be made in the middle or loweſt part of the ground, and into this all the others muſt lead. The number and direction of them will depend on its extent. They muſt be cut through the wet ſpongy upper ſoil, quite down to the clay or retentive ſubſtratum, which is then to be perforated by the auger, in order to give an outlet downwards for the water, which will immediately ſink into the porous ſtrata below. The drains ſhould be cut as narrow as poſſible, and, after the auger holes have been made, and a conduit formed on the under ſtones coupled be-

low, they ſhould be filled with looſe ſtones to within a foot and a half of the ſurface, having a turf, graſs-ſide downwards, next the ſtones. The noxious moiſture contained in the bog will be extracted by the drains, and will ſubſide through the auger holes into the porous ſtrata below. If the ground is afterwards ploughed, care muſt be taken in forming the ridges, and giving them a deſcent towards the main drain, which will greatly aſſiſt the others in diſcharging heavy falls of rain. But before proceeding to drain this kind of ſwampy land, in the manner deſcribed, it ſhould firſt be aſcertained whether the porous ſtrata immediately under the bed of clay will receive the water when let down into it; for ſhould it be already ſaturated with water, it may, inſtead of receiving more, throw up a greater quantity to the ſurface; and thus render the evil worſe. This may ſometimes be the caſe; for the ſubſtrata may contain water that makes no appearance on the ſurface at this place, owing to the ſuperincumbent body of clay, but which, being connected with ſome higher ſpring, may flow up when a vent is given to it by the auger. Thus would a greater quantity of water be brought to the ſurface, which, having no outlet through the circumjacent bank, would render the ground much more wet, and might, in ſome ſituations, almoſt form a lake, or pond. But if the ſurrounding high ground declines deeper or lower than the bog, although at ſome diſtance, which may eaſily be aſcertained by the ſpirit-level, (for a deſcription of which ſee the article LEVEL,) a drain may be conducted thither, which will effectually draw off the water, though at a greater expence. A ſection of a landlocked bog of this kind is ſhewn at the foot of the engraving, fig. 3, completely ſhut in by elevated banks or hills of marl or clay. A, B, C, D, E, F, repreſent the drains, and G, H, I, K, L, M, the auger-holes, diſcharging the water into the looſe ſtratum below.

It frequently happens that ſprings riſe in the middle of a field, at a diſtance from any ditch or open drain into which the water may be diſcharged; ſo that a covered drain brought from the neareſt outlet, would paſs ſo far through dry ground as to render the expence of conducting the water from the ſpout, greater than the injury done by it. To remedy this, begin by cutting a drain a few yards in length, or by ſinking a pit into the porous ſoil immediately between the lower ſide of the wet and dry ground; and from that bring an upright drain to the upper ſide of the wet ground, from which take a branch to both ſides, along the upper ſide of the wet, ſo far as it goes. This upper drain will cut off the water where it riſes to the ſurface; the upright drain will convey it to that cut along the lower ſide of the wet ground, where the water will ſubſide into the porous ſubſoil. An eaſier method may be, where the retentive ſubſtratum is not deep, firſt to cut the drain along the upper ſide of the wet ground, and, after coming to the ſtratum in which the water flows, either to bore through the retentive ſubſtratum, or cut the drain to that depth, by which means the water cut off above will be let down into the abſorbent ſtratum below, and thus got rid of at once.

In diſtricts where the ſoil is compoſed of an intermixed variety, moſt commonly ſand, gravel, and clay, but where clay forms the moſt predominant part, draining is a work of much greater difficulty and expence than in thoſe where both the ſurface and internal ſtrata are more regularly diſpoſed. In theſe ſoils, where almoſt every puddle is unconnected with another, and ſeparated by intervening ridges of clay, the partial collections of water remain until the time of great rains, when they have a free iſſue, as over the edges of a diſh, and thus overflow and ſurcharge the ſurface of the clay, and render it ſo wet and ſour, that its produce becomes every year more ſcanty, and the ſoil itſelf more barren. As the intervening ſand-beds have no communication with each other, it will require as many drains as there are banks in number, to extract the water from each of them. From the neareſt and loweſt part of the field to be drained, a main trench ſhould be cut up to the higheſt or moſt diſtant ſand-bank, and into this ſhould fall other drains, ſomewhat in the form of the letter Y, communicating with each of the other ſand-banks, ſo as to draw off the water they contain, ultimately leading into the main trench, which diſembogues into the brook below. The plan of this intereſting mode of draining is ſhewn at fig. 4, in the preceding copper-plate.

Beſides the ſoils correſponding to the above deſcription, there are others of a ſimilar nature, where each bed being of leſs extent, and lying more regularly together, their drainage might be effected by leſs cutting, and conſequently leſs expence. Under the beds of ſand and clay that thus lie alternately together, and almoſt parallel to one another, is generally found a body of impervious clay, that keeps up the water contained in the ſand, which continues always full, moiſtening the adjacent clay, and, in wet ſeaſons, running over it. As this main under-ſtratum of clay is ſeldom above four or five feet below the ſurface, a drain muſt be cut to that depth through the middle of the field, if it has a deſcent from both ſides; or, if the ground decline all to one ſide, the drain muſt be cut there, where the water will more eaſily diſcharge itſelf into it; and, unleſs the field is of conſiderable extent, and have more hollows in it, one drain will anſwer the purpoſe effectually; becauſe, by croſſing all the different beds that hold the water, it will draw it from each. The great difficulty in draining land of this deſcription is, when the direction of the alternate beds of clay and ſand lie acroſs the declivity of the ground; ſo that one drain in this caſe can have no other effect than that of carrying off the water after it has paſſed over the different ſtrata, and would here naturally ſtagnate in the loweſt part of the field, if there was no other outlet for it. Therefore, when the ground lies in this manner, which is often the caſe, beſides the drain in the hollow, or middle, others muſt be cut from it, in a ſloping direction, acroſs the declivity, which, by croſſing all the different veins of ſand, will extract the water from each.

In drains of this kind, there is ſeldom any need for applying the auger, as the neceſſary depth of the trench reaches far enough down; and as there is no ſpring for want of connection with higher ground, to force itſelf up through the auger-holes, or, if there is, it cannot, at ſo great a depth, and below ſuch a body of clay, do any injury to the ground above. A plan of this method is exhibited at fig. 5, in the engraving.

In flat tracts of rich land, where the ſurface is injured by a ſuperfluity of ſtagnant water not proceeding from ſprings, their drainage becomes an object of the firſt importance, and which may, in moſt caſes, be accompliſhed with very little expence. The upper ſoil being compoſed of a porous ſtratum, of two, three, or four, feet in thickneſs, and having under this a ſtrong retentive body of clay, the rain-water falling on the ſurface, eaſily ſubſides till it meets the clay, and there being obſtructed from farther deſcent, the whole open part of the ſoil ſtands ſo full of water, as to retard the progreſs of vegetation, or greatly to injure it. To carry off this water requires but few drains, and theſe no deeper than juſt to reach a few inches into the clay; betwixt which, and the under part of the porous ſoil, the greateſt quantity of water will remain ſtagnant, when it does not appear ſo much on the ſurface. In this kind of drainage the auger is not employed, there being no ſubterraneous water to get rid of. If the ground has a ſmall deſcent from both ſides, one drain cut through the hollow part of the field will effectually draw off all the water that the porous ſoil may contain; which will be greatly facilitated by properly forming the ridges to anſwer the declivity of the ground, and by deepening and clearing out the furrows with the ſpade. If a field of this ſoil has

has more than one hollow in it, in that caſe, it is neceſſary to have more than one drain; but if it is almoſt level, or inclines only a little to one ſide, a ditch or drain at the lower extremity, having the ridges and furrows formed, as already mentioned, will anſwer the purpoſe effectually. In ſome caſes, however, it may be neceſſary to have a few ſide-cuts from the main drain, where the field is large and flat, cut as narrow as poſſible, and filled with ſtone, in the uſual manner.

Such is the method of draining theſe ſoils with moſt advantage; but many fields ſuffer equally from wetneſs, that conſiſt of ſoil exactly oppoſite to the former, viz. a clay ſurface having a porous ſubſtratum. Fields of this nature commonly lie very flat, without any declivity, whereby the noxious water, ſtagnant on the clay ſurface, might naturally diſcharge itſelf without the help of drains; for ſoils of the ſame nature, in a hanging ſituation, are ſeldom or never affected by the ſame cauſe. Such ground is more difficult to drain, and requires a greater number of trenches than any other ſoil whatever; and they muſt be ſo arranged as to collect all the water from the ſurface, which can only diſcharge itſelf into the drains from above, being unable to flow into them through the clay, as in ſoils of an oppoſite deſcription; and where there is any irregularity in the ground, the water will remain in the hollows, perhaps within a few feet only of the drain. The firſt thing is, therefore, to make one main conductor in the loweſt part of the field, to receive and carry off the water collected by the ſmaller lateral ones on each ſide of it. If it ſuits the ſituation or diviſion of the field, this main drain had better be open than covered; and then the outlets of the other drains that fall into it, can eaſily be inſpected, and frequently cleared. The formation of the ridges in ploughing, to anſwer the declivity of the ground, ſhould alſo be particularly attended to in ſuch ſoils. The ridges ſhould have riſe enough in the middle to give the water a fall into the furrows; and theſe ſhould have depth and fall enough to convey it into the drains. Thus would a great part of the rain-water, as it occaſionally falls, be carried off, which would leſſen the number of ſmall cuts, otherwiſe neceſſary. The drains ſhould all be dug as narrow as poſſible, and filled up in the uſual manner with looſe ſtones; only the bottom of the conducting drain (if it is not an open one) ſhould be formed in the manner already deſcribed, with a ſmall open conduit at bottom, the more effectually to carry off the water. The ſmall drains ſhould alſo be coupled at bottom; i. e. two of the largeſt ſtones laid againſt each other at the top, forming a triangular opening, of four or ſix inches, below. This mode of draining is calculated for every tenacious clay ſoil, whether porous below or not; but, in many inſtances, the deepening of the furrows, with very few drains, might remedy the evil, where the retentive upper ſoil is only a foot or two deep, with a porous ſubſoil under it, through which the water would eaſily ſubſide downwards, and again empty itſelf at ſome lower extremity of the field.

Other extenſive tracts of land are wet and ruſhy, from a cauſe that can hardly be removed by any contrivance in the art of draining. This is the land which generally lies along the ſides of brooks or rivers, which, having often altered their courſe between the oppoſite banks, and depoſiting ſand and gravel as they recede from their laſt channel, the water of the river always percolates through the ground thus formed to the level of its preſent courſe, keeping it ſo moiſt and wet as to produce ruſhes, and other coarſe vegetables; and wherever a drain or pit is dug in ſuch ground, it immediately fills with water, to the level of that in the river. Where the river has a quick deſcent, it is leſs apt to produce this effect; but where its current is ſlow, and the level of its ſurface little below that of the ground on either ſide, the ſoil will be conſtantly ſaturated with water. Drains cut in any direction, can have no good effect, while the river continues in this ſituation. The only remedy, therefore, where it can be done at a moderate expence, is deepening and widening the bed of the river; the earth taken out of which, will at the ſame time ſerve to form an embankment on either ſide; for while it can riſe higher than the outlet of the drains, and flow back into them, it will render the ground equally wet as before they were made; and the expence of making them is laid out to no advantage. Beſides being thus injured by the river water, ſprings, in many ſituations, iſſue from the bottom of the higher ground, and ooze through the ſoil higher than its level. Yet the water of theſe may eaſily be cut off, and lowered to the level of the river. But in ſome caſes, the wetneſs proceeds entirely from ſprings, where the ſoil of the flat ground betwixt them and the river does not conſiſt of looſe gravel or ſand, but of a loamy or clayey mixture. In this caſe, the water of the ſprings is reſiſted, and prevented from finding its way, below the ſoil, to the river, and therefore is forced to flow nearer the ſurface, keeping it conſtantly in a ſwampy ſtate in all ſeaſons. To drain this ground, a trench muſt be cut at the lower end of it, and brought from the river, along the bottom of the bank from whence the ſprings iſſue. This trench ſhould be cut below the line of the ſprings, and kept open to receive the river water in floods, and alſo any run of water from the higher ground in times of rain, which would blow it up, if covered; and muſt diſcharge itſelf into the river at the loweſt poſſible level. From this trench, ſhort covered drains might be cut a little way into the bank, to lead in the ſprings that are above it, if boring oppoſite to them has not that effect. The bottom of theſe drains muſt be higher than that of the open cut, to prevent its water flowing back into them. In theſe alſo the auger muſt be uſed to tap the ſprings, if the depth of this level does not reach the ſtratum containing the water.

The principles of Mr. Elkington's ſyſtem have hitherto been confined to the draining of land only; but there is no doubt that it might be equally uſeful in mines and quarries, by diminiſhing the quantity of water that is frequently found in the courſe of working them, and which very much obſtructs, and even ſometimes puts a ſtop, to the work altogether. Thus, in ſinking a pit for coal, or any other mineral, near the bottom of a hill or high ground, a bed of quickſand is met with, ſo full of water, that to paſs through it becomes a very difficult and expenſive operation; and as this water proceeds from the porous ground above, it may in many caſes be practicable to intercept the greater part of that water, before it reach the ſand-bed in the pit, and by means of tapping at the tail of the ſand-bank (provided the ground naturally declines lower than where the ſand is found in the pit), the whole of the water may be extracted from it, at a comparatively ſmall expence with what is uſed as the common remedy in like caſes. At preſent, the water that is found in the bottom of the pit, or what proceeds from the rocks, &c. in the courſe of working the mine, is got rid of by means of an engine pump; to aſſiſt in working which, the water obtained by means of the drains already deſcribed, may be very uſeful, where the ſtream for that purpoſe is deficient; and may ſave the great expence of working it by ſteam. It may, however, in ſome caſes, be removed by the auger; as the following inſtance will ſhew: "The water was raiſed by a ſteam engine about ſixty yards, from a colliery in Yorkſhire, which had been wrought ſeveral years; the proprietors bored down to the depth of ten yards farther, to aſcertain the thickneſs of a ſeam of coal, which was ſuppoſed to lie below thoſe then wrought; the workmen bored from the bottom of the pit next the engine pit, and when they had bored to the above depth, and taken out the auger, the water from the works, which uſually ran acroſs the bottom of this pit to the engine pump, ran down the hole they had then made.

As ſoon afterwards as the ſteam engine was ſet to work at the ſtated period, the engine pump contained no water; it had eſcaped through this hole, and continued to run through the ſame ever afterwards, and rendered the engine unneceſſary. This inſtance of water, at ſo great a depth from the ſurface, finding a paſſage at a further depth of ten yards, and immediately below, is very ſingular and ſtriking. Experiments of this ſort ſeldom fall to the lot of man to make, therefore ſuch inſtances are rare and uncommon. In large tracts of level land, where lakes or moraſſes have been formed, and which cannot be drained by cutting open drains, or driving levels through rocks, but at an expence for which the lands, when drained, would never compenſate, the above inſtance warrants experiments being made with the auger, which, if not ſucceſsful, may be tried at little expence." *Agricultural Reports of Hertfordſhire*, p. 67.

It frequently occurs, in working quarries of lime or freeſtone, that, at a certain depth, part of the rock containing water is met with, whereby the quarry is ſoon ſo filled with water as to put a ſtop to working it deeper, where the beſt of the ſtone lies. The common remedy in ſuch caſes is, either to erect a windmill-pump to draw out part of the water, or to open a new quarry adjoining to the laſt, which at the ſame depth meets with the like obſtruction; or to bring up a very deep and expenſive cut, under the level of the water, from the neareſt declivity. By the following method, however, all quarries of limeſtone, freeſtone, marl, &c. liable to ſuch an obſtruction, may be completely cleared of water at little expence; and the drain, at the ſame time, will ſerve a double purpoſe, by drying the wet ground, which, in conſequence of the ſpring contained in the rock, is found adjoining to it. Immediately under the rock, commonly lies a bed of ſtrong retentive clay, that upholds all the water retained in that rock, and which being alſo bound round on each ſide by a covering of clay, or other ſtiff ſoil, cannot diſcharge itſelf. In the firſt place, endeavour to find to what ſide the rock dips or inclines, which may be aſcertained by the appearance of the ſurface in examining the adjacent ground, and by the aſſiſtance of the ſpirit-level. After diſcovering this, cut a drain through the clay covering to the rock, and the offending water will be drawn completely off. The ſituation of marl pits is often ſuch that it requires a very extenſive cut through ſome part of the ſurrounding bank, to carry off the water that prevents taking out the marl. This might often be accompliſhed by ſinking a pit through the retaining ſtratum under the marl bed, into ſome abſorbent ſtratum below, that would receive the water let down into it by the pit. If the ground where the marl lies is of conſiderable extent, ſeveral ſuch pits will be neceſſary to carry off the water. In many caſes the water may be got rid of in a ſtill eaſier manner, provided the ſituation of the ground is anſwerable. If the ſurrounding bank declines on the oppoſite ſide lower than the water, by cutting a drain into it, and boring with the horizontal auger into the tail of the ſtratum containing the water, it will immediately be drawn off, and reduced to a level lower than that of the bed of marl. We have noticed, with gratification and pleaſure, very ſimilar methods of draining and tapping ſprings, by means of the auger, laid down by Dr. Anderſon, F. R. S. and by Mr. John Wedge, of Bickenhill, near Coventry, to whom the Society of Arts and Manufactures awarded their ſilver medal, for his communications on this ſubject.

Notwithſtanding the great advantages to be derived from this new mode of *under-draining*, we muſt not forget to notice, in a variety of inſtances, the utility and convenience of the common hollow or open drains. Theſe are chiefly uſed to correct that temporary wetneſs of ſoil which reſults from rain; and which, from flatneſs of ſurface, or its retentive quality, ſtagnates, to the injury of both ſoil and crops. This is an evil of conſiderable magnitude to the practical farmer; to remedy which, in a cheap and expeditious manner, ſeveral inventions have been recently offered to the public. The Society of Arts, &c. gave a bounty to Mr. Makins of Suffolk, for the firſt offer of a plough to cut hollow drains. There was merit in the idea, but his plough has fallen into diſuſe. Another plough, for the ſame purpoſe, was invented by Mr. Arbuthnot, of Mitcham, of which an account is given in the "Eaſtern Tour." And lately, the Society of Arts have made ſeveral trials with what is called a mole plough; the intention of which is, to draw a pointed iron cylinder, at a given depth, through the earth, which ſhall form a pipe or hollow drain, of the ſize of the iron cylinder, through which the water will flow freely under the ſoil, at a depth below the roots of the grain, and will find its way into a furrow, or watercourſe, made at the end of the field on purpoſe to receive it. This plough was introduced by Mr. Adam Scott, of Guildford, in Surry; who, in the ſpring of 1797, received a bounty of thirty guineas from the Society of Arts, for the invention. It is found to anſwer beſt in ſuch ſoils where it is not likely to meet with obſtructions from ſtones and rocks; and the drains will endure longeſt in ſtrong adheſive land, or clay; but in light ſandy ſoils they quickly fall in. A plough very ſimilar to the above has been projected, by Mr. Watts, of Binley, in Warwickſhire, for which a patent was obtained the 19th of October, 1797.

For the purpoſe of making *open* drains, and for drawing off cold ſtagnant ſurface water in paſture land, the lateſt and beſt invention ſeems to be that of a plough, conſtructed under the direction of the late duke of Bridgewater, by Robert Tomlinſon, of Worſley, near Mancheſter. The thanks of the Society for the Encouragement of Arts, &c. were voted to his grace in 1801, for a model of this plough, which his grace preſented to them; and which is now placed in the ſociety's repoſitory, in the Adelphi, London, for public inſpection. In clay or ſtiff land that lies flat, the plough cannot go too deep; but if it lies on a declivity, about five inches deep will be ſufficient. In ſoft light ſoil, the plough ſhould go as deep as it can in all ſituations, becauſe the ſides are apt to moulder into the gutters. The beſt time for this draining is about Michaelmas, or as ſoon as the graſs is eaten; and the whole ſhould be accompliſhed betwixt that time and Chriſtmas. In clay ground, that has never been drained, ſix good horſes will be requiſite to draw the plough. In every following year the plough ſhould be run through the ſame gutters, and four horſes will then be ſufficient. At Broughton, in the neighbourhood of Mancheſter, conſiderable quantities of ſtiff clay, paſture, and meadow land, have been much improved, under the inſpection of the ſecretary of the ſociety, by the uſe of this plough. After the cattle were houſed for the winter, three horſes only were employed to form drains with the plough at proper intervals: the ſmall drains were made at the diſtance of about nine yards from each other, in old furrows of the ground, and about five inches deep: the ſod, when cut out by the plough, was placed in a heap in the field, with quicklime in a powdery ſtate: the whole maſs was reduced to a compoſt by the froſt during the winter, and in the following ſpring was laid upon the ſurface of the land, and formed an excellent top-dreſſing. The water from the ſmall drains is directed into the larger drains, made by lowering the ſhare of the plough to the depth of nine or more inches. Little or no loſs of land ariſes from the ſmall drains, as natural graſſes are produced therein early in the ſpring. It will be highly advantageous to repeat the operation every winter: it is eaſily and expeditiouſly performed; and no perſon, without an actual experiment of the fact, can form a ſufficient judgment of the great benefit ariſing to vegetation by the removal of cold ſtagnant water, during the winter, from land of every deſcription. A drawing of this plough is given in the Draining Plate II. fig. 1, of which the following

lowing is a deſcription: A B, the beam of the plough, C D, the handles. E, the ſhare or ſock. F, the coulter, or firſt cutter of the ſod; which coulter is fixed to the ſhare. G, the other coulter, or ſecond cutter, which ſeparates the ſod from the land, and directs it through the open ſpace betwixt F and G. This coulter is connected with the ſhare and the beam. H I, the ſheath of the plough. K, the bridle or muzzle, to which the ſwingle-tree is to be fixed. L M, two wheels of caſt iron, which may be raiſed or lowered by ſcrews at N, preſſing upon the flat irons O O, to which the axis of each wheel is fixed. Theſe wheels regulate the depth which the ſhare is to penetrate into the earth. P, a chain with an iron pin, to move the ſcrews at O.

Another invention for draining land is thus deſcribed in the "Annals of Agriculture," and in the agricultural report of the county of Eſſex:—"The author of this experiment has conſtructed, and uſes, a *draining-wheel* of caſt iron, that weighs about four hundred weight; it is four feet in diameter; the cutting edge, or extreme circumference of the wheel, is half an inch thick, which increaſes in thickneſs towards the nave or centre, and will, at fifteen inches deep, cut a drain half an inch wide at the bottom, and four inches wide at the top. This wheel is ſo placed in a frame, that it may be loaded at pleaſure, and be made to operate to a greater or leſs depth, according to the reſiſtance made by the ground. The trenches are thus cut in the winter, and are then either filled with ſtraw-ropes, and lightly covered, or left to crack wider and deeper during the enſuing ſummer. The drains are then filled with twiſted ſtraw or buſhes, and covered lightly with earth moſt conveniently at hand. Thus hollow drains are formed at little expence, and which, upon trial, have been found to anſwer extremely well. Twelve acres have been drained with this wheel in one day.

With reſpect to the formation of drains, and the materials for filling them up, the farmer muſt be guided by circumſtances of ſituation, &c. The materials moſt commonly uſed, are ſtone, wood, bruſhwood, ſtraw and ſtubble, heath or ling, or bricks made for the purpoſe. If the drain is to be made ſquare at the bottom, the trench muſt be wide enough to contain two ſide-ſtones about ſix inches aſunder, and the ſame in height, with a flat ſtone laid over, which covers and ſecures the cavity through which the water is deſtined to flow. Theſe drains are more expenſive than when the ſtones are thrown in promiſcuouſly, but are the only conductors applicable to ſprings, which are to be prevented from injuring large tracts of land. A ſection of this drain is ſhown in the Draining-plate, II. fig. 2.

In ſituations where the ſoil is looſe, or ſubject to give way at the bottom of the trench, a method of laying the drain has been recommended by ſir Henry Fletcher, bart. member of the Board of Agriculture, whereby this evil may be overcome. He directs three ſquare ſtones to be uſed, of a thin, flat, form, two of which are to be placed againſt the ſides of the drain, meeting at bottom, and the third laid over on the top, thus forming a hollow triangular ſpace, through which the water will flow without impediment. Stones, from their weight, are always liable to ſink; and, where the ſoil is looſe, they are ſtill more apt to give way, and thus occaſion ſtoppages in the drain. But when the ſtones are fixed in the above triangular poſition, if the ſoil gives way, the work will ſubſide regularly with it, and ſtill keep its form, preſerving conſtantly a paſſage for the water. A ſection of this drain is repreſented in the engraving at fig. 3. In many caſes where the ſoil is firm and adheſive, and the flow of water not very conſiderable, it is quite ſufficient to make the drain by throwing in field-ſtones promiſcuouſly, with a turf laid on the top, graſs-ſide downwards, or covered over with ſtraw, heath, ling, ruſhes, &c. The water will always trickle through the crevices of the ſtones, while the upper ſoil is prevented from choaking them up. A ſection of this drain is given in the plate, at fig. 4.

Upon the ſubject of filling drains with wood, lord Petre thus expreſſes his opinion: "The drains filled with wood, and covered as uſual with ſtraw or ruſhes, before the top mould is put on, are preferable to ſtones or any other kind of materials; the reaſon is, as the wood decays, the water continues to paſs. When filled with ſtones, and the drains ſtop up, which muſt be expected to take place in time, the earth becomes quite ſolid round the ſtones, and, as they do not decay, the filtering of the water is for ever obſtructed: not ſo when buſhes or wood are uſed; continual filtering and draining are then for ever to be perceived; and by repeating the operation a ſecond time, cutting the drains tranſverſely of the old ones, the benefit of the filterings through the rotten wood is ſecured, and the ſpewing up of old broken and damaged drains corrected and carried off. Moreover, as buſhes form a much greater number of cavities than either ſtones or poles, they are leſs able to ſtop up, and encourage filtering more than larger and more ſolid bodies." For this purpoſe ſome perſons prefer black-thorn buſhes to every other material for filling. There is alſo a method of filling with wood, by ſuſpending the buſhes upon ſtakes or billets ſet croſſways in the bottom of the drain. This kind of drain is much recommended by the writer of the Agricultural Report of the County of Caermarthen, who ſays, "The completeſt method is to cut the ſtrongeſt ends of alder, willow, or other aquatic wood, into lengths of about twenty inches, and place them alternately in the drain, with one end againſt one ſide of the bottom, and the other leaning againſt the oppoſite ſide, forming, as it were, a St. Andrew's croſs. Having placed the ſtakes or billets in this manner, about a foot apart, I fill the ſpace left between them on the upper ſide with the ſmall bruſhwood, laid as it were in faggots, longitudinally; upon which a few ruſhes or ſtraw being laid, as before mentioned, the work is done. By this method there is a triangular open ſpace at the bottom of the drain, and one on each ſide. See the ſection of this drain in the plate, at fig. 5. There is another method ſaid to be preferable to the above, and requiring leſs wood: it is to fix in at every foot diſtance a ſtick, bent in manner of a hoop, or ſemicircular arch; and along theſe to lay the poles or branches longitudinally. This will form a ſecure vacuity below, and an arch capable of ſupporting any weight of earth neceſſary above it. From its known durability in water, and being ſufficiently pliant, the young branches of larch are well adapted for this purpoſe; as are alſo willow, beach, &c. In ſituations where quarry ſtones are at hand, we think after all, that no method excels the common form of laying the drain with ſuch ſtones, coupled like two tiles leaning againſt each other, and forming a triangular ſough for the water. The ſection of a coupled drain is ſhewn in the plate at fig. 6. It is laid with great facility; requires only a few common field ſtones thrown in upon the couples, and then the earth or mould.

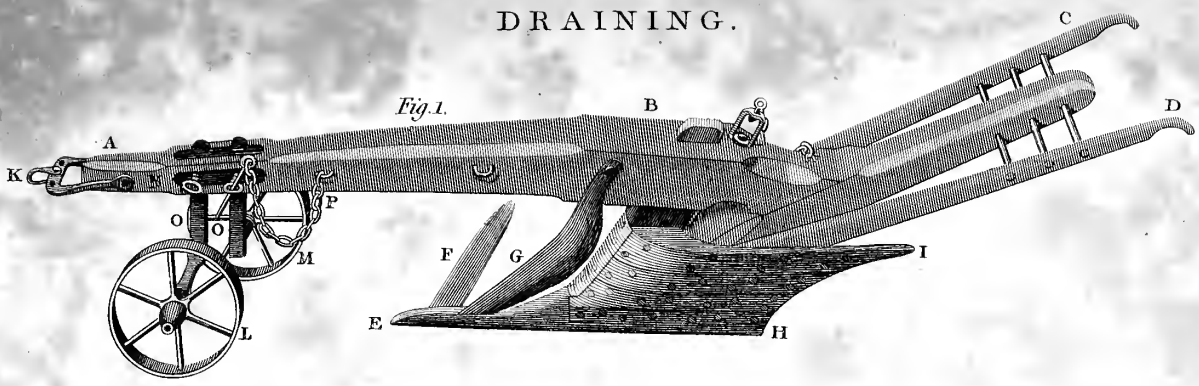
Reſpecting filling drains with ſtraw, the following obſervations by Mr. Vancouver, in his Report of the Eſſex Huſbandry, merits attention: "When the ſoil is a very cloſe and retentive clay, the drains ſhould be made proportionably near to each other, ſhallow, and filled with ſtraw only, it being totally unneceſſary to uſe wood, or any more durable material, upon land where the ſides of the drains are not likely to crumble in. Upon a ſoil like this, the drains ſhould ſeldom exceed the diſtance of three or four yards apart, and twenty inches deep, or ſuch a depth as may be the moſt conveniently obtained, by firſt opening the drains with the plough, ſhovelling the bottom of the loweſt furrow, and then digging one ſpit only with the land ditch ſpade. Drains formed in this manner, in tough and retentive clays, will be found, in a ſhort time after the work is finiſhed, to have formed over the

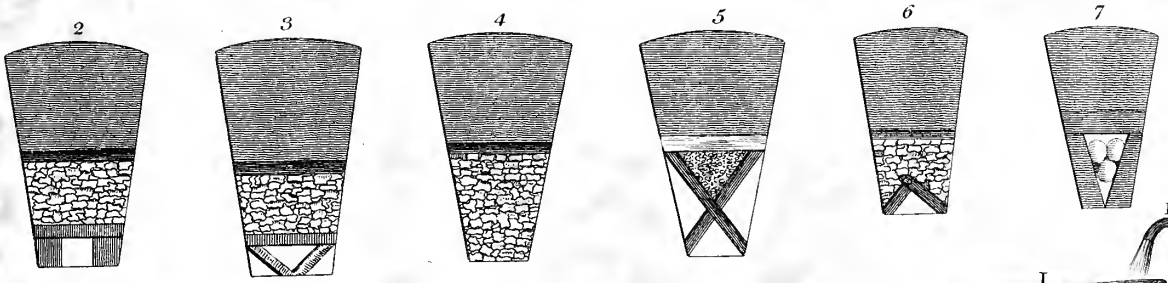
the ſtraw with which the drain was filled, an arch of ſufficient ſtrength to ſupport the incumbent weight of the ſoil, and the caſual traffic of the field. In twelve or eighteen months, it may be obſerved, that the ſtraw, being of one uniform ſubſtance, is all rotted and carried away, leaving a clear pipe through the land in every drain, for the water to run off. But the lateſt and beſt improvement in filling hollow drains with ſtraw, is that of twiſting the ſtraw into a rope, deſcribed as follows: "The common practice of filling drains is to tread in looſe ſtraw; but Mr. Bedwell has invented a method of winding it into a hard rope, as large as a man's arm, which he forces to the bottom of the drains, and finds from experience, copied ſucceſsfully by his neighbours, to convey the water off more readily, and to have much longer duration; at the ſame time the quantity of ſtraw conſumed is not increaſed, and the operation of filling accelerated. After the cattle have picked it over, he finds the ſtraw tougher, and in better order to twiſt, than when quite dry and freſh." The machine for twiſting the ſtraw is upon the ſame principle with that uſed by the rope-makers. This invention of twiſting the ſtraw into ropes, has ſuggeſted a very excellent method of forming drains in ſtiff adheſive lands, without any other material. The method is, firſt to open the drains with the duke of Bridgewater's plough: then, with the draining ſpade open a triangular pipe or ſough in the ground below. This is to be laid with three large ſtraw ropes, one at bottom, and two over, placed longitudinally; then clay, trampled in upon theſe ropes, completes the drain. See a ſection of it in the engraving, at fig. 7.

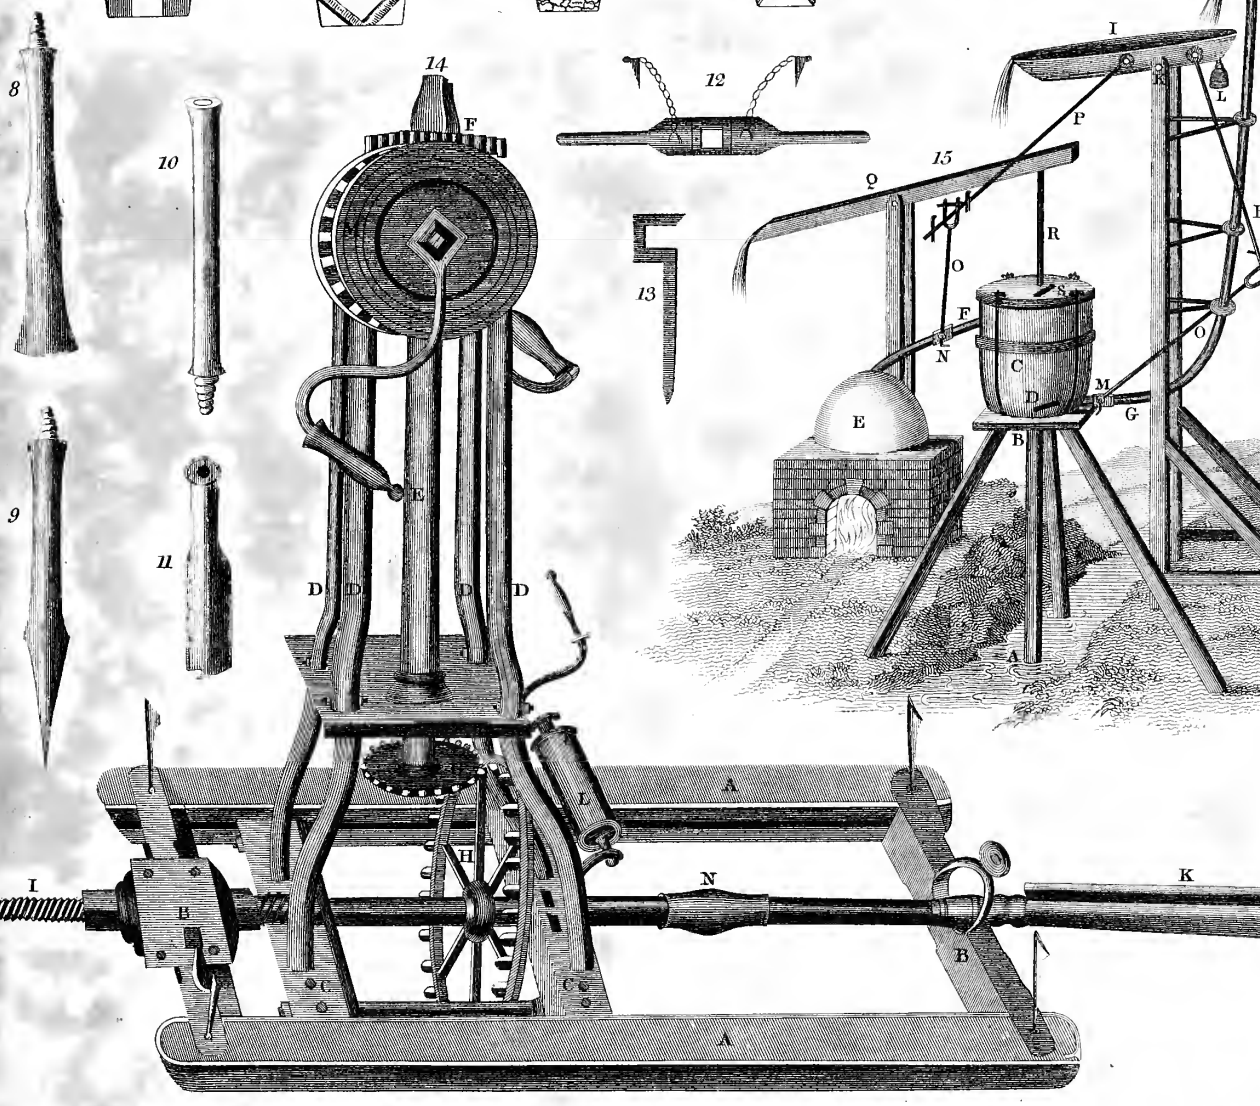
With reſpect to the common implements uſed in draining, they are ſo ſimple and ſo well known, that it is needleſs to deſcribe them; but thoſe of more modern invention, as now uſed in Mr. Elkington's practice, it will be extremely neceſſary to explain. Theſe are alſo very few, and very ſimple, conſiſting only of a large ſtrong ſteel chiſel; a ſharp-pointed punch; a perpendicular borer or auger, lengthened by rods; and an horizontal auger, in many caſes, is an indiſpenſable aſſiſtant to the other. The perpendicular augur or borer, uſed in modern draining, is nearly ſimilar to that made uſe of in ſearching for coal or other minerals. This inſtrument is from two and a half to three and a half inches in diameter; the hollow part of it one foot four inches in length, and conſtructed nearly in the ſhape of the wimble uſed by carpenters; only in this the ſides of the ſhell come cloſer to one another. The rods are made in ſeparate pieces, of four feet long each, and ſcrew into one another, to any aſſignable length, or as the depth of the hole requires. The ſize above the auger is about an inch ſquare, unleſs at the joints, where, for the ſake of ſtrength, they are a quarter of an inch more. The chiſel and punch are alſo made to ſcrew into the ſame rods, and are deſtined to cut their way through hard gravel, or metallic ſubſtances, to accelerate and prepare the paſſage of the auger, which could not otherwiſe perforate ſuch hard bodies. The punch is often uſed when the auger is not applied, to prick or open the ſand or gravel, and give a more ready iſſue to the water. The chiſel is an inch and a half or two inches wide, and made very ſharp. There is a ſhifting handle of wood adapted to the auger, and faſtened with two iron wedges, for the purpoſe of turning round the rods in boring, and alſo iron keys for ſcrewing and unſcrewing the rods, and for aſſiſting the handle when the ſoil is very ſtiff, and requires more than two men to turn it. The manner of uſing it is thus: in working it, two or three men are neceſſary. Two ſtand above, on each ſide of the drain, who turn it round by means of the wooden handle; and when the auger is full, they draw it out, and the man in the bottom of the drain clears out the earth, aſſiſts in pulling it out, and directing it into the hole again, and can alſo aſſiſt in turning with the iron handle or key, when the depth and length of the rods require additional force to perform the operation. The workmen ſhould be cautious, in boring, not to go deeper at a time, without drawing, than the exact length of the ſhell, otherwiſe the earth, clay, or ſand, through which it is boring, after the ſhell is full, makes it very difficult to pull out. Flat boards, with a hole cut through, and laid over the drain, in time of boring, are very uſeful for directing the rods in going down perpendicularly, for keeping them ſteady in boring, and for the men to ſtand upon when performing the operation. A hollow ſpade, made of oak timber, and ſcooped out in the middle, is uſed in ſoft peat ſoils, being light and eaſy, to throw the mould out of the trench. They are made of iron, in the ſame ſhape alſo, for throwing out clay or tough ſoil. A crook-handled ſpade or ſhovel, having the edges turned up, is well adapted for ſmoothing the bottom of the drain before laying the ſough, and with which the workmen have leſs occaſion to ſtoop. As the moſt uſual opening of the ſough is ſix inches ſquare, a piece of wood of that ſize, and one yard in length, is very uſeful for laying in the bottom of the drain, and building the ſtones on each ſide of it, and which can be ſhifted forward as the workman proceeds in forming the drain. The moſt material of theſe implements are delineated in the engraving, viz. fig. 8, the chiſel; 9, the punch; 10, a four-feet length of the auger rod, made to ſcrew on; 11, the auger, for boring perpendicularly from the bottom of the drains; 12, the wooden handle and wedges; 13, the iron key. Fig. 14, is the *horizontal auger*, a very ingenious inſtrument, lately invented by Mr. Haford, of Hathern, in Leiceſterſhire. The advantages of it are in many caſes conſiderable, by ſaving the expence of digging or cutting, and performing the work in a ſhorter time. Where a drain or water-courſe is intended to paſs under a bank, road, wall, or rivulet, it may be uſed to advantage in excavating a ſufficient paſſage for the water, without opening a trench. In laying leaden pipes for the conveyance of water, it is alſo extremely uſeful, by making a hole in which the pipe may be laid, without opening a trench on purpoſe. For tapping ſprings, or finding water at the bottom of a hill, either for the ſupply of a houſe, or for draining the ground, it may be uſed with ſucceſs, as the water of the ſpring will flow more eaſily, and in greater abundance, through a horizontal perforation, than through a perpendicular outlet. The manner of uſing it is thus: ſuppoſe a lake or pond, ſurrounded with high banks, is to be emptied; if the ground declines lower on the oppoſite ſide, find the level of the botom of the water, and trace that level to the face of the bank where the perforation is to be made. There ſmooth the ſurface of the ground, ſo as to place the frame nearly level, with the auger pointing a little upwards. It requires two men to turn the handles at top, in order to work it. When the auger ſhell is full, the rods are drawn back by reverſing the lower handle; and rods are added at the joint, whenever the diſtance requires. In boring through a bank of the hardeſt clay, two men will work through from thirty to forty feet in a day, provided there be no interruption from hard ſtones, which will require a chiſel to be fixed on in place of the ſhell, and longer time to work through. The parts of this machine, as delineated on the plate, are as follow: AA, frame groved within, eight feet ten inches. BB, ends of the frame, two feet ten inches, through which the ſcrew and augur paſs. CC, bottom of the carriage to which the uprights are fixed. DDDD, upright ſtandards, four feet high. E, ſpindle, two feet ten inches long. F, upper cog wheel with ten teeth. G, lower cog wheel with twenty-four teeth. H, main wheel with thirty-two teeth. I, the main ſcrew, ſix feet three inches. K, the auger, ſix feet long, and three inches and a half in diameter. L, winch and roller for reverſing the rods. M, two contright or ſide wheels, with twenty-four cogs each, upon which the two handles are fixed. N, joint for lengthening the rods.

We

DRAINING.







Modern Implements for Draining.

J. Pass sculp.ᵉ

London Published as the Act directs. Augᵗ 1ˢᵗ 1803. by J. Wilkes.

We have noticed, in the former part of this article, that the water which diſturbs the working of coal-pits and mines, is often obliged to be pumped up by means of a ſteam engine. To elucidate the great utility of ſuch machines, and to ſhew the eaſy application of them to the purpoſes of draining marſhy land, we ſhall here deſcribe a ſteam-engine for raiſing water without a piſton, invented by M. François, and publiſhed in the Memoirs of the Philoſophical Society of Lauſanne. The author deſcribes it as follows: "Some members of the government having conſulted me reſpecting the draining of a conſiderable extent of marſhy land, between the lakes of Neufchatel, Bienne, and Morat, I firſt conſidered whether I could not, for that purpoſe, employ the method which is uſed with ſo much ſucceſs by the Dutch; this method conſiſts in ſurrounding with banks the land which is intended to be drained, and placing, at certain diſtances, wind-mills which draw off the waters within, and pour them into canals formed on the other ſide of the bank: as is commonly done in ſalterns. An inſpection of the places, however, convinced me that it was impoſſible to make uſe of ſuch mills. Theſe marſhes are bounded on the eaſt and weſt by the mountains Jura and Jorat, which render the direction of the wind very irregular; beſides which thoſe mills are ſubject to two very great inconveniences; the firſt, that, even in flat open countries, they do not go more than one third of the year; the ſecond, that they can only raiſe water to a moderate height, that is to ſay, to the height of the radius of the wheel. It is true that this inconvenience has been attempted to be remedied, by inclining the axis of the wheel, but, that being found to produce other inconveniences, it was thought neceſſary to recur to the horizontal axis. It appears to me therefore, that for undertakings of this nature, we ſhould give up the idea of wind-mills, and, inſtead of them, make uſe of ſteam-engines. The Engliſh have, for a long time, employed them with great advantage; the French, and other nations, begin now to bring them into uſe. Theſe conſiderations induced me to propoſe a machine, the conſtruction and effects of which, are as follow: The machine is compoſed of the pipe A B, as delineated in the preceding plate, fig. 15, part of which pipe is plunged into the water: to this pipe is joined the pump-body of iron C, the lower opening of which is cloſed by the valve D, which opens from D. The diameter of C is ſix times as great as that of A B. E is a copper ſtill, two thirds filled with water, and placed upon a furnace; it communicates, by the tube F, with the upper part of the pump-body C. G H is a tube, through which the water is forced to riſe into the bucket I, which is ſuſpended by the centre K, upon which it turns; L is the counterpoiſe of the bucket. At M and N are two cocks. O P and O P are the arms of the regulator, which ſerve to open and ſhut the cocks. Q is the trough which carries off the water. R is the tube of ſupply, the inferior orifice of which is ſhut by the ſpring-valve S, which opens from S towards C. Let us now ſuppoſe the water boiling in the ſtill, the cocks M and N cloſed, and A B C filled with water: for the water will eaſily be made to riſe into the pump-body, by giving an oſcillatory movement to the bucket I. It is evident that, as ſoon as the cocks are opened, the ſteam eſcapes through the tube F; it preſſes upon the ſurface of the water, the valves D and S are cloſed, and the water is forced to riſe from G to H, where it empties itſelf into the ſwinging-bucket I. This bucket, being filled, turns upon its axis, and empties itſelf into the trough Q; as ſoon as it is empty, it is brought back into its horizontal poſition, by the counterpoiſe L. The bucket, however, as it turns down, gives a motion to the two branches of the regulator, by which the cocks M and N are cloſed, and as it riſes opens them again. On the other hand, the trough Q, which receives the water from the bucket, gives a portion of it, at every turn, to the tube of ſupply R, which water, in falling, overcomes the reſiſtance of the ſpring-valve S; this water being cold, and falling into the pump-body C, condenſes the ſteam, and conſequently occaſions a vacuum; and the water which is in the tube A B, being forced up by the weight of the atmoſphere, comes into its place. The pump-body C, becomes then filled afreſh, the cocks are opened, the ſteam eſcapes, and the water is again driven out; this takes place alternately, five or ſix times in every minute. A view of this machine, as delineated in the engraving, will ſufficiently ſhew its ſimplicity: it is ſubject neither to the friction of piſtons, nor to the ſhaking of levers which riſe and fall, as in the ſteam-engines made uſe of in England. It poſſeſſes in itſelf the principle of its regular motion; for, the bucket, being put in motion by the water which empties itſelf from it, cauſes the regulator to act, which opens and ſhuts the cocks, without the aſſiſtance of any perſon. This machine can raiſe water at leaſt fifty feet, reckoning thirty for the weight of the atmoſphere, and twenty only for the action of the ſteam. Its power conſiſts in the proportion which the capacity of the ſtill bears to that of the pump-body above it. According to this proportion, the quantity of water which goes out at each action may be eſtimated.

DRAKE, *ſ.* The male of the duck. See ANAS.—The duck ſhould hide her eggs from the *drake*, who will ſuck them if he finds them. *Mortimer.*—[From *draco*, Lat. a dragon.] A ſmall piece of artillery, now out of uſe.—Two or three ſhots, made at them by a couple of *drakes*, made them ſtagger. *Clarendon.*

DRAKE (ſir Francis), a very eminent Engliſh navigator and naval commander, born of obſcure parentage near Taviſtock in Devonſhire, probably in 1545. He was the eldeſt of twelve brothers, and was brought up to a maritime life under the care of ſir John Hawkins, who was his kinſman. After ſome ſubordinate commands, he roſe to be captain of a veſſel at the age of twenty-two; and in that capacity he ſerved under Hawkins in the gulf of Mexico, and acquired great reputation for his gallantry. He returned, however, bankrupt in fortune; and by naval cauſiſtry he conceived that he had a right to retrieve his loſſes, by making repriſals, as they were called, upon the ſubjects of the king of Spain. It is not to be concealed, that the private expeditions of ſeveral of our naval adventurers againſt the Spaniſh trade and ſettlements, however deſerving of admiration on account of the boldneſs and ability with which they were conducted, partook very much of the character of piracies, and were always regarded as ſuch by the court of Spain. Without, therefore, examining the point of right, we ſhall proceed to relate hiſtorically the principal exploits of this great hero. Drake's deſign of cruiſing againſt the Spaniards, ſoon raiſed him a number of volunteers ſufficient to man two ſmall veſſels, with which he made a voyage to the Weſt Indies in 1570. The next year he repeated his voyage with one ſhip alone. Of the particular tranſactions of theſe years we have no account; but his purpoſe ſeems to have been chiefly exploratory and commercial, and he avoided alarming the Spaniards by open hoſtilities. He ſailed again in 1572 with two veſſels, one of ſeventy, the other of twenty-five tons burthen, and manned by ſeventy-three perſons. Yet with this ſmall force he ventured to ſtorm the town of Nombre de Dios on the iſthmus of Darien, in which action he received a wound. He afterwards took Vera Cruz on the ſame iſthmus; and he had the fortune to make a large addition to the booty acquired at theſe places, by falling in with a ſtring of fifty mules laden with ſilver, of which his men carried off as much as they could, and buried the reſt. In this expedition he had the aſſiſtance of an Indian nation, hoſtile to the Spaniards, whom he made his friends by liberal treatment. Satisfied with his ſucceſs, he re-embarked with his wealth, and arrived ſafe at Plymouth in Auguſt, 1573. Drake, upon his return, honourably ſettled with his owners, and employed the money which remained to him in a manner which, if it is to be imputed to diſintereſted patriotiſm, will appear very extraordinary. He fitted out three

ſtout

ſtout frigates at his own expence, and ſailed with them to Ireland, where he ſerved as a volunteer under Walter Devereux, earl of Eſſex, then engaged againſt the rebels. But it appears that the Iriſh expeditions in thoſe days were much carried on by individuals, who were paid by grants of land or other emoluments. The ſpirit he diſplayed on this occaſion ſeems to have recommended him at court, where he was introduced by his patron, ſir Chriſtopher Hatton. It was the wiſh of his heart to make a voyage to the South Sea. He had obtained a ſight of this ocean from the iſthmus of Darien, and it had ſo kindled his enthuſiaſm, that he put up a fervent prayer that he might be the firſt Engliſhman who ſhould ſail upon it. Queen Elizabeth's permiſſion for undertaking this deſign was at length obtained, and his own reputation ſoon furniſhed him with the means. He aſſembled a fleet of five veſſels, the largeſt of 100 tons burden, the ſmalleſt of only fifteen tons; and manned by no more than 164 men. He kept his deſtination ſecret, though it was generally ſuſpected that he was bound to ſome port of America. He took his final departure from Falmouth on December 13, 1577, and arrived in the ſucceeding June at port St. Julian, not far from the ſtraits of Magellan. He had been furniſhed, by permiſſion of the queen, with power of life and death over his crews, though his ſhips did not belong to the royal navy. This power he now thought proper to exerciſe upon the perſon of John Doughty, the ſecond in command on board his own ſhip, whom he tried by a court-martial for the crimes of plotting to murder him, and to defeat the expedition. By the verdict of a jury of twelve men, according to Camden; by the ſentence of the whole council of forty perſons, according to others; Doughty was found guilty, and ſentenced to death. It is added, that he made a full confeſſion. Drake gave him the choice either to be executed where they were, to be ſet on ſhore upon the continent, or to be brought back to abide the juſtice of his country. Doughty choſe the firſt; and he was accordingly, with all due ſolemnity, and after receiving the ſacrament along with Drake, beheaded by the provoſt-marſhal of the fleet. Such was the fact relative to this ſingular tranſaction. It was ſcarcely to be expected that ſuch an exertion of power ſhould go uncenſured; and ſome attributed it to the commander's jealouſy of Doughty, who appears to have been a brave and able ſeaman; others to ſecret directions from the carl of Leiceſter, who had a quarrel againſt the man. Yet he was never legally queſtioned concerning the fact after his return; and he appears to have proceeded in it with coolneſs and deliberation, and all the forms of juſtice. After refitting at St. Julian, he paſſed the ſtraits of Magellan; and, with his own ſhip ſolely, proceeded along the coaſts of Chili and Peru, making captures of the Spaniſh veſſels he met with, and plundering on ſhore, till the avarice of his crew was ſatiated. He then coaſted California and North America as far as the forty-eighth degree, in hopes of finding a paſſage to the Atlantic; but, being diſappointed in this expectation, he landed and took poſſeſſion, in the queen's name, of the country, which he named New Albion. Having careened his ſhips, he boldly ſet ſail acroſs the Pacific Ocean. Within leſs than ſix weeks he reached the Molucca iſlands, and touched at Ternate. Thence, by Java and the Cape of Good Hope, he proceeded homewards, and arrived at Plymouth on November 3, 1580, having completed the circumnavigation of the globe in two years ten months and twenty days. He was the firſt commander in chief who had performed this great exploit; for Magellan died in his voyage, and his ſhip was brought round by Cano. Drake brought home a large quantity of treaſure, and his adventure became an intereſting topic of diſcuſſion. The Spaniſh ambaſſador made complaints of him as a pirate, and reclaimed the plunder he had taken; and there were not wanting thoſe who ſupported the ſame opinion, and thought that the nation would ſuffer more from the interruption of commerce with Spain, than it would benefit from prizes. On the other hand, many were elated with the reputation for valour and maritime ſkill which redounded to Engliſhmen from this enterpriſe, and thought that the injuries offered by the Spaniards to the traders in the Weſt Indies juſtified repriſals. The court long wavered; at length, in the ſpring of 1581, the queen gave a ſanction to Drake's conduct, by dining on-board of his ſhip at Deptford, and conferring upon him the honour of knighthood. The nation gladly joined in the applauſe. The commander's fame became a favourite theme, and verſes were written to celebrate the ſhip which had "match'd in race the chariot of the ſun." Elizabeth having come to an open breach with Spain, Drake was ſent, in 1585, with a fleet of twenty ſail, having a body of land forces on-board, to attack the Spaniſh Weſt Indies. Several officers of diſtinguiſhed merit ſerved under him, and his ſucceſs was anſwerable to the national expectations. He took St. Jago in Cuba, St. Domingo, Carthagena, and St. Auguſtin, and made a large booty, though the miſchiefs he did to the enemy were greater than the profits which accrued to the adventurers. His expedition fully demonſtrated the weakneſs of the Spaniards in thoſe parts, and placed in a ſtriking point of view that ſuperiority in naval ſkill and valour of the Engliſh, which has conduced ſo much to the glory and proſperity of this country. In 1587 Drake ſailed with a fleet of thirty veſſels under his command, partly fitted out by the queen, partly by the London merchants. Its firſt object was to deſtroy the ſhipping aſſembled on the coaſt of Spain to form the great armada. This ſervice he gallantly purſued, by entering the harbour of Cadiz, and burning upwards of 10,000 tons of ſhipping. After this, gaining intelligence of a rich carrack from the Eaſt Indies expected at Terceira, he ſailed thither, and took it, and thus ſatisfied his merchant owners in point of profit, as well as he had done the ſtate by his other ſucceſſes. On this occaſion he boaſted, in ſeaman-like language, of "burning the king of Spain's beard." He liberally employed ſome of the wealth he had acquired, in bringing water from a diſtant ſpring to the town of Plymouth, which place he repreſented in parliament in the thirty-fifth year of Elizabeth, as he did Boſſiney in Cornwall in the twenty-ſeventh of that reign.

In the memorable year 1588, ſir Francis Drake was entruſted with the defence of his country as vice-admiral under lord Howard of Effingham. In the conflict againſt the armada, he captured a large galleon, commanded by Don Pedro de Valdez, who ſurrendered, without reſiſtance, through the terror of his name. His ſquadron had the principal ſhare in the diſcomfiture of the Spaniſh fleet, as it fled before the ſtorms and the foe. An Engliſh fleet was ſent the next year under Drake, with a body of land forces commanded by ſir John Norris, for the purpoſe of reſtoring Don Antonio to the throne of Portugal. That diſagreement which has ſo often taken place between land and ſea officers, proved fatal to this enterpriſe. Norris inſiſted upon landing at Corunna, whereas Drake propoſed ſailing directly for Liſbon. The firſt meaſure was put in practice, and Drake promiſed to proceed with the fleet up the Tagus and meet the army. He unaccountably broke his promiſe, and to this, Norris imputed the miſcarriage of the enterpriſe. Drake juſtified himſelf before the council; yet upon the whole it appears, that he loſt ſome credit by this affair. He had, however, the good fortune to capture a large fleet laden with naval ſtores. Some time after, a propoſal was made to the queen by Drake and Hawkins for an important expedition againſt the enemy, where he was moſt vulnerable, and whence he drew his chief pecuniary reſources—in the Weſt Indies. The deſign was approved; and a ſquadron of men of war was given to ſir John Hawkins, while ſo many private ſhips were furniſhed by Drake and his friends, as to make the whole force a fleet of twenty-ſeven veſſels, on-board of which were embarked 2500 troops. After a conſiderable delay, the joint commanders ſet ſail from Plymouth in Auguſt, 1695, their grand deſign being to burn

burn Nombre de Dios, and to march thence acroſs the iſthmus to Panama, in order to ſeize the treaſure from Peru, lying at that place. Before their departure they received advice that the plate-fleet was ſafely arrived in Spain, except one galleon which had put into Porto Rico. The commanders differed about the expediency of attempting to take this veſſel, as the queen adviſed. An attempt was firſt made upon the Canaries, which failed. Time was then loſt in refitting at Dominica; and the Spaniards had the opportunity of conveying away their galleons from Porto Rico. Vexation threw Hawkins into a diſeaſe, of which he died in November. On the day after his deceaſe, Drake made a deſperate attack upon the port and ſhipping of Porto Rico, which, though very deſtructive to the enemy, proved finally unſucceſsful. The fleet afterwards took and burnt Rio de la Hacha and Nombre de Dios. From the laſt place an expedition was ſent over land againſt Panama, but it was found impracticable to effect any thing. Theſe diſappointments preyed upon the mind of Drake, and his depreſſion, joined with the effects of an unhealthy climate, threw him into a fever and flux, of which he died on January 28th, 1596, in the fifty-firſt year of his age, according to the date of his birth given in the Biog. Britan. but in the fifty-fifth according to other accounts. He was a man, upon the whole, of an eſtimable private character; careful of thoſe under his command, courteous and humane towards thoſe whom the fortune of war threw into his power, juſt and generous in his dealings, ſober and religious. He poſſeſſed a natural eloquence, and though without the advantages of education, acquitted himſelf with credit on public occaſions. He was eminently ſkilled in all the branches of his profeſſion; and with ſo much courage and ability did he conduct his enterpriſes, that ſcarcely any name among naval adventurers ſtood ſo high, not only in his own country, but throughout Europe, as that of ſir Francis Drake.

DRAKE, a harbour in California, ſo called after the celebrated ſir Francis Drake, who diſcovered and took poſſeſſion of the peninſula of California, for his miſtreſs, queen Elizabeth. Lat. 28. 15. N. lon. 111. 3. W.

DRAKE, or Drake's Bay, a baſon in the middle of the Virgin Iſles, in the Weſt Indies, four leagues broad and ſeven long, in which ſhips may anchor, landlocked and ſheltered from all winds.

DRAKE, or Druse-hol, *ſ.* A Swediſh denomination, uſed in their mineralogy to expreſs a cluſter of cryſtals which line a cavity in any mineral.

DRAKE's ISLAND, or St. Nicholas, an iſland in Plymouth ſound.

DRAKE'NA, *ſ.* in botany. See Dorstenia.

DRA'KENBORCH (Arnold), profeſſor of rhetoric and hiſtory in the univerſity of Utrecht, and one of the moſt celebrated critics of modern times, born in that city on the 1ſt of January 1684. He ſtudied the belles-lettres under Grævius and Burmann, and law under Cornelius van Eck, after which he went to Leyden, and in 1706 took his degree of LL.D. at Utrecht. In 1716, he ſucceeded Burmann as profeſſor in that univerſity, and died there on the 16th of January 1748. His works are: 1. *Diſputatio Philolog. Hiſt de præfectis urbis*, Traj. ad Rhen. 1704, 4to. On account of its merit and great ſcarcity it was reprinted in ſix ſheets, at Frankfort-on-the-Oder, in 1750, by profeſſor Uhl, with the author's life; and at Bayreuth in 1787, by J. C. Kapp, co-rector of the gymnaſium at Hof, with corrections and annotations. 2. *Diſputatio de officio præfectorum prætorio*, Traj. ad Rhen. 1707, 4to. 3. *C. Silii Italici Punicorum*, libri xvii. Traj. ad Rhen. 1717. 4to. 4. *T. Livii Patavini hiſtoriarum ab urbe condita libri, qui ſuperſunt, omnes. Accedunt Supplementa deperditorum T. Livii libror. a J. Freinſhemio concinnata*, Lugd. Batav. 1738, 1746, tom. vii. 4to. with the author's portrait. Seven of Drakenborch's letters to La Croze may be found in Theſaurus Epiſt. *La Crozianus*, part. i. and others in *Sylloge nova Epiſtolarum*, Norimb. 1758, 8vo.

DRAM, *ſ.* [from *drachm*; *drachma*, Lat.] In weight the eighth part of an ounce. See Drachma.—The trial being made betwixt lead and lead, weighing ſeverally ſeven drams in the air, the balance in the water weigheth only four *drams* and forty-one grains, and abateth of the weight in the air two *drams* and nineteen grains: the balance kept the ſame depth in the water. *Bacon.*—A ſmall quantity, in a kind of proverbial ſenſe:

One loving hour
For many years of ſorrow can diſpenſe;
A *dram* of ſweet is worth a pound of ſour. *Spenſer.*

Such a quantity of diſtilled ſpirit as is uſually drunk at once.—Every *dram* of brandy, every pot of ale that you drink, raiſeth your character. *Swift.*—Spirits; diſtilled liquors:

A ſecond ſee, by meeker manners known,
And modeſt as the maid that ſips alone;
From the ſtrong fate of *drams* if thou get free,
Another Durfy, Ward! ſhall ſing in thee. *Pope.*

To DRAM, *v. n.* In low language, to drink drams; to drink diſtilled ſpirits.

DRA'MA, *ſ.* [Gr.] A poem accommodated to action; a poem in which the action is not related, but repreſented; and in which therefore ſuch rules are to be obſerved as make the repreſentation ſtrictly natural and probable. The drama includes both tragedy and comedy; for the origin, ſtyle, and proper verſification of which, ſee the article Poetry.—Many rules of imitating nature Ariſtotle drew from Homer, which he fitted to the *drama*; furniſhing himſelf alſo with obſervations from the theatre, when it flouriſhed under Æſchylus, Euripides, and Sophocles. *Dryden.*

DRA'MA, a town of European Turkey, in the province of Romania: ſixteen miles north-eaſt of Emboli.

DRAMA'TIC, or Dramatical, *adj.* Repreſented by action; not narrative.—I hope to make it appear, that, in the great *dramatic* poem of nature, is a neceſſity of introducing a God. *Bentley.*

DRAMA'TICALLY, *adv.* Repreſentatively; by repreſentation.—Ignorance and errors are ſeverally reprehended, partly *dramatically*, partly ſimply. *Dryden.*

DRA'MATIST, *ſ.* The author of dramatic compoſitions.—The whole theatre reſounds with the praiſes of the great *dramatiſt*, and the wonderful art and order of the compoſition. *Burnet.*

DRAM'BURG, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg: forty miles ſouth-ſouth-eaſt of Colberg, and 118 north-eaſt of Berlin.

DRAN, a river of Germany, which runs into the Drave, four miles ſouth of Pettau, in the duchy of Stiria.

DRAN (Henry Francis le), an eminent French ſurgeon, born in 1685, the ſon of Henry le Dran, a ſurgeon at Paris, diſtinguiſhed for the treatment of cancers. Henry Francis was a man of great experience and ability. He wrote, 1. *Parallele des differentes Manières de tirer la Pierre hors de la Veſſie*, 1730, 8vo. 2. *Obſervations de Chirurgie, avec des Reflections*, 2 vols. 12mo. 1731. 3. *Traité ou Reflections tirées de la Pratique ſur les Playes d'Armes à Feu*, 1757, 12mo. the reſult of his own army-practice in gun-ſhot wounds, and inculcating bold and efficacious modes of treatment. 4. *Traité des Operations de Chirurgie*, 1743, 12mo. To Gataker's Engliſh tranſlation of it, Cheſelden made ſome valuable additions. 5. *Conſultations ſur la plupart des Maladies qui ſont du Reſſort de la Chirurgie*, 1765, 8vo. He died at Paris in 1770, at the age of eighty-five.

DRANCE, a river of Switzerland, which runs into the Rhone, near Martigny, in the Valais.

DRANK, the pret. of *drink*; and, *ſ.* a provincial term for the wild oat.

DRANS'FELD, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg: ſix miles ſouth-weſt of Gottingen.

To DRAPE, *v. n.* [*drap*, Fr. *drapus*, low Lat.] To make cloth.—It was rare to ſet prices by ſtatute; and this act did not preſcribe prices, but ſtinted them not to exceed a rate, that the clothier might *drape* accordingly as he might afford. *Bacon.*—To jeer, or ſatirize; [*drapper*, Fr.] It is uſed in this ſenſe by the innovator Temple, whom nobody has imitated.

DRA'PER, *ſ.* One who ſells cloth.—If a piece of cloth in a *draper*'s ſhop be variouſly folded, it will appear of differing colours. *Boyle.*

DRA'PERY, *ſ.* [*draperie*, Fr.] Clothwork; the trade of making cloth; woollen manufacture.—He made ſtatutes for the maintenance of *drapery*, and the keeping of wools within the realm. *Bacon.*—Cloth; ſtuffs of wool.—The Bulls and Frogs had ſerved the lord Strutt with *drapery* ware for many years. *Arbuthnot.*—The dreſs of a picture or ſtatue.—Poets are allowed the ſame liberty in their deſcriptions and compariſons, as painters in their *draperies* and ornaments. *Prior.*—See the article PAINTING.

DRA'PET, *ſ.* Cloth; coverlet. *Not in uſe:*

Thence ſhe them brought into a ſtately hall,
Wherein were many tables fair diſpred,
And ready dight with *drapets* feſtival,
Againſt the viands ſhould be miniſtred. *Spenſer.*

DRAS'CUS, *ſ.* in old writings, grains, the refuſe of malt after brewing. *Aſh.*

DRAS'TIC, *adj.* [*draſticus*, Lat. δραστικος, Gr. from δραω, to effect.] It is uſed of a medicine that works with ſpeed; as jalap, ſcammony, and the ſtronger purges. *Quincy.*

DRAVE, the pret. of *drive*. *Drove* is more uſed:

The foe ruſh'd furious as he pants for breath,
And thro' his navel *drave* the pointed death. *Pope.*

DRAVE, a river of Germany, which riſes in the mountains of Tyrol, and joins the Danube about ſixteen miles below Eſzek in Sclavonia.

DRAUGH, *ſ.* [corruptly written for *draff*.] Refuſe; ſwill. See DRAFF.

We do not act, that often jeſt and laugh.
'Tis old, but true, ſtill ſwine eat all the *draugh*. *Shakeſp.*

DRAUGHT, *ſ.* The act of drinking.—They ſlung up one of their hogſheads, and I drank it off at a *draught*; which I might well do, for it did not hold half a pint. *Gulliver.*—A quantity of liquor drunk at once.—Every *draught*, to him that has already quenched his thirſt, is but a farther quenching of nature; a proviſion for rheum and diſeaſes. *South.*

Fill high the goblets with the ſparkling flood,
And with deep *draughts* invoke our common god. *Dryden.*

Liquor drunk for pleaſure:

Were it a *draught* for Juno when ſhe banquets,
I would not taſte thy treaſonous offer. *Milton.*

Delicious wines th' attending herald brought;
The gold gave luſtre to the purple *draught*. *Pope.*

[In commerce.] An order for the payment of money, commonly written *draft*. See BILL OF EXCHANGE, vol. iii. p. 30. The act of drawing or pulling carriages.—A general cuſtom of uſing oxen for all ſorts of *draught*, would be, perhaps the greateſt improvement. *Temple.*—The moſt occaſion that farmers have, is for *draught* horſes. *Mortimer.*—The quality of being drawn.—The Hertfordſhire wheel-plough is the ſtrongeſt for moſt uſes, and of the eaſieſt *draught*. *Mortimer.*—Repreſentation by picture:

Her pencil drew whate'er her ſoul deſign'd,
And oft the happy *draught* ſurpaſs'd the image in her mind. *Dryden.*

Delineation; ſketch; outline.—A good inclination is but the firſt rude *draught* of virtue; but the finiſhing ſtrokes are from the will. *South.*—A picture drawn.—Whereas in other creatures we have but the trace of his footſteps, in man we have the *draught* of his hand: in him were united all the ſcattered perfections of the creature. *South.*—The act of ſweeping with a net.—Upon the *draught* of a pond, not one fiſh was left, but two pikes grown to an exceſſive bigneſs. *Hale.*—The quantity of fiſhes taken by once drawing the net.—He laid down his pipe, and caſt his net, which brought him a very great *draught*. *L'Eſtrange.*—The act of ſhooting with the bow.—Geoffrey of Boullion, at one *draught* of his bow, ſhooting againſt David's tower in Jeruſalem, broached three feetleſs birds called allerions. *Camden.*—Diverſion in war; the act of diſturbing the main deſign; perhaps ſudden attack.—I conceive the manner of your handling of the ſervice, by drawing ſudden *draughts* upon the enemy, when he looketh not for you. *Spenſer.*—Forces drawn off from the main army; a detachment.—Such a *draught* of forces would leſſen the number of thoſe that might otherwiſe be employed. *Addiſon.*—A ſink; a drain.—Whatſoever entereth in at the mouth goeth into the belly, and is caſt out into the *draught*. *Matt.* xv. 17.—The depth which a veſſel draws, or ſinks into the water.—With a ſmall veſſel one may keep within a mile of the ſhore, go amongſt rocks, and paſs over ſhoals, where a veſſel of any *draught* would ſtrike. *Ellis.*

With roomy decks, her guns of mighty ſtrength,
Deep in her *draught*, and warlike in her length. *Dryden.*

[In the plur. *draughts*.] A kind of play reſembling cheſs.

DRAUGHT'HOUSE, *ſ.* A houſe in which filth is depoſited.—And they brake down the image of Baal, and brake down the houſe of Baal, and made it a *draughthouſe*. 2 *Kings.*

DRAUN'SEN SEA, a lake of Pruſſia, in the province of Ermeland, a little to the ſouth of Elbing.

DRAW, a town of Perſia, in the province of Segeſtan: ſeventy miles north-weſt of Zareng.

To DRAW, *v. a.* pret. *drew*; part. paſſ. *drawn*; [dragan, Sax.] To pull along; not to carry.—Then ſhall all Iſrael bring ropes to that city, and we will draw it into the river. 2 *Sam.*—To pull forcibly; to pluck.—He could not *draw* the dagger out of his belly. *Judges*, ii. 22.—To bring by violence; to drag.—Do not rich men oppreſs you, and *draw* you before the judgment-ſeats? *James* ii. 6.—To raiſe out of a deep place.—They *drew* up Jeremiah with cords, and took him up out of the dungeon. *Jer.* xxxviii. 13.—To ſuck.—He hath *drawn* thee dry. *Eccluſ.* xiii. 7.—Sucking and *drawing* the breaſt diſcharges the milk as faſt as it can be generated, *Wiſeman.*—To attract; to call towards itſelf.—We ſee that ſalt, laid to a cut finger, healeth it; ſo as it ſeemeth ſalt *draweth* blood, as well as blood *draweth* ſalt. *Bacon.*—Majeſty in an eclipſe, like the ſun, *draws* eyes that would not have looked towards it if it had ſhined out. *Suckling.*—To draw as a magnet does:

She had all magnetic force alone,
To *draw* and faſten ſundred parts in one. *Donne.*

To inhale:

Thus I call'd, and ſtray'd I know not whither,
From where I firſt *drew* air, and firſt beheld
This happy light. *Milton.*

To take from any thing containing or holding.—They *drew* out the ſtaves of the ark. 2 *Chron.*—To take off the ſpit or broacher:

They cut out legs and fillets for the feaſt,
Which *drawn* and ſerv'd, their hunger they appeaſe. *Dryd.*

To take from a caſk:

The wine of life is *drawn*, and the meer lees
Are left this vault to brag of. *Shakeſpeare.*

To pull a ſword from the ſheath.—I will *draw* my ſword; my hand ſhall deſtroy them. *Exod.* xv.

In all your wars good fortune blew before you,
Till in my fatal cauſe your ſword was *drawn*;
The weight of my misfortunes dragg'd you down. *Dryd.*

To let out any liquid.—I opened the tumor by the point of a lancet, without *drawing* one drop of blood. *Wiſeman.* —To take bread out of the oven.—The joiner puts boards into ovens after the batch is *drawn*. *Mortimer.*—To uncloſe or ſlide back curtains:

Alarm'd, and with preſaging heart he came,
And *drew* the curtains, and expos'd the dame. *Dryden.*

To cloſe or ſpread curtains.—Philoclea intreated Pamela to open her grief; who, *drawing* the curtain, that the candle might not complain of her bluſhing, was ready to ſpeak. *Sidney.*—To extract.—Spirits, by diſtillations, may be *drawn* out of vegetable juices, which ſhall flame and fume of themſelves. *Cheyne.*—To procure as an agent cauſe.—When he finds the hardſhip of ſlavery outweigh the value of life, 'tis in his power, by reſiſting his maſter, to *draw* on himſelf death. *Locke.*—To produce, or bring, as an efficient cauſe.—Religion will requite all the honour we can do it, by the bleſſings it will *draw* down upon us. *Tillotſon.*

When the fountain of mankind
Did *draw* corruption, and God's curſe, by ſin,
This was a charge that all his heirs did bind,
And all his offſpring grew corrupt therein. *Sir J. Davies.*

To convey ſecretly or gradually.—The liers in wait *draw* themſelves along. *Judg.* xx. 37.—To protract; to lengthen; to ſpin:

If we ſhall meet again with more delight,
Then *draw* my life in length; let me ſuſtain,
In hopes of his embrace, the worſt of pain. *Dryden.*

To utter lingeringly:

The brand, amid the flaming fuel thrown,
Or *drew*, or ſeem'd to *draw*, a dying groan. *Dryden.*

To derive; to have from ſome original cauſe or donor.—Several wits entered into commerce with the Egyptians, and from them *drew* the rudiments of ſciences. *Temple.*—To deduce as from poſtulates.—From the events and revolutions of theſe governments, are *drawn* the uſual inſtructions of princes and ſtateſmen. *Temple.*—To imply; to produce as a conſequential inference.—What ſhews the force of the inference but a view of all the intermediate ideas that *draw* in the concluſion, or propoſition inferred. *Locke.*—To allure; to entice.—*Draw* me not away with the wicked. *Pſalm* xxviii. 3.—To lead as a motive:

Your way is ſhorter;
My purpoſes do *draw* me much about. *Shakeſpeare.*

To perſuade to follow:

The poet
Did feign that Orpheus *drew* trees, ſtones, and floods;
Since nought ſo ſtockiſh, hard, and full of rage,
But muſic, for the time, doth change his nature. *Shakeſp.*

To induce; to perſuade.—The Engliſh lords did ally themſelves with the Iriſh, and *drew* them in to dwell among them, and gave their children to be foſtered by them. *Davies.*—To win; to gain: a metaphor from gaming:

This ſeems a fair deſerving, and muſt *draw* me
That which my father loſes. *Shakeſpeare.*

To receive; to take up: as, to *draw* money from the funds:

For thy three thouſand ducats here is ſix.
—If every ducat in ſix thouſand ducats
Were in ſix parts, and every part a ducat,
I would not *draw* them, I would have my bond. *Shakeſp.*

To extort; to force:

Can you e'er forget
The fond embraces, and repeated bleſſings,
Which you *drew* from him in your laſt farewel? *Addiſon.*

To wreſt; to diſtort.—I wiſh that both you and others would ceaſe from *drawing* the ſcriptures to your fantaſies and affections. *Whitgifte.*—To compoſe; to form in writing: uſed of formulary or juridical writings.—The report is not unartfully *drawn*, in the ſpirit of a pleader, who can find the moſt plauſible topies. *Swift.*—Shall Ward *draw* contracts with a ſtateſman's ſkill? *Pope.*—To withdraw from judicial notice.—Go, waſh thy face, and *draw* thy action: come, thou muſt not be in this humour with me. *Shakeſpeare.*—To eviſcerate; to diſbowel:

In private *draw* your poultry, clean your tripe,
And from your eels their ſlimy ſubſtance wipe. *King.*

To convey a criminal to execution on a ſledge.

To DRAW *in*. To apply to any purpoſe by diſtortion or violence.—A diſpute, where every little ſtraw is laid hold on, and every thing that can but be *drawn in* any way, to give colour to the argument, is advanced with oſtentation. *Locke.*—To repreſent by picture, or in fancy:

From the ſoft aſſaults of love
Poets and painters never are ſecure;
Can I, untouch'd, the fair one's paſſions move,
Or thou *draw* beauty, and not feel its pow'r. *Prior.*

To form a repreſentative image.—The emperor one day took up a peneil which fell from the hand of Titian, who was then *drawing* his picture; and, upon the compliment which Titian made him on that occaſion, he ſaid, Titian deſerves to be ſerved by Cæſar. *Dryden.*—To contract; to pull back:

Now, ſporting muſe, *draw in* the flowing reins;
Leave the clear ſtreams awhile for ſunny plains. *Gay.*

To inveigle; to entice.—It was the proſtitute faith of faithleſs miſcreants that *drew* them *in*, and deceived them. *South.*

To DRAW *off*. To extract by diſtillation.—Authors, who have thus *drawn off* the ſpirits of their thoughts, ſhould lie ſtill for ſome time, till their minds have gathered freſh ſtrength, and by reading, reflection, and converſation, laid in a new ſtock of elegancies, ſentiments, and images of nature. *Addiſon.*—To drain out by a vent. —Stop your veſſel, and have a little vent-hole ſtopped with a ſpill, which never allow to be pulled out till you *draw off* a great quantity. *Mortimer.*—To withdraw; to abſtract.—It *draws* men's minds *off* from the bitterneſs of party. *Addiſon.*

To DRAW *on*. To occaſion; to invite.—Under colour of war, which either his negligence *draws on*, or his practices procured, he levied a ſubſidy. *Hayward.*—To cauſe; to bring by degrees.—The examination of the ſubtile matter would *draw on* the conſideration of the nice controverſies that perplex philoſophers. *Boyle.*

To DRAW *over*. To raiſe in a ſtill.—I took rectified oil of vitriol, and by degrees mixed with it eſſential oil of wormwood, *drawn over* with water in a limbeck. *Boyle.*—To perſuade to revolt; to induce to change a party.—Some might be brought into his intereſts by money, others *drawn over* by fear. *Addiſon.*

To DRAW *out*. To protract; to lengthen:

He muſt not only die the death,
But thy unkindneſs ſhall his death *draw out*
To ling'ring ſufferance. *Shakeſpeare.*

To beat out, as is done to hot iron.—Batter a piece of iron out, or, as workmen call it, *draw* it *out*, till it comes to its breadth. *Moxon.*—To extract; to pump out by inſinuation.—Philoclea found her, and, to *draw out* more, ſaid ſhe, I have often wondered how ſuch exeellencies could be. *Sidney.*—To induce by motive.—What needed this, to *draw out* from us an accuſation of foreign churches? *Hooker.*—To call to action; to detach for ſervice; to range:

Draw out a file, pick man by man,
Such who dare die, and dear will ſell their death. *Dryd.*

To range in battle.—Let him deſire his ſuperior officer, that, the next time he is *drawn out*, the challenger may be poſted near him. *Collier.*

To DRAW *up*. To form in order of battle:

So Muley-Zeydan found us
Drawn up in battle, to receive the charge. *Dryden.*

To form in writing; to compoſe in a formulary manner.—To make a ſketch, or a more perfect model of a picture, is, in the language of poets, to *draw up* the ſcenery of a play. *Dryden.*

To DRAW, *v. n.* To perform the office of a beaſt of draught.—An heifer which hath not been wrought with, and which hath not *drawn* in the yoke. *Deut.* xxi. 3.—To act as a weight.—They ſhould keep a watch upon the particular bias in their minds, that it may not *draw* too much. *Addiſon.*—To contract; to ſhrink.—I have not yet found certainly, that the water itſelf, by mixture of aſhes, or duſt, will ſhrink or *draw* into leſs room. *Bacon.*—To advance; to move; to make progreſſion any way.—*Draw* ye near hither all the chief of the people. 1 *Sam.*

He ended; and th' archangel ſoon *drew* nigh,
Not in his ſhape celeſtial, but as man
Clad to meet man. *Milton.*

To draw together; to be collected; to come together:

They muſter there, and round the center ſwarm,
And *draw* together in a globoſe form. *Blackmore.*

To draw a ſword:

For his ſake
Did I expoſe myſelf, pure; for his love
Drew to defend him, when he was befet. *Shakeſpeare.*

To practiſe the art of delineation.—So much inſight into perſpective, and ſkill in *drawing*, as will enable him to repreſent tolerably on paper any thing he ſees, ſhould be got. *Locke.*—To take a card out of the pack; to take a lot.—He has *drawn* a black, and ſmiles. *Dryden.*—To make a fore run by attraction.

To DRAW *off*. To retire; to retreat.—When the engagement proves unlucky, the way is to *draw off* by degrees, and not to come to an open rupture. *Collier.*

To DRAW *on*. To advance; to approach.—The fatal day *draws on*, when I muſt fall. *Dryden.*

To DRAW *up*. To form troops into regular order.—The lord Bernard, with the king's troops, ſeeing there was no enemy left on that ſide, *drew up* in a large field oppoſite to the bridge. *Clarendon.*

To DRAW retains, through all its varieties of uſe, ſome ſhade of its original meaning, *to pull*. It expreſſes an action, gradual or continuous, and leiſurely. Thus we *forge* a ſword by blows, but we *draw* it by a continued line. We *pour* liquor quick, but we *draw* it in a continued ſtream. We *force* compliance by threats, but we *draw* it by gradual prevalence. We *write* a letter with whatever haſte, but we *draw* a bill with ſlow ſcrupuloſity.

DRAW, *ſ.* The act of drawing. The lot or chance drawn.

DRA'WA, a town of Poland, in the palatinate of Poſnania: forty-eight miles north-weſt of Poſen.

DRAW'BACK, *ſ.* Money paid back for ready payment, or any other reaſon. It is commonly underſtood of the allowance made at the cuſtom-houſe, or exciſe-office, either on the exportation of our home manufactures, or upon certain foreign merchandiſe, which had paid duty on its importation:

In poundage and *drawbacks* I loſe half my rent;
Whatever they give me, I muſt be content. *Swift.*

DRAW'BRIDGE, *ſ.* A bridge made to be lifted up, to hinder or admit communication at pleaſure. See the article BRIDGE, vol. iii. p. 396.

DRAWE'E, *ſ.* The perſon on whom a bill of exchange is drawn.

DRAW'ER, *ſ.* One employed in procuring water from the well.—From the hewer of thy wood unto the *drawer* of thy water. *Deut.* xxix. 11.—One whoſe buſineſs is to draw liquors from the caſk:

Let the *drawers* be ready with wine and freſh glaſſes;
Let the waiters have eyes, tho' their tongues muſt be ty'd.
Ben Jonſon.

That which has the power of attraction.—Love is a flame, and therefore we ſay beauty is attractive, becauſe phyſicians obſerve that fire is a great *drawer*. *Swift.*—A box in a caſe, out of which it is drawn at pleaſure.—We will ſuppoſe the China diſhes taken off, and a *drawer* of medals ſupplying their room. *Addiſon.*—He that draws a bill of exchange.—The perſon who writes this letter is called in law the *drawer*, and he to whom it is written the *drawee*. *Blackſtone.*—[In the plural.] The lower part of a man's dreſs.—The Malteſe harden the bodies of their children, by making them go ſtark naked, without ſhirt or *drawers*, till they are ten years old. *Locke.*

DRAW'ING, *ſ.* Delineation; repreſentation; the firſt rudiment of the art of painting, wherein conſiſts the formation of the outline of every object or figure; for the principles of which ſee the article PAINTING.

They random *drawings* from your ſheets ſhall take,
And of one beauty many blunders make. *Pope.*

DRAW'ING, among hunters, is beating the buſhes, &c. after a fox.—*Drawing amiſs*, is when the hounds hit the ſcent of their chace contrary, *i. e.* up the wind inſtead of down.—*Drawing in the ſlot*, is when the hounds having touched the ſcent, draw on till they hit on the ſame again.

DRAW'ING-ROOM, *ſ.* The room in which company aſſembles at court.—What you heard of the words ſpoken of you in the *drawing-room* was not true: the ſayings of princes are generally as ill related as the ſayings of wits. *Pope.*—The company aſſembled there.

To DRAWL, *v. n.* To utter any thing in a ſlow driveling way:

Then mount the clerks, and in one lazy tone
Through the long heavy page *drawl* on. *Pope.*

DRAW'LATCHES, *ſ.* Thieves and robbers, mentioned by Lambert in his Eiren. i. c. 6. He calls them *thieves*, *waſters*, and *roberdſmen*; the two laſt words are now grown out of uſe. See 5 *Edw.* III. c. 14. 7 *Rich.* II. c. 5.

DRAWN, *part.* [from *draw.*]—An army was *drawn* together of near ſix thouſand horſe. *Clarendon.*

So lofty was the pile, a Parthian bow,
With vigour *drawn*, muſt put the ſhaft below. *Dryden.*

Equal; where each party takes his own ſtake.—If we make a *drawn* game of it, or procure but moderate advantages, every Britiſh heart muſt tremble. *Addiſon.*—With a ſword drawn.—What, art thou *drawn* among thoſe heartleſs hinds? *Shakeſpeare.*—Open; put aſide, or uncloſed:

A curtain *drawn* preſented to our view
A town beſieg'd. *Dryden.*

Eviſcerated.—There is no more faith in thee than in a ſtoned prune; no more truth in thee than in a *drawn* fox. *Shakeſpeare.*—Induced as from ſome motive.—The Iriſh will better be *drawn* to the Engliſh, than the Engliſh to the Iriſh government. *Spenſer.*—As this friendſhip was *drawn* together by fear on both ſides, ſo it was not like to be more durable than was the fear. *Haward.*

"DRAWN wells are ſeldom dry." The Latins ſay, *Puteus ſi hauriatur melior evadit*. The Greeks, Φρεατα αντλημενα βελτιω γινεται. Implying that motion, uſe, and exerciſe, improve every thing. Waters, when they ſtagnate, become putrid. The air, not agitated by the wind, would be unwholeſome, if not peſtilential. Every inſtrument of ſteel, if diffuſed, grows ruſty; but, above all, the minds of men, if not exerciſed, and improved, would ſoon become dry, barren, and ſavage.

DRAW'NET, *ſ.* A net for taking wildfowl, &c. See the article BIRD-CATCHING, vol. iii. p. 53.

DRAW'WELL, *ſ.* A deep well; a well out of which water is drawn by a long cord.—The firſt conceit, tending to a watch, was a *drawwell*: the people of old were wont only

only to let down a pitcher with a handcord, for as much water as they could eaſily pull up. *Grew.*

DRAY, or DRAYCART, *ſ.* [ðnaȝ, Sax.] The car on which beer is carried.—Let him be brought into the field of election upon his *draycart*, and I will meet him there in a triumphant chariot. *Addiſon.*

When *drays* bound high, then never croſs behind,
Where bubbling yeſt is blown by guſts of wind. *Gay.*

The neſt of a ſquirrel:

Whilſt he from tree to tree, from ſpray to ſpray,
Gets to the wood, and hides him in his *dray*. *W. Browne.*

DRAY'HORSE, *ſ.* A horſe which draws a dray.—This truth is illuſtrated by a diſcourſe on the nature of the elephant and the *drayhorſe*. *Tatler.*

DRAY'MAN, *ſ.* One that attends a dray or cart.—Have not coblers, *draymen*, and mechanics, governed as well as preached? Nay, have not they by preaching come to govern? *South.*

DRAY'TON, or MARKET-DRAYTON, an ancient town in the county of Salop, pleaſantly ſituated on the river Tern, which here ſeparates Shropſhire from Staffordſhire. It is diſtant from Shrewſbury nineteen miles, from Staffordnineteen, from Cheſter thirty, and from London 150. It lies about three miles from Tern-hill inn, which ſtands in the great road leading from London to Cheſter. Here is a manufactory of hair-weaving, for chair-ſeats, ſieve-bottoms, &c. Its principal market-day is Wedneſday, with a ſmall market on Saturday for butchers meat, &c. It has four fairs annually, viz. nine days before Eaſter, nearеſt Wedneſday to the 22d of June, September 19, and the 26th of October. Here was a very ancient church, dedicated to St. Mary, the tower of which is now ſtanding; but the body of it was rebuilt in 1782. About two miles from this town was fought the obſtinate battle of Bloorheath, upon which ſpot was erected a ſtone-croſs, with an inſcription, to perpetuate this memorable action. The battle was fought in 1459. Lord Audley commanded for the houſe of Lancaſter, and was ſlain: the earl of Saliſbury commanded for the houſe of York. In this battle, the earl of Saliſbury, with five thouſand men, beat Lord Audley, who had ten thouſand, after a moſt bloody engagement.

DRAY'TON (Michael), an Engliſh poet, born in 1563, at Hartſhill, a village in Warwickſhire. He was for ſome time a ſtudent at Oxford; but of his profeſſional purſuits, and the circumſtances of his life, very little is known. He ſeems early to have entered among the votaries of the muſes; and he became known by various poetical publications during the reign of queen Elizabeth. He died in 1631, and was honoured with a tomb among the poets in Weſtminſter-abbey. A great portion of his pieces are derived from Engliſh hiſtory. The battle of Agincourt, the barons' wars, the ſtories of queen Margaret of Anjou, of Robert duke of Normandy, of Matilda the Fair, Pierce Gaveſton, and Cromwell earl of Eſſex, have employed his heroic or epic ſtrain; and in England's Heroical Epiſtles, feigned to have paſſed between lovers of the firſt rank and fame in our hiſtories, he has imitated the elegiac manner of Ovid. His greateſt performance, intitled Polyolbion, is a kind of ſyſtem of the geography and antiquities of England and Wales. It has the peculiarity of being written in uniform Alexandrines, the effect of which is far from agreeable to a modern ear, and ſeems to aggravate the natural tedioufneſs of the work. The learned Selden thought it worth while to write annotations on this poem; which is a circumſtance to its honour as a curious piece of narrative, though it will not conclude much in favour of its poetry. The other poems of Drayton are paſtorals, odes, elegies, ſatires, and various anomalous compoſitions. An edition of his works appeared in folio, in 1748, and another in 4 vols. 8vo. in 1753.

DRA'ZEL, *ſ.* [perhaps corrupted from *droſſel*, the ſcum or droſs of human nature; or from *droſteſſe*, Fr. a ſtrumpet.] A low, mean, worthleſs, wretch:

As the devil uſes witches,
To be their cully for a ſpace,
That, when the time's expir'd, the *drazels*
For ever may become his vaſſals. *Hudibras.*

DREAD, *ſ.* [ðnað, Sax.] Fear; terror; affright; horror either felt or impreſſed.—Was ever any wicked man free from the ſtings of a guilty conſcience, from the ſecret *dread* of divine diſpleaſure, and of the vengeance of another world? *Tillotſon.*

Think'ſt thou that duty ſhall have *dread* to ſpeak,
When pow'r to flatt'ry bows? To plainneſs honour
Is bound, when majeſty to folly falls. *Shakeſpeare.*

Habitual fear; awe.—The fear of you, and the *dread* of you, ſhall be upon every beaſt of the earth. *Gen.* ix. 2.—The perſon or thing feared; the cauſe of fear.—Let him be your *dread*. *Iſaiah.*

To thee, of all our good the ſacred ſpring;
To thee, our deareſt *dread*; to thee, our ſofter king. *Prior.*

DREAD, *adj.* [ðnæð, Sax.] Terrible; frightful:

To be expos'd againſt the warring winds;
To ſtand againſt the deep *dread* bolted thunder. *Shakeſp.*

Awful; venerable in the higheſt degree:

Thou, attended glorioufly from heav'n,
Shalt in the ſky appear, and from thee ſend
The ſummoning archangels to proclaim
Thy *dread* tribunal. *Milton.*

This ſeems to be the meaning of that controverted phraſe, *dread majeſty*. Some of the old acts of parliament are ſaid in the preface to be *metuendiſſimi regis*, our *dread* ſovereign's. *Johnſon.*

To DREAD, *v. a.* To fear in an exceſſive degree.—You may deſpiſe that which terrifies others, and which yet all, even thoſe who moſt *dread* it, muſt in a little time encounter. *Wake.*

To DREAD, *v. n.* To be in fear.—*Dread* not, neither be afraid of them. *Deut.* i. 8.

"Do well, and DREAD no ſhame." He who acts upon principles of juſtice and honour, never need be apprehenſive of the conſequences that follow. This proverb directs us to be virtuous and honeſt in every exigency of our lives.

DREAD-BOLTED, *adj.* Having a dreadful bolt.—To ſtand againſt the deep *dread-bolted* thunder. *Shakeſp.*

DREAD'ER, *ſ.* One that lives in fear.—I have ſuſpended much of my pity towards the great *dreaders* of popery. *Swift.*

DREAD'FUL, *adj.* Terrible; frightful; formidable:

The ſtill night,
Accompanied with damps and *dreadful* gloom. *Milton.*

Awful; venerable.—How *dreadful* is this place! *Geneſis.*—Full of fear.—*Dreadful* of danger that moſe him betyde. *Spenſer.*

This to me
In *dreadful* ſecrecy impart they did. *Shakeſpeare.*

DREAD'FULNESS, *ſ.* Terribleneſs; frightfulneſs.—It may juſtly ſerve for matter of extreme terror to the wicked, whether they regard the *dreadfulneſs* of the day in which they ſhall be tried, or the quality of the judge by whom they are to be tried. *Hakewell.*

DREAD'FULLY, *adv.* Terribly; frightfully:

Not ſharp revenge, nor hell itſelf, can find
A fiercer torment than a guilty mind,
Which day and night doth *dreadfully* accuſe,
Condemns the wretch, and ſtill the charge renews. *Dryd.*

DREAD'LESS, *adj.* Fearleſs; unaffrighted; intrepid; unſhaken; undaunted; free from terror:

All night the *dreadleſs* angel, unpurſu'd,
Thro' heav'n's wide campaign held his way. *Milton.*

DREAD'LESSNESS, *ſ.* Fearleſſneſs; intrepidity; undauntedneſs.—Zelmane, to whom danger then was a cauſe of *dreadleſſneſs*, all the compoſition of her elements being nothing but fiery, with ſwiftneſs of deſire croſſed him. *Sidney.*

DREAM, *ſ.* [*droom*, Dut. This word is derived by Meric Caſaubon, with more ingenuity than truth, from δραμα τε βιε, *the comedy of life*; dreams being, as plays are, a repreſentation of ſomething which does not really happen. This conceit Junius has enlarged by quoting an epigram:

Σκηνη τως ο βιος και παιγνιον η μαλε παιζειν,
Την σπευδην μεταθεις, η φερε τας οδυνας. *Anthol.*]

A phantaſm of ſleep; the thoughts of a ſleeping man:

Glorious *dreams* ſtand ready to reſtore
The pleaſing ſhapes of all you ſaw before. *Dryden.*

An idle fancy; a wild conceit; a groundleſs ſuſpicion:

Let him keep
A hundred knights; yes, that on ev'ry *dream*,
Each buz, each fancy, each complaint, diſlikc,
He may enguard his dotage. *Shakeſpeare.*

To DREAM, *v. n.* [pret. *dreamed*, or *dreamt*.] To have the repreſentation of ſomething in ſleep.—*Dreaming* is the having of ideas, whilſt the outward ſenſes are ſtopped, not ſuggeſted by any external objects, or known occaſion, nor under the rule or conduct of the underſtanding. *Locke.*—It has *of* before the noun:

I have nightly ſince
Dreamt of encounters 'twixt thyſelf and me:
We have been down together in my ſleep,
Unbuckling helms, fiſting each other's throat,
And wak'd half dead with nothing. *Shakeſpeare.*

To think; to imagine.—He never *dreamed* of the deluge, nor thought that firſt orb more than a tranſient cruſt. *Burnet.*

He little *dream'd* how nigh he was to care,
Till treach'rous fortune caught him in the ſnare. *Dryd.*

To think idly.—They *dream* on in a conſtant courſe of reading, but not digeſting. *Locke.*—To be ſluggiſh; to idle:

Why does Anthony *dream* out his hours,
And tempts not fortune for a noble day? *Dryden.*

To DREAM, *v. a.* To ſee in a dream:

At length in ſleep their bodies they compoſe,
And *dreamt* the future fight, and early roſe. *Dryden.*

"*Dreams*, (ſays Addiſon,) look like the amuſements of the ſoul, when ſhe is diſencumbered of her machine; her ſports and recreations, when ſhe has laid her charge aſleep."—Scarcely indeed are there any of the functions of nature leſs open to our obſervation, than the human mind in this ſtate. The dreamer himſelf cannot well obſerve the manner in which dreams ariſe or diſappear to him. When he awakes, he cannot recollect the circumſtances of his dreams with ſufficient accuracy. Were we to watch over him with the moſt vigilant attention, we could not perceive with certainty what emotions are excited in his mind, or what thoughts paſs through it, during his ſleep. But though we could aſcertain theſe phenomena, many other difficulties would ſtill remain. What parts of a human being are active, what dormant, when he dreams? Why does not he always dream while aſleep? Or why dreams he at all? Do any circumſtances in our conſtitution, ſituation, and peculiar character, determine the nature of our dreams? Theſe are queſtions about which we can only conjecture. In dreaming, we are not conſcious of being aſleep. This is well known from a thouſand circumſtances. When awake, we often recollect our dreams; and we remember on ſuch occaſions, that while thoſe dreams were paſſing through our minds, it never occurred to us that we were ſeparated by ſleep from the active world. In dreaming, alſo, we do not conſider ourſelves as witneſſing or bearing a part in a fictitious ſcene: we ſeem not to be in a ſimilar ſituation with the actors in a dramatic performance, or the ſpectators before whom they exhibit, but appear to be engaged in the buſineſs of real life. All the varieties of thought which paſs through our minds when awake, may alſo occur in dreams; all the images which imagination preſents in the former ſtate, ſhe is alſo able to call up in the latter; all the ſame emotions may be excited, and we are often actuated by equal violence of paſſion; none of the tranſactions in which we are capable of engaging while awake is impoſſible in dreams: and while dreaming, we are not ſenſible of any diſtinction between our dreams and the events and tranſactions in which we are actually concerned in our intercourſe with the world.

Though in dreams the imagination appears to be free from all reſtraint, yet it is generally agreed, that the imaginary tranſactions of the dreamer bear always ſome relation to his particular character in the world, his habits of action, and the circumſtances of his life. The lover, we are told, dreams of his miſtreſs; the miſer of his money; the philoſopher renews his reſearches in ſleep often with the ſame pain and fatigue as when awake; and even the merchant, at times, returns to balance his books, and compute the profits of an adventure, when ſlumbering on his pillow. And not only do the more general circumſtances of a perſon's life influence his dreams; his paſſions and habits are nearly the ſame when aſleep as when awake. A perſon whoſe habits of life are virtuous, does not in his dreams plunge into a ſeries of crimes; nor are the vicious reformed when they paſs into this imaginary world. The choleric man finds himſelf offended by ſlight provocations as well in his dreams as in his ordinary intercourſe with mankind; and a mild temper continues pacific in ſleep. The character of a perſon's dreams is influenced by his circumſtances when awake in a ſtill more unaccountable manner. Certain dreams uſually ariſe in the mind after a perſon has been in certain ſituations. Dr. Beattie relates, that he once, after riding thirty miles in a high wind, paſſed a part of the ſucceeding night in dreams beyond deſcription terrible. The ſtate of a perſon's health, and the manner in which the vital functions are carried on, are thought to have a conſiderable influence in determining the character of dreams. After too full a meal, or after eating an unuſual kind of food, a perſon is ſaid to have dreams of a troubleſome and terrifying nature.

In dreaming, the mind for the moſt part carries on no intercourſe through the ſenſes with ſurrounding objects. Touch a perſon gently who is aſleep, he rarely feels the impreſſion. You may awake him by a ſmart blow; but when the ſtroke is not ſufficiently ſtrong to awake him, he remains inſenſible of it. We ſpeak ſoftly beſide a perſon aſleep, without fearing that he will overhear. His eye-lids are ſhut; and even though light ſhould fall upon the eye-ball, yet ſtill his powers of viſion are not awakened to active exertion, unleſs the light be ſo ſtrong as to rouſe him from ſleep. He is inſenſible both to ſweet and to diſagreeable ſmells. It is not eaſy to try whether his organs of taſte retain their activity, without awakening him; yet from analogy it may be preſumed that theſe too are inactive. With reſpect to the circumſtances here enumerated, it is indifferent whether a perſon be dreaming or buried in deep ſleep. Yet there is one remarkable fact concerning dreaming, which may ſeem to contradict what has been here aſſerted. In dreams, we are liable not only to ſpeak aloud in conſequence of the ſuggeſtions of imagination, but even to get up, and walk about, and engage in little enterpriſes, without awaking. Now, as we are in this inſtance ſo active, it ſeems that we cannot be then inſenſible of the preſence of ſurrounding objects. The ſleep-walker is really ſenſible in a certain degree of the preſence of the objects around him; but he does not attend to them with all their circumſtances, nor do they excite

in

in him the ſame emotions as if he were awake. He feels no terror on the top of a houſe, or brink of a precipice; and, in conſequence of being free from fear, he is alſo without danger in ſuch ſituations, unleſs ſuddenly awaked. This is one of the moſt inexplicable phenomena of dreaming. There is alſo another fact not ſtrictly conſonant with what has been above advanced. It is ſaid, that in ſleep a perſon will continue to hear the noiſe of a cataract in the neighbourhood, or regular ſtrokes with a hammer, or any ſimilar ſound ſufficiently loud, and continued uninterruptedly from before the time of his falling aſleep. We know not whether he awakes on the ſudden ceſſation of the noiſe. This fact is aſſerted on ſufficient evidence, and is curious. Even when awake, if very deeply intent on any piece of ſtudy, or cloſely occupied in buſineſs, the ſound of a clock ſtriking in the neighbourhood, or the beating of a drum, will eſcape us unnoticed: and it is therefore the more ſurpriſing that we ſhould thus continue ſenſible to ſounds when aſleep.

Though dreams have been regarded among almoſt all nations of the world, as prophetic of future events; yet it does not appear that this popular opinion has been eſtabliſhed on good grounds. Chriſtianity teaches us to believe, that the Supreme Being may, and actually does, operate on our minds, and influence at times the determinations of our will, without making us ſenſible of the reſtraint to which we are thus ſubjected. And, in the ſame manner, no doubt, the ſuggeſtions which ariſe to us in dreams may be produced. The imaginary tranſactions in which we are then engaged, may be ſuch as are actually to occupy us in life; the ſtrange and ſeemingly incoherent appearances which are then preſented to the mind's eye, may allude to ſome circumſtances which are eventually to befal ourſelves or others. It is, therefore, by no means impoſſible, or inconſiſtent with the general analogy of nature, that dreams ſhould in ſome caſes have a reſpect to futurity. We have no reaſon to regard the dreams which are related in the Holy Scriptures to have been prophetic of future events, as not inſpired by Heaven, or to laugh at the idea of a prophetic dream as abſurd or ridiculous.

Various theories have been propoſed to explain what in dreams appears moſt inexplicable. The ingenious Mr. Baxter, in his Treatiſe on the Immateriality of the Human Soul, endeavours to prove that dreams are produced by the agency of ſome ſpiritual beings, who either amuſe or employ themſelves ſeriouſly in engaging mankind in all thoſe imaginary tranſactions with which they are employed in dreaming. This theory, however, is far from being plauſible. It leads us entirely beyond the limits of our knowledge. It requires us to believe without evidence. It is unſupported by any analogy. It creates difficulties ſtill more inexplicable than thoſe which it has been propoſed to remove. Till it appear that our dreams cannot poſſibly be produced without the interference of other ſpiritual agents, poſſeſſing ſuch influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions, we cannot reaſonably refer them to ſuch a cauſe. Beſides, from the facts which are known concerning dreams, it appears that their nature depends both on the ſtate of the human body, and on that of the mind.

Wolfius, and after him M. Formey, have ſuppoſed, that dreams never ariſe in the mind, except in conſequence of ſome of the organs of ſenſation having been previouſly excited. Either the ear or the eye, or the organs of touching, taſting, or ſmelling, communicate information, ſomehow, in a tacit, ſecret, manner; and thus partly rouſe its faculties from the lethargy in which they are buried in ſleep, and engage them in a ſeries of confuſed and imperfect exertions. But what paſſes in dreams is ſo very different from all that we do when awake, that it is impoſſible for the dreamer himſelf to diſtinguiſh, whether his powers of ſenſation *perform* any part on the occaſion. It is not neceſſary that imagination be always excited by ſenſation. Fancy, even when we are awake, often wanders from the preſent ſcene. *Abſence of mind* is incident to the ſtudious: the poet and the mathematician many times forget where they are. We cannot diſcover, from any thing that a perſon in dreaming diſplays to the obſervation of others, that his organs of ſenſation take a part in the imaginary tranſactions in which he is employed. In thoſe inſtances, indeed, in which perſons aſleep are ſaid to hear ſounds; the ſounds which they hear are ſaid alſo to influence, in ſome manner, the nature of their dreams. But ſuch inſtances are ſingular. Since then it appears that the perſon who dreams is himſelf incapable of diſtinguiſhing either during his dreams, or by recollection when awake, whether any new impreſſions are communicated to him in that ſtate by his organs of ſenſation; that even by watching over him, and comparing our obſervations of his circumſtances and emotions, in his dreams, with what he recollects of them after awaking, we cannot, except in one or two ſingular inſtances, aſcertain this fact; and that the mind is not incapable of acting while the organs of ſenſation are at reſt, and on many occaſions refuſes to liſten to the information which they convey; we may, without heſitation, conclude, that the theory of Wolfius and Formey has been too incautiouſly advanced.

Some medical writers have aſſerted, that the mind, when we dream, is in a ſtate of delirium. Sleep, they ſay, is attended with what is called a *collapſe* of the brain; during which either the whole or a part of the nerves of which it conſiſts, are in a ſtate in which they cannot carry on the uſual intercourſe between the mind and the organs of ſenſation. When the whole of the brain is in this ſtate, we become entirely unconſcious of exiſtence, and the mind ſinks into inactivity: when only a part of the brain is *collapſed*, as they term it, we are then neither aſleep nor awake, but in a ſort of trance. This theory, like the preceding, ſuppoſes that we know the nature of a ſtate of which we cannot aſcertain the phenomena; it alſo contradicts a known fact, in repreſenting dreams as images of things around us, inſtead of fanciful combinations of things not exiſting together in nature or in human life. We muſt treat it, therefore, as a baſeleſs fabric.

Modern phyſiologiſts attribute the cauſe of dreams to the action of the nervous fluid; while other writers conceive it to ariſe from the ceaſeleſs vigilance of *thought*. Under this hypotheſis it is contended, that "thought is uniformly connected with a vaſt variety of our motions, where it is at the ſame time of ſo ſubtle a nature as nearly to elude our conſciouſneſs. It ſeems, for inſtance, to precede every ſtep we take; ſince we find, that if the attention be at any time ſtrongly bent upon a ſubject that is unconnected with the motion of our limbs, this motion will involuntarily be interrupted. The ſame remark may be applied to the act of ſwallowing our food, and in ſome inſtances to the function of reſpiration. Now, if by the aid of reaſoning we are able to detect the preſence of thought, where we had leaſt ſuſpected its exiſtence, why ſhould we be unwilling to ſuppoſe that it can be equally active during our ſleep, although it may ſometimes be ſo evaneſcent as altogether to eſcape our recollection? It may be aſked, how can we account for the very ſenſible refreſhment which the mind uſually derives from ſleep, whilſt we allow that it is then as continually occupied as in our waking ſtate? The anſwer is obvious. Sleep, by entirely ſuſpending the exertion of the voluntary muſcles, promotes the repoſe of the body; and this, from the intimate ſympathy that exiſts between the intellectual and the corporeal part of our frame, will be ſufficient to account, in a conſiderable degree, for the refreſhment of the mind.

"As an argument againſt the exiſtence of dreams which we are unable to recollect, it has often been urged, that in ſuch caſes the mind has been occupied to no purpoſe; for thought, it is ſaid, cannot anſwer any end which is immediately forgotten. To this it may readily be replied,

plied, that our not being able to aſcertain the end which may be anſwered by a ſuppoſed fact, can in no caſe operate as a weighty argument againſt its reality; ſince it is impoſſible for us to doubt the exiſtence of ſo many phenomena, the final cauſe of which we are, at the ſame time, perfectly at a loſs to diſcover. Beſides, theſe nocturnal impreſſions cannot but be allowed to happen to all men, although they ſhould be entirely effaced by the light of day. The long dream of human exiſtence ought not to be regarded as entirely deſtitute of at leaſt collateral evidence of this fact; although, at the concluſion of it, all its occurrences and variety of emotions are buried in the oblivion of the grave.

"It is commonly remarked, that the tendency to dreaming diminiſhes in proportion as we are leſs expoſed to cauſes of corporeal irritation. But theſe cauſes always operate in a certain degree; this tendency therefore can never be counteracted. In proportion as the ſtimuli of light, noiſe, &c. are removed, ſleep is obſerved to be accompanied with leſs ſenſibility; but theſe ſtimuli can in no caſe be entirely removed, conſequently this ſenſibility can in no caſe be entirely extinguiſhed: hence not only men, but brutes, are obſerved to dream. An objection may ariſe, that if the mind be in fact influenced by every impreſſion that is made upon the body, it muſt be ſubject to an inconceivable number of them every inſtant of our exiſtence. But this, however incredible it may ſeem, is really the fact, although it muſt be allowed that we are unable to attend to more than one idea at the ſame time; or, in other words, that, however vaſt the aſſemblage of ſimultaneous impreſſions, they invariably *coaleſce*, and aſſume in this way the appearance of unity. No impreſſion is *loſt*, although many are prevented from conveying a ſeparate report to the mind, by reaſon of the predominance of ſome more violent impreſſion. Every one of thoſe faint notes, which in a concert of muſic we are unable diſtinctly to perceive, has ſtill, there can be no doubt, an effect in ſwelling and modifying the prevailing ſound. That which acts in ſo ſlight a degree upon our bodies, that we ſhould not in general be at all aware of its operation, would be perceived diſtinctly by the mind, if we were placed in a ſituation that was quite inſulated from all other impreſſions. If, for inſtance, every ſenſe, except that of hearing, were completely cloſed, and all other ſound annihilated, the falling of a feather upon the earth would, beyond all doubt, be heard at an inconceivably greater diſtance than that at which we now perceive the report of a cannon.

"No one will deny, that thought is, in the ſtricteſt ſenſe of the expreſſion, *independent of the will*; ſince it is obvious, that at no time can we chooſe whether we will *think*, or not. But reſpiration, the circulation of the blood, and every other action of the ſyſtem which is independent of the will, continues during ſleep. Shall we then, contrary to analogy, preſume, that thought alone, of all the involuntary functions, is ſuſpended during that ſtate? That we never ceaſe to think, is an opinion we are juſtified in maintaining, until ſome argument can be brought to demonſtrate the negative of the propoſition. We cannot conceive of the ſoul as conſiſting in any thing but what we call *thought*; and hence *thought* appears to be the eſſence of the ſpirit or ſoul within us, which is, conſiſtently with its immortality, ever active and awake even during our ſoundeſt ſlumbers. Had the ingenious phyſiologiſt Andrew Baxter, attributed the impreſſion of dreams upon the dormant ſenſorium, to the active miniſtration of the ſoul or ſpirit within us, rather than to the miniſtration of ſpirits deſtined to attend upon it, there is little doubt but his hypotheſis would have been better received: for whatever it be that operates upon the mind in dreams, it has ſo completely the direction of the ſleeping body, as to make it perform actions far beyond its ability when awake; ſuch as to open caſements and climb the roofs of houſes; to deſcend the moſt difficult and dangerous precipices; to write even in the dark; and purſue paths and avenues in the dead of night, through which, when awake, it could not poſſibly proceed, without a lantern and a guide: witneſs the many aſtoniſhing though well-founded facts that are related of ſomnambuliſts, or ſleep-walkers."

Thoſe phyſiologiſts who contend that dreams are influenced by the nervous fluid, and that ſomnambuliſm is a diſeaſe proceeding from a morbid affection of the nerves, have, in a medical view, much reaſon in their theory. One of the moſt ſtriking inveſtigations of this kind, is extant in a report made to the Phyſical Society of Lauſanne, by a committee of gentlemen appointed to examine a young man who was accuſtomed to walk in his ſleep. "The diſpoſition to dream, ſeems, in the opinion of this committee, to depend on a particular affection of the nerves, which both ſeizes and quits the patient during ſleep. Under the influence of this affection, the imagination repreſents to him the objects that ſtruck him while awake, with as much force as if they really affected his ſenſes; but does not make him perceive any of thoſe that are actually preſented to his ſenſes, except in ſo far as they are connected with the dreams which engroſs him at the time. If, during this ſtate, the imagination has no determined purpoſe, he receives the impreſſion of objects as if he were awake; only, however, when the imagination is excited to bend its attention towards them. The perceptions obtained in this ſtate are very accurate, and, when once received, the imagination renews them occaſionally with as much force as if they were again acquired by means of the ſenſes. Theſe academicians ſuppoſe, that the impreſſions received during this ſtate of the ſenſes, diſappear entirely when the perſon awakes, and do not return till the return of the ſame diſpoſition in the nervous ſyſtem. Their remarks were made on the ſieur Devaud, a lad thirteen years and a half old, who lives in the town of Vevey, and who is ſubject to that ſingular affection or diſeaſe called *ſomnambuliſm*, or ſleep-walking. This lad poſſeſſes a ſtrong and robuſt conſtitution, but his nervous ſyſtem appears to be organiſed with peculiar delicacy, and to diſcover marks of the greateſt ſenſibility and irritability. His ſenſes of ſmell, taſte, and touch, are exquiſite; he is ſubject to fits of immoderate and involuntary laughter, and he ſometimes weeps without any apparent cauſe. He does not walk in his ſleep every night; ſeveral weeks ſometimes paſs without any appearance of ſuch a fit. He is ſubject to the diſeaſe generally two nights ſucceſſively, one fit laſting for ſeveral hours. The longeſt are from three to four hours, and they commonly begin about three or four o'clock in the morning. The fit may be prolonged, by gently paſſing the finger or a feather over his upper lip, and this ſlight irritation likewiſe accelerates it. Having once fallen aſleep upon a ſtaircaſe, his upper lip was thus irritated with a feather, when he immediately ran down the ſteps with great precipitation, and reſumed all his accuſtomed activity. This experiment was repeated ſeveral times.

"This young lad thinks he has obſerved, that, on the evenings previous to a fit, he is ſenſible of a certain heavineſs in his head, but eſpecially of a great weight in his eyelids. His ſleep is at all times unquiet, but particularly when theſe fits of ſomnambuliſm are about to ſeize him. During his ſleep, motions are obſervable in every part of his body, with ſtarting and palpitations; he utters broken words, ſometimes ſits up in his bed, and afterwards lies down again. He then begins to pronounce words more diſtinctly, he riſes abruptly, and acts as he is inſtigated by the dream that then poſſeſſes him. The departure of the fit is always preceded by a few minutes of calm ſleep. He then awakes like a perſon who has ſlept quietly. It is dangerous to awaken him during the fit, eſpecially if it is done ſuddenly; for then he ſometimes falls into convulſions. Having riſen one night with the intention of going to eat grapes, he left the houſe, paſſed through the town, and got into a vineyard. He was followed by perſons

ſons deputed to watch his actions, one of whom fired a piſtol, the noiſe of which inſtantly awakened him, and he fell down without ſenſe. He was carried home and brought to himſelf, when he recollected very well the having been awakened in the vineyard; but nothing more, except the fright at being found there alone, which had made him ſwoon.

"The ſubject of his dreams is circumſcribed in a ſmall circle of objects, that relate to the few ideas with which at his age his mind is furniſhed; ſuch as his leſſons, the church, the bells, and eſpecially tales of ghoſts. It is ſufficient to ſtrike his imagination the evening before a fit with ſome tale, to direct his ſomnambuliſm towards the object of it. There was read to him while in this ſituation the ſtory of a robber; he imagined the very next moment that he ſaw robbers in the room. However, as he is much diſpoſed to dream that he is ſurrounded with them, it cannot be affirmed that this was an effect of the reading. It is obſerved, that when his ſupper has been more plentiful than uſual, his dreams are more diſmal. Once he was obſerved dreſſing himſelf in perfect darkneſs. His clothes were on a large table, mixed with thoſe of ſome other perſons; he immediately perceived this, and, in his ſleep, complained of it much; at laſt a ſmall light was brought, and then he dreſſed himſelf with ſufficient preciſion. If he is teaſed or gently pinched, he is always ſenſible of it, except he is at the time ſtrongly engroſſed with ſome other thing, and wiſhes to ſtrike the offender; however, he never attacks the perſon who has done the ill, but an ideal being whom his imagination preſents to him, and whom he purſues through the chamber without running againſt the furniture, nor can the perſons whom he meets in his way divert him from his purſuit. While his imagination was employed on various ſubjects, he heard a clock ſtrike, which repeated at every ſtroke the note of the cuckoo. There are cuckoos here, ſaid he; and, upon being deſired, he imitated the ſong of that bird immediately. When he wiſhes to ſee an object, he makes an effort to lift his eyelids; but they are ſo little under his command, that he can hardly raiſe them a line or two, while he draws up his eyebrows; the iris at that time appears fixed, and his eye dim. When any thing is preſented to him, and he is told of it, he always half opens his eyes with a degree of difficulty, and then ſhuts them after he has taken what was offered to him.

"The gentlemen of the committee infer from theſe facts, and from many others relative to the different ſenſes, that their functions are not ſuſpended as to what the ſleep-walker wiſhes to ſee, that is, as to all thoſe perceptions which accord with the objects about which his imagination is occupied; that he may alſo be diſpoſed to receive thoſe impreſſions, when his imagination has no other object at the time; that in order to ſee, he is obliged to open his eyes as much as he can, but when the impreſſion is once made, it remains; that objects may ſtrike his ſight, without ſtriking his imagination, if it is not intereſted in them; and that he is ſometimes informed of the preſence of objects without either ſeeing or touching them. Having engaged him to write a theme, (ſay the committee,) we ſaw him light a candle, take pen, ink, and paper, from the drawer of his table, and begin to write, while his maſter dictated. As he was writing, we put a thick paper before his eyes, notwithſtanding which he continued to write and to form his letters very diſtinctly; ſhowing ſigns, however, that ſomething was incommoding him, which apparently proceeded from the obſtruction which the paper, being held too near his noſe, gave to his reſpiration. Upon another occaſion, the young ſomnambuliſt aroſe at five o'clock in the morning, and took the neceſſary materials for writing, with his copy-book. He meant to have begun at the top of a page; but finding it already written on, he came to the blank part of the leaf, and wrote ſome time from the following words, *Ils deviennent ignorans par la pareſſe*; and, what is remarkable, after ſeveral lines he perceived he had forgot the *s* in the word *ignorans*, and had put erroneouſly a double *r* in *pareſſe*; he then gave over writing, to add the *s* he had forgot, and to eraſe the ſuperfluous *r*. Another time he had made, of his own accord, a piece of writing, in order, as he ſaid, to pleaſe his maſter. It conſiſted of three kinds of writing, text, half text, and ſmall writ; each of them performed with the proper pen. He drew, in the corner of the ſame paper, the figure of a hat; he then aſked for a penknife to take out a blot of ink which he had made between two letters, and he eraſed it without injuring them. He alſo made ſome arithmetical calculations with great accuracy.

"In order to explain ſome of the facts obſerved by the academicians which we have here mentioned, they eſtabliſh two general obſervations, which reſult from what they have ſaid with reſpect to the ſenſes and the dreams of this ſleep-walker. 1. That he is obliged to open his eyes, in order to recogniſe objects which he wiſhes to ſee; but the impreſſion once made, although rapidly, is vivid enough to ſuperſede the neceſſity of his opening them again, to view the ſame objects anew; that is, the ſame objects are afterwards preſented to his imagination with as much force and preciſion as if he actually ſaw them. 2. That his imagination, thus warmed, repreſents to him objects, and ſuch as he figures to himſelf, with as much vivacity as if he really ſaw them; and, further, that all his ſenſes, being ſubordinate to his imagination, ſeem concentrated in the object with which it is occupied, and have at that time no perception of any thing but what relates to that object. Theſe two cauſes united ſeem to them ſufficient for explaining one of the moſt ſingular facts that occurred to their obſervation, to wit, how young Devaud can write, although he has his eyes ſhut, and an obſtacle before them. His paper is imprinted on his imagination, and every letter which he means to write is alſo painted there, at the place in which it ought to ſtand on the paper, and without being confounded with the other letters; now it is clear that his hand, which is obedient to the will of his imagination, will trace them on the real paper, in the ſame order in which they are repreſented on that which is pictured in his head. It is thus that he is able to write ſeveral letters, ſeveral ſentences, and entire pieces of writing; and what ſeems to confirm the idea, that he writes according to the paper painted on his imagination is, that a certain ſleep-walker, who is deſcribed in the French *Encyclopédie* (article Somnambuliſm), having written ſomething on a paper, another piece of paper of the ſame ſize was ſubſtituted in its ſtead, which he took for his own, and made upon this blank paper the corrections he meant to have made on the other which had been taken away, preciſely in the places where they would have been.

"It appears from the recital of another fact, that Devaud, intending to write at the top of the firſt leaf of a white paper book, *Vevey, le*—ſtopped a moment as if to recollect the day of the month, left a blank ſpace, and then proceeded to *Decembre* 1787; after which he aſked for an almanac: a little book, ſuch as is given to children, was offered to him; he took it, opened it, brought it near his eyes, then threw it on the table. An almanac which he knew, was then preſented to him; this was in German, and of a form ſimilar to the almanac of Vevey; he took it, and then ſaid, 'What is this they have given me; here, there is your German almanac.' At laſt they gave him the almanac of Berne; he took this likewiſe, and went to examine it at the bottom of an alcove that was perfectly dark. He was heard turning over the leaves, and ſaying 24, then a moment afterwards 34. Returning to his place, with the almanac open at the month of December, he laid it on the table and wrote in the ſpace which he had left blank the 24th. This ſcene happened on the 23d; but as he imagined it to be the 24th, he did not miſtake. The following is the explication given of this fact by the authors of the report: 'The dates 23d, 24th, and 25th, of the month of December,

had long occupied the mind of this young lad. The 23d and 25th were holidays, which he expected with the impatience natural to perſons of his age, for the arrival of thoſe moments when their little daily labours are to be ſuſpended. The 25th eſpecially was the object of his hopes; there was to be an illumination in the church, which had been deſcribed to him in a manner that quite tranſported him. The 24th was a day of labour, which came very diſagreeably between the two happy days. It may eaſily be conceived, how an imagination ſo irritable would be ſtruck with thoſe pleaſing epochs. Accordingly, from the beginning of the month he had been perpetually turning over the almanac of Vevey. He calculated the days and the hours that were to elapſe before the arrival of his wiſhed-for holidays; he ſhewed to his friends and acquaintance the dates of thoſe days which he expected with ſo much impatience; every time he took up the almanac, it was only to conſult the month of December. We now ſee why that date preſented itſelf to his mind. He was performing a taſk, becauſe he imagined the day to be the Monday which had ſo long engroſſed him. It is not ſurpriſing, that it ſhould have occurred to his imagination, and that on opening the almanac in the dark, he might have thought he ſaw this date which he was ſeeking, and that his imagination might have repreſented it to him in as lively a manner as if he had actually ſeen it. Neither is it ſurpriſing that he ſhould have opened the almanac at the month of December; the cuſtom of peruſing this month muſt have made him find it in the dark by a mere mechanical operation. Man never ſeems to be a machine ſo much as in the ſtate of ſomnambuliſm; it is then that habit comes to ſupply thoſe of the ſenſes that cannot be ſerviceable, and that it makes the perſon act with as much preciſion as if all his ſenſes were in the utmoſt activity. Theſe circumſtances deſtroy the idea of there being any thing miraculous in the behaviour of young Devaud with reſpect to the date and the month that he was in queſt of; and the reader, who has entered into our explanations, will not be ſurpriſed at his knowing the German almanac; the touch alone was ſufficient to point it out to him; and the proof of this is the ſhortneſs of the time that it remained in his hands.

"An experiment was made by changing the place of the inkſtand, during the time this youth, in his ſleep, was writing. He had a light beſide him, and had certified himſelf of the place where his ink-holder was ſtanding by means of ſight. From that time he continued to take ink with preciſion, without being obliged to open his eyes again: but the inkſtand being removed, he returned as uſual to the place where he thought it was. It muſt be obſerved, that the motion of his hand was rapid till it reached the height of the ſtandiſh, and then he moved it ſlowly, till the pen gently touched the table as he was ſeeking for the ink: he then perceived that a trick had been put on him, and complained of it; he went in ſearch of his inkſtand, and put it in its place. This experiment was ſeveral times repeated, and always attended with the ſame circumſtances. Does not what we have here ſtated prove, that the ſtandiſh, the paper, the table, &c. are painted on his imagination in as lively a manner as if he really ſaw them, as he ſought the real ſtandiſh in the place where his imagination told him it ought to have been? Does it not prove that the ſame lively imagination is the cauſe of the moſt ſingular actions of this ſleep-walker? And laſtly, does it not prove, that a mere glance of his eye is ſufficient to make his impreſſions as lively as durable?

"The committee, upon the whole, recommend to ſuch as wiſh to repeat ſimilar experiments, 1. To make their obſervations on different ſleep-walkers. 2. To examine often whether they can read books that are unknown to them in perfect darkneſs. 3. To obſerve whether they can tell the hours on a watch in the dark. 4. To remove, when they write, the inkſtand from its place, to ſee whether they will return to the ſame place in order to take ink. 5. To take notice whether they walk with the ſame confidence in a dark and unknown place, as in one with which they are acquainted. They likewiſe recommend to ſuch who would confirm or invalidate the above obſervations, to make all their experiments in the dark; becauſe it has been hitherto ſuppoſed that the eyes of ſleep-walkers are of no uſe to them."

Mr. Belſham, in his "Philoſophy of the Mind," publiſhed in 1801, explains the phenomena of dreams as follows: "Dreams are the imaginations or reveries of a ſleeping man; deducible, firſt, from impreſſions lately received; ſecondly, from the ſtate of the body, and particularly of the ſtomach and brain; and, thirdly, from aſſociation. This is evident from the frequent recurrence of impreſſions of the preceding day, from the dreams of ſick perſons, and from experience. Therefore, concerning dreams it may be obſerved: 1. That the ſcenes which preſent themſelves are miſtaken for real. This is owing, firſt, to the excluſion of real impreſſions with which they may be compared; ſecondly, to the increaſed vividneſs in the trains of viſible ideas, to whatever cauſe that phenomenon may be owing. 2. Dreams are wild and inconſiſtent: for the brain is in a very different ſtate from that of vigilance; and vibrations of the ſtomach, pleaſant or otherwiſe, being propagated to the brain, produce ſucceſſions of ideas, dependent indeed upon aſſociation, but very different from thoſe which would take place in a ſtate of vigilance. 3. We take no notice of, and are not offended at, theſe inconſiſtencies; for thoſe aſſociations which ſhould lead us to take notice of them, are as it were aſleep; and bodily cauſes hurry us into new trains ſucceſſively. But if the ſtate of the brain be ſuch as to favour ideas of anxiety and perplexity, the apparent inconſiſtencies give great uneaſineſs. 4. Perſons often appear to be transferred to different places by a kind of ſailing or flying motion. This is owing to the change of magnitude and poſition of viſible images, ſuch as would be effected by a change of diſtance. But if there are no ideas correſponding with the impreſſions of walking, we appear to ourſelves to fly, or ride. When perſons walk and talk in their ſleep, the vibrations deſcend into the motory muſcles; at the ſame time the brain is oppreſſed, and they have no memory. Similar to this is the caſe of a perſon reading inattentively, and forgetting every thing immediately. 5. Dreams conſiſt chiefly of viſible imagery; for vivid impreſſions are made perpetually upon the optic nerve during vigilance. Viſible ſcenes are made up of the fragments of the viſible images lately impreſſed. Theſe ſcenes are ſometimes repeated again and again, and by repetition coaleſce. 6. Many of the things preſented in dreams appear to be remembered by us and familiar to us, becauſe of the readineſs with which they ſucceed each other in the fancy. 7. Dreams are ſoon forgotten, becauſe of their incoherence, and of the change which takes place in the brain in paſſing from ſleep to vigilance. 8. Dreams preſented in the firſt part of the night, are more confuſed and irregular than morning dreams; for in the firſt caſe we approach to ſleep, in the latter to vigilance. 9. Many prophecies were communicated in dreams and trances, and the deſcriptions of them bear a ſtriking reſemblance to the phenomena of dreams, which Dr. Hartley regards as a conſiderable internal proof of their genuineneſs and credibility. 10. Dreams are uſeful by interrupting and breaking accidental aſſociations, which might by continuance be ſo cloſely cemented that nothing could diſjoin them; which would be madneſs. 11. A perſon may form a judgment of his health and temperance by the pleaſantneſs or unpleaſantneſs of his dreams, and likewiſe learn ſome uſeful hints relating to the ſtrength of the paſſions." This theory, however, ſeems inſufficient to explain the many very extraordinary caſes of ſomnambuliſm related by different writers.

Profeſſor Dugald Stewart ſuppoſes, that during ſleep, the influence of the will is ſuſpended, and that the phenomena of dreams are produced by the ſucceſſion of our thoughts

thoughts in ſleep, regulated by the ſame laws of aſſociation to which it is ſubjected while we are awake. The profeſſor does not ſeem to be aware, or perhaps is not willing to admit, that volition itſelf has been proved by Dr. Hartley to be a caſe of aſſociation, and the neceſſary reſult of previous circumſtances, which therefore may and actually does occur in dreaming like any other mental phenomenon.

DREAMER, *ſ.* One who has dreams; one who has fancies in his ſleep:

The viſion ſaid, and vaniſh'd from his ſight;
The *dreamer* waken'd in a mortal fright. *Dryden.*

An idle fanciful man; a viſionary:

Sometimes he angers me
With telling of the moldwarp and the ant,
Of *dreamer* Merlin, and his prophecies. *Shakeſpeare.*

A mope; a man loſt in wild imagination. A ſluggard: an idler:

The man of ſenſe his meat devours,
But only ſmells the peel and ſlow'rs:
And he muſt be an idle *dreamer*,
Who leaves the pie and gnaws the ſtreamer. *Prior.*

DREAM'INGLY, *adv.* Sluggiſhly.

DREAM'INGNESS, *ſ.* Sluggiſhneſs.

DREAM'LESS, *adj.* Without dreams.—The ſavages of Mount Atlas, in Barbary, were reported to be both nameleſs and *dreamleſs*. *Camden.*

DREAR, *ſ.* Dread; terror:

The ill-fac'd owl, death's dreadful meſſenger;
The hoarſe night raven, trump of doleful *drear*. *Spenſer.*

DREAR, *adj.* [ðɲeoɲiȝ, Sax. dreary.] Mournful; diſmal; ſorrowful:

In urns and altars round,
A *drear* and dying ſound
Affrights the flamens at their ſervice quaint. *Milton.*

DREAR'IHEAD, *ſ.* Horror; diſmalneſs: *a word not in uſe:*

She grew to hideous ſhape of *drearihead*,
Pined with grief of folly late repented. *Spenſer.*

DREAR'ILY, *adv.* Diſmally:

Comes the breme winter with chamfred brows,
Full of wrinkles and froſty furrows,
Drerily ſhooting his ſtormy dart,
Which cruddles the blood and pricks the heart. *Spenſer.*

DREAR'IMENT, *ſ.* Sorrow; diſmalneſs; melancholy:

I teach the woods and waters to lament
Your doleful *drearimenf*. *Spenſer.*

Horror; dread; terror. *Obſolete:*

Almighty Jove, in wrathful mood,
To wreak the guilt of mortal ſins is bent;
Hurls forth his thund'ring dart with deadly feud,
Inroll'd in flames and ſmouldring *drearimenf*. *Spenſer.*

DREAR'ING, *ſ.* Diſmalneſs.—All were myſelf thro' grief in deadly *drearing*. *Spenſer.*

DREA'RY, *adj.* [ðɲeoɲiȝ, Sax.] Sorrowful; diſtreſsful.—This word is ſcarcely uſed but in poetical diction:

The meſſenger of death, the ghaſtly owl,
With *dreary* ſhrieks did alſo yell;
And hungry wolves continually did howl
At her abhorred face, ſo horrid and ſo foul. *Spenſer.*

Gloomy; diſmal; horrid:

Obſcure they went thro' *dreary* ſhades, that led
Along the vaſt dominions of the dead. *Dryden.*

DREB'BER JACOBS, a town of Germany, in the circle of Weſtphalia, and county of Diepholz.

DREB'BER MARIEN, a town of Germany, in the circle of Weſtphalia, and county of Diepholz: five miles north of Diepholz.

DREDGE, *ſ.* [*To dretch*, in Chaucer, is to delay; perhaps a net ſo often ſtopped may be named from this.] A kind of net.—For oyſters they have a peculiar *dredge*; a thick, ſtrong, net, faſtened to three ſpills of iron, and drawn at the boat's ſtern, gathering whatſoever it meeteth lying in the bottom. *Carew.*—With farmers, oats and barley mixed together. *Aſh.*

To DREDGE, *v. a.* To gather with a dredge.—The oyſters *dredged* in the Lyne find a welcome acceptance. *Carew.*—To ſcatter flour on meat from a dredging-box.

DRED'GER, *ſ.* One who fiſhes with a dredge; a flour-box.

DRE'GEL, a town and caſtle of Hungary: twelve miles north-eaſt of Gran.

DREG'GINESS, *ſ.* Fulneſs of dregs or lees; foulneſs; muddineſs; feculence.

DREG'GISH, *adj.* Foul with lees; feculent.—To give a ſtrong taſte to this *dreggiſh* liquor, they fling in an incredible deal of broom or hops, whereby ſmall beer is rendered equal in miſchief to ſtrong. *Harvey.*

DREG'GY, *adj.* Containing dregs; conſiſting of dregs; muddy; feculent:

Theſe num'rous veins, ſuch is the curious frame,
Receive the pure inſinuating ſtream;
But no corrupt or *dreggy* parts admit,
To form the blood or feed the limbs unfit. *Blackmore.*

DREGS, *ſ.* [ðɲeȝȝen, Sax. *dreggian*, Iſlan.] The ſediment of liquors; the lees; the grounds; the feculence:

They often tread deſtruction's horrid path,
And drink the *dregs* of the revenger's wrath. *Sandys.*

We from the *dregs* of life think to receive
What the firſt ſprightly running could not give. *Dryden.*

Any thing by which purity is corrupted.—The king by this journey purged a little the *dregs* and leaves of the northern people, that were before in no good affections towards him. *Bacon.*—Droſs; ſweepings; refuſe.—What diffidence we muſt be under whether God will regard our ſacrifice, when we have nothing to offer him but the *dregs* and refuſe of life, the days of loathing and fatiety, and the years in which we have no pleaſure. *Rogers.*

Heav'n's favourite thou, for better fates deſign'd
Than we, the *dregs* and rubbiſh of mankind. *Dryden.*

Dreg in the ſingular number occurs in Troilus and Creſſida.—What too curious *dreg* eſpies my ſweet lady in the fountain of our love? *Act* iii. *ſc.* 2.

DREHE'MI, a town of Arabia, in the country of Yemen: twenty miles ſouth-eaſt of Hodeida.

To DREIN, *v. n.* See DRAIN. To empty. The ſame with *drain*: ſpelt differently perhaps by chance.—She is the ſluice of her lady's ſecrets: 'tis but ſetting her mill agoing, and I can *drein* her of them all. *Congreve.*

'Tis *drein'd* and emptied of its poiſon now;
A cordial draught. *Southern.*

DRE'ITSCH, a town of Germany, in the circle of Upper Saxony, and circle of Neuſtadt: two miles north-eaſt of Neuſtadt.

DRE'LINCOURT (Charles), an eminent French proteſtant divine, born at Sedan, where his father occupied the poſt of regiſtrar to the ſupreme council. He was educated in the claſſics and theology in his native town; whence he was ſent to Saumur, to ſtudy philoſophy under the celebrated profeſſor Duncan. In 1618 he was admitted to the office of the miniſtry; and he removed to Paris in 1620, where he was induced to ſettle as paſtor with the church at Charenton. In 1625 he married the daughter of a merchant at Paris, by whom he had ſixteen children. In his pulpit ſervices he was very impreſſive and edifying; and, in his paſtoral viſits to his flock, particularly excelled in his manner of adminiſtering conſola-

tion

tion to the ſick and afflicted. But he ſerved the intereſts of religion not only by the zeal of his paſtoral labours, but the productions of an able and fertile pen. His works were partly practical and devotional, and partly controverſial. Of the former deſcription, his Treatiſe on the Preparation for the Lord's Supper, and his Conſolations againſt the Fears of Death, met with peculiar acceptance; and, beſides undergoing numerous impreſſions in the French, have been repeatedly publiſhed in the German, Flemiſh, Italian, and Engliſh, languages. His Charitable Viſits, alſo, in five volumes, and three volumes of Sermons, which he publiſhed, have contributed, from the vein of piety and fervent devotion which pervades them, to the edification and improvement of all claſſes of readers. Among his controverſial pieces, his Catechiſm, and his Abridgment of Controverſies, have been moſt frequently printed, and are likely to be longeſt remembered. The reſt of his polemical works were more particularly applicable to the controverſies of his day. Though he wrote with freedom and ſpirit in defence of the proteſtant cauſe, he never provoked the reſentment of his opponents by injurious aſperſions, unfair practices, or illiberal language; which greatly contributed, with the uniform rectitude and decorum of his conduct, and the inoffenſiveneſs of his manners, to ſecure the eſteem and friendly offices of all men. He died in 1669.

Of his ſons, the eldeſt, Laurence, was brought up to the miniſtry, and was ſettled as paſtor at Rochelle, and afterwards at Niort, where he died in 1681, in the fiftieth year of his age. He publiſhed ſeveral excellent Sermons, and alſo a collection of Chriſtian Hymns or Sonnets, ſaid to be very much eſteemed.

His third ſon, Charles, was bred to the medical profeſſion, and roſe by his merit to diſtinguiſhed eminence and reputation. He took his degree of M.D. at Montpellier, in 1654, ſoon after which he was appointed firſt phyſician to the king of France's armies in Flanders under the command of marſhal Turenne. The character which he acquired by his practice in that ſituation, and afterwards at Paris, recommended him to the curators of the univerſity of Leyden, who made him their profeſſor of phyſic in 1668. In ſuch repute was his medical ſkill, that the prince and princeſs of Orange, before their advancement to the throne of England, placed their chief confidence in his advice; as did likewiſe all the perſons of diſtinction at the court of the Hague. He died at Leyden in 1697, in the ſixty-fourth year of his age. His inaugural diſſertation refuted the uſual calumny againſt the medical profeſſion, of being addicted to impiety; and ſhewed that none were ſo likely to be rendered truly religious, by a contemplation of the works of God. In his *Apologia Medica*, Leid. 1672, he endeavoured to diſprove the injurious opinion, that phyſicians were baniſhed from Rome during the firſt ſix hundred years from its foundation. He wrote alſo, 1. *De Arthritide*, 1681. 2. *Obſervationes Medicæ circa Regimen Puerperarum & recens natorum*, 1684. 3. *De Variolis & Morbillis*. 4. *Sermo de Divinis apud Hippocratem Dogmatibus*, 1689; and ſeveral orations and diſputations.

DRE'NA, a town of Germany, in the county of Tyrol: ſeven miles north-eaſt of Riva.

To DRENCH; *v. a.* [ðrencean, Sax. to immerſe.] To waſh; to ſoak; to ſteep.—Our garments, being as they were *drenched* in the ſea, hold notwithſtanding their freſhneſs and gloſſes. *Shakeſpeare.*

Now dam the ditches, and the floods reſtrain;
Their moiſture has already *drench'd* the plain. *Dryden.*

To ſaturate with drink or moiſture: *in an ill ſenſe:*

Too oft, alas! has mutual hatred *drench'd*
Our ſwords in native blood. *Philips.*

To phyſic by violence.—If any of your cattle are infected, ſpeedily let both ſick and well blood, and *drench* them. *Mortimer.*

DRENCH, *ſ.* A draught; a ſwill: by way of abhorrence or contempt:

Let ſuch bethink them, if the ſleepy *drench*
Of that forgetful lake benumb not ſtill,
That in our proper motion we aſcend. *Milton.*

Phyſic for a brute.—A *drench* is a potion or drink prepared for a ſick horſe, and compoſed of ſeveral drugs in a liquid form. *Farrier's Dict.*

A *drench* of wine has with ſucceſs been us'd,
And thro' a horn the gen'rous juice infus'd. *Dryden.*

Phyſic that muſt be given by violence.—Their counſels are more like a *drench* that muſt be poured down, than a draught which muſt be leiſurely drank if I liked it. *King Charles.*—A channel of water.

DREN'CHER, *ſ.* One that dips or ſteeps any thing. One that gives phyſic by force.

DRENG'FURTH, a town of Pruſſia, in the province of Natangen: forty-four miles ſouth-eaſt of Konigſberg.

DRENT, *part.* Probably corrupted from *drenched:*

What flames, quoth he, when I the preſent ſee
In danger rather to be *drent* than brent. *Spenſer.*

DRENTE, a quarter or diſtrict of Overiſſel, in the United Dutch States, now the Batavian republic.

DREN'TELBURG, or TRENTELBURG, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe: eighteen miles north-north-weſt of Caſſel, and thirty-two eaſt-ſouth-eaſt of Paderburn. Lat. 51. 23. N. lon. 26. 45. E. Ferro.

DRE'PANE, the ancient name of Corcyra, from the curvity of its figure, reſembling a ſcythe.

DRE'PANE, or DREPANUM, anciently a town of Bithynia, ſituated between the Sinus Aſtacenus and the Boſphorus Thracius; called *Helenopolis* by Conſtantine, in honour of his mother Nicephorus Calliſtus.

DRE'PANUM, *ſ.* in ancient geography, the promontory Rhium in Achaia; ſo called becauſe bent in the manner of a ſcythe.—Another Drepanum on the Arabic gulf, on the ſide of Egypt.—A third on the north ſide of Crete, ſituated between Cydonia and the Sinus Amphimallus.—A fourth on the weſt ſide of Cyprus.—A fifth, a promontory of Cyrenaica on the Mediterranean.

DRE'PANUM, a town and port on the weſt ſide of Sicily, and to the weſt of mount Eryx: now *Trepano*, a port-town on the weſternmoſt point of Sicily. Here Anchiſes died, on his voyage to Italy with his ſon Æneas; and near its coaſt the Romans under Cl. Pulcher were defeated, B. C. 249, by the Carthagenian general Adherbal.

DRES'BACH, a town of Germany, in the circle of Upper Saxony, and circle of Erzgebirg: two miles north-weſt of Wolkenſtein.

DRES'DEN, a conſiderable city of Germany, and capital of the electorate of Saxony, ſituated at the conflux of the Elbe and the Weſeritz. It is the ſeat of the principal tribunals of the country; and divided into three towns, New Dreſden, or Dreſden; Old Dreſden, or Neuſtadt, and Frederickſtadt. New Dreſden was built in the year 1020, on the right bank of the Elbe, and became a town in 1216; here the elector of Saxony reſides in an ancient chatcau, the apartments of which are magnificent, and furniſhed with a numerous library, a rich cabinet of rare and precious articles, mathematical inſtruments, &c. Beſides a number of palaces, this quarter contains an opera-houſe, an arſenal, a foundry, three Lutheran churches, and one Roman-catholic church, of moſt beautiful architecture. In the fauxbourgs are the priſon, a houſe of orphans, two hoſpitals, a military hoſpital, a poor-houſe, a foundling hoſpital, a plate-glaſs manufacture, &c. Old Dreſden, or, as it is called, Neuſtadt, is united to New Dreſden by a ſtone-bridge, ſupported by nineteen piers. It owes its origin to a chateau, built by Charlemagne, in 808. It was of little conſequence till the year 1403, when it began to acquire importance. Here are extenſive barracks, the menagerie, a valuable

a valuable china manufacture, a church, a college, &c. In the ſquare is a ſtatue of Auguſtus II. king of Poland and elector of Saxony. An avenue of lime-trees reaches to Frederickſtadt. In the whole, Dreſden is ſuppoſed to contain between eighty and ninety thouſand inhabitants. The vineyards of Dreſden ſtretch over a tract about three leagues in length; that is to ſay, one league above the city, and nearly two leagues below it, next to the electoral-chateau of Pilnitz. Some of theſe vineyards are, in a manner, public, as they are open, at all times, to the curioſity of ſtrangers. Although this city has no very conſiderable commerce, it contains, nevertheleſs, a number of manufactures. A great exportation is made to foreigners of gold and ſilver lace, as likewiſe of the beautiful manufacture of paper-hangings, one of thoſe branches of induſtry wherein the German genius has taken the lead. The works of jewellery which are made at Dreſden are known through all Europe, as likewiſe the inſtruments of muſic, organs, hautbois, French-horns, hunting-horns, and German-flutes. The manufacture of macaroni enjoys a reputation, which ſcarcely yields to that of Italy; but the moſt conſiderable manufacture of the environs by far, and the moſt celebrated, is, unqueſtionably, that of porcelain. The other manufactures are fine cloth, ſerges, ſhalloons, ſtockings, linen, ſtuffs of linen and ſilk mixed, carpets, Morocco leather, plate-glaſs, &c. Hoſpitality towards ſtrangers is a ſtriking feature of the inhabitants of Dreſden. Both the men and the women are diſtinguiſhed by an agreeable cultivated mind; the ladies are in poſſeſſion of a correct pronunciation; their manners and converſation are replete with the moſt ſeductive graces; and, although great lovers of pleaſure, they cheerfully and ſucceſsfully apply themſelves to all the occupations of their ſex. The men are, in general, well-informed; and many ſpeak with facility ſeveral foreign languages.

In 1756, in the war between Pruſſia and Auſtria, the king of Pruſſia took poſſeſſion of Leipſic and Dreſden, in a ſtate of neutrality; towards the cloſe of the year 1758, the king of Pruſſia, being compelled to evacuate Saxony, marſhal Daun marched towards Dreſden, threatened to beſiege it, and, on the 9th of November, made an attempt on the ſuburbs, in which his troops were beaten back. Count Schmettau, who commanded in the city, ſet fire to the ſuburbs, which were greatly ſuperior to the city within the walls, and inhabited by the moſt wealthy of the inhabitants, with the richeſt and moſt conſiderable of the manufacturers. Count Schmettau acted as a ſoldier, entruſted with the command of a city, perhaps, ought to have done; he reſiſted the united prayers of the royal family, the magiſtrates, and citizens; combuſtibles were placed in ſeveral places, and the whole ſet on fire, after which they retired within the walls. Marſhal Daun retired on the 17th. On the 27th of July following, the imperial troops appeared again before the town, and Schmettau ſurrendered on capitulation, on the 4th of Auguſt. In 1760, the king of Pruſſia attempted to recover the place, but marſhal Daun ſeized the opportunity of throwing troops into the town, and ſupporting the beſieged with a numerous army, the Pruſſians retired, but not before a conſiderable number of houſes were conſumed by fire from the bombs. Dreſden is ſixty-two miles north-north-weſt of Prague, and 262 eaſt of Cologn. Lat. 51. N. lon. 31. 29. E. Ferro.

DRES'DEN, a townſhip of the American States, in Lincoln county, diſtrict of Maine, nine miles from Wiſcaſſet Point, fifteen from Fort Weſton at Hallowell, and 180 north by eaſt from Boſton. Swan Iſland is in this townſhip.

DRES'NICK, a town of Croatia: eighteen miles north-weſt of Bihacs.

To DRESS, *v. a.* [*dreſſer*, Fr.] To clothe; to inveſt with clothes:

The firſt requeſt
He made, was, like his brothers to be *dreſs'd*;
And, as his birth requir'd, above the reſt. *Dryden.*

To clothe pompouſly or elegantly. It is uſed with *up* and *out* to enforce it.—Lollia Paulina wore, in jewels, when *dreſſed out*, the value of three hundred twenty-two thouſand nine hundred and ſixteen pounds thirteen ſhillings and four-pence. *Arbuthnot.*

Few admir'd the native red and white,
Till poets *dreſs'd* them *up* to charm the ſight. *Dryden.*

To adorn; to deck; to embelliſh; to furniſh.—The mind loſes its natural reliſh of real truth, and is reconciled inſenſibly to any thing that can be *dreſſed up* into any faint appearance of it. *Locke.*—To cover a wound with medicaments.—In time of my ſickneſs another chirurgeon *dreſſed* her. *Wiſeman.*—To curry; to rub; a term of the ſtable.—Our infirmities are ſo many, that we are forced to *dreſs* and tend horſes and aſſes, that they may help our needs. *Taylor.*

Three hundred horſes, in high ſtables fed,
Stood ready, ſhining all, and ſmoothly *dreſs'd*. *Dryden.*

To break or teach a horſe: a term of horſemanſhip:

A ſteed
Well mouth'd, well manag'd, which himſelf did *dreſs*;
His aid in war, his ornament in peace. *Dryden.*

To rectify; to adjuſt:

Adam! well may we labour ſtill to *dreſs*
This garden; ſtill to tend plant, herb, and flow'r. *Milton.*

To prepare for any purpoſe.—In Orkney they *dreſs* their leather with roots of tormentil, inſtead of bark. *Mortimer.*—To trim; to fit any thing for ready uſe.—When he *dreſſeth* the lamps he ſhall burn incenſe. *Exod.* xxx.—When you *dreſs* your young hops, cut away roots or ſprigs. *Mortimer.*—To prepare victuals for the table:

Thus the voluptuous youth, bred up to *dreſs*
For his fat grandſire ſome delicious meſs,
In feeding high his tutor will ſurpaſs,
An heir apparent of the gourmand race. *Dryden.*

DRESS, *ſ.* Clothes; garment; habit.—*Dreſſes* laughed at in our forefathers wardrobes or pictures, when, by the circulation of time and vanity they are brought about, we think becoming. *Government of the Tongue.*

A robe obſcene was o'er his ſhoulders thrown,
A *dreſs* by fates and furies worn alone. *Pope.*

Splendid clothes; habit of ceremony.—Full *dreſs* creates dignity, augments conſciouſneſs, and keeps at diſtance an encroacher. *Clariſſa.*—The ſkill of adjuſting dreſs.—The men of pleaſure, *dreſs*, and gallantry. *Pope.*

To DRESS, *v. n.* To be over attentive to dreſs; to pay a due regard to dreſs.—Dance, *dreſs*, preſent yourſelf habitually well now, that you may have none of theſe things to think of hereafter. *Cheſterfield.*

My hair I'd powder in the women's way,
And *dreſs*, and talk of *dreſſing*, more than they. *Bramſton.*

DRES'SER, *ſ.* One employed in putting on the clothes and adorning the perſon of another:

She hurries all her hand-maids to the taſk;
Her head alone will twenty *dreſſes* aſk. *Dryden.*

One employed in regulating, trimming, or adjuſting, any thing.—Said he unto the *dreſſer* of his vineyard, Behold, theſe three years I come ſeeking fruit on this fig-tree, and find none. *Luke.*—The bench in a kitchen on which meat is dreſſed or prepared for the table:

A maple *dreſſer* in her hall ſhe had,
On which full many a ſlender meal ſhe made. *Dryden.*

DRES'SERUS (Matthew), an eminent German philoſophical profeſſor, of the Lutheran perſuaſion, born at Erfurt, the capital of Thuringia, in 1536. After receiving a preparatory education at Eiſleben, he commenced his firſt collegiate exerciſes at Wittemberg, under the inſtructions of Luther and Melancthon. Having taken his degree of M. A. in 1559, he delivered a private courſe of lectures on rhetoric. After that, he de-

livered public lectures in the college of Erfurt; and being admitted into the number of profeſſors of philoſophy, taught claſſical learning, and particularly the Greek tongue, with diſtinguiſhed reputation, for ſixteen years. In 1574 he removed to Jena to become the ſucceſſor of Lipſius, who had been the profeſſor of hiſtory and eloquence in that univerſity. His continuance at Jena was but ſhort, ſince, in the following year, he accepted of the ſituation of head of the college of Meiſſen, which he occupied for ſix years. In 1581 he was appointed to the profeſſorſhip of polite learning in the univerſity of Leipſic, and had a particular penſion aſſigned him to write a continuation of the hiſtory of Saxony. He ſpent the remainder of his life at Leipſic, and died there in 1607. He was the author of ſeveral publications, of which the principal are, 1. *Rhetoricæ Inventionis, Diſpoſitionis, & Elocutionis, Libri quatuor, &c.* 8vo. 1584. 2. *Tres Libri Progymnaſmatum Literaturæ Græcæ, Orationem, Epiſtolarum, &c.* 8vo. 3. *Iſagoge Hiſtorica per Millenarios diſtributa, & ad Annum uſque ad nonageſimum primum ſupra mille quingentos deducta,* 8vo. 1587. 4. *M. D. de Feſtis & præcipuis Anni Partibus, Liber, &c.* 8vo. 1584; and, 5. *De Feſtis Diebus Chriſtianorum Judæorum & Ethnicorum, Liber,* 8vo. 1597.

DRESS'ING, *ſ.* in ſurgery, the application made to a ſore or wound.—The ſecond day after we took off the *dreſſings*, and found an eſchar made by the catheretic.—*Wiſeman.*—Outward appearance:

Even ſo may Angelo,
In all his *dreſſings*, charaćts, titles, forms,
Be an arch villain. *Shakeſpeare.*

DRESS'ING-ROOM, *ſ.* The room in which clothes are put on.—Latin books might be found every day in his *dreſſing-room*, if it were carefully ſearched. *Swift.*

DRESS'INGS, *ſ.* a term in architećture, for certain decorations and enrichments introduced on the external and internal parts of buildings.

DRES'SY, *adj.* Showy in dreſs.

DREST, or DRESSED, *part.* [from *to dreſs, v. a.*]

In flow'ry wreaths the royal virgin *dreſt*
His bending horns, and kindly clapt his breaſt. *Addiſon.*

DRESVIA'NIA, a town of Ruſſian Siberia, in the government of Tobolſk, on the Vagai: ſixty miles ſouth of Tobolſk.

DREUX, a town of France, and principal place of a diſtrict, in the department of the Eure and Loire, on the Blaiſe. A battle was fought near this town, on the 18th of December, 1562, between the army of the king of France, commanded by the conſtable Montmorency, marſhal St. André, and the duke of Guiſe; and that of the proteſtants, commanded by the prince of Condé, admiral Coligny, and his brother, when the latter were defeated, and the prince of Condé taken priſoner. Henry IV. took it in the year 1593: ten poſts and a half weſt-ſouth-weſt of Paris. Lat. 48. 45. N. lon. 19. 2. E. Ferro.

DRE'YE, or DREIHE, a town of Germany, in the circle of Weſtphalia, and county of Hoya: five miles ſouth-ſouth-eaſt of Bremen.

DRE'YEN, a ſmall iſland of Denmark, in the Little Belt: three miles ſouth-weſt of Middalfahrt.

DREY'GELHAUSEN, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: five miles north-weſt of Bingen.

DREYS, or DREYSZ, a town of Germany, in the circle of Weſtphalia: four miles weſt-ſouth-weſt of Witlich.

DREYSAL'LIGKEIT, a town of Germany, in the duchy of Stiria: five miles north of Pettau.

To DRIB, *v. a.* [contracted from *dribble.*] To crop; to cut off; to defalcate. *A cant word:*

Merchants gains come ſhort of half the mart;
For he who drives their bargains *dribs* a part. *Dryden.*

To DRIB'BLE, *v. n.* [This word ſeems to have come from *drop* by ſucceſſive alterations, ſuch as are uſual in living languages: *drop, drip, dripple, dribble,* from thence *drivel,* and *driveller. Drip* may indeed be the original word, from the Daniſh *drypp.*] To fall in drops.—A *dribbling*, difficulty, and a momentary ſuppreſſion of urine, may be cauſed by the ſtone's ſhutting up the orifice of the bladder. *Arbuthnot.*—To fall weakly and ſlowly:

Believe not that the *dribbling* dart of love
Can pierce a complete boſom. *Shakeſpeare.*

To ſlaver as a child or idiot.

To DRIB'BLE, *v. a.* To throw down in drops.—Let the cook follow with a ladle full of ſoup, and *dribble* it all the way up ſtairs. *Swift.*

DRI'BENTZ, a river of Pruſſia, which runs into the Viſtula: ſix miles ſouth-eaſt of Thorn.

DRI'BLET, *ſ.* A ſmall ſum; odd money in a ſum:

Twelve long years of exile borne,
Twice twelve we number'd ſince his bleſt return;
So ſtrictly wert thou juſt to pay,
Even to the *driblet* of a day. *Dryden.*

DRI'EDO, or DRIDOENS (John), a learned Flemiſh divine, in the ſixteenth century, native of Turnhout in Brabant. He was a pupil of Adrian Florent, afterwards pope Adrian VI. who, when he obſerved him almoſt wholly attached to the ſtudy of human ſciences, knowing that he was deſigned for the church, adviſed him to pay his principal attention to the ſtudy of theology, the miſtreſs of ſcience, and more particularly ſo in the profeſſion on which he was about to enter. This advice he followed with diligence and ſucceſs; and, by the progreſs which he made, became qualified for the theological chair in the univerſity of Louvain. At the ſame time that he filled that poſt, he was rector of St. James's, and canon of St. Peter's, in that city. In the controverſy between the Lutherans and Catholics he took an active and vigorous part; and, according to the teſtimony of Eraſmus, diſputed both coolly and learnedly. He died at Louvain in 1535. He was the author of a variety of treatiſes on theological ſubjects, of which the moſt important are intitled, 1. *Lib. IV. De Scripturis & Dogmaticis Eccleſiaſticis.* 2. *Lib. II. De Gratia & Libero Arbitrio.* 3. *De Concordia Liberi Arbitrii & Prædeſtinations.* 4. *De Captivitate & Redemptione Generis Humani.* 5. *De Libertate Chriſtiana.* They have been frequently printed at Louvain in quarto and in folio, in four volumes.

DRI'ER, *ſ.* That which has the quality of abſorbing moiſture; a deſiccative.—There is a tale, that boiling of daiſy roots in milk, which it is certain are great *driers*, will make dogs little. *Bacon.*

DRIE'SEN, or DRESNO, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg. This town was betrayed to the Swedes in the year 1639, but reſtored in 1650: twenty miles north-north-eaſt of Schwerin, and ninety eaſt-north-eaſt of Berlin.

DRIFF'BOR, a town of Norway: forty-ſix miles eaſt of Romſdal.

DRIF'FIELD, or GREAT DRIFFIELD, a town in Yorkſhire, formerly called *Dryfield*, ſituated in a fine ſporting part of the Eaſt Riding, twenty-three miles from the port of Scarborough, fourteen from the port of Bridlington, twenty-three from that of Hull, thirty from the city of York, and 195 from London. Upwards of 20,000 quarters of corn are annually ſent by the navigation from this town into the river Humber, and ſo into the weſt of Yorkſhire, from whence they return with coals. About a mile from the town is a large woollen manufactory, erected in 1792; alſo a large bleaching-ground, and a cotton manufactory of conſiderable extent, employs the poor of the town and neighbourhood. Here is a good market on Thurſdays for corn, calves, pigs, &c. and is well ſupplied with ſea-fiſh. It has four annual fairs, viz. Eaſter-Monday, Whit-Monday, Auguſt 26, and September 19, for ſheep, black cattle, horſes, &c. In 1784, the ſociety of antiquarians, having had information that the remains of king Alfred the Great, who died in 901, were

were depoſited in this pariſh-church, they deputed two of that learned body, accompanied by ſome other gentlemen, to take up and examine the ſame. After digging ſome time, they found a ſtone coffin, containing the entire ſkeleton of that great and pious prince, together with the greateſt part of his ſteel armour, the remainder of which had probably been corroded by the length of time. After ſatisfying their curioſity, the coffin and grave were again carefully cloſed. It appears that king Alfred, being wounded in the battle of Stamford Briggs, returned to Driffield, where he languiſhed of his wounds twenty days, and then expired, and was interred in the pariſh church thereof; during his ſickneſs he chartered the four fairs above-mentioned.

DRIFT, *ſ.* Force impellent; impulſe; overbearing influence.—A man being under the *drift* of any paſſion, will ſtill follow the impulſe of it till ſomething interpoſe, and, by a ſtronger impulſe, turn him another way. *South.*—Violence; courſe:

The mighty trunk, half rent with rugged rift,
Doth roll adown the rocks, and fall with fearful *drift*.
Spenſer.

Any thing driven at random:

Some log, perhaps, upon the waters ſwam,
An uſeleſs *drift*, which rudely cut within,
And hollow'd, firſt a floating trough became,
And croſs ſome riv'let paſſage did begin. *Dryden.*

Any thing driven or borne along in a body:

The ready racers ſtand;
Swift as on wings of wind upborne they fly,
And *drifts* of riſing duſt involve the ſky. *Pope.*

A ſtorm; a ſhower:

Our thunder from the ſouth
Shall rain their *drift* of bullets on this town. *Shakeſpeare.*

A heap or ſtratum of any matter thrown together by the wind: as, a *ſnowdrift*, a deep body of ſnow. Tendency or aim of action.—The particular *drift* of every act, proceeding eternally from God, we are not able to diſcern; and therefore cannot always give the proper and certain reaſon of his works. *Hooker.*

Their *drift* comes known, and they diſcover'd are;
For ſome, of many, will be falſe of courſe. *Daniel.*

Scope of a diſcourſe.—The main *drift* of his book being to prove, that what is true is impoſſible to be falſe, he oppoſes nobody. *Tillotſon.*

This, by the ſtile, the manner, and the *drift*,
'Twas thought could be the work of none but Swift. *Swift.*

In mining, a ſhaft or paſſage cut from one mine or ſhaft to another.

To DRIFT, *v. a.* To drive; to urge along.—Snow, no larger than ſo many grains of ſand, *drifted* with the wind in clouds from every plain. *Ellis.*—To throw together in heaps. *Not authoriſed:*

He wanders on
From hill to dale, ſtill more and more aſtray,
Impatient flouncing through the *drifted* heaps. *Thomſon.*

DRIFT OF THE FOREST, *ſ.* in law, a view or examination of what cattle are in a foreſt, chaſe, &c. that it may be known whether it be ſurcharged or not; and whoſe the beaſts are, and whether they are commonable. Theſe drifts are made at certain times in the year by the officers of the foreſt; when all the cattle of the foreſt are driven into ſome pound or place incloſed, for the purpoſes above-mentioned; and in order to diſcover whether any cattle of ſtrangers be there, which ought not to common. 32 *Hen.* VIII. c. 13. See the article FOREST.

DRIFT-LAND, *ſ.* in old writings, an early rent paid by ſome tenants for driving cattle through a manor.

DRIFT-SAIL, *ſ.* A ſail uſed under water to guide the head of a ſhip in a ſtorm.

DRIFT-WAY, *ſ.* A ſea term, the lee-way.

To DRILL, *v. a.* [*drillen*, Dut. ðɪɲlıan, Sax. from ðuɲh, through.] To pierce any thing with a drill.—The drill-plate is only a piece of flat iron, fixed upon a flat board, which iron hath an hole punched a little way into it, to ſet the blunt end of the ſhank of the drill in, when you *drill* a hole. *Moxon.*—To perforate; to bore; to pierce:

Tell, what could *drill* and perforate the poles,
And to th' attractive rays adapt their holes. *Blackmore.*

To make a hole.—When a hole is *drilled* in a piece of metal, they hold the drill-bow in their right hand; but, when they turn ſmall work, they hold the drill-bow in their left hand. *Moxon.*—To delay; to put off: in low phraſe; corrupted from *drawled.*—She has bubbled him out of his youth: ſhe hath *drilled* him on to five-and-fifty, and ſhe will drop him in his old age. *Addiſon.*—To draw from ſtep to ſtep. *A low phraſe.*—When by ſuch inſinuations they have once got within him, and are able to *drill* him on from one lewdneſs to another, by the ſame arts they corrupt and ſqueeze him. *South.*—To drain; to draw ſlowly:

Drill'd through the ſandy ſtratum every way.
The waters with the ſandy ſtratum riſe. *Thomſon.*

To form to arms; to teach the military exerciſe:

The foe appear'd drawn up and *drill'd*,
Ready to charge them in the field. *Hudibras.*

DRILL, *ſ.* An inſtrument with which holes are bored. It is a point preſſed hard againſt the thing bored, and turned round with a bow and ſtring.—*Drills* are uſed for the making ſuch holes as punches will not ſerve for; as a piece of work that hath already its ſhape, and muſt have an hole made in it. *Moxon.*—An ape; a baboon.—Shall the difference of hair be a mark of a different internal ſpecific conſtitution between a changeling and a *drill*, when they agree in ſhape and want of reaſon? *Locke.*—A ſmall dribbling brook; properly a *rill*:

Springs through the pleaſant meadows pour their *drills*,
Which ſnake-like glide between the bordering hills. *Sandys.*

DRILL-BOW, *ſ.* A bow uſed by watchmakers in turning the drill; the ſtring is ſome times neceſſarily ſo ſmall as to be made of a human hair.

DRILL-BOX, *ſ.* A name given to an inſtrument for ſowing land in the new method of horſe-hoeing huſbandry. See HUSBANDRY.

DRIL'LO, a river of Sicily, in the valley of Noto, which runs into the Mediterranean: ſix miles ſouth-eaſt from Terra Nuova.

DRIMA'NA POINT, a cape of Ireland, on the north coaſt of the Bay of Donegal: three miles ſouth of Killibegs.

DRIN, a river which riſes in the ſouth-weſt part of Servia, and runs into the Save thirty-two miles weſt of Sabatz.

DRIN'GENBERG, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderburn: ſix miles eaſt-ſouth-eaſt of Paderburn.

To DRINK, *v. n.* preter. *drank*, or *drunk*; part. paſſ. *drunk*, or *drunken*. [ðpuncan, Sax.] To ſwallow liquors; to quench thirſt.—She ſaid, *drink*, and I will give thy camels drink alſo; ſo I *drank*, and ſhe made the camels *drink* alſo. *Gen.* xxiv. 46.

Here, between the armies,
Let's *drink* together friendly, and embrace. *Shakeſpeare.*

To feaſt; to be entertained with liquors.—We came to fight you.——For my part, I am ſorry it is turned to a *drinking*. *Shakeſpeare.*—To drink to exceſs; to be an habitual drunkard:

Firſt for his ſon a gay commiſſion buys;
Who *drinks*, whores, fights, and in a duel dies. *Pope.*

To DRINK *to*. To ſalute in drinking; to invite to drink by drinking firſt:

I gave

I gave it you, and will maintain my word;
And thereupon I *drink unto* your grace. *Shakeſpeare.*

To wiſh well to in the act of taking the cup:

Give me ſome wine; fill full:
I *drink to* th' general joy of the whole table,
And to our dear friend Banquo, whom we miſs. *Shakeſp.*

To DRINK, *v. a.* To ſwallow: applied to liquids.—He had eaten no bread, nor *drunk* any water, three days and three nights. 1 *Sam.* xxx. 12.—We have *drunken* our water for money. *Lam.* v. 4.—To ſuck up; to abſorb:

Set rows of roſemary with flow'ring ſtem,
And let the purple violets *drink* the ſtream. *Dryden.*

To take in by any inlet; to hear; to ſee.—I *drink* delicious poiſon from thy eye. *Pope.*

My ears have yet not *drunk* a hundred words
Of that tongue's uttering, yet I know the ſound. *Shakeſp.*

To act upon by drinking.—Come, we have a hot veniſon paſty to dinner: come, gentlemen, I hope we ſhall *drink* down all unkindneſs. *Shakeſpeare.*—He will drown his health and his ſtrength in his belly; and, after all his *drunken* trophies, at length *drink* down himſelf too. *South.*—To make drunk.—Benhadad was *drinking* himſelf *drunk* in the pavilions. 1 *Kings.*—It is uſed with the intenſive particles *off*, *up*, and *in*. *Off*, to note a ſingle act of drinking.—One man gives another a cup of poiſon, a thing as terrible as death; but at the ſame time he tells him that it is a cordial, and ſo he *drinks* it *off*, and dies. *South.*—*Up*, to note that the whole is *drunk*.—Alexander, after he had *drank up* a cup of fourteen pints, was going to take another. *Arbuthnot.*—*In*, to enforce the ſenſe: uſually of inanimate things.—The body being reduced nearer unto the earth, and emptied, becometh more porous, and greedily *drinketh in* water. *Brown.*

DRINK, *ſ.* Liquor to be ſwallowed; oppoſed to *meat:*

When God made choice to rear
His mighty champion, ſtrong above compare,
Whoſe *drink* was only from the liquid brook! *Milton.*

Liquor of any particular kind.—We will give you rare and ſleepy *drinks*. *Shakeſpeare.*

O madneſs, to think uſe of ſtrongeſt wines,
And ſtrongeſt *drinks*, our chief ſupport of health! *Milton.*

DRINK'ABLE, *adj.* Potable; ſuch as may be drunk.

DRINK'ER, *ſ.* One that drinks to exceſs; a drunkard.—The *drinker* and debauched perſon is the object of ſcorn and contempt. *South.*—The urine of hard *drinkers* affords a liquor extremely fetid, but no inflammable ſpirit: what is inflammable ſtays in the blood, and affects the brain. Great *drinkers* commonly die apoplectic. *Arbuthnot.*

DRINK'ING, *ſ.* [from *to drink*, *v. n.*] The habit of drinking ſtrong liquors to exceſs.—I then conſidered *drinking* as a neceſſary qualification for a fine gentleman and a man of faſhion. *Cheſterfield.*

DRINK'LEAN, *ſ.* A contribution of tenants, in the time of the Saxons, towards a potation, or ale, provided to entertain the lord, or his ſteward.

DRI'NO BIAN'CA, or WHITE DRINO, a river of European Turkey, which riſes near Reehia, on the borders of Dalmatia, and joins the Drino Nero, fifteen miles north-weſt of Ibali, where they form one ſtream, called *Drino*.

DRI'NO NE'RO, or BLACK DRINO, a river of European Turkey, which riſes in a lake near Akrida; joining the Drino Bianea, it takes the name of *Drino* only, and runs into the Adriatic, about eight miles ſouth-weſt of Aleſſio, forming a bay at its mouth, called the *Gulf of Drino*.

DRI'NOVATZ, a town of European Turkey, in Bulgaria: twenty-eight miles ſouth of St. Viddin.

To DRIP, *v. n.* [*drippen*, Dut.] To fall in drops. To have drops falling from it:

The ſoil, with fatt'ning moiſture fill'd,
Is cloath'd with graſs, and fruitful to be till'd;
Such as in fruitful vales we view from high,
Which *dripping* rocks, not rolling ſtreams, ſupply. *Dryden.*

To DRIP, *v. a.* To let fall in drops:

Her flood of tears
Seem like the lofty barn of ſome rich ſwain,
Which from the thatch *drips* faſt a ſhow'r of rain. *Swift.*

To drop fat in roaſting.—Let what was put into his belly, and what he *drips*, be his ſauce. *Walton.*

His offer'd entrails ſhall his crime reproach,
And *drip* their fatneſs from the hazle broach. *Dryden.*

DRIP, *ſ.* That which falls in drops.—Water may be procured for neceſſary occaſions from the heavens, by preſerving the *drips* of the houſes. *Mortimer.*

DRIP'PING, *ſ.* The fat which houſewives gather from roaſt meat:

Shews all her ſecrets of houſekeeping;
For candles how ſhe trucks her *dripping*. *Swift.*

DRIP'PING-PAN, *ſ.* The pan in which the fat of roaſt meat is caught.—When the cook turns her back, throw ſmoaking coals into the *dripping-pan*. *Swift.*

DRIP'PLE, *adj.* [from *drip*.] This word is uſed by Fairfax for weak, or rare; *dripple ſhot*.

DRIPS, *ſ.* in architecture, the ſlopes or falls with which ſome roofs are conſtructed.

DRIP'SEY, a river of Ireland, which runs into the Lee ten miles weſt of Cork.

DRIS, a town of Perſia, in the province of Farſiſtan: ſeventy miles weſt-ſouth-weſt of Schiras.

DRIS'SA, a town of Ruſſia, in the government of Polotſk, at the conflux of the Driſſa with the Dwina: twenty miles weſt-north-weſt of Polotſk, and 272 ſouth of Peterſburg.

DRIS'SA, a river of Ruſſia, which runs into the Duna at the town of Driſſa.

DRIS'TRA, or SILISTRIA, a town of European Turkey, in Bulgaria, near the Danube: 216 miles north of Conſtantinople, and 160 north of Adrianople. Lat. 44. 17. N. lon. 44. 55. E. Ferro.

DRIT'TEY, a town of Germany, in the duchy of Carniola: ten miles eaſt-ſouth-eaſt of Stein.

DRIVAS'TO, a town of European Turkey, in Albania: twenty miles north-eaſt of Duleigno.

To DRIVE, *v. a.* preterite *drove*, anciently *drave*; part. paſſ. *driven*, or *drove*; [*dreiban*, Goth. ᵭᵲᵻᵽᵃⁿ, Sax. *dryven*, Dut.] To produce motion in any thing by violence: as, the hammer *drives* the nail. To force along by impetuous preſſure:

On helmets helmets throng,
Shield preſs'd on ſhield, and man *drove* man along. *Pope.*

To expel by force from any place; with *from:*

Driven from his native land to foreign grounds,
He with a gen'rous rage reſents his wounds. *Dryden.*

To ſend by force to any place; with *to:*

Time *drives* the flocks from field *to* fold,
When rivers rage, and rocks grow cold. *Shakeſpeare.*

To chaſe; to hunt:

To *drive* the deer with hound and horn
Earl Percy took his way. *Chevy Chaſe.*

To force or urge in any direction.—He ſtood and meaſured the earth: he beheld, and *drove* aſunder the nations. *Hab.* iii. 6.—To impel to greater ſpeed. To guide and regulate a carriage.—He took off their chariot wheels, that they *drave* them heavily. *Exod.* xiv. 25.—To convey animals; to make animals march along under guidance:

There find a herd of heifers, wand'ring o'er
The neighb'ring hill, and *drive* 'em to the ſhore. *Addiſon.*

To clear any place by forcing away what is in it:

We come not with design of wasteful prey,
To *drive* the country, force the swains away. *Dryden.*

To force; to compel.—For the metre sake, some words in him sometime be *driven* awry, which require straighter placing in plain prose. *Ascham.*—To hurry on inconsiderately.—Most miserable, if such unskilfulness make them *drive* on their time by the periods of sin and death. *Taylor.*—He was *driven* by the necessities of times, more than led by his own disposition, to rigour. *King Charles.*—To distress; to straighten.—This kind of speech is in the manner of desperate men far *driven*. *Spenser.*—To urge by violence, not kindness:

He taught the gospel rather than the law,
And forc'd himself to *drive*, but lov'd to draw. *Dryden.*

To impel by influence of passion.—It is better to marry than to burn, says St. Paul; where we may see what *drives* men into a conjugal life: a little burning pushes us more powerfully than greater pleasures in prospect. *Locke.*—To urge; to press to a conclusion.—To *drive* the argument farther, let us inquire into the obvious designs of this divine architect. *Cheyne.*—To carry on; to keep in motion.—As a farmer cannot husband his ground so well, if he sit at a great rent; so the merchant cannot *drive* his trade so well, if he sit at a great usury. *Bacon.*

Your Pasimond a lawless bargain *drove*,
The parent could not sell the daughter's love. *Dryden.*

To purify by motion: so we say to *drive* feathers.—His thrice-*driven* bed of down. *Shakespeare.*—The one's in the plot, let him be never so innocent; and the other is as white as the *driven* snow, let him be never so criminal. *L'Estrange.*

To DRIVE *out*. To expel.—Tumults and their exciters *drave* myself and many of both houses out of their places. *King Charles.*

To DRIVE, *v. n.* To go as impelled by any external agent:

Love, fixt to one, still safe at anchor rides,
And dares the fury of the winds and tides;
But losing once that hold, to the wide ocean born,
It *drives* away at will, to every wave a scorn. *Dryden.*

To rush with violence.—The wolves scampered away as hard as they could *drive*. *L'Estrange.*

As a ship which winds and waves assail,
Now with the current *drives*, now with the gale;
She feels a double force, by turns obeys
Th' imperious tempest, and th' impetuous seas. *Dryden.*

To pass in a carriage; to regulate the course of a carriage:

Thy flaming chariot-wheels, that shook
Heav'n's everlasting frame, while o'er the necks
Thou *drov'st* of warring angels disarray'd. *Milton.*

To tend to; to consider as the scope and ultimate design.—Authors *drive* at these, as the highest elegancies, which are but the frigidities of wit. *Brown.*—We cannot widely mistake his discourse, when we have found out the point he *drives* at. *Locke.*—To aim; to strike at with fury.—Four rogues in buckram let *drive* at me. *Shakespeare.*

At Auxur's shield he *drove*, and at the blow
Both shield and arm to ground together go. *Dryden.*

To *drive*, in all its senses, whether active or neuter, may be observed to retain a sense compounded of violence and progression.

DRIVE BAY, a bay of the river St. Lawrence, on the south coast of Canada. Lat. 48. 52. N. lon. 68. 20. W. Greenwich.

DRIVE-BOLT, *s.* A particular kind of bolt used in ship-building.

To DRI'VEL, *v. n.* [from *drip*, *dripple*, *dribble*, drivel.] To slaver; to let the spittle fall in drops, like a child, an idiot, or a dotard.—A *driveling* old fellow, lean, shaking both of head and hands, already half earth, and yet then most greedy of earth. *Sidney.*—To be weak or foolish; to dote:

I hate to see a brave bold fellow sotted,
Made sour and senseless, turn'd to whey, by love;
A *driveling* hero, fit for a romance. *Dryden.*

DRI'VEL, *s.* Slaver; moisture shed from the mouth.—A fool; an idiot; a driveller:

Besides th' eternal *drivel*, that supplies
The dropping beard, from nostrils, mouth, and eyes. *Dryden.*

DRI'VELLER, *s.* A fool; an idiot; a slaverer.—I have heard the arrantest *drivellers* commended for their shrewdness, even by men of tolerable judgment. *Swift.*

DRI'VEN, part. of *drive*.—They were driven forth from among men. *Job*, xxx. 5.

DRI'VER, *s.* The person or instrument who gives any motion by violence. One who drives beasts—The multitude or common rout, like a drove of sheep, or an herd of oxen, may be managed by any noise or cry which their *driver* shall accustom them to. *South.*

He from the many-peopled city flies.
Contemns their labours, and the *driver*'s cries. *Sandys.*

One who drives a carriage:

Not the fierce *driver* with more fury lends
The sounding lash, and, ere the stroke descends,
Low to the wheels his pliant body bends. *Dryden.*

To DRIZ'ZLE, *v. a.* [*driselen*, Germ. to shed dew.] To shed in small slow drops, as winter rains.—When the sun sets, the air doth *drizzle* dew. *Shakspeare.*

Though now this face of mine be hid
In sap-consuming winter's *drizzled* snow,
And all the conduits of my blood froze up,
Yet hath my night of life some memory. *Shakespeare.*

To DRIZ'ZLE, *v. n.* To fall in slow drops.—The neighbouring mountains, by reason of their height, are more exposed to the dews and *drizzling* rains than any of the adjacent parts. *Addison.*

DRIZ'ZLY, *adj.* Shedding small rain:

This during winter's *drizzly* reign be done,
Till the new ram receives th' exalted sun. *Dryden.*

DRO'CI, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra: nine miles south-south-east of Nicotera.

DROCK, *s.* in husbandry, the upright piece of timber in a plough, to which the earth-board is fixed.

DROF'LAND, or DRYFLAND, *s.* [Saxon.] A tribute or yearly payment formerly made by some tenants to the king, or their landlords, for driving their cattle through a manor to fairs or markets. *Cowel.*

DROG'HEDA, a sea-port town of Ireland, in the county of Louth, situated on the Boyne, on the borders of the county of Meath, (near which the prince of Orange obtained a complete victory over the army of James II. called the battle of the Boyne,) and a county of itself, holding its own assizes. It is a well-built town on both sides of the river Boyne, and increases in wealth and commerce, and the number of its inhabitants, which amount to more than ten thousand. This port supplies the neighbouring country, for many miles round, with English coals, and other heavy goods; and exports very considerable quantities of corn, the produce of the adjacent and of several of the inland counties. Here is also a celebrated school, with a good endowment. It is twenty-three miles north of Dublin. Lat. 53. 43. N. lon. 6. 22. W. Greenwich.

DROGIE'ZYN, a town of Poland, in the palatinate of Bielsk: thirty-six miles south-west of Bielsk.

DROGO'NE, a river of Italy, in the kingdom of Naples, which runs into the bay of Squillace.

DROIL, *s.* [by Junius, understood a contraction of *drivel*.] A drone; a sluggard.

To DROIL, *v. n.* To work ſluggiſhly and ſlowly; to plod.—The *droiling* peaſant ſcarcely thinks there is any world beyond the neighbouring markets. *Government of the Tongue.*

DROIT, *ſ.* [Fr.] Right, juſtice, equity.

DROIT'WICH, an ancient borough-town in Worceſterſhire, ſituate on the river Salwarp; it has four churches, though only three are made uſe of. It is diſtant from London ninety-five miles, from Worceſter ſeven, Bromſgrove ſix, Kidderminſter twelve, and Alceſter twelve. It ſends two members to parliament. This borough is governed by a recorder, town-clerk, two ſerjeants at mace, two third-boroughs, and a crier. The right of election is in two bailiffs, the recorder, and eleven burgeſſes, who are ſtiled The Corporation of the Salt-ſprings of Droitwich. It was originally incorporated by king John, and afterwards by charter of *inſpeximus* of James the Firſt. The number of voters is fourteen. The town conſiſts of about 400 houſes, chiefly inhabited by poor people. The principal manufacture carried on here is making fine white ſalt, which is by far the fineſt and whiteſt in all Europe. In Domeſday-book it is ſaid, that every week, in the ſeaſon of wealing, they paid off a tax of ſixteen bullions; which is ſufficient to prove, that ſalt was made here long before the Conqueror's ſurvey was compiled. Mention is alſo made, in the reign of king Athelſtan, of the ſalt produced in this town. The brine-pits at Droitwich are immenſe, and continually running over, owing to the greatneſs of the ſprings. The brine is ſuppoſed to be the ſtrongeſt ever known, containing about one-fourth ſalt, whilſt thoſe of Nantwich in Cheſhire yield only one-ſixth; and thoſe of Weſton in Staffordſhire only one-ninth part. The annual amount of the duty on ſalt made here is from 150,000l. to 200,000l. which is paid regularly every Wedneſday into the collector's hands, by the different proprietors of the works. See the article SALT. This town was known to the Romans, and under the Saxons gave name to the whole country. It was populous in the time of the Conqueror. In 1290, St. Andrew's church, and the greateſt part of the town, was burnt. It had great privileges from king John, ſome of which it ſtill retains, and was much favoured by Henry III. and other princes. The exchequer-houſe was built in 1580, whoſe windows have ſome curious painted glaſs. Here is an hoſpital, founded in 1688. A canal, about ſeven miles long, goes from this town into the river Severn, at a place called Hawford, within three miles of the city of Worceſter; it was begun in 1756; and is navigable for veſſels carrying from ſixty to ſixty-three tons burthen. By this canal the greateſt part of the ſalt manufactured in this town is conveyed into the Severn, and from thence to different parts of the kingdom. By this alſo the town is ſupplied with coal; great quantities of which are conſumed in the ſalt-works. The coal, which chiefly comes from Dudley, is about twelve ſhillings or twelve ſhillings and ſixpence per ton. The market is on Friday; fairs, April 13, June 18, September 22 and 24, and December 21. The market-houſe was built in 1628.

DROLL, *ſ.* [*droler*, Fr.] One whoſe buſineſs is to raiſe mirth by petty tricks; a jeſter; a buffoon; a jack-pudding:

Democritus, dear *droll!* reviſit earth,
And with our follies glut thy heighten'd mirth. *Prior.*

A farce; ſomething exhibited to raiſe mirth:

Some as juſtly fame extols,
For lofty lines in Smithfield *drolls*. *Swift.*

To DROLL, *v. n.* [*dröle*, Fr.] To jeſt; to play the buffoon.—Men that will not be reaſoned into their ſenſes, may yet be laughed or *drolled* into them. *L'Eſtrange.*

DROL'LERY, *ſ.* Idle jokes; buffoonery.—They hang between heaven and hell, borrow the Chriſtians faith, and the atheiſts *drollery* upon it. *Government of the Tongue.*—A puppet-ſhow. To which alludes the following expreſſion in *Shakeſpeare.*—A living *drollery*. *Tempeſt.*

DROLS'HAGEN, a town of Germany, in the circle of the Lower Rhine, and the duchy of Weſtphalia: thirty-four miles eaſt of Cologn, and forty-eight eaſt-ſouth-eaſt of Duſſeldorp.

DRO'MA, a town of Africa, on the Grain Coaſt, noted for its market for pepper.

DROME, a department of France, ſituated on the eaſt ſide of the Rhone, which takes its appellation from the river Drome, which croſſes it. Valence is the capital.

DROME, a river of France, which riſes near Valdrome, paſſes by Die, Pontaix, Saillans, Creſt, Livron, &c. and falls into the Rhone, about eleven miles ſouth of Valence.

DROM'EDARY. See the article CAMELUS, vol. iii. p. 649.

DROM'EUS, *ſ.* in ancient authors, the dromedary, the ſtag, ſo called on account of their ſwiftneſs.

DRO'MO, *ſ.* [from δρομων, Gr.] A caraval, a ſwift bark; a very ſwift fiſh. *Scott.*

DRO'MO, a ſmall iſland in the Grecian Archipelago. Lat. 39. 28. N. lon. 41. 46. E. Ferro.

DROMO'RE, a town of Ireland, in the county of Down, the ſee of a biſhop, ſaid to have been erected in the ſixth century. The cathedral is ſmall, but the epiſcopal palace, erected ſome years ſince, is handſome and convenient: ſeventeen miles eaſt of Armagh, and fifteen ſouth-weſt of Belfaſt.

DROMO'RE, a townſhip of the American States, in Lancaſter county, Pennſylvania.

DROM'WA PE'TRI, a town of Africa, on the Ivory Coaſt.

DRONE, *ſ.* [ðnoen, Sax.] The bee which makes no honey, and is therefore driven out by the reſt. See APIS, vol. i. p. 792, &.

All, with united force, combine to drive
The lazy *drones* from the laborious hive. *Dryden.*

A ſluggard; an idler.—It is my misfortune to be married to a *drone*, who lives upon what I get, without bringing any thing into the common ſtock. *Addiſon.*—The hum, or inſtrument of humming:

Here while his canting *drone-pipe* ſcann'd
The myſtic figures of her hand,
He tipples palmeſtry, and dines
On all her fortune-telling lines. *Cleaveland.*

To DRONE, *v. n.* To live in idleneſs; to dream:

What have I loſt by my forefathers fault!
Why was not I the twentieth by deſcent
From a long reſtive race of *droning* kings? *Dryden.*

To give a heavy dull tone:

Melfoil and honeyſuckles pound,
With theſe alluring ſavours ſtrew the ground,
And mix with tinkling braſs the ſymbal's *droning* ſound.
Dryden.

DRONE-BEE, *ſ.* The male bee.

DRONE-FLY, *ſ.* A two-winged inſect reſembling the drone-bee.

DRONE'RO, a town of Piedmont, in the marquiſate of Saluzzo, on the Maira: fourteen miles ſouth-ſouth-weſt of Saluzzo.

DRON'FIELD, a neat and pleaſant town in Derbyſhire, four miles weſt of Bolſover, and 153 north-weſt of London, ſituated among the mountains at the edge of the peak. It is ſurrounded, except on the weſtern ſide, with verdant eminences crowned with trees of various hues, and beautifully interſperſed with luxuriant corn-fields. The fineſt ſprings iſſue abundantly from the rocks, and wind in ſerpentine directions, almoſt through every part. Here too is plenty of coal at a very reaſonable rate, and every neceſſary of life on moderate terms. The church, dedicated to St. John the Baptiſt, is a handſome edifice, about 132 feet in length, exactly correſponding with the height of the ſpire; and the chancel is ſaid far to exceed any other in the county. Henry Fanſhawe, eſquire, remembrancer

membrancer of the xchequer during the reign of queen Elizabeth, founded and liberally endowed a free-ſchool here in 1567. This town had a market on Thurſdays; but, owing to its vicinity to Cheſterfield and Sheffield, the effect of it is totally done away. It has one annual fair, on the 25th of April.

DRO'NISH, *adj.* Idle; ſluggiſh; dreaming; lazy; indolent; unactive:

The *droniſh* monks, the ſcorn and ſhame of manhood,
Rouſe and prepare once more to take poſſeſſion,
To neſtle in their ancient hives again. *Rowe.*

DRO'NISHLY, *adv.* Slothfully.

DRO'NISHNESS, *ſ.* Slothfulneſs.

DRONNE, a river of France, which riſes about ſix miles from Thiviers, in the department of the Dordogne, and joins the Ille, near Coutras, in the department of the Gironde.

DRONT'HEIM, a town of Norway, formerly the capital, and the uſual reſidence of the kings, ſituated on a gulf of the North Sea, to which it gives name, at the mouth of the Nidder; nearly ſurrounded by the ſea and lofty mountains, with a well-frequented ſeaport, but not capable of receiving large veſſels, on account of rocks at the entrance of the harbour: it has neither ditches nor fortifications, but is encloſed by a wall, and defended by a caſtle, by no means ſtrong. It was taken by the Swedes, in 1658, after a ſiege of a few days, but retaken by the Danes the ſame year. It was erected into an archbiſhopric by pope Eugenius III. Near it are mines of copper and ſilver. The principal exports are maſts, fir-timber, copper, iron, pitch, tar, ſtock-fiſh, ſkins, potaſh, &c. In exchange, they receive and import ſpices, wine, ſalt, brandy, corn, tobacco, cloth, &c. The territory, or province, extends nearly 500 miles in length along the coaſt of the North Sea; the whole was ceded to Sweden in 1658, but by the peace of Copenhagen was confirmed to Denmark. Lat. 63. 26. N. lon. 10. 38. E. Greenwich.

DROOG, *ſ.* [Indian.] A term in Hindooſtan for a fort erected upon the ſummit of a hill. They form the principal mode of defence on the borders of the different provinces in India.

To DROOP, *v. n.* [*droef*, Dut. ſorrow.] To languiſh with ſorrow:

I *droop* with ſtruggling ſpent;
My thoughts are on my ſorrows bent. *Sandys.*

To faint; to grow weak; to be diſpirited.—I ſaw him ten days before he died, and obſerved he began very much to *droop* and languiſh. *Swift.*

When factious rage to cruel exile drove
The queen of beauty and the court of love,
The muſes *droop'd* with their forſaken arts. *Dryden.*

I'll animate the ſoldiers *drooping* courage
With love of freedom and contempt of life. *Addiſon.*

To ſink; to lean downwards; commonly by weakneſs or grief:

On her heav'd boſom hung her drooping head,
Which with a ſigh ſhe rais'd, and this ſhe ſaid. *Pope.*

DROOP'INGLY, *adv.* Faintly; languiſhingly.

DROP, *ſ.* [ðnoppa, Sax.] A globule of moiſture; as much liquor as falls at once when there is not a continual ſtream:

Meet we the med'cine of our country's weal,
And with him pour we, in our country's purge,
Each *drop* of us. *Shakeſpeare.*

Diamond hanging in the ear:

The *drops* to thee, Brillante, we conſign;
And, Momentilla, let the watch be thine. *Pope.*

To DROP, *v. a.* [ðnoppan, Sax.] To pour in drops or ſingle globules.—His heavens ſhall *drop* down dew. *Deut.* xxxiii. 28.—To let fall from a higher place:

Others o'er chimney tops and turrets row,
And *drop* their anchors on the meads below. *Dryd'n.*

To let go; to diſmiſs from the hand, or the poſſeſſion:

Though I could
With barefac'd power ſweep him from my ſight,
And bid my will avouch it; yet I muſt not,
For certain friends that are both his and mine,
Whoſe loves I may not *drop*. *Shakeſpeare.*

To utter ſlightly or caſually.—*Drop* not thy word againſt the houſe of Iſaac. *Amos.*—To inſert indirectly, or by way of digreſſion.—St. Paul's epiſtles contain nothing but points of Chriſtian inſtruction, amongſt which he ſeldom fails to *drop* in the great and diſtinguiſhing doctrines of our holy religion. *Locke.*—To intermit; to ceaſe.—Where the act is unmanly or immoral, we ought to *drop* our hopes, or rather never entertain them. *Collier.*—To quit a maſter.—I have beat the hoof till I have worn out theſe ſhoes in your ſervice, and not one penny left me to buy more; ſo that you muſt even excuſe me if I *drop* you here. *L'Eſtrange.*—To let go a dependant, or companion, without farther aſſociation.—She drilled him on to five-and-fifty, and will *drop* him in his old age, if ſhe can find her account in another. *Addiſon.*—To ſuffer to vaniſh, or come to nothing.—Opinions, like faſhions, always deſcend from thoſe of quality to the middle ſort, and thence to the vulgar, where they are *dropped* and vaniſh. *Swift.*—To bedrop; to ſpeckle; to variegate with ſpots, *Variis ſtellatus corpora* guttis:

Or ſporting, with quick glance,
Shew to the ſun their wav'd coats, *dropp'd* with gold.
Milton.

To DROP, *v. n.* To fall in drops, or ſingle globules:

The quality of mercy is not ſtrain'd;
It *droppeth* as the gentle rain from heaven
Upon the place beneath. *Shakeſpeare.*

To let drops fall; to diſcharge itſelf in drops.—The heavens *dropped* at the preſence of God. *Pſalm* lxvii. 8.

While cumber'd with my *dropping* cloaths I lay,
The cruel nation, covetous of prey,
Stain'd with my blood th' unhoſpitable coaſt. *Dryden.*

To fall; to come from a higher place.—In every revolution, approaching nearer and nearer to the ſun, this comet muſt at laſt *drop* into the ſun's body. *Cheyne.*—To fall ſpontaneouſly:

So may'ſt thou live, till, like ripe fruit, thou *drop*
Into thy mother's lap; or be with eaſe
Gather'd, not harſhly pluck'd. *Milton.*

To fall in death; to die ſuddenly:

It was your preſurmiſe,
That in the dole of blows your ſon might *drop*. *Shakeſp.*

To die.—Nothing, ſays Seneca, ſo ſoon reconciles us to the thoughts of our own death, as the proſpect of one friend after another *dropping* round us. *Digby.*—To ſink into ſilence; to vaniſh; to come to nothing: a familiar phraſe.—I heard of threats occaſioned by my verſes: I ſent to acquaint them where I was to be found, and ſo it *dropped*. *Pope.*—To come unexpectedly:

Either you come not here, or, as you grace
Some old acquaintance, *drop* into the place,
Careleſs and qualmiſh, with a yawning face. *Dryden.*

To fall ſhort of a mark.—Often it *drops* or overſhoots by the diſproportions of diſtance or application. *Collier.*

"Many DROPS make a ſhower." The Germans ſay, *Nale pfennige machen einen thaler:* Many pennies make a dollar. The Scots ſay, Many a little makes a mickle. Intimating, that if by care and economy our ſavings are ever ſo ſmall and trivial, they will in the end amount to ſuch a ſum as will amply reward our frugality.

DROP SERENE, *ſ.* [*gutta ſerena*, Lat.] A diſeaſe of the eye, proceeding from an inſpiſſation of the humour:

So

So thick a *drop ſerene* hath quench'd their orbs,
Or dim ſuffuſion veil'd. *Milton.*

DRO'PACISM, or DROPAX, *ſ.* [from δρεπω, to remove.] A medicine to deſtroy or remove hair; the application of the ſame.

DRO'PACIST, *ſ.* [from *dropax.*] One that uſes the dropax, or dropaciſm.

DRO'PALACH, a town of Germany, in the duchy of Carinthia: twelve miles ſouth of Saxenburg.

DRO'PAX, *ſ.* See DROPACISM.

DROP'LET, *ſ.* A little drop:

Thou abhorr'dſt in us our human griefs,
Scorn'd our brine's flow, and thoſe our *droplets*, which
From niggard nature fall. *Shakeſpeare.*

DROP'PING, *ſ.* That which falls in drops:

Thrifty wench ſcrapes kitchen-ſtuff,
And barrelling the *droppings* and the ſnuff
Of waſting candles. *Donne.*

That which drops when the continuous ſtream ceaſes:

Strain out the laſt dull *droppings* of your ſenſe,
And rhyme with all the rage of impotence. *Pope.*

DROPS, *ſ.* in architecture, an ornament repreſenting drops or little bells.

DROP'STONE, *ſ.* Spar formed into the ſhape of drops. *Woodward.*

DROP'SICAL, *adj.* Diſeaſed with a dropſy; hydropical; tending to a dropſy.—The diet of nephritic and *dropſical* perſons ought to be ſuch as is oppoſite to, and ſubdueth, the alkaleſcent nature of the ſalts in the ſerum of the blood. *Arbuthnot.*

DROP'SIED, *adj.* Diſeaſed with a dropſy:

Where great addition ſwells, and virtue none,
It is a *dropſied* honour: good alone
Is good. *Shakeſpeare.*

DROP'SY, *ſ.* [*hydrops*, Lat. whence anciently *hidropiſy*, thence *dropiſy*, *dropſy.*] A collection of water in the body, from too lax a tone of the ſolids, whereby digeſtion is weakened, and all the parts ſtuffed. For the medical treatment of this diſorder, ſee the article MEDICINE.

DROP'WORT, *ſ.* in botany. See SPIRÆA and OENANTHE.

DROS'CHOLM, a town of Denmark, in the iſland of Zealand: twelve miles ſouth-ſouth-weſt of Nyekiobing, and forty weſt of Copenhagen.

DRO'SENDORF, a town of Germany, in the archduchy of Auſtria, on the river Taya: fifteen miles weſt of Znaym, and forty-ſix north-weſt of Vienna. Lat. 48. 45. N. lon. 33. 24. E. Ferro.

DRO'SERA, *ſ.* [δροσερος, dewy, from δροσος, dew; drops hanging on the leaves, like dew.] SUNDEW; in botany, a genus of the claſs pentandria, order pentagynia, natural order gruinales, (capparides, *Juſſ.*) The generic characters are—Calyx: perianthium one-leaſed, five-cleft, ſharp, upright, permanent. Corolla: funnel-form; petals five, ſomewhat ovate, obtuſe, rather larger than the calyx, and alternate with it. Stamina: filaments five, ſubulate, length of the calyx, and alternate with the petals; antheræ ſmall, growing to the filaments. Piſtillum: germ ſuperior, roundiſh; ſtyles five, ſimple, length of the ſtamens; ſtigmas ſimple. Pericarpium: capſule ſurrounded with the calyx, ſomewhat ovate, one-celled, three, four, or five-valved at the tip. Seeds: very many, very ſmall, ſomewhat ovate, ſcabrous, fixed to a branching looſe receptacle in the centre at bottom. —*Eſſential Character.* Calyx, five-cleft; petals, five; capſule, one-celled, five (or three) valved at the tip; ſeeds, very many.

Species. 1. Droſera acaulis, or ſtemleſs ſundew: flower radical, without any ſcape, ſolitary; leaves oblong. 2. Droſera cuneifolia, or wedge-leaved ſundew: ſcapes radicate, leaves wedge-form-rounded. Theſe are herbs of a ſmall ſize, and ſingular ſtructure. The leaves, in moſt of the ſpecies, only next the root, furniſhed with glandulous hairs on the upper ſurface, and fringed with them round the edge: theſe hairs have each a ſmall globule of a pellucid liquor like dew, continuing even in the hotteſt part of the day, and in the fulleſt expoſure to the ſun. Hence their Engliſh name of *ſundew.* The two firſt ſpecies are natives of the Cape of Good Hope, where they were firſt obſerved by Thunberg.

3. Droſera rotundifolia, or round-leaved ſundew: ſcapes radicate; leaves orbiculate, ſtyles ſix. Root perennial, black; flowers from ſix to eleven in number, white; they are open from nine to twelve; the young leaves, before they are expanded, are rolled inwards, and at the ſame time bent in to the very peduncle. Droſera and Utricularia are the only two plants which are common to Sweden and the Eaſt Indies, and they are both water plants: Linnæus remarks that Droſera is a native of all the four continents, on bogs. The Eaſt Indian plant, however, is probably different from the European, and Vahl has ſeparated it under the name of *Droſera Burmanni.* It is diſtinct from the preceding ſpecies D. cuneifolia, in the ſmoothneſs of the ſcape and pedicels, and in being only one third of the ſize. With us, D. rotundifolia flowers in July and Auguſt; and is found on Hampſtead heath; at Battle's well near Harefield, and Iver heath; on Hinton and Teverſham moors, and Gamlingay bogs in Cambridgeſhire; on Malvern chace; Birmingham heath; Selborne, in Hampſhire; Ludgvan Lee, on the Barton and Moors; and Senan, in Torvorian Commons, Cornwall; Halſton in Northamptonſhire; near Mansfield and Oxton in Nottinghamſhire; and in Scotland frequent.

The whole plant is acrid, and ſufficiently cauſtic to erode the ſkin; ſome ladies, however, know how to mix the juice with milk, ſo as to make it an innocent and ſafe application to remove freckles and ſun-burn. The juice that exſudes from it unmixed will deſtroy warts and corns. The plant has the ſame effect upon milk as the *pinguicula vulgaris*; and like that, too, is ſuppoſed to occaſion the rot in ſheep. Is not the ſour coagulated milk of the Syrians, called *leban* or *leven*, at firſt prepared with ſome plant of this kind? It is called in Engliſh *ſundew, youth-woort*; in the north parts *red-rot*, and in Yorkſhire *mooregraſſe*; in German, *ſonnenthau, findaw, loffleinkraut*; in Dutch, *zonnedaauw*, or *loopighruid*; in Daniſh, *ſoeldug* or *himmeldug*; in Swediſh, *Mariæfileſhar*; in Smoland, *daggort*; in Italian, *rugiada del ſole*; in Spaniſh, *rociada* or *rocio del ſol*; in Portugueſe, *roſſolina*; in Ruſſian, *ſolneznaja trawa.*

4. Droſera longifolia, or long-leaved ſundew: ſcapes radicate; leaves ovate-oblong. Linnæus is of opinion that this is ſcarcely ſpecifically diſtinct from the foregoing, ſince they agree in every thing except the form of the leaves. Scopoli does not heſitate to join this and the round-leaved ſundew together, and affirms that he has many ſpecimens ſhewing a gradual change from the one to the other. Haller will not allow that they ever change one to the other. This ſeems not to be ſo common as the round-leaved ſort; Mr. Woodward, however, informs us that it is frequent in Norfolk; and Mr. Lightfoot, that it is ſo alſo in Scotland; on Brigſtear moſs, near Kendal, it grows to twice or thrice the ſize it does about London; it is alſo found on Hinton moor near Cambridge; on Bagſhot heath in Surrey; and at Selborne in Hants.

β. *D. Anglica*, or great ſundew, which Mr. Hudſon makes a diſtinct ſpecies, becauſe it is larger, has eight ſtyles, and four-valved capſules: is common, as he informs us, in the northern counties; alſo in Devonſhire, Hampſhire, and Norfolk; three miles from Carliſle towards Scotland, where Mr. Dickſon found it near Fort Auguſtus; near Elleſmere in Shropſhire, and in Ireland. The variety deſcribed by Ray, was found by Thomas

Williſel in Yorkſhire, between Doncaſter and Bautrey; and by Mr. J. Sherard on Weſtfield down, near Haſtings.

Theſe plants have the ſame property with *Dionæa muſcipula*, of entrapping ſmall inſects within their folded leaves. It was diſcovered by Mr. Whately, a ſurgeon, in Auguſt 1780. On inſpecting ſome of the contracted leaves, he obſerved a fly in cloſe impriſonment; and on centrically preſſing other leaves, yet in their expanded form, with a pin, he obſerved a ſudden elaſtic ſpring of them, ſo as to become inverted upwards, and as it were encircling the pin. The ſame account occurs in a German author (Wroth. beytrog. p. 64.) in July 1779. An ant was placed on the middle of a leaf; the inſect endeavoured to eſcape, but was held faſt by the clammy juice at the points of the hairs; in ſome minutes the ſhort hairs on the diſk of the leaf began to bend, then the long hairs, and laid themſelves upon the ant: after a while the leaf began to bend, and in ſome hours the end of the leaf was ſo bent inwards as to touch the baſe. The ant died in fifteen minutes.

5. Droſera Capenſis, or Cape ſundew: ſcapes radicate; leaves lanceolate, ſcabrous underneath. Root putting out ſpiral threads; flowers violet-coloured. Native of the Cape of Good Hope.

6. Droſera Luſitanica, or Portugueſe ſundew: ſcapes radicate; leaves ſubulate, convex underneath, flowers ten-ſtamened. Ray will not allow it to be a ſpecies of this genus. Alſtroemer obſerved that it had conſtantly ten ſtamens; and therefore it would be an *Oxalis*, if the flowers were in an umbel, and the peculiar property of the leaves, together with its one-celled capſule, did not detain it in this genus. Native of Portugal; collected there by Tournefort.

7. Droſera ciſtiflora, or ciſtus-flowered ſundew: ſtem ſimple, leafy; leaves lanceolate. Stems a foot high, pubeſcent. Native of the Cape of Good Hope.

8. Droſera Indica, or Indian ſundew: ſtem branched, leafy; leaves linear. Native of the Eaſt-Indies: the Ceyloneſe call it *kandulaeſſa*, from *kandula*, a tear; the leaves being ſurrounded by drops, as in our European ſpecies. The ſtem is half a foot high, and very ſlender.

9. Droſera umbellata, or umbellated ſundew: ſcapes rooted; leaves ovate, flowers umbelled. Stem none; leaves next the ground only on long petioles. Native of China.

Propagation and Culture. Theſe plants are not eaſily preſerved in gardens. They muſt be taken from their native bogs, with a ſufficient quantity of bog-earth and water-moſs, and planted in pots, ſet in pans, conſtantly ſupplied with water. They will ſucceed better if defended from the ſun, and well enveloped in moſs kept conſtantly wet.

DRO'SING, a town of Germany, in the archduchy of Auſtria: ſix miles eaſt of Ziſterſdorf.

DROSO'MELI, *ſ.* [of δρόσος, dew, and μελι, honey.] Honey-dew, or manna.

DROSS, *ſ.* [ɒnoꝛ, Sax.] The recrement or deſpumation of metals:

Some ſcumm'd the *droſs* that from the metal came,
Some ſtirr'd the molten ore with ladles great,
And every one did ſwink, and every one did ſweat. *Spenſer.*

Ruſt; incruſtation upon metal.—An emperor, hid under a cruſt of *droſs*, after cleanſing, has appeared with all his titles freſh and beautiful. *Addiſon.*—Refuſe; leavings; ſweepings; any thing remaining after the removal of the better part; dregs; feculence; corruption.—Such precepts exceedingly diſpoſe us to piety and religion, by purifying our ſouls from the *droſs* and filth of ſenſual delights. *Tillotſon.*

Fair proud, now tell me why ſhould fair be proud,
Sith all world's glory is but *droſs* unclean;
And in the ſhade of death itſelf ſhall ſhroud,
However now thereof ye little ween? *Spenſer.*

DROS'SEN, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg: twelve miles ſouth-eaſt of Cuſtrin, and fourteen eaſt of Francfort on the Oder.

DROS'SENFELD, a town of Germany, in the circle of Franconia, and principality of Culmbach, on the Maine: ſix miles ſouth of Culmbach.

DROS'SINESS, *ſ.* Foulneſs; feculence; ruſt.—The furnace of affliction refines us from earthly *droſſineſs*, and ſoftens us for the impreſſion of God's ſtamp. *Boyle.*

DROS'SY, *adj.* Full of ſcorious or recrementitious parts: full of droſs.—So doth the fire the *droſſy* gold refine. *Davies.*—For, by the fire, they emit not only many *droſſy* and ſcorious parts, but whatſoever they had received either from earth or loadſtone. *Brown.*—Worthleſs; foul; feculent:

Your intention hold,
As fire theſe *droſſy* rhymes to purify,
Or as elixir to change them into gold. *Donne.*

DROT, a river of France, which runs into the Garonne at Gironde.

DROT'CHELL, *ſ.* [corrupted perhaps from *dretchel*. *To dretch*, in *Chaucer*, is to *idle*, to *delay*. *Droch*, in Friſick, is *delay*.] An idle wench; a ſluggard. In Scottiſh it is ſtill uſed.

DROT'NINGHOLM, a royal palace of Sweden, ſituated in an iſland about ſeven miles from Stockholm.

DROTZ'DORF, a town of Sileſia, in the principality of Neyſza: three miles ſouth of Grotkaw.

DRO'VA-DRUE, or Drou, a town of Africa, on the Grain Coaſt: ſixty miles north-weſt of Cape Palmas.

DROU'AIS (M.) a young painter of eminence in the French ſchool, who, even when a boy, diſcovered uncommon enthuſiaſm for painting. He was placed under David, a moſt diſtinguiſhed painter of the city of Paris. Drouais, in 1783, enliſted among the competitors for the academical prize, but cut his picture to pieces when it only wanted the finiſhing ſtroke, and ſhewed to his maſter ſome remnants of it. "What have you done!" cried David, "you deprive yourſelf of the prize." "I am ſufficiently rewarded," replied the pupil, "by meeting with your approbation: next year I ſhall endeavour to be ſtill more worthy of you." He kept his word, for he obtained the prize of 1784, which was awarded to him by the academy; and had not the regulations of the academy oppoſed it, he would have been immediately admitted of their body: but he was conducted in triumph to his maſter, and thence to his mother. On David's tour to Rome, Drouais accompanied him. Although he poſſeſſed a yearly revenue of 20,000 livres, the uſual pleaſures of youth had no charms for him, whoſe idol was Raphael. He would be at his ſtudies from four in the morning till night. "Painting, or nothing," was the uſual reply which he made to David, who frequently remonſtrated with him on his too unremitted application. "Firſt, fame; then, amuſement;" he would often add. David leaving him at Rome, Drouais ſhortly afterward completed his Marius, a picture which aſtoniſhed all Paris: but while he was engaged in a ſubject, the execution of which promiſed the greateſt honour to him, his conſtitution began to decline. His glowing zeal for his profeſſion had dried up the vital juices of his frame, and he died of a putrid fever at the age of twenty-five.

DROU'E, a town of France, in the department of the Loire and Cher, and chief place of a canton, in the diſtrict of Montdoubleau: nine miles north-eaſt of Montdoubleau.

DROVE, *ſ.* A body or number of cattle: generally uſed of oxen or black cattle.—They brought to their ſtations many *droves* of cattle; and within a few days were brought out of the country two thouſand muttons. *Hayward.*—A number of ſheep driven. To an *herd* of oxen we regularly oppoſe, not a *drove*, but a *flock*, of ſheep.—

A *drove* of ſheep, or an herd of oxen may be managed by any noiſe or cry which the drivers ſhall accuſtom them to. *South.*—Any collection of animals:

The ſounds and feas, with all their finny drove,
Now to the moon in wavering morrice move. *Milton.*

A crowd; a tumult:

But if to fame alone thou doſt pretend,
The miſer will his empty palace lend,
Set wide with doors, adorn'd with plated braſs,
Where *droves*, as at a city-gate, may paſs. *Dryden.*

DRO'VEN, *part.* from *drive*. *Not now uſed:*

This is fought indeed;
Had we ſo done at firſt, we had *droven* them home
With clouts about their heads. *Shakeſpeare.*

DRO'VER, *ſ.* One that fats oxen for ſale, and drives them to market:

The *drover*, who his fellow *drover* meets
In narrow paſſages of winding ſtreets. *Dryden.*

A boat driven by the current:

At laſt when droncke with drowſineſs he woke
And ſaw his *drover* drive along the ſtreame,
He was diſmay'd. *Spenſer.*

This word ſeems to have been fabricated only for the occaſion. *Maſon's Supplement.*

DROUGHT, *ſ.* [ꝺꝛuȝoꝺe, Sax.] Dry weather; want of rain.—Upon a ſhower, after a *drought*, earth-worms and land-ſnails innumerable come out of their lurking-places. *Ray.*—Thirſt; want of drink:

O earth! I will befriend thee more with rain
Than youthful April ſhall with all his ſhowers:
In ſummer's *drought* I'll drop upon thee ſtill. *Shakeſpeare.*

Thirſt, want of drink:

One whoſe *drought*
Yet ſcarce allay'd, ſtill eyes the current ſtream
Whoſe liquid murmur heard new thirſt excites. *Milton.*

DROUGH'TINESS, *ſ.* The ſtate of wanting rain.

DROUGH'TY, *adj.* Wanting rain; ſultry.—That a camel, ſo patient of long thirſt, ſhould be bred in ſuch *droughty* and parched countries, where it is of ſuch eminent uſe for travelling over thoſe dry and ſandy deſarts where no water is to be had, muſt be acknowledged an act of Providence and deſign. *Ray.*—Thirſty; dry with thirſt:

If the former years
Exhibit no ſupplies, alas! thou muſt
With taſteleſs water waſh thy *droughty* throat. *Philips.*

DROU'IN (René), a learned French dominican monk, who diſtinguiſhed himſelf in the controverſy between the Janſeniſts and the Jeſuits. For ſome time he was profeſſor of theology at Chamberry, and afterwards at Verceil, and died in 1742, at Ivrea in Piedmont, in the ſixtieth year of his age. He was the author of a profound and learned work, in conſiderable eſtimation among the catholics, and intitled, A dogmatical and moral Treatiſe on the Sacraments; which was publiſhed at Venice in 1737, in two volumes folio, and has ſince been reprinted at Paris, in 1775, in nine volumes 12mo.

DROUNE, a river of France, which runs into the Dordogne, between Libourne and Fronſac.

DROUX, a town of France, in the department of the Upper Vienne: five miles ſouth-eaſt of Dorat.

To DROWN, *v. a.* [from *drunden*, below, German, *Skinner*; from ꝺꝛuncman, Sax. Mr. *Lye.*] To ſuffocate in water.—They would ſoon *drown* thoſe that refuſed to ſwim down the popular ſtream. *King Charles.*

When of God's image only eight he found
Snatch'd from the wat'ry grave, and ſav'd from nations *drown'd*. *Prior.*

To overwhelm in water.—Gallcys might be *drowned* in the harbour with the great ordnance, before they could be rigged. *Knolles.*—To overflow; to bury in an inundation; to deluge:

Betwixt the prince and parliament we ſtand,
The barriers of the ſtate on either hand:
May neither overflow, for then they *drown* the land.
Dryden.

To immerge; to loſe in any thing:

Moſt men being in ſenſual pleaſures *drown'd*,
It ſeems their ſouls but in their ſenſes are. *Davies.*

To loſe in ſomething that overpowers or covers.—My private voice is *drown'd* amid the ſenate. *Addiſon.*

Some aged man who lives this act to ſee,
And who in former times remember'd me,
May ſay, the ſon, in fortitude and fame,
Outgoes the mark, and *drowns* his father's name. *Dryden.*

To DROWN, *v. n.* To be ſuffocated in the waters:

Methought what pain it was to *drown!*
What dreadful noiſe of waters in my ears! *Shakeſpeare.*

DROWN'ED LANDS, a conſiderable tract of flat country in North America, in the ſtate of New York, amounting to near 50,000 acres, annually overflowed by waters which fall from the neighbouring hills in the winter; this adds much to the fertility of the ſoil, but makes the air unhealthy, and produces inflammatory and intermitting fevers among the inhabitants: ſituated weſtward of Hudſon's River, on the borders of Jerſey.

DROW'NING, *ſ.* The act of ſuffocation by water. For the moſt effectual means of recovering DROWNED PERSONS, ſee the article MEDICINE.

To DROWSE, *v. a.* [*drooſen*, Dut.] To make heavy with ſleep:

There gentle ſleep
Firſt found me, and with ſoft oppreſſion ſeiz'd
My *drowſed* ſenſes uncontroll'd. *Milton.*

To DROWSE, *v. n.* To ſlumber; to grow heavy with ſleep:

All their ſhape
Spangled with eyes, more numerous than thoſe
Of Argus; and more wakeful than to *drowſe*,
Charm'd with Arcadian pipe. *Milton.*

To look heavy; not cheerful:

They rather *drows'd*, and hung their eyelids down,
Slept in his face, and render'd ſuch aſpect
As cloudy men uſe to their adverſaries. *Shakeſpeare.*

DROW'SIHED, *ſ.* Sleepineſs; inclination to ſleep. *Obſolete:*

The royal virgin ſhook off *drowſihed*;
And riſing forth out of her baſer boure,
Look'd for her knight. *Spenſer.*

DROW'SILY, *adv.* Sleepily; heavily; with an inclination to ſleep:

The air ſwarms thick with wand'ring deities,
Which *drowſingly* like humming beetles rife. *Dryden.*

Sluggiſhly; idly; ſlothfully; lazily.—We ſatisfy our underſtanding with the firſt things, and, thereby ſatiated, ſlothfully and *drowſily* ſit down. *Raleigh.*

DROW'SINESS, *ſ.* Sleepineſs; heavineſs with ſleep; diſpoſition to ſleep.—He that from his childhood has made riſing betimes familiar to him, will not waſte the beſt part of his life in *drowſineſs*, and lying a-bed. *Locke.*

In deep of night, when *drowſineſs*
Hath lock'd up mortal ſenſe, then liſten I
To the celeſtial ſyren's harmony. *Milton.*

Idleneſs; indolence; inactivity.—It falleth out well, to ſhake off your *drowſineſs*; for it ſeemed to be the trumpet of a war. *Bacon.*

DROW'SY, *adj.* Sleepy; heavy with ſleep; lethargic.—Men are *drowſy*, and deſirous to ſleep, before the fit of an ague, and do uſe to yawn and ſtretch. *Bacon.*

The

The flowers, call'd out of their beds,
Start and raiſe up their *drowſy* heads. *Cleaveland.*

Heavy; lulling; cauſing ſleep:

While thus ſhe reſted, on her arm reclin'd,
The hoary willows waving with the wind,
And purling ſtreams that through the meadow ſtray'd,
In *drowſy* murmurs lull'd the gentle maid. *Addiſon.*

Stupid; dull.—Thoſe inadvertencies, a body would think, even our author, with all his *drowſy* reaſoning, could never have been capable of. *Atterbury.*

DROW'SY-FLIGHTED, *adj.* Moving drowſily:

Gave reſpite to the *drowſy-flighted* ſteeds
That draw the litter of cloſe-curtain'd ſleep. *Milton.*

DROYE, a river of Pruſſia, which runs into the Pregel, four miles weſt of Inſterburg.

DROYS'ZIG, a town of Germany, in the circle of Upper Saxony, in Thuringia: ſix miles ſouth-eaſt of Stoſſen.

DRU, *ſ.* in Doomſday-book, a thicket or wood. A man's name.

To DRUB, *v. a.* [*druber*, to kill, Dan.] To threſh; to beat; to bang; to thump; to thwack; to cudgel. *A word of contempt.*—The little thief had been ſoundly *drubbed* with a good honeſt cudgel. *L'Eſtrange.*

He that is valiant, and dares fight,
Though *drubb'd*, can loſe no honour by't. *Hudibras.*

DRUB, *ſ.* A thump; a knock; a blow.—By ſetting an unfortunate mark on their followers, they have expoſed them to innumerable *drubs* and contuſions. *Addiſon.*

DRUCK'EBACH, a river of Germany, in the Upper Bavaria, which runs into the Inn, about three miles below Kufſtein.

To DRUDGE, *v. a.* [ðnæccan, to vex, Sax. *draghen*, to carry, Dut.] To labour in mean offices; to toil without honour or dignity; to work hard; to ſlave.—Advantages obtained by induſtry, directed by philoſophy, can never be expected from *drudging* ignorance. *Glanville.*

Proffering for hire his ſervice at the gate,
To *drudge*, draw water, and to run or wait. *Dryden.*

DRUDGE, *ſ.* One employed in mean labour; a ſlave; one doomed to ſervile occupation.—The hard maſter makes men ſerve him for nought, who rewards his *drudges* and ſlaves with nothing but ſhame, and ſorrow, and miſery. *Tillotſon.*

He is content to be their *drudge*,
And on their errands gladly trudge. *Hudibras.*

DRUD'GER, *ſ.* A mean labourer. An oiſter-fiſher. The drudging-box; the box out of which flour is thrown over meat. See DREDGER.

DRUD'GERY, *ſ.* Mean labour; ignoble toil; diſhonourable work; ſervile occupation.—Paradiſe was a place of bliſs, as well as immortality, without *drudgery*, and without ſorrow. *Locke.*

Even *Drudgery* himſelf,
As at the car he ſweats, or duſty hews
The palace ſtone, looks gay. *Thomſon.*

DRUD'GING-BOX, *ſ.* The box out of which flour is ſprinkled upon roaſt meat, &c.

But if it lies too long, the crackling's pall'd,
Not by the *drudging-box* to be recall'd. *King.*

DRUD'GINGLY, *adv.* Laboriouſly; toilſomely.—He does now all the meaneſt and triflingeſt things himſelf *drudgingly*, without making uſe of any inferior or ſubordinate miniſter. *Ray.*

DRU'ENT, a town of the principality of Piedmont: four miles ſouth-weſt of Turin.

DRUG, *ſ.* [*drogue*, Fr.] An ingredient uſed in phyſic; a medicinal ſimple. See MATERIA MEDICA, and PHARMACY.—In the names of *drugs* and plants, the miſtake in a word may endanger life. *Baker.*

Judicious phyſic's noble art to gain,
He *drugs* and plants explor'd, alas! in vain. *Smith.*

Bright Helen mix'd a mirth-inſpiring bowl,
Temper'd with *drugs* of ſov'reign uſe, t'aſſuage
The boiling boſom of tumultuous rage. *Pope.*

It is uſed ſometimes for poiſon:

Mortal *drugs* I have; but Mantua's law
Is death to any he that utters them. *Shakeſpeare.*

And yet no doubts the poor man's draught controll;
He dreads no poiſon in his homely bowl:
Then fear the deadly *drug*, when gems divine
Enchaſe the cup, and ſparkle in the wine. *Dryden.*

Any thing without worth or value; any thing of which no purchaſer can be found:

Each noble vice ſhall bear a price,
And virtue ſhall a *drug* become:
An empty name, was all her fame,
But now ſhe ſhall be dumb. *Dryden.*

A drudge. *This ſeems the meaning here:*

He from his firſt ſwath proceeded
Thro' ſweet degrees that this brief world affords,
To ſuch as may the paſſive *drugs* of it
Freely command. *Shakeſpeare.*

To DRUG, *v. a.* To ſeaſon with ingredients, commonly medicinal. To tincture with ſomething offenſive:

Oft they aſſay'd,
Hunger and thirſt conſtraining; *drugg'd* as oft
With hatefuleſt diſreliſh, writh'd their jaws
With foot and cinders fill'd. *Milton.*

DRUG-DAMNED, *adj.* Infamous for poiſons.—That *drug-damn'd* Italy hath out-crafted him. *Shakeſpeare.*

DRUG'GET, *ſ.* A ſlight kind of woollen ſtuff:

In *druggets* dreſt, of thirteen pence a-yard,
See Philip's ſon amidſt his Perſian guard. *Swift.*

DRUG'GIST, *ſ.* One who ſells phyſical drugs. A dealer in medicine.

DRUG'STER, *ſ.* One who ſells phyſical ſimples.—Common oil of turpentine I bought at the *drugſter's*. *Boyle.*—They ſet the clergy below their apothecaries, the phyſician of the ſoul below the *drugſters* of the body. *Atterbury.*

DRU'IA, a town of Lithuania, in the palatinate of Wilna: ſixteen miles north-eaſt of Braſlaw.

DRU'IA, a town of Ruſſia, in the government of Polotſk, on the Duna: fifty miles north-weſt of Polotſk, and 260 ſouth-ſouth-weſt of Peterſburgh.

DRU'IDÆ, or DROIUM, a very ancient town, the principal place of the Druids in Gaul: now *Dreux*. Here they met annually, in a conſecrated grove, according to Cæſar. The town was alſo called *Durocaſes*.

DRU'IDS, DRUIDES, or DRUIDÆ, *ſ.* Prieſts or miniſters of religion among the ancient Celtæ or Gauls, Britons, and Germans. Some authors derive the word from the Hebrew דרושים *deruſſim* or *druſſim*, which they tranſlate *contemplatores*. Picard, Celtopæd. lib. ii. p. 58, believes the druids to have been thus called from *Druis*, or *Dryius*, their leader, the fourth or fifth king of the Gauls. Pliny, Salmaſius, Vigenere, &c. derive the name from δρυς, oak; on account of their teaching in groves, or under oaks. Menage derives the word from the old Britiſh *drus*, dæmon, magician. Borel, from the old Britiſh *dru*, or *derw*, oak, whence he takes δρυς to be derived; which is the moſt probable ſuppoſition. Becanus, lib. i. takes *druis* to be an old Celtic and German word, formed from *trowis* or *truwis*, "a doctor of the truth and the faith;" which etymology Voſſius adopts and approves.

The accounts we have of the druids, from different writers, are extremely various and contradictory, mingled with much childiſh ſuperſtition and fable. The moſt rational conjectures relative to their eſtabliſhment and deſignation, are to be collected from Julius Cæſar, Pliny, Strabo,

Strabo, and Diodorus Siculus. They were divided into different claſſes, called bardi, or bards, eubages, vates, ſemnothei, ſarronides, and ſamothei. They were held in the greateſt veneration by the people. Their life was auſtere and recluſe from the world, their dreſs peculiar to themſelves, and they generally appeared with a tunic which reached a little below the knee. The chief power was lodged in their hands; they puniſhed as they pleaſed, and could declare war and make peace at their option. Their power was extended not only over private families, but they could depoſe magiſtrates and even kings, if their actions in any manner deviated from the laws of the ſtate. They had the privilege of naming the magiſtrates which annually preſided over the cities, and the kings were created only with their approbation. They were entruſted with the education of youth, and all religious ceremonies, feſtivals, and ſacrifices were under their peculiar care. They taught the doctrine of the metempſychoſis, or tranſmigration, and believed the immortality of the ſoul. They were profeſſionally acquainted with the art of magic; and from their knowledge of aſtrology they drew omens, and fancied they ſaw futurity revealed before their eyes. In their ſacrifices they often immolated human victims to their gods, a barbarous cuſtom which continued long among them, and which the Roman emperors in vain attempted to aboliſh. The power and privileges which they enjoyed were beheld with admiration by their countrymen; and as their office was open to every rank and every ſtation, there were many who daily propoſed themſelves as candidates to enter upon this important function. The rigour, however, and ſeverity of a long noviciate, deterred many, and few were willing to attempt a labour, which enjoined them during fifteen or twenty years to load their memory with the long and tedious maxims of druidical religion.

There has been much abſurd controverſy concerning their origin, and the places of their religious ceremonies, temples, altars, &c. but the moſt rational concluſion is, that they uniformly officiated under the ſolemn ſhades of trees and groves. Mr. Pinkerton, in his Deſcription of Empires, &c. publiſhed in 1802, inveſtigates this part of the druidical hiſtory, and detects ſome of the errors which have crept into it. He ſays, "A radical miſtake in the ſtudy of Engliſh antiquities, has ariſen from the confuſion of the Celtic and Belgic languages and monuments. The druids have deſervedly attracted much curioſity and reſearch; but it would be erroneous to impute to them, as is uſual, the whole of our earlieſt remains. Cæſar ſpeaks of druidiſm as a recent inſtitution; and ſuch being the caſe, it is probable that it originated from the Phœnician factories, eſtabliſhed in wooden fortreſſes on the coaſt, the uſual practice of commercial nations, when trading with ſavage or barbarous races. The tenets correſpond with what little exiſts of Phœnician mythology, and the miſſionaries of that refined people might be not a little zealous in their diffuſion. However this be, the ancient authors, from whom we derive our ſole authentic information concerning the druids, minutely deſcribe their religious rites, but are totally ſilent concerning any monuments of *ſtone* being uſed among them. On the contrary, they mention gloomy groves, and ſpreading oaks, as the only ſcenes of the druidic ceremonies. Yet our antiquaries have inferred that Stonehenge is a druidic monument, though it be ſituated in an extenſive plain, where not a veſtige of wood appears, and where the very ſoil is reputed adverſe to its vegetation.

"It might, perhaps, be a vain effort of inveſtigation, to attempt to diſcriminate the remains of the earlieſt inhabitants from thoſe of the druidic period; indeed, if we ſet aſide the authorities of modern antiquaries, too commonly viſionary and diſcordant, there is no foundation whatever for any ſound or real knowledge on the ſubject. The following have been eſteemed druid monuments by Borlaſe: 1. Single ſtones erect. 2. Rock idols and pierced ſtones. 3. Rocking-ſtones uſed as ordeals. 4. Sepulchres of two, three, or more, ſtones. 5. Circular temples, or rather circles of erect ſtones. 6. Barrows or tumuli. 7. Cromlechs, or heaps of ſtones. 8. Rock-baſons, imagined to have been uſed in druidic expiations. 9. Caves, uſed as places of retreat in time of war. But as moſt of theſe relics may alſo be found in Germany and Scandinavia, it becomes hazardous to pronounce whether they be Gothic or Celtic; and, as we learn from ancient authors that the Germans had no druids, to beſtow the name of druidic upon ſuch monuments, is the mere wantonneſs of conjecture. It is, however, moſt probable, that the earlieſt inhabitants, as is ever the practice in the infancy of ſociety, made uſe of wood, *not ſtone*, in their religious as well as in their domeſtic erections. If we ſurvey the various ſavage regions of the globe, we ſhall ſeldom or never perceive the uſe of ſtone; and it is certainly juſt to infer, that the ſavages of the weſt were not more ſkilful than thoſe of the eaſt; nor thoſe of the old continents and iſlands than thoſe of the new. A learned ignorance upon ſuch topics, is preferable to an aſſumed and imaginary knowledge.

"But as many of theſe monuments are found in Germany, Scandinavia, and Iceland; and as the Icelandic writers in particular, often indicate their origin and uſe, which are unknown in the Celtic records, there is every reaſon to attribute them to a more advanced ſtage of ſociety, when the Belgic colonies introduced agriculture, and a little further progreſs in the rude arts of barbariſm. The nature of this work will not admit a formal inveſtigation of ſuch topics, but a few remarks may be offered on Stonehenge, a ſtupendous monument of barbaric induſtry. Inigo Jones, in attempting to prove that it is Roman, only evinces that no talents can avail when ſcience is wanting, and that antiquities require a ſevere and peculiar train of ſtudy. Doctor Stukeley aſſigns Stonehenge to the druids; while Dr. Charlton, perceiving that ſuch monuments are found in Denmark, aſcribed it to the Danes. If the latter had conſidered that the Belgæ were a Gothic nation, of ſimilar language and inſtitutions, he might with more juſtice have extended its antiquity. From the Icelandic writers, we learn, that ſuch circles were called *domh-ringr*, that is, literally, *doom-ring*, or circle of judgment, being the ſolemn places where courts were held, of all kinds and dignities, from the national council down to the baronial court, or that of a common proprietor of land, for adjuſting diſputes between his *villani* and ſlaves. The magnificence of Stonehenge loudly pronounces that it was the ſupreme court of the nation, equivalent to the *champs de Mars et de Mai* of the Franks, where the king and chiefs aſſembled in the circle, and the men capable of arms in the open plain; nor is it improbable that the chiefs aſcended the tranſverſe ſtones, and declared their reſolves to the ſurrounding crowd, who, in the deſcription of Tacitus, diſſented by loud murmurs, or applauded by claſhing their ſhields. This idea receives confirmation from the circumſtance that the Belgæ peculiarly ſo called, as being the chief and ruling colony of that people, were ſeated in the ſurrounding province; and Sorbiodunum, now Old Sarum, was their capital city.

"Similar circles of ſtone, but far inferior in ſize, are found in many parts of Great Britain and Ireland; and ſeveral undoubtedly as late as the Daniſh inroads and uſurpations, the practice being continued by that people at leaſt till their converſion to Chriſtianity, in the tenth and eleventh centuries. Some of the ſmalleſt, as we learn from the northern antiquaries, were merely places of family ſepulture. At a later period the circles of judgment, which had been polluted with human ſacrifices, and other pagan rites, were abandoned; and the great courts were held on what were called *moot-hills*, or hills of meeting, many of which ſtill exiſt in the Britiſh dominions, and in the Netherlands. They commonly conſiſt of a central eminence, on which ſat the judge and

his aſſiſtants; beneath was an elevated platform for the parties, their friends, and conpurgators, who ſometimes amounted to a hundred or more; and this platform was ſurrounded with a treneh to ſeeure it from the aeeeſs of mere ſpectators. Of the other monuments of this period, a more brief eonſideration will ſuffiee. When a monarch, or diſtinguiſhed general, was buried, a barrow or hilloek was erected to preſerve his name and memory to future ages: the ſize depending on the reputation of the perſon, which attracted a ſmaller or larger number of operators. Sueh monuments are very aneient, and even to this day, aeeording to Dallaway, Morritt, and others, denote the ſepulchres of ſome of the heroes of the Trojan war. In later times a large ſingle ſtone erected was eſteemed a ſuffieient memorial: ſuch ſingle ſtones alſo ſometimes appear as monuments of remarkable battles, or merely as boundaries."

Dr. Bryant has endeavoured to ſhew, that the religion of the druids was the worſhip of the ſun, whieh prevailed univerſally over all nations of the earth in thoſe primitive ages, when the people had apoſtatiſed from the worſhip of the true God, and reſorted to "groves" and "high plaees;" ſo much depreeated in the holy ſcriptures. "High groves, and aneient woods of oak, (ſays this author,) were named *ſaron*; and as oaks were ſtiled *ſaronides*, ſo likewiſe were the aneient druids, by whom the oak was held ſo saered. Henee Diodorus Sieulus, ſpeaking of the prieſts of Gaul, ſtiles them φιλοσοφοι, θεολογοι—περιτ῎λως τιμωμενοι, ους ΣΑΡΩΝΙΔΑΣ ονομαζουσι. This is one proof among many how far the Amonian religion, or worſhip of the ſun, was extended: and how little we know of druidieal worſhip, either in reſpect to its eſſenee or its origin. The praetiee of ſhewing a reverential regard to huge ſtones, and fragments of roeks, whieh were particularly uneouth and horrid, prevailed alſo in many eountries. It was uſual with much labour to place one vaſt ſtone upon another for a religious memorial. The ſtones thus plaeed, they oftentimes poized ſo equably, that they were affected with the leaſt external foree: nay, a breath of wind would ſometimes make them vibrate. We have many inſtanees in our own eountry; and they are to be found in other parts of the world: and wherever they oeeur we may eſteem them of the higheſt antiquity. All ſueh works we generally refer to the Celts, and druids; under the ſanction of whieh names we ſhelter ourſelves, whenever we are ignorant and bewildered. But they were the operations of a very remote age; probably before the time, when the druids, or eeltæ, were firſt known. I queſtion, whether there be in the world a monument, whieh is much prior to the eelebrated Stonehenge. There is reaſon to think, that it was erected by a foreign eolony; one of the firſt, whieh eame into the iſland. Here is extant at this day, one of thoſe roeking ſtones, of whieh I have been ſpeaking.

"The ancients diſtinguiſhed ſtones erected with a religious view by the name of *amber*; by which was ſignified any thing ſolar and divine. The Grecians called them πε῎ρει αμβροσιαι; and there are repreſentations of ſuch upon coins. Stonehenge is compoſed of theſe amberſtones: henee the next town is denominated *Ambros-bury*; not from a Roman Ambroſius, for no ſueh perſon exiſted; but from the *ambroſiæ petræ*, in whoſe vieinity it ſtands. Some of theſe were roeking ſtones; and there was a wonderful monument of this ſort near Penzanee in Cornwall. It ſtill retains the name of *main-amber*, by whieh is ſignified the *ſacred ſtones*. The like myſteries, aeeording to Artemidorus, prevailed in one of the Britiſh iſlands; in whieh, he ſays, that the worſhip of Damater was carried on with the ſame rites as in Samothracia. *Strabo*, l. 4. I make no doubt, but that this hiſtory was true, and that theſe rites prevailed in many parts of Britain, eſpeeially in the iſle of Mona, i. e. Angleſey; where, in aftertimes, was the chief ſeat of the faronides, or druids. Monai ſignifies *inſula ſelenites*. It was ſometimes expreſſed Menai; as is evident from the frith between the iſland and the main land being ſtiled *Aber Menai*, at this day. Aber Men Ai ſignifies *fretum inſulæ dei lunæ*; which iſland undoubtedly had this name from its rites. The ſame worſhip was probably extended to ſome of the Seottiſh iſles, the Hebrides of the aneients, and partieularly into that ealled Columbkil." For a further elueidation, ſee the articles ANGLESEY, vol. i. p. 700; BARD, vol. ii. p. 716; and BARROW, p. 758.

DRUI'DICAL, *adj.* Relating to the druids.—Any *druidical* anecdotes I can meet with I will be ſure to ſend you. *Gray.*

DRU'IDISM, *ſ.* The religion of the druids.—It was reſerved for Dr. Borlaſe to lay open the whole ſyſtem of *druidiſm*. *Gough.*

DRUM, *ſ.* [*tromme*, Dan. *drumme*, Erſe.] An inſtrument of military muſic, conſiſting of vellum ſtrained over a broad hoop on each ſide, and beaten with ſtieks.—*Kettle Drums* are in the ſhape or form of large baſons of eopper or braſs, rounded in the bottom, and eovered with vellum or goat ſkin, whieh is kept faſt by a eircle of iron round the body of the drum. They are uſed among the cavalry, and in eoneerts of muſie, &c. The drum is by Le Clere ſaid to have been an oriental invention, and to have been brought by the Moors into Spain.—Let's mareh without the noiſe of threatening *drums*. *Shakeſpeare.*

Now no more the *drum*
Provokes to arms, or trumpet's clangor ſhrill
Affrights the wives, and chills the virgin's blood. *Philips.*

The tympanum of the ear, or the membrane which perceives the vibration of the air, or of ſound. A fine fieve.—A word once in vogue for a large aſſembly of viſitors—From the dueheſs at her *drum* to the landlady behind her bar. *Fielding.*

And oft though Juno begg'd ſhe'd come
To Mount Olympus, to her *drum*,
Yet ſhe refus'd. *Maſon.*

To DRUM, *v. n.* To beat a drum; to beat a tune on a drum. To beat with a pulſatory motion:

Now, heart,
Set ope thy ſluiees, ſend the vigorous blood
Through every active limb for my relief;
Then take thy reſt within the quiet eell,
For thou ſhalt *drum* no more. *Dryden.*

DRUM, a town of Bohemia, in the eirele of Leitzmeritz: three miles ſouth of Leypa.

DRUM, mountains of Ireland, in the county of Waterford: three miles ſouth-weſt of Dungarvan.

DRUM POINT, a cape of the American States, on the north ſide of the Patuxen, at the mouth oppoſite Cedar Point.

To DRUM'BLE, *v. n.* To drone; to be ſluggiſh. *Hanmer.*—Take up theſe elothes here quickly: where is the eowiſtaff? Look, how you *drumble!* earry them to the landreſs in Datchet Mead. *Shakeſpeare.*

DRUM'BOTE, a town in Ireland, in the county of Monaghan, and provinee of Ulſter.

DRUMLANRI'G, a town of Scotland, in the county of Dumfries, ſituated on the Nith: thirteen miles north of Dumfries.

DRUMMA'JOR, *ſ.* The chief drummer of a regiment:

Sueh company may chanee to ſpoil the ſwearing,
And the *drummajor*'s oaths, of bulk unruly,
May dwindle to a feeble— *Cleaveland.*

DRUM'MAKER, *ſ.* He who deals in drums.—The *drummaker* uſes it, and the cabinetmaker. *Mortimer.*

DRUM'MER, *ſ.* He whoſe offiee is to beat the drum.—*Drummer*, ſtrike up, and let us mareh away. *Shakeſpeare.*

Here rows of *drummers* ſtand in martial file,
And with their vellum-thunder ſhake the pile. *Gay.*

DRUM'MING, *part. adj.* Beating a drum; diſcarding by beat of drum.

DRUM'MOND (William), an elegant Scottiſh poet,

ſon of ſir John Drummond of Hawthornden, born in 1585. He was educated at the high ſchool, and afterwards at the univerſity of Edinburgh. When he had finiſhed his academical ſtudies, he ſpent four years in foreign travel; during part of which he reſided at Bourges, for the ſtudy of the civil law. On his return to Scotland, inſtead of following the profeſſion for which he had qualified himſelf, he choſe to devote his time to mental improvement, and the cultivation of polite literature. The affecting circumſtance of being deprived by a fever of a beautiful young lady, to whom he was going to be married, threw him into a melancholy, which rendered his home inſupportable, and drove him for relief again to foreign travel. He remained abroad eight years, viſiting the principal cities and univerſities of Germany, France, and Italy, and cultivating an acquaintance with men of letters. Upon his return he employed himſelf in compoſing his Hiſtory of the five Jameſes, Kings of Scotland, which work did not appear till after his death. As his principles were highly monarchical and epiſcopalian, he was much afflicted when his country broke out into civil war againſt Charles I. and he wrote many pieces in ſupport of the regal and eccleſiaſtical claims. The fatal event of the conteſt is thought to have ſhortened his days. He died in December, 1649, in his ſixty-fourth year. From the preceding narrative it appears that Drummond poſſeſſed that gentle and unambitious diſpoſition which fits a man for the retired walks of life, and becomes a votary of the muſes. It is almoſt ſolely as a poet that Drummond is now remembered; and in that claſs he may claim as high a rank as almoſt any of his contemporaries, without requiring any allowance for provinciality of language. In fact, his diction is Engliſh of the moſt cultivated kind then in uſe, and muſt have been derived to him from the ſtudy of the beſt models. The ſweetneſs and melody of his verſe in many inſtances are ſcarcely to be exceeded; and though in the thoughts there is a tinge of the conceit of the Italian ſchool, yet much real beauty of imagery and truth of feeling are to be found.

DRUM'STICK, *ſ.* The ſtick with which a drum is beaten.

DRUNK, *adj.* Intoxicated with ſtrong liquor; inebriated.—We generally conclude that man *drunk*, who takes pains to be thought ſober. *Spectator.*—Drenched or ſaturated with moiſture.—I will make mine arrows *drunk* with blood. *Deut.*

DRUNK'ARD, *ſ.* One given to exceſſive uſe of ſtrong liquors; one addicted to habitual ebriety.—God will not take the *drunkard*'s excuſe, that he has ſo long accuſtomed himſelf to intemperate drinking, that now he cannot leave it off. *South.*

DRUNK'EN, *adj.* Intoxicated with liquor; inebriated:

O monſtrous beaſt! how like a ſwine he lies!
Sirs, I will practiſe on this *drunken* man. *Shakeſpeare.*

—*Drunken* men imagine every thing turneth round; they imagine that things come upon them; they ſee not well things afar off; thoſe things that they ſee near hand, they ſee out of their place, and ſometimes they ſee things double. *Bacon.*—Given to habitual ebriety. Saturated with moiſture.—Then let the earth be *drunken* with our blood. *Shakeſpeare.*—Done in a ſtate of inebriation:

When your carters, or your waiting vaſſals,
Have done a *drunken* ſlaughter, and defac'd
The precious image of our dear Redeemer,
You ſtraight are on your knees for pardon. *Shakeſpeare.*

DRUNK'ENLY, *adv.* In a drunken manner:

My blood already, like the pelican,
Haſt thou tapt out, and *drunkenly* carous'd. *Shakeſpeare.*

DRUNK'ENNESS, *ſ.* Intoxication with ſtrong liquor. Every going off from our natural and common temper, and our uſual ſeverity of behaviour, is a degree of *drunkenneſs*. *Taylor.*—Habitual ebriety.—The Lacedemonians trained up their children to hate *drunkenneſs*, by bringing a drunken man into their company. *Watts.*—Intoxication or inebriation of any kind; diſorder of the faculties.—Paſſion is the *drunkenneſs* of the mind, and therefore in its preſent workings not controulable by reaſon. *Spenſer.*

Drunkenneſs, ſays Mr. Paley, is a ſocial feſtive vice, the example of which, like an influenza, may corrupt others, until a whole neighbourhood be infected with the contagion. The fatal conſequences of this vice cannot be enough abhorred, nor ſufficiently deplored: nor is it eaſy to imagine, after ſo many ſhocking inſtances of revengeful cruelty and infamous conduct which ſtand upon record as reſulting from drunkenneſs, how any human being in theſe enlightened days, can ſuſtain the indignity and folly of ſuch a vice. Drunkenneſs was the higheſt diſgrace to the court of Alexander the Great; who, according to Seneca, died of a debauch. Being carouſing with twenty gueſts at table, in the city of Babylon, he drank to the health of every perſon in company, and then pledged them ſeparately. After this, calling for Hercules's cup, which held an incredible quantity, it was filled, when he poured it all down, drinking to a Macedonian, Proteus by name; and afterwards pledged him again, in the ſame extravagant bumper. He had no ſooner ſwallowed it, than he fell ſenſeleſs upon the floor. "Here, then, (cries Seneca,) this hero, unconquered by all the toils of prodigious marches, expoſed to the dangers of ſieges and combats, to the moſt violent extremes of heat and cold; here he lies ſubdued by his intemperance, and ſtruck to the earth by the fatal cup of Hercules." In this condition he was ſeized with a fever, which, in a few days, terminated in death. No one, ſays Plutarch and Arrian, ſuſpected then that Alexander had been poiſoned; the true poiſon which brought him to this diſgraceful end was wine, which has killed many thouſands beſides Alexander.

The vice of drunkenneſs is ſeverely reprehended in the holy ſcriptures. It is repeatedly forbidden by St. Paul: *Be not drunk with wine, wherein is exceſs. Let us walk honeſtly as in the day, not in rioting and drunkenneſs. Be not deceived: neither fornicators, nor drunkards, nor revilers, nor extortioners, ſhall inherit the kingdom of God.* Eph. v. 18. Rom. xiii. 13. 1 Cor. vi. 9. 10. The ſame apoſtle likewiſe condemns drunkenneſs, as peculiarly inconſiſtent with the Chriſtian profeſſion: *They that be drunken, are drunken in the night; but let us, who are of the day, be ſober.* 1 Theſſ. v. 7, 8. By the law of England, drunkenneſs is conſidered as an aggravation rather than an excuſe for any criminal behaviour. A drunkard, ſays ſir Edward Coke, who is *voluntarius dæmon*, hath no privilege thereby; but what hurt or ill ſoever he doth, his drunkenneſs doth aggravate it: *nam omne crimen ebrietas, et incendit, et detergit.* For the offence of drunkenneſs, a man may be puniſhed in the eccleſiaſtical court, as well as by juſtices of the peace. And, by 4 Jac. I. c. 5. and 21 Jac. I. c. 7. if any perſon ſhall be convicted of drunkenneſs by the view of a juſtice, or oath of one witneſs, &c. he ſhall forfeit five ſhillings for the firſt offence, to be levied by diſtreſs and ſale of his goods; and for want of a diſtreſs, ſhall ſit in the ſtocks ſix hours: and, for the ſecond offence, he is to be bound with two ſureties in ten pounds each, to be of good behaviour, or to be committed. And he who is guilty of any crime through his own voluntary drunkenneſs, ſhall be puniſhed for it as if he had been ſober. It has been held that drunkenneſs is a ſufficient cauſe to remove a magiſtrate: and the proſecution for this offence by the ſtatute of 4 Jac. I. c. 5. was to be, and ſtill may be, before juſtices of peace in their ſeſſions by way of indictment. Equity will not relieve againſt a bond, &c. given by a man when drunk, unleſs the drunkenneſs is occaſioned through the management or contrivance of him to whom the bond is given. *Co. Lit.* 247. 3 *P. Wil.* 130.

The baneful effects of drunkenneſs on the human frame and conſtitution are conſtantly before our eyes, and yet operate not at all in diminiſhing the evil. Vinous particles abſorbed into the ſyſtem muſt diſtend the blood in the

the veins and ſinuſes, compreſs the medullary ſubſtance, and diſpoſe to ſleep, and to a paralytic affection of the nervous ſyſtem.

"What ſoberneſs conceals, DRUNKENNESS reveals." The Latins ſay; *Quod in corde ſobrii, in lingua ebrii:* What is in the heart of the ſober man, is in the tongue of the drunkard; or, *In vino veritas.* Gr. Εν οινω αληθεια, In wine is truth. Fr. *Le vin fait dire la verité:* When wine is in, the wit is out. A proverb calculated to guard all men againſt placing any confidence in drunkards.

DRUPACE'Æ, *ſ.* in botany, the thirty-eighth order in Linnæus's Fragments of a Natural Method: containing thoſe trees which bear a drupe or plum.

DRUPA'CEOUS, *adj.* [*drupa*, Lat. ripe fruit.] In botany, trees bearing ripe fruit with a fleſhy pericarpium.

DRUPE, *ſ.* [*drupa*, Lat.] In botany, a pulpy pericarp or fruit without valves, containing a nut or ſtone with a kernel: as plum, apricot, peach, almond, olive, cherry, &c.

DRU'RYD, a river of Wales, in the county of Merioneth, which runs into the Iriſh ſea, about two miles north-north-weſt of Harlech.

DRU'SES, or DRUZES, a remarkable nation in Paleſtine, inhabiting between Mount Lebanon and the Mediterranean Sea, and about Keſroan, under the ſovereignty of the grand emir of Deir al Camer; and of whoſe origin and hiſtory a very entertaining detail is given in the writings of M. Volney. The proper and diſtinctive character of the Druſes is a ſort of republican ſpirit, which gives them more energy than any other ſubjects of the Turkiſh government, and an indifference for religion, which forms a ſtriking contraſt with the zeal of the Mahometans and Chriſtians. In other reſpects, their private life, their cuſtoms and prejudices, are the ſame with other orientals. They may marry ſeveral wives, and repudiate them when they chooſe; but, except by the emir and a few men of eminence, that is rarely practiſed. Occupied with their rural labours, they experience neither artificial wants, nor thoſe inordinate paſſions which are produced by the idleneſs of the inhabitants of cities and towns. The veil, worn by their women, is of itſelf a preſervative againſt thoſe deſires which are the occaſion of ſo many evils in ſociety. No man knows the face of any other woman than his wife, his mother, his ſiſter, and ſiſters-in-law. Every man lives in the boſom of his own family, and goes little abroad. The women, thoſe even of the ſhaiks, make the bread, roaſt the coffee, waſh the linen, cook the victuals, and perform all domeſtic offices. The men cultivate their lands and vineyards, and dig canals for watering them. In the evening they ſometimes aſſemble in the court, the area, or houſe of the chief of the village or family. There, ſeated in a circle, with legs croſſed, pipes in their mouths, and poniards at their belts, they diſcourſe of their various labours, the ſcarcity or plenty of their harveſts, peace or war, the conduct of the emir, or the amount of the taxes; they relate paſt tranſactions, diſcuſs preſent intereſts, and form conjectures on the future. Their children, tired with play, come frequently to liſten; and a ſtranger is ſurpriſed to hear them, at ten or twelve years old, recounting, with a ſerious air, why Djezzar declared war againſt the emir Youſef, how many purſes it coſt that prince, what augmentation there will be of the miri, how many muſkets there were in the camp, and who had the beſt mare. This is their only education. They are neither taught to read the pſalms as among the Maronites, nor the koran like the Mahometans. But if their mind be deſtitute of uſeful or agreeable information, at leaſt it is not pre-occupied by falſe and hurtful ideas; and, without doubt, ſuch natural ignorance is worth all our artificial folly. This advantage reſults from it, that their underſtandings being nearly on a level, the inequality of conditions is leſs perceptible. For, in fact, we do not perceive among the Druſes that great diſtance which, in moſt other ſocieties, degrades the inferior, without contributing to the advantage of the great. All, whether ſhaiks or peaſants, treat each other with that rational familiarity which is equally remote from rudeneſs and ſervility. The grand emir himſelf is not a different man from the reſt: he is a good country gentleman, who does not diſdain admitting to his table the meaneſt farmer. In a word, their manners are thoſe of ancient times, and of that ruſtic life which marks the origin of every nation; and prove that the people among whom they are ſtill found are as yet only in the infancy of the ſocial ſtate. According to Volney, they practiſe neither circumciſion, prayers, nor faſting; they obſerve neither feſtivals nor prohibitions; they drink wine; and allow marriage between brothers and ſiſters, but not between parents and children, nor with ſtrange women. They ſubmit with implicit obedience to the government of their emirs, and are ſaid to make the beſt ſoldiers in the Turkiſh empire. They are divided into a profane and a ſacred caſt, and make a diſtinction between clean and unclean food. They ſwear not at all; and only corroborate their affirmations with an "I have ſaid it." Their ſabbath is kept on the Friday. Their iman, or chief prieſt, is elective. They are Unitarians; but they acknowledge ſeven holy law-givers, or prophets, Adam, Noah, Abraham, Moſes, Jeſus, Muhamed, and Sain. They maintain that the ſame celeſtial ſpirit, divine mind, holy ghoſt, or angelic ſoul, was ſucceſſively incarnate in each of theſe human bodies. They believe the ſouls of the four evangeliſts to have in like manner re-appeared among them, in the forms of Iſmael, Aleolamoch, Ali, and Behardin. They permit exterior conformity to the rights of other ſects, in thoſe who travel; but forbid the revelation of their own tenets to the heathens. Their Muhamed flouriſhed in 1017, and was alſo called *Druſi*, whence they take their name; but they value ſtill higher a later prophet, whom they not only call Sain, but Hamſa, and whom they conſider as the real Meſſiah. See C. W. Ludeeke's Deſcription of the Turkiſh Empire, 1780; and Eichhorn's Repertory, part xii.

DRUSIL'LA, [Gr. *i. e.* dewy eyes.] A proper name of women.

DRU'SIUS (John), a proteſtant writer of great learning, born at Oudenarde, in Flanders, in 1555. He was deſigned for the ſtudy of divinity; but his father being outlawed, and deprived of his eſtate, they both retired to England, where the ſon became profeſſor of the oriental languages at Oxford: but, upon the pacification of Ghent, they returned to their own country, where Druſius was ſoon appointed profeſſor of the oriental languages. From thence he removed to Frieſland, where he was admitted Hebrew profeſſor in the univerſity of Franeker; the functions of which he diſcharged with great honour till his death in 1616. His works ſhew him to have been well ſkilled in Hebrew; and the ſtates-general employed him to write notes on the moſt difficult paſſages in the Old Teſtament, with a penſion of 400 florins a-year: but, being frequently diſturbed in this undertaking, it was not publiſhed till after his death. He held a vaſt correſpondence with the learned; for, beſides letters in Hebrew, Greek, and other languages, there were found 2300 Latin letters among his papers. He had a ſon John, who died in England, aged only twenty-one, and was a prodigy for his early acquiſition of learning; he wrote Notes on the Proverbs of Solomon, with many letters and verſes in Hebrew.

DRU'SUS, a valiant Roman, ſon of Tiberius and Vipſania, who made himſelf famous by his intrepidity and courage in the provinces of Illyricum and Pannonia. He was raiſed to the greateſt honours of the ſtate by his father, but a blow which he gave to Sejanus, an audacious libertine, proved his ruin. Sejanus corrupted Livia the wife of Druſus, and in conjunction with her he cauſed him to be poiſoned by an eunuch, A. D. 23.—A ſon of Germanicus and Agrippina, who enjoyed offices of the greateſt truſt under Tiberius. His enemy Sejanus, how-

ever, effected his ruin by his infinuations; Druſus was confined by Tiberius and deprived of all aliment. He was found dead nine days after his confinement, A. D. 33. —A ſon of the emperor Claudius, who died by ſwallowing a pear thrown in the air.—M. Livius, a celebrated Roman who renewed the propoſals of the Agrarian laws, which had proved fatal to the Gracchi. He was murdered as he entered his houſe, though he was attended by a number of clients and Latins, to whom he had propoſed the privileges of Roman citizens, 190 years before Chriſt. *Cic. ad Her.* 4, c. 12.—Nero Claudius, a ſon of Tiberius Nero and Livia, adopted by Auguſtus. He was brother to Tiberius, who was afterwards made emperor. He greatly ſignalized himſelf in his wars in Germany and Gaul againſt the Rhæti and Vindelici, and was honoured with a triumph. He died of a fall from his horſe in the thirtieth year of his age, nine years before Chriſt. He left three children, Germanicus, Livia, and Claudius, by his wife Antonia. The plebeian family of the Druſi produced eight conſuls, two cenſors, and one dictator. The ſurname of Druſus was given to the family of the Livii, as ſome ſuppoſe, becauſe one of them killed a Gauliſh leader of that name. *Virgil, in Æn.* vi. 824, mentions the Druſi among the illuſtrious Romans, and that perhaps more particularly becauſe the wife of Auguſtus was of that family.

DRUS'WER, a town of Lithuania, in the palatinate of Wilna: fourteen miles weſt of Braſlaw.

DRUT'ISCHKEN, a town of Pruſſian Lithuania, on the Rominte: four miles ſouth-ſouth-eaſt of Gumbinen.

DRUTZ, a river of Ruſſia, which runs into the Dnieper, at Rogatchev, in the government of Mogilev.

DRU'YN, or DREVIN PETRI, or GRAND DREVIN, a town of Africa, on the Ivory coaſt, at the mouth of the river St. Andre. Lat. 5. N. lon. 4. 5. W. Greenwich.

DRUYSKID'WAR, a town of Lithuania, in the palatinate of Wilna: eight miles north-eaſt of Braſlaw.

DRU'YE, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of St. Fargeau: ſixteen miles ſouth of Auxerre.

DRU'ZENHEIM, a town of France, in the department of the Lower Rhine, on the Zorn, taken by the imperial troops in 1704, and retaken by the French two years after: four leagues and a half north-north-eaſt of Straſburg.

DRY, *adj.* [ðpiȝ, Sax.] Arid; not wet; not moiſt.—If the pipe be a little wet on the inſide, it will make a differing ſound from the ſame pipe *dry*. *Bacon.*

When God ſaid,
Be gather'd now, ye waters under heav'n,
Into one place, and let *dry* land appear! *Milton.*

Not rainy.—A *dry* March and a *dry* May portend a wholeſome ſummer, if there be a ſhowering April between. *Bacon.*—Not ſucculent; not juicy.—I will drain him *dry* as hay. *Shakeſpeare.*—Wine that, by reaſon of age, is pretty well dephlegmated, or has loſt much of its wateriſh quality.—Being without tears:

Dry mourning will decays more more deadly bring,
As a north wind burns a too forward ſpring;
Give ſorrow vent, and let the ſluices go. *Dryden.*

Thirſty; a-thirſt:

Void of a bulky charger near their lips,
With which, in often interrupted ſleep,
Their frying blood compels to irrigate
Their *dry* furr'd tongues. *Philips.*

Jejune; barren; plain; unembelliſhed; without pathos; without flowers.—As we ſhould take care that our ſtile in writing be neither *dry* nor empty, we ſhould look again if it be not winding or wanton with far-fetched deſcriptions: either is a vice. *Ben Jonſon.*—Hard; ſevere. [*Drien* anciently to *endure*; *dree*, Scottiſh.]

Hard *dry* baſtings us'd to prove
The readieſt remedies of love;
Next a *dry* diet. *Hudibras.*

"He who drinks when he is not DRY, will be DRY when he has no drink." That is, will conſume his ſubſtance in drunkenneſs and folly, and thereby render himſelf incapable of providing for his common neceſſities.

"DRY bargains are ſeldom ſucceſsful." Spoken when people are about a bargain, and propoſe doing it over the bottle or bowl. The Latins ſay: *Venalia, fine vino, expediri non poſſunt.*

"To DRY ſnow in an oven." The Germans ſay: *Soknee in ofen doerren.* There are many proverbs to the ſame purpoſe, calculated to ſhew the folly of attempting impoſſibilities; as, *To waſh a blackmoor white*; *To draw water in a ſieve*; *to kick againſt the pricks*, &c.

To DRY, *v. a.* To free from moiſture; to rareſy; to exſiccate.—Herbs and flowers, if they be *dried* in the ſhade, or *dried* in the hot ſun a ſmall time, keep beſt. *Bacon.*

The running ſtreams are deep:
See, they have caught the father of the flock,
Who *dries* his fleece upon the neighbouring rock. *Dryden.*

To exhale moiſture:

'Twas grief no more, or grief and rage were one
Within her ſoul: at laſt 'twas rage alone;
Which, burning upwards in ſucceſſion, *dries*
The tears that ſtood conſidering in her eyes. *Dryden.*

To wipe away moiſture.—Then with her veſt the wound ſhe wipes and *dries*. *Denham.*—To ſcorch with thirſt.—Their honourable men are famiſhed, and their multitude *dried* up with thirſt. *Iſaiah*, v. 13.—To drain; to exhauſt:

Raſh Elpenor, in an evil hour,
Dried an immeaſurable bowl, and thought
T' exhale his ſurfeit by irriguous ſleep,
Imprudent: him death's iron ſleep oppreſt. *Philips.*

To DRY *up*. To deprive totally of moiſture; to take all moiſture away.—The water of the ſea, which formerly covered it, was in time exhaled and *dried up* by the ſun. *Woodward.*

To DRY, *v. n.* To grow dry; to loſe moiſture; to be drained of its moiſture.

DRY EXCHANGE, *ſ.* [*cambium ſiccum*, Lat.] A term invented in former times for the diſguiſing and covering of uſury; in which ſomething was pretended to paſs on both ſides, whereas nothing paſſed but on one ſide, in which reſpect it was called *dry*: puniſhed by ſtat. 3 Hen. VII. c. 5.

DRY-FOOT, *ſ.* [a term of the chace.] Hunting by the ſcent of the foot.—A hound that runs counter, and yet draws *dry-foot* well. *Shakeſpeare.*

DRY HARBOUR, a bay on the north coaſt of the iſland of Jamaica. Lat. 18. 30. N. lon. 77. 16. W. Greenwich.

DRY-ROT, *ſ.* a term lately given by ſome modern ſurveyors to what is called "an *infectious* diſeaſe in timber," ſaid to ariſe from an infection in the ground, or from the infectiouſneſs of old houſes. Others contend that this decay of the timber in buildings, ariſes from nothing more than a conſtant *moiſture* or *damp*, either internal or external, which encourages the growth of a ſpecies of fungus, or other cryptogamian plant, of which the ſeeds are capable of taking root, on coming in contact with the wood; and which, by drawing moiſture from the atmoſphere, and conveying it inwardly by means of its inſinuating and ſpreading property, thus produces a decay. Analogous to this, a communication has been made from Robert Batſon, eſq. of Limehouſe, near London, to the Society for the encouragement of Arts, who have long offered premiums for the diſcovery and cure of the dry-rot in timber; and in which view Mr. Batſon ſtates to the ſociety as follows: "The dry-rot having taken place in

in one of my parlours, in ſuch manner as to require the pulling down part of the wainſcot every third year, and perceiving that it aroſe from a *damp* ſtagnated air, and from the moiſture of the earth, I determined, in the month of June, 1783, to build a narrow cloſet next the wall through which the damp came to the parlour, which had the deſired effect; but, though it put a total ſtop to the rot in the parlour, the evil ſoon appeared in the cloſet; fungi of a yellow colour aroſe, to a great degree, in various parts of it. In the autumn of the year 1786, the cloſet was locked up about ten weeks; on opening it, numerous fungi were obſerved about the lower part of it, and a white mould was ſpread by a plant reſembling a vine or ſea-weed, and the whole of the inſide, china, &c. was covered with a fine powder of the colour of brick-duſt. It being then cleaned out, I ſoon perceived that the evil had impregnated the wood ſo far as to run through every ſhelf therein, and the brackets that ſupported them; it had alſo ſeized upon, and deſtroyed, a moveable board for breaking ſugar on. I therefore, in the beginning of the year 1787, determined to ſtrip the whole cloſet of lining and floor, and not leave a particle of the wood behind; and alſo to dig and take away about two feet of the earth in depth, and leave the walls to dry, ſo as to deſtroy the roots or ſeeds of the evil. When, by time, and the admiſſion of air, and good bruſhing, it had become ſufficiently dry and cleanſed, I filled it, of ſufficient height for my joiſts, with anchor-ſmith's aſhes; knowing that no vegetable would grow in them. My joiſts being ſawed off to their proper lengths, and fully prepared, they and the plates were well charred, and laid upon the aſhes; particular directions being given that not any ſcantling or board might be cut or planed in the place, leſt any duſt or ſhavings might drop among the aſhes. My flooring-boards being very dry, I cauſed them to be laid cloſe, to prevent the dirt getting down, which I thought in a courſe of time might bring on vegetation. The framing for lining the cloſet was then fixed up, having all the lower pannels let in to be faſtened with buttons only; that, in caſe any vegetation ſhould ariſe, the pannels might with eaſe be taken out to examine them. This having now been done upwards of ſix years, and no vegetation or damp appearing, the whole of the pannels and floor remaining in the ſame ſtate as when firſt put in, I ſhall have a ſatisfaction in taking a part of the floor up, if the ſociety think proper to appoint a committee to examine the place."

In conſequence of the foregoing letter, a committee was appointed by the ſociety, to examine and report the ſtate of the cloſet, who met on the 15th of May, 1794; the wainſcot being taken down, and the flooring-boards taken up, they were all found entirely free from any appearance of the rot; and from all the circumſtances then obſerved, it was the opinion of the committee, that the method adviſed by Mr. Batſon, when fully and completely put in execution, appeared to have anſwered every intention mentioned in his letter; and this opinion ſeemed the more juſtly founded, as two pieces of wood (yellow fir) which had been driven into the wall as plugs, without being previouſly charred, were affected by the rot.

The ſociety, however, appear not to feel ſatisfied that the above experiment detects the radical cauſe of the evil; and therefore, in their Tranſactions of the year 1802, vol. xx. p. 32, they award "To the perſon who ſhall diſcover to the ſociety the cauſe of the dry-rot in timber, and diſcloſe a certain method of prevention ſuperior to any hitherto known, the gold medal, or thirty guineas."

To DRY-RUB, *v. a.* To rub clean without wetting:

At twelve years old the ſprightly youth is able
To turn a pancake, or *dry-rub* a table. *Anon. in Dodſley.*

DRY'ADES, nymphs that preſided over the woods. Oblations of milk, oil, and honey, were offered to them; and ſometimes the votaries ſacrificed a goat. *Virgil.*— They are uſually painted of a brown or tawny complexion, hair thick like moſs, and their garments of a dark green.

DRYAN'DRA, *ſ.* [ſo named by Thunberg in honour of his friend *Jonas Dryander*, M. A. a Swede, and moſt excellent botaniſt; now librarian to ſir Joſeph Banks, and the Royal and Linnæan Societies.] In botany, a genus of the claſs dioecia, order monodelphia, natural order tricoccæ, (euphorbiæ, *Juſſ.*) The generic characters are—I. Male. Calyx: perianthium two-leaved: diviſions ovate, acute, ſhorter than the corolla. Corolla five-petalled; petals obovate-oblong, from reflex patulous, unguicular. Stamina: filaments nine, united below into one body, unequal, ſhorter by half than the corolla; antheræ minute. II. Female. Pericarpium: tricoccous or tetracoccous, three-grooved or four-grooved, wrinkled, fleſhy. Seeds: ſolitary, oblong. What Thunberg calls the corolla, Juſſieu names the calyx.—*Eſſential Character.* Calyx two-leaved; corolla five-petalled; (or, calyx five-leaved, reſembling a corolla, ſurrounded by a two or three-leaved calycle;) ſtamina nine; fruit three or four-grained.

Dryandra cordata, or wrinkled dryandra. Stem arboreous, a fathom or more in height. Branches round, with a wrinkled back, dotted, ſmooth. Leaves at the ends of the twigs, approximate, alternate, petioled, cordate, acute, entire, five-nerved, the nerves branching, ſmooth, paler underneath, ſpreading, a hand in length and breadth. Flowers yellow. From the ſeeds they expreſs an oil for lamps, and the table. The elæococca of Commerſon, commonly called *arbre d'huile*, or oil-tree, if not the ſame with this, is of this genus. By Thunberg obſerved in Japan, where it is called *abraſin.*

DRY'AS, *ſ.* [ſo called by Linnæus, from the *Dryades*, or nymphs of the oaks; the leaves bearing ſome reſemblance to thoſe of the oak.] In botany, a genus of the claſs icoſandria, order polygynia, natural order of ſenticoſæ, (roſaceæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, eight-parted; diviſions ſpreading, linear, obtuſe, equal, a little ſhorter than the corolla. Corolla: petals eight, oblong, emarginate, ſpreading, inſerted into the calyx. Stamina: filaments numerous, capillary, ſhort, inſerted into the calyx; antheræ ſmall. Piſtillum: germs many, crowded, ſmall; ſtyles capillary, inſerted into the ſide of the germ; ſtigmas ſimple. Pericarpium: none. Seeds: numerous, roundiſh, compreſſed, furniſhed with extremely long woolly ſtyles. —*Eſſential Character.* Calyx five to ten-cleft; petals five to eight; ſeeds tailed, hairy.

Species. 1. Dryas anemonoides, or five-petalled dryas: five-petalled; leaves pinnate, with all the pinnas diſtinct. This is a very ſmall plant, native of Siberia; the radical leaves are commonly ternate, compound, conſiſting of a middle leaflet longer than the reſt, and two lateral ones: ſometimes the leaves have more than three diviſions; they are of a bright green, and very ſmooth; the foot-ſtalk is round; the ſtalk is terminated by a ſingle flower, which is large in proportion; the calyx is outwardly green, and inwardly lanuginous, and of a ſilvery appearance; the corolla is pale yellow, the petals ſtriated; the ſtamens are extremely numerous, and ſhort; the germs converge into a globe, and are coated with a white down.

2. Dryas octopetala, or eight-petalled dryas: eight-petalled; leaves ſimple. This delicate ever-green plant, with its ſnow-white bloſſoms, is a great ornament to alpine heights. The ſtalk and branches are woody and perennial, lying flat upon the ground, and ſpreading wide about the root in tufts. Leaves ever-green, ovate, turned back at the edge, ending very obtuſely, and ſometimes emarginate, deeply and bluntly ſerrate, or more properly crenate, wrinkled on the upper ſide, and hoary underneath, having woolly foot-ſtalks, and a large halbert-ſhaped ſtipule to each, embracing the ſtem. The ſtructure of the ſtipules renders this genus the connecting link between roſa and the reſt of the ſenticoſæ. Villars ſays, it has the leaves of germander, the petals and fruit of anemone, the calyx and ſtamens of geum, with which genus it might be united. It forms large tufts, like arbutus alpina, but the leaves are crenate and ſmaller, and the

flowers are very different. Native of high mountains in Lapland, Denmark, Swifferland, where Ray obſerved it on Thuiri, one of the higheſt points of mount Jura; the Griſons, Savoy, Auſtria, Carniola, Stiria, Carinthia, Germany, France, Italy, Siberia, Ireland, Scotland, and the north of England; as between Gort and Galloway, where it was found by Mr. Heaton, and near Sligo in Ireland; Breadalbane, iſle of Skye; Roſsſhire; Sutherland, and Argyleſhire, in Scotland; Arncliff Clowder in Littendale, near Kilnſay; and near Settle, in Yorkſhire. It flowers in June. No cattle eat it.

Dryas pentapetala, mentioned by Sibbald as growing in the den of Bethaick, four miles from Perth, is not now to be found there; poſſibly the potentilla argentea was miſtaken for it. See GEUM POTENTILLOIDES.

DRY'BURG, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderburn: ſeven miles eaſt-north-eaſt of Paderburn.

DRY'DEN (John), one of the moſt eminent of the Britiſh poets, born, as is ſuppoſed, in 1631, in the pariſh of Aldwinkle-All-Saints, in Northamptonſhire. His father, Eraſmus Driden, (ſo the name was then ſpelt,) was the third ſon of ſir Eraſmus Driden, bart. of Canons-Aſhby in the ſame county. He poſſeſſed a ſmall eſtate, acted as a juſtice of peace during the uſurpation, and appears to have been a preſbyterian. John, after ſome early education in the country, was ſent to Weſtminſter ſchool, of which Buſby was maſter, and was thence elected to a ſcholarſhip in Trinity-college, Cambridge, in 1650. Neither at ſchool nor at the univerſity does it appear that he diſtinguiſhed himſelf for brilliancy of parts. In the latter he took his degrees of bachelor and maſter of arts; but though he had written two ſhort copies of verſes about the time of his admiſſion, his name is not found among the academical poets of that period. His father died in 1654, and John, as his eldeſt ſon, ſucceeded to the eſtate. He removed to the metropolis, and made his entrance into public life under the auſpices of his kinſman, ſir Gilbert Pickering, a man of influence at that time, one of Cromwell's council and houſe of lords, and ſtaunch in his religious and political principles to the party then predominant. Dryden is ſaid to have been his clerk or ſecretary; and there is no reaſon to ſuppoſe that he did not voluntarily concur in the opinions and practices adopted by his family. In the hiſtory of the changes of the human mind, few facts will appear more extraordinary than that Milton ſhould have been deſcended from a catholic and loyaliſt family, and Dryden from a ſectarian and republican one. On the death of Oliver Cromwell, Dryden joined the band of poets who celebrated his memory; and wrote on the occaſion, Heroic Stanzas, which are among the earlieſt of his printed verſes, and are ſtrongly marked with the loftineſs of expreſſion and variety of imagery which characteriſed his matureſt efforts. After the reſtoration, Dryden loſt no time in endeavouring to obliterate former politics. He greeted the king's return with a poem intitled *Aſtræa Redux*; and followed it up by A Panegyric on the Coronation, both written in ſtrains of fervent loyalty. In 1662 he paid another homage, in ſome lines addreſſed to lord chancellor Clarendon. It was probably on account of ſome elegant verſes in praiſe of modern improvements in philoſophy, which he prefixed to Dr. Charleton's treatiſe on Stonehenge, that he was elected a member of the then newly-formed royal ſociety. About this time he appears as a writer for the ſtage; and his comedy of The Wild Gallant was acted in February, 1663. It was unfavourably received by the public, notwithſtanding the patronage of Barbara Villiers, afterwards ducheſs of Cleaveland, who, however, procured for it a kind reception at court. He then raiſed his dramatic ſtrain, and wrote the tragi-comedy of The Rival Ladies, and the tragedy of The Indian Emperor; and aſſiſted ſir Robert Howard in his Indian Queen. By theſe attempts, if he did not prove himſelf a firſt-rate favourite of the theatric muſe, he diſplayed a facility of harmonious verſification, and a ſplendour of poetic diction. The ſuſpenſion of dramatic entertainments, in conſequence of the plague and the fire of London, gave him leiſure, in a rural retirement, to compoſe an Eſſay on Dramatic Poeſy, which proved him to be an elegant writer in proſe, and an ingenious critic. His marriage with lady Elizabeth Howard, daughter of the earl of Berkſhire, is ſuppoſed to have taken place during this interval, in 1665. Some circumſtances attended this connection which rendered it leſs propitious to his advancement in life than might have been expected from ſo noble an alliance.

In 1667, Dryden publiſhed one of his moſt ſingular poems, the *Annus Mirabilis*, the ſubjects of which were the naval war with the Dutch, and the fire of London. It is written in quatrains, or four-line ſtanzas, or what is now called the elegiac meaſure; but which at that time, from the example of Davenant's Gondibert, and other pieces, ſeems to have been rather appropriated to heroic topics. This piece could not fail of adding to the author's poetical fame, for it abounds in images of high and genuine poetry, though intermixed with many extravagances. At this period of his life he became profeſſionally a writer for the ſtage; for it appears that he entered into a contract with the patentees of the king's theatre to furniſh them with three plays in a-year, upon the condition of being allowed the profit of one ſhare and a quarter, out of twelve ſhares and three-quarters, into which the theatrical ſtock was then divided. This is aſſerted to have brought him in between 300l. and 400l. per ann. and was probably the principal part of his income. Dryden ſeems never to have had, or to have required, any other inſpirer of his poetical exertions, than either the call of party, or the regular demand of pecuniary employment; and he well deſerves to be noted as an illuſtrious example of one who, poſſeſſing the character of true genius, was yet able to reduce the labour of his mind to a mechanical exactneſs, and could bring all his intellectual powers into action whenever he found it neceſſary. This neceſſity, indeed, is ſuppoſed frequently to have rendered his productions leſs perfect than they might have been with the expenditure of more time and attention; and it is certain, that of the plays written upon the contract above-mentioned, a ſmall proportion have kept their place on the ſtage or in the cloſet. He did not, however, keep to his engagement as to number; and it is computed, that during the greateſt vigour of his exertions he produced fewer than two dramatic pieces within the year. On the death of ſir W. Davenant in 1668, Dryden obtained the poſt of poet-laureat. He alſo obtained the ſinecure place of hiſtoriographer; and the joint ſalaries amounted to 200l. which, however, in that needy reign do not ſeem to have been paid with exactneſs. The tragedies written by Dryden in his earlier periods were compoſed in rhyme, as were alſo thoſe of ſeveral contemporary poets. This circumſtance probably contributed to that poetical rant by which they were too much characteriſed, and which tended to vitiate the dramatic taſte both of writers and auditors. For the purpoſe of correcting this fault, Villiers duke of Buckingham, in conjunction with other wits, wrote in 1671 the celebrated burleſque drama, entitled The Rehearſal, of which Dryden, under the name of Bayes, was made the hero. In order to point the ridicule, Dryden's dreſs, phraſeology, and manner of recitation, were exactly mimicked by the actor. But although the town enjoyed the laugh raiſed againſt him, it does not appear that his ſolid reputation as a poet was injured by the attack. He had the candour to acknowledge that ſeveral of the ſtrokes in it were juſt, and he wiſely refrained from making any direct reply to it. "I anſwered not the Rehearſal, (ſays he,) becauſe I knew the author ſat to himſelf when he drew the picture, and was the very Bayes of his own farce: becauſe alſo I knew that my betters were more concerned than I was in that ſatire." In fact, more of the parodied

paſſages

JOHN DRYDEN.

London Published as the Act directs April 9th 1803 by J. Wilkes.

paſſages and the inſtances of abſurdity are drawn from other writers than from Dryden. In 1679, in conjunction with lord Mulgrave, he publiſhed an Eſſay upon Satire, in verſe. Some very ſevere lines in this piece againſt lord Rocheſter, provoked from that peer the retaliation of a cudgelling inflicted upon Dryden by means of hired ruffians, as he was returning home one evening from the coffee-houſe. The ducheſs of Portſmouth is ſaid to have joined in this outrage, in revenge of ſome ſatire beſtowed in the piece upon "the royal miſtreſſes."

In 1681, at the king's expreſs deſire, as is aſſerted, he wrote his famous political poem, Abſalom and Achitophel, an adaptation of the incidents in the life of king David to thoſe of the reign of Charles II. relative to the duke of Monmouth and the earl of Shafteſbury. Its poetry and ſeverity cauſed it to be read with great eagerneſs; and as it raiſed the author to high favour with the court party, ſo it involved him in irreconcileable enmity with its opponents. This was ſtill embittered by his Medal, a Satire on Sedition, written the ſame year on occaſion of a medal ſtruck by the whig party, when a grand jury returned *ignoramus* to an indictment preferred againſt lord Shafteſbury for high treaſon. The rancour of this piece is not eaſily to be paralleled among party poems. It is ſaid to have been rewarded by the king with the gift of a hundred broad pieces. A circumſtance relative to the Abſalom and Achitophel, has occaſioned ſome fruitleſs ſpeculation. In the ſecond edition he added ſome lines to the portrait of Shafteſbury, liberally praiſing him for his judicial conduct in his capacity of chancellor. It has been enquired what could have been the motive for a compliment which, according to the king's opinion, injured the poem; and a ſuppoſed preſentation of a ſcholarſhip in the Charter-houſe to one of Dryden's ſons, by Shafteſbury, has been ſuggeſted. But Mr. Malone ſeems to have proved that this preſentation came from the king himſelf; and whether the compliment was a voluntary tribute to candour, or a return for ſome favour conferred, is ſtill undecided.

As he had ſhewn his eminent powers in political ſatire, ſo in 1682 he gave an admirable ſpecimen of literary ſatire in his Mac-Flecknoe, a ſhort piece ridiculing his rival Shadwell. One of his moſt ſerious poems, the *Religio Laici*, appeared in the ſame year. Its purpoſe is to give a compendious view of the arguments for revealed religion, and to aſcertain in what the authority of revelation eſſentially conſiſts. Many of the ſentiments are candid and judicious; and though he dwells ſtrongly upon the difficulty of a right interpretation of the ſcriptures, and therefore admits the weight of early opinion and tradition, yet he was at this time far from aſſenting to the excluſive claims of the Romiſh church, as will appear from the following lines reſpecting the Papiſts:

When want of learning kept the laymen low,
And none but prieſts were authoris'd to know;
When what ſmall knowledge was, in them did dwell,
And he a *god* who could but write and ſpell;
Then mother church did mightily prevail:
She parcell'd out the Bible by retail;
But ſtill expounded what ſhe ſold or gave,
To keep it in her power to damn or ſave:
Scripture was ſcarce, and to the market went;
Poor laymen took ſalvation on content,
As needy men take money good or bad:
God's word they had not, but the *prieſt's* they had.
In thoſe dark times they learn'd their knack ſo well,
That by long uſe they grew infallible.

Soon after this he ceaſed to write for the ſtage. Probably his dramatic vein was exhauſted; for the patentees had already made complaints of his dilatorineſs, and demurs had ariſen about the payment of his ſalary. His circumſtances were diſtreſſed; and it is to this period that Mr. Malone refers a letter written by him to Hyde earl of Rocheſter, in which, with modeſt dignity, he pleads merit enough not to deſerve to ſtarve, and requeſts ſome ſmall employment in the cuſtoms or exciſe, or, at leaſt, the payment of half a year's penſion for his preſent neceſſities. "I have (he ſays) three ſons, growing to man's eſtate. I breed them all up to learning, beyond my fortune; but they are too hopeful to be neglected, though I want——. I am going to write ſomewhat by his majeſty's command; and cannot ſtir into the country for my health and ſtudies, till I ſecure my family from want." Such was the condition of this champion for loyalty under Charles II. though he was by no means an extravagant, and was certainly an induſtrious, man! He never obtained any of the requeſted places, and was doomed to find the bookſellers his beſt patrons. The work to which he alludes is ſuppoſed to have been a tranſlation of Maimbourg's Hiſtory of the League, which was probably thought by the king to afford an inſtructive parallel to the fanatical opponents of his government. Some tranſlations from the claſſics, and the publication of two volumes of Miſcellany Poems, were his other literary occupations, till the king's death, in February, 1685. On that occaſion he compoſed *Threnodia Auguſtalis*, a funeral Pindaric Poem, which is not one of his happieſt effuſions.

A ſhort time after the acceſſion of James II. Dryden conformed to the religion of the new ſovereign. This ſtep has been the ſource of much obloquy againſt him on the one ſide, while, on the other, he has not wanted advocates in favour of the ſincerity of his converſion. But if the period of its taking place be contraſted with his opinion of popery, declared in the lines above quoted, and the bitter ſarcaſms beſtowed on its clergy in his Spaniſh Friar, it will ſurely require an uncommon ſtretch of candour to ſuppoſe that its immediate motive was any thing more than intereſt. It may, indeed, be alleged, that in changing his profeſſion he encountered little difficulty from his convictions. He had habitually treated religion with very little reverence in his works; and where he conſiders it ſeriouſly in his *Religio Laici*, he ſeems wavering between different ſyſtems, and not excluſively attached to any. It is therefore very credible that he might regard the Roman-catholic as a true church, and at leaſt of as good authority as any other; nor, in reality, is it ever to be wondered at, that one who is convinced of the duty of making reaſon ſubmit to faith, ſhould adopt that mode of faith which is ſupported by the moſt ſpecious authorities. It is ſuppoſed that Dryden's lady had long been a catholic, as her brother the earl of Berkſhire was. The adherence of the poet to his new religion till the end of his life, notwithſtanding the inconveniences he afterwards underwent from it, can ſcarcely be adduced as a proof of his conviction, without ſuppoſing him ſo deſtitute of ſhame, that he would have been ready to recant a ſecond time. An additional penſion of 100l. per annum was the reward he obtained for his compliance; and to this ſeems to have been annexed an expectation that he ſhould employ his pen in the ſervice of popery. He wrote a defence of a paper left at her deceaſe by Anne Hyde ducheſs of York, ſtating the motives of her converſion; and he appears, at the king's recommendation, to have undertaken a tranſlation of the Hiſtory of Revolutions in matter of Religion, by Varillas, though the diſcredit of that author prevented it from being given to the public. But the capital taſk which he executed in the ſame intention was his elaborate controverſial poem of The Hind and Panther, the longeſt ſingle piece he ever compoſed. This work, written upon a very unpromiſing ſubject, and on a plan of ſignal abſurdity, affords a ſtriking proof of the power of Dryden's verſe. It was publiſhed in 1687, was read with avidity, criticiſed, ridiculed, and bore every mark of occupying the public attention. At preſent, the admirers of Dryden's muſe will probably concur in regretting that he ſhould have employed the vigour of his mature faculties on ſuch a deſign. The birth of a prince in June, 1688, called forth a congratulatory poem, entitled *Britannia Redivivæ*,

diviva, from the courtly bard, who ventured on the occaſion to uſe the poet's privilege of prophecy, and foretold a commencing era of proſperity to the nation and the church from this auſpicious event. It is ſcarcely poſſible for the *devotion* of loyalty to be carried farther than is done in Dryden's celebration of The Venerable Infant; indeed, the poetry (as is not unfrequent in his compoſitions) ſometimes trenches upon the piety, and his thoughts borrow more from heatheniſm than from Chriſtianity. But, equally to the confuſion of the poet and his patrons, the revolution took place within a few months, and the hopes of the party were blaſted for ever. Poor Dryden was an early and ſevere ſufferer from the change. His poſts and penſions were taken away, and to increaſe the mortification, the poetical laurel was conferred upon his inſignificant rival Shadwell. The earl of Dorſet, it is ſaid, would gladly have retained Dryden in his ſtation, but this was impoſſible. It would, however, have been worthy of a government eſtabliſhed upon the principles of freedom, to have ſhewn ſome generous regard to the literary merit of ſo diſtinguiſhed a perſon, notwithſtanding his political demerits.

Dryden now, in advanced life, was to depend upon his own exertions for a ſecurity from abſolute indigence: for his other reſources appear to have been inadequate to a decent ſupport. His faculties were equal to the exigence; and it will ſurpriſe ſome theoriſts to be told, that the ten concluding years of his life, in which he actually wrote for bread, and compoſed at a certain rate per line, were thoſe of the compoſition of ſome of the pieces which have moſt contributed to immortalize his name. Probably, as one of the moſt lucrative ſpecies of writing, he reſumed that for the ſtage. In 1690, he brought out Don Sebaſtian, one of the beſt of his tragedies, which was received with great applauſe. Cleomenes, written the next year, underwent ſome political obſtacles in its way to the ſtage, but was at length acted. A tragi-comedy concluded his theatric labours in 1693, and its unfavourable reception muſt have convinced him that he had lingered on the ſtage too long. In 1692, the production of an elegy on Eleonora counteſs of Abingdon, a lady whom he never ſaw, written at the requeſt of a nobleman with whom he had no perſonal acquaintance, atteſted that facility of mercenary praiſe, which leſs honoured his genius than it degraded his moral character. He ſhewed in the ſame year that he had been better employed, by the publication of a tranſlation of the ſatires of Juvenal and Perſius, of which three ſatires of the firſt, and the whole of the laſt, were executed by himſelf. He prefixed to the volume a large diſcourſe on ſatire, dedicated to lord Dorſet. We ſhall paſs over ſome other works, and proceed to that great undertaking, the entire tranſlation of Virgil. It ſeems to have been intended by his admirers that this ſhould be a work of emolument to him, as well as of reputation, and accordingly a ſubſcription, at that time an unuſual thing, was entered into for its encouragement. He began it in 1694, and it was ſent to the preſs in 1697, a period which muſt be reckoned ſhort for ſuch a labour. He himſelf has aſſerted, that "it would require ſeven years to tranſlate Virgil exactly;" and it cannot be denied that his work in various reſpects bears the marks of haſte. It nevertheleſs maintains an exalted rank amid the performances of this kind with which the Engliſh language is enriched, and has greatly contributed towards the author's poetical fame. The emolument he derived from it is ſuppoſed to have been twelve or thirteen hundred pounds. It is aſſerted that his ſon, and Tonſon the bookſeller, urged him to dedicate his tranſlation to king William, but he rejected the propoſal. Soon after the appearance of his Virgil, he was ſolicited by the ſtewards of the muſical celebration of St. Cecilia's Day, to write a ſecond ode for the purpoſe: he had written the firſt in 1687, which did immortal honour to his name. The next requeſt produced his celebrated Alexander's Feaſt, which ſtands, perhaps, at the head of all the lyric poems in the Engliſh language. Whether it was, as ſome aſſert, "ſtruck off at a heat," or whether it occupied a fortnight in its completion, it is certainly a wonderful proof of the fire of genius preſerved in full vigour to a late period of life. It appears that about this time he meditated a tranſlation of Homer, of which he actually wrote the firſt Iliad; but this deſign gave way to that of modernizing ſome of Chaucer's tales, which he undertook in 1698. He ſoon proceeded ſo far in the taſk, as to venture upon a contract with his bookſeller, in 1699, to furniſh him with 10,000 lines for the ſum of 300l. a ſpecies of bargain which may be deemed as *unpoetical* as can well be conceived. Yet ſo rich and ductile was the verſifying faculty of Dryden, that it produced the collection called his Fables, which contains ſome of the moſt entertaining and perhaps the moſt truly poetical pieces he ever compoſed. Theſe are not taken from Chaucer alone, but comprife ſtories from Boccace, Ovid, &c. This was the laſt of his great works, for death cut ſhort the time for writing more; otherwiſe, there was ſtill enough of the poet left in him to have made important additions to the liſt. His conſtitution ſeems gradually to have declined; but the immediate cauſe of his diſſolution was an inflammation in one of his toes, terminating in a mortification, which, ſpreading rapidly, put an end to his life on the 1ſt of May, 1700. Of a romantic account of his funeral, publiſhed by Mrs. Thomas, the following facts appear to have been the only foundation: The corpſe was conveying in a private manner for interment, at the expence of Mr. Montague, afterwards earl of Halifax; when lords Dorſet and Jeffries, with ſome others, thinking the funeral unworthy of ſo great a poet, prevailed upon the attendants to ſuffer the body to be taken for embalment to an undertaker's; and in the mean time applied to the college of phyſicians for leave to ſuffer it to be depoſited in their hall till it ſhould be conveyed to Weſtminſter-abbey. It accordingly lay there in ſtate for ten days; after which period, a Latin oration having been pronounced over the remains by Dr. Garth, and the ode of Horace, beginning *Exegi monumentum ære perennius*, having been ſung, a proceſſion, very honourably attended, ſet out for the abbey, in which, with due ſolemnity, the body of Dryden was interred next to that of Chaucer. The place was undiſtinguiſhed by a monument, till a plain one, with his buſt, was erected at the expence of Sheffield duke of Buckingham. The inſcription, with good taſte, contains the name of the poet, without addition or eulogy.

With reſpect to private character, Dryden ſeems to have been of a cold and reſerved temper; and, as he himſelf denominated it, of a ſaturnine caſt. Yet, from Congreve's teſtimony, he was friendly and humane, eaſy of acceſs, and prompt to reconciliation after a quarrel. He was backward in perſonal advances to the great, and rather heavy in converſation. Though his pen was extremely licentious, his manners appear to have been decently regular. He was domeſtic in his habits, and affectionate towards his family. With a due ſenſe of his own ſuperior merit, he was ſenſible of his defects, and patient under criticiſm. That he was capable of the utmoſt bitterneſs of party rancour, and unbounded in the diſtribution of venal praiſe, his writings too plainly teſtify. His real ſentiments of men and things appear to have been free, and it would be eaſy to deduce from his works ſtrong expreſſions of ſcorn and indignation relative to every ſpecies of tyranny exerciſed over mankind; but theſe are ſingularly contraſted by the doctrines of paſſive ſubmiſſion, civil and religious, which it was his taſk to ſupport. Few writers have ſo much delighted in approaching the verge of profaneneſs; whence it may be fairly inferred, that, though religion was an intereſting topic of diſcuſſion to him, he had very little of its ſpirit in his heart. Yet he was not proof againſt ſuperſtition: he was a believer in judicial aſtrology, and formed predictions from nativities caſt by himſelf. The character

of

of Dryden has been admirably drawn by Dr. Johnſon in his Lives of the Poets: it will here ſuffice to ſketch an outline. Dryden was a man of various and extenſive, rather than of deep and accurate, learning. He had a propenſity to diſplay all that he poſſeſſed, whence he abounds in alluſions derived from every branch of ſcience and ſcholaſtic knowledge then cultivated. But his copiouſneſs of ideas ſurpaſſed his judgment and ſenſe of propriety in the uſe of them; and his erudition is often ridiculous from the mouth which is made to utter it. In tranſlation he is frequently unfaithful to the ſenſe of his author; and, what is, perhaps, worſe, he ſometimes deviates widely from his character, and what may be called his *coſtume*. As a dramatic writer, he has wit, force, and majeſty; but not much of nature or propriety. He long ſupported the practice of writing tragedies in rhyme, and forming them into what he called *Heroic Plays*, the model of which was undoubtedly falſe and extravagant. Of comedy, he ſeems to have had no juſt idea, as may be judged by his depreciating every comic writer in compariſon of Jonſon. It has already been mentioned that few of his plays ſurvive; perhaps the Spaniſh Friar, Don Sebaſtian, and All for Love, are the only ones. The laſt of theſe is regarded as his maſter-piece, and he has ſaid that it was the only one which he wrote for himſelf; but it has leſs true character than Shakeſpeare's upon the ſame ſtory. As a general poet, he ſtands, perhaps, unrivalled in point of verſification; for though more correctneſs in the formation of rhyme couplet has ſince been attained, yet it is generally acknowledged that for fulneſs and variety of harmony, for the free flow and reſiſtleſs current of numbers, he has never had an equal. The ſenſe often overflows to a third line with fine effect; and triplets and alexandrines contribute to vary the meaſure, though theſe, perhaps, occur with too much frequency. The poetical character of the diction is not leſs ſtriking than the harmony of the verſe; and more happineſs of expreſſion are found in Dryden than perhaps in any other poet. With great ſplendour, there is alſo a ſpirit and familiarity of language, ſometimes ſinking to coarſeneſs, but often conducing to wonderful ſtrength. There is ſcarcely any ſpecies of poetry in which he has not excelled. Perhaps he was leaſt fitted for the pathetic. He delights in the grand and ſwelling, which ſometimes deviates into bombaſt, or loſes itſelf in rhapſody.

His ſtyle in proſe deſerves great praiſe. It is eaſy, elegant, and animated, full of variety and energy, and ſo far idiomatic as to afford perhaps the beſt ſpecimen of genuine Engliſh. He chiefly exerciſed it in the critical eſſays prefixed to many of his works. Theſe are performances of extraordinary vigour and comprehenſion of mind, abounding in juſt thoughts beautifully elucidated, but written haſtily, and without the accuracy which would now be required in ſimilar compoſitions. They are rather effuſions than regular treatiſes, but bear as ſtrong a ſtamp of his own peculiar genius, as the moſt elaborate of his poems. They greatly contributed to the progreſs of critical diſcernment and juſt taſte in this country, which was only then beginning to ſpeculate upon ſuch topics. His panegyrical dedications exhibit many graces of writing, but the fulſomeneſs of their praiſe muſt diſguſt every reader poſſeſſed of manly ſentiments.

Dryden's reputation has loſt nothing by age, though ſome of his pieces, once popular, are now perhaps little read, on account of the temporary nature of their ſubjects. He is ſtill one of the heroes of Engliſh poetry, which preſents ſcarcely two or three names of greater celebrity. The preſent age pardons him as a man, and venerates him as a poet.

DRY'DEN, a military townſhip of the American States, the ſtate of New York, having Ulyſſes weſt, and Virgil on the eaſt; and on the ſouth the town of Owego, in Tioga county: eight miles from the ſouth end of Cayuga lake.

DRY'ER, *ſ.* That which has the quality of abſorbing moiſture.—The ill effects of drinking are relieved by this plant, which is a great *dryer* and opener, eſpecially by perſpiration. *Temple.*

DRY'EYED, *adj.* Without tears; without weeping:

Sight ſo deform'd what heart of rock could long
Dryeyed behold? Adam could not, but wept. *Milton.*

DRY'ING, *part. adj.* Making dry.

DRY'ING, *ſ.* [from the *part.*] The act of making dry.

DRY'LY, *adv.* Without moiſture. Coldly; frigidly; without affection:

Wouldſt thou to honour and preferments climb,
Be bold in miſchief, dare ſome mighty crime,
Which dungeons, death, or baniſhment deſerves;
For virtue is but *dryly* prais'd, and ſtarves. *Dryden.*

Jejunely; barrenly; without ornament or embelliſhment:

Some *dryly* plain, without invention's aid,
Write dull receipts how poems may be made. *Pope.*

DRY'NESS, *ſ.* Want of moiſture; ſiccity.—The marrow ſupplies an oil for the inunction of the bones and ligaments in the articulations, and particularly of the ligaments, preſerving them from *dryneſs* and rigidity, and keeping them ſupple and flexible. *Ray.*

Such was the diſcord which did firſt diſperſe
Form, order, beauty, through the univerſe;
While *dryneſs* moiſture, coldneſs heat reſiſts,
All that we have, and that we are, ſubſiſts. *Denham.*

Want of ſucculence.—The difference of muſcular fleſh depends upon the hardneſs, tenderneſs, moiſture, or *dryneſs*, of the fibres. *Arbuthnot.*—Want of embelliſhment; want of pathos; jejuneneſs; barrenneſs.—Be faithful where the author excels, and paraphraſe where penury of fancy or *dryneſs* of expreſſion aſk it. *Garth.*—Want of ſenſibility in devotion; want of ardour; aridity.—It may be, that by this *dryneſs* of ſpirit, God intends to make us the more fervent and reſigned in our direct and ſolemn devotions, by the perceiving of our weakneſs. *Taylor.*

DRY'NURSE, *ſ.* A woman who brings up and feeds a child without the breaſt. One who takes care of another: with ſome contempt of the perſon taken care of.—Mrs. Quickly is his nurſe, or his *drynurſe*, or his cook, or his laundry, his waſher, and his wringer. *Shakeſpeare.*

To DRY'NURSE, *v. a.* To feed without the breaſt:

As Romulus a wolf did rear,
So he was *drynurs'd* by a bear. *Hudibras.*

DRYOPE'IA, an anniverſary day obſerved at Aſine in Argolis, in honour of Dryops, the ſon of Apollo.

DRY'OPES, a people of Greece, near Mount Œta. They afterwards paſſed into the Peloponneſus, where they inhabited the towns of Aſine and Hermione in Argolis. When they were driven from Aſine by the people of Argos, they ſettled among the Meſſenians, and called a town by the name of their ancient habitation *Aſine*. Some of their deſcendants went to make a ſettlement in Aſia Minor, together with the Ionians. *Herodotus.*

DRY'OPIS, or DRYOPIDA, in ancient geography, a ſmall country at the foot of Mount Œta in Theſſaly. Its true ſituation is not well aſcertained. According to Pliny, it bordered on Epirus. It was for ſome time in the poſſeſſion of the Hellenes, after they were driven from Hiſtiæotis by the Cadmeans. *Herodotus.*

DRYOP'TERIS, *ſ.* in botany. See ASPLENIUM and POLYPODIUM.

DRY'PIS, *ſ.* [απο του δρυπτειν, Gr. from its prickly tearing quality.] In botany, a genus of the claſs pentandria, order trigynia, natural order caryophyllei. The generic characters are—Calyx: perianthium one-leafed, tubular, half five-cleft, permanent. Corolla: petals five; claws length of the calyx, narrow; border flat; plates two-parted; diviſions, linear, obtuſe; throat crowned with the two toothlets of each petal. Stamina: filaments five, length of the corolla; antheræ ſimple, oblong, incumbent. Piſtillum: germ obovate, compreſſed; ſtyles

ſtyles three, ſimple, patulous; ſtigmas ſimple. Pericarpium: capſule roundiſh, covered by the calyx, one-celled, ſmall, clipped round. Seed: ſingle, kidney-form, gloſſy.—*Eſſential Character.* Calyx, five-toothed; petals five; capſule clipped round, one-ſeeded.

Drypis ſpinoſa, a ſingle ſpecies. The ſtems are procumbent, four-cornered, brachiate; the laſt dichotomous and flower-bearing. Freſh green branches puſh forth in the ſpring from the dry ones of the former year, the extreme ones are dichotomous, and bear flowers. Biennial. Native of Barbary, Italy, Iſtria, &c. It is named *ſperage thiſtle* by Johnſon in Gerarde; in Italy they call it *erba ciuccia*, or aſs-herb, becauſe that animal feeds freely on it. See CUCUBALUS and SALSOLA.

DRYS'DALE (John), an eminent miniſter of the church of Scotland, born at Kirkaldy, in the county of Fife, April 29, 1718. He was the third ſon of the rev. J. Dryſdale, miniſter of Kirkaldy, and of Anne Fergu ſon, daughter of William Fergu ſon, eſq. provoſt or chief magiſtrate of the ſame town. He received the elements of claſſical learning at a ſchool in the ſame town, under David Miller, a man who had alſo the honour of inſtructing the celebrated Adam Smith, and James Oſwald of Dunikeir, perſons who have reflected ſo much luſtre on their country, the one as a philoſopher and man of letters, and the other as an eminent ſtateſman. While at ſchool, John Dryſdale greatly diſtinguiſhed himſelf as a claſſical ſcholar; inſomuch that he was ſent very early to the univerſity of Edinburgh. He there proſecuted his ſtudies with great ſucceſs, and ſoon attracted the notice of the profeſſors. After paſſing through the ordinary courſes of languages and philoſophy, he engaged in the ſtudy of divinity, the ultimate object of his repairing to the univerſity; and, in 1740, he was employed as aſſiſtant miniſter in the college church at Edinburgh. In 1743, he obtained a crown-preſentation to the church of Kirkliſton in Weſt Lothian. Won by his amiable manners, and ſedulous to reward profeſſional piety and virtue, the mariſchal college of Aberdeen, without his ſolicitation or knowledge, conferred on him the degree of doctor in divinity, by diploma, bearing date the 15th of April 1765: and the following year, the death of Dr. John Jardine having produced a vacancy in the Tron church, Dr. Dryſdale was tranſlated thither; and by royal warrant he was appointed one of his majeſty's chaplains, with one-third of the emoluments of the deanry of the chapel royal, on the recommendation of the late marquis of Rockingham. In 1773, Dr. Dryſdale's numerous friends thought it due time to raiſe him to the dignity of moderator of the general aſſembly; the greateſt mark of reſpect which an eccleſiaſtical commonwealth can beſtow on any of its members; and, being accordingly choſen without oppoſition, he diſcharged the duties of the office with great ſatisfaction to the venerable court, and with infinite credit to himſelf. In 1784, Dr. Dryſdale was, by a very great majority of votes, ſeated a ſecond time in the moderator's chair. But he did not long ſurvive this double honour; for he died on the 16th of June 1788; leaving behind him a moſt valuable collection of Sermons, publiſhed in London, in 1793, in 2 vols. 8vo.

DRY'SHOD, *adj.* Without wet feet; without treading above the ſhoes in the water:

Has honour's fountain then ſuck'd back the ſtream?
He has; and hooting boys may *dryſhod* paſs,
And gather pebbles from the naked ford. *Dryden.*

To DRY'STITCH, *v. a.* in ſurgery, is when by means of a piece of linen-cloth with ſtrong glue, ſtuck on each ſide a wound, its lips are drawn together.

DRYSWI'ATY, a town of Lithuania, in the palatinate of Wilna: ſixteen miles ſouth-weſt of Braſlaw.

DRZEWIC'ZE, a town of Poland, in the palatinate of Sandomirz: twenty-four miles weſt-north-weſt of Sandomirz.

DSAP'RONG, or TCHAPRONG, a town of Aſia, in the country of Thibet, on the Lantchau: 345 leagues weſt of Laſſa.

DSA'RIN, a lake of Thibet, about twelve leagues in circumference. Lat. 32. 10. N. lon. 95. 10. E. Ferro.

DSAT'CHOU, or TSATCHOU, or SAICHOU, a river of Aſia, which riſes in Thibet, and paſſes into the Chineſe province of Yun-nan, where it changes its name to Lant-ſan; after croſſing the province of Yun-nan, it takes the name of Kiou-long.

DSEP'TONG, or SEPTONG, a town of Aſia, in Thibet: eight leagues weſt-north-weſt of Rimbou.

DSCHIK'KETAEI, or wild mule. See EQUUS.

DSJAB'BE TAR, a ſmall iſland of Arabia, in the Red Sea, about forty miles weſt-ſouth-weſt of Loheia. Lat. 15. 32. N. lon. 41. 35. E. Greenwich.

DSJAB'BEL, a ſmall iſland in the Red Sea, about eight leagues from the coaſt of Arabia. Lat. 14. 4. N. lon. 43. 34. E. Greenwich.

DSJA'LIE, a town of Arabia: twenty-four miles ſouth-eaſt of Loheia.

DSJAR, a town of Arabia: eighty miles ſouth-weſt of Medina.

DSJE'BI, a town of Arabia, in the country of Yemen: fifty-ſix miles eaſt of Hodeida. Lat. 14. 44. N. lon. 43. 40. E. Greenwich.

DSJEL'LEDI, a town of Arabia, in the country of Yemen: twenty-four miles eaſt-ſouth-eaſt of Chamir.

DSJOB EL ALA, a town of Arabia, in the country of Yemen: forty miles ſouth-weſt of Sana.

DSJO'BLA, a town of Arabia, in the country of Yemen: ſixty miles north-eaſt of Mocha.

DSOU'KIOAG, a lake of Thibet, fifteen leagues in circumference. Lat. 30. 30. N. lon. 92. 10. E. Ferro.

DU'AL, *adj.* [*dualis*, Lat.] Expreſſing the number two.—Modern languages have only one variation, and ſo the Latin; but the Greek and Hebrew have one to ſignify two, and another to ſignify more than two: under one variation the noun is ſaid to be of the *dual* number, and under the other of the plural. *Clarke.*

DUA'BOS (Los), a town of the iſland of Cuba: thirty-ſix miles eaſt of Villa del Principe.

DUA'NESBURGH, a townſhip of the American States, in Albany county, New York, containing 1470 inhabitants; of whom 260 are electors.

DU'ARCHY, *ſ.* [of δυω and αρχη, Gr.] A form of government where two rule jointly.

DUA'RE, a town of Venetian Dalmatia, taken from the Turks in 1646, and loſt to them again ſoon after. It was again taken by the Venetians in 1652: twenty miles eaſt-north-eaſt of Spalatro.

DUA'REN (Francis), an eminent French lawyer, born near the beginning of the ſixteenth century, at St. Brieu in Britany. He was an intimate friend of the learned Budé, and acquired from him much knowledge of the Greek tongue, and of Roman antiquities, which he repaid by inſtructing the children of Budé. He ſtudied the civil law at Bourges under Alciatus, and afterwards practiſed at the bar of the parliament of Paris. At length he became profeſſor of law at Bourges, where he acquired great fame as a teacher and writer. De Thou accounts him the moſt learned juriſt of the age, next to Alciatus. When advanced in life he had to ſuſtain a warm competition from Cujas, then riſing into notice; and the univerſity of Bourges was ſo divided between their diſciples, that ſerious effects might have followed, had not Cujas retired to Valence. Duaren had an indifferent memory, ſo that he was obliged to read his harangues, which in ſome meaſure injured his reputation abroad. His works were much eſteemed, even by his rival Cujas; though after his death ſome pieces, not meant for the preſs, were injudiciouſly added from notes taken by his ſcholars. The principal are: 1. *Pro libertate Eccleſiæ Gallicæ adverſus Romanam, Defenſio Pariſienſis Curiæ.* 2. *De ſacris Eccleſiæ Miniſteriis ac Beneficiis.* 3. Commentaries on the Code and the Digeſt. The works of Duaren were printed

printed together at Lyons, 2 vols. folio, 1578, and at Geneva, folio, 1603. He died about the age of fifty, in 1559.

DUARZE, a river of Spain, in the province of Guipuſcoa, which runs into the Orio, at Toloſa.

DU'AULT-QUELIN, a town of France, in the department of the North Coaſts, and principal place of a canton, in the diſtrict of Roſtrenen: three leagues north-weſt of Roſtrenen.

To DUB, *v. a.* [ðubban zo ꝥbeꝑe, Sax. *addubba till riddara*, Iſlan. to dub a knight. *Addubba*, in its primary ſenſe, ſignifies to *ſtrike*, knights being made by a blow on the ſhoulder with a ſword.] To make a man a knight.—The king ſtood up under his cloth of ſtate, took the ſword from the lord protector, and *dubbed* the lord mayor of London knight. *Hayward.*

Knight, knight, good mother! Baſiliſco like.
What! I am *dubb'd*; I have it on my ſhoulder. *Shakeſp.*

To confer any kind of dignity or new character.—A plain gentleman, of an ancient family, is of better quality than a new knight, though the reaſon of his *dubbing* was meritorious. *Collier.*

A man of wealth is *dubb'd* a man of worth;
Venus ſhall give him form, and Anſtis birth. *Pope.*

DUB, *ſ.* A blow; a knock:

As ſkilful coopers hoop their tubs
With Lydian and with Phrygian *dubs*. *Hudibras.*

DUB'BA FETTEE, a river of Hindooſtan, one of the branches of the Sinde.

DUBCHES'KIAIA, a town of Ruſſian Siberia, in the government of Toboliſk, on the Eniſei: 164 miles north-north-eaſt of Eniſeiſk.

DUB'DU, a town of Africa, in the country of Fez. It was at one time an independent ſtate, and governed by a prince who took the title of king: eighty miles eaſt of Fez.

DU'BEN, a town of Germany, in the circle of Upper Saxony, and circle of Leipſic, on the Mulda: eighteen miles north-north-eaſt of Leipſic.

DU'BENINKEN, a town of Pruſſian Lithuania: four miles eaſt of Goldapp.

DU'BENOW, a town of the duchy of Courland: twenty miles ſouth-eaſt of Seelburg.

DU'BICE, a town of Lithuania, in the palatinate of Wilna: twenty miles weſt-north-weſt of Lida.

DUBIEC'Z, a town of Poland, in the palatinate of Lemberg: fifty-two miles weſt of Lemberg.

DUBIN'KY, a town of Lithuania, in the palatinate of Wilna: twenty-four miles north of Wilna.

DUBIO'SITY, *ſ.* A thing doubtful. *Not uſed.*—Men often ſwallow falſities for truths, *dubioſities* for certainties, feaſibilities for poſſibilities, and things impoſſible for poſſible. *Brown.*

DU'BIOUS, *adj.* [*dubius*, Lat.] Doubting; not ſettled in an opinion. Uncertain; that of which the truth is not fully known.—No quick reply to *dubious* queſtions make. *Denham.*—Not plain; not clear:

Satan with leſs toil, and now with eaſe,
Wafts on the calmer wave, by *dubious* light. *Milton.*

Having the event uncertain:

His utmoſt pow'r with adverſe pow'r oppos'd,
In *dubious* battle, on the plains of heav'n. *Milton.*

DU'BIOUSLY, *adv.* Uncertainly; without any determination.—Authors write often *dubiouſly*, even in matters wherein is expected a ſtrict definitive truth. *Brown.*

DU'BIOUSNESS, *ſ.* Uncertainty; doubtfulneſs.—She ſpeaks with *dubiouſneſs*, not with the certainty of a goddeſs. *Broome.*

DU'BITABLE, *adj.* [*dubito*, Lat.] Doubtful; uncertain; what may be doubted.

DUBITA'TION, *ſ.* [*dubitatio*, Lat.] The act of doubting; doubt.—Many of the ancients denied the antipodes; but the experience of our enlarged navigation can now aſſert them beyond all *dubitation*. *Brown.*

DU'BITZA, a town and fortreſs of Croatia on the Unna: eleven miles north-eaſt of Kaſtanovitz.

DUB'KI, a town of Ruſſia, in the government of Peterſburg, on the gulf of Finland: ſixteen miles north-north-weſt of Peterſburg.

DUBLIN, a county of Ireland, bounded on the north by the county of Meath, on the eaſt by the Iriſh ſea, on the ſouth by the county of Wicklow, and on the weſt by the counties of Meath and Kildare; twenty-five miles in extent from north to ſouth, and from nine to ſixteen broad from eaſt to weſt. It contains about 142,050 acres, and, in the year 1790, 25,510 houſes, and 107 pariſhes, twenty of which are in the city of Dublin. This county is in general flat, except towards the ſouth, where it is mountainous and rocky; towards the ſea it is broken into bays and creeks, with ſeveral places of reſort for ſea-bathing. The principal river is the Liffey.

DUB'LIN, the metropolis of Ireland, ranks as the ſecond city in the Britiſh dominions, and the fifth for magnitude in Europe, is ſituated in the province of Leinſter, in the county of Dublin, at the bottom of a large bay. The river Liffey, which here diſembogues itſelf into the ocean, divides the town into nearly two equal parts. Formerly the city of Dublin was confined to the ſouth ſide of the river, and was a place of great antiquity. Ptolemy, who flouriſhed in the reign of Antoninus Pius, about the year 140, ſays, it was anciently called *Aſchcled*. In 155, Alpinus, whoſe daughter Auliana was drowned in the Liffey, changed the name from *Aſchcled* to *Auliana*. It was afterwards named *Dublana*, and Ptolemy calls it *Eblana*. *Dublana*, whence comes *Dublinum* and *Dublin*, is evidently derived from *Dub-leana*, "the place of the black harbour or lake," or rather "the lake of the ſea," the bay of Dublin being frequently ſo called. This city has had a variety of names. The Iriſh call it *Drom-choll-coil*, "the brow of a hazle wood;" and in 181, Eogan king of Munſter, being on a royal tour, paid a viſit to this place, which was then called *Atha Cliath-Dubb-Line*, "the paſſage of the ford of hurdles over the black pool."

The city of Dublin is ſeated in view of the ſea on the eaſt, and a fine country which ſwells into gently riſing eminences on the north and weſt, while it towers boldly up in lofty mountains that bound the horizon on the ſouth. The city itſelf cannot be ſeen to full advantage on entering the harbour: but the approach to it from thence exhibits a fine proſpect of the country for improvement and cultivation, interſperſed with numerous villas, that have a moſt agreeable effect to enliven this delightful ſcene, which, beginning at the water's edge, is continued all over the coaſt to the northward of the bay as far as the eye can reach, and is finely contraſted by a diſtant view of the Wicklow mountains to the ſouth, where the conical hills, called the *ſugar-loaves*, contribute not a little, by the ſingularity of their appearance, to embelliſh the landſcape, ſo extenſive and picturеſque as not to be equalled by any natural ſcenery in Europe, but the entrance of the bay of Naples, to which it bears a very ſtriking reſemblance. The form of Dublin is nearly a ſquare, a figure that includes the largeſt area proportioned to its circumference. The length is two miles and an half, and its greateſt breadth is computed to be of the ſame extent: hence the city is about ten miles in circumference. It is ſaid to contain about 22,000 houſes, whoſe inhabitants are eſtimated at 156,000.

The river Liffey is croſſed by ſix bridges; the ſides are embanked with ſpacious quays, ſo that veſſels can load and unload before the houſes of the merchants. The bay is about ſeven miles broad, and unſafe in ſtormy weather, but the channel is confined for three miles on each ſide by a broad ſtone wall, for the protection of ſhips in the road. Veſſels which draw more than ſeven feet cannot come up to the quay. A floating light has been erected on the north ſide of the harbour, to prevent accidents,

cidents, and lighted every night; and, in the day time, a flag is conſtantly hoiſted from half flood to half ebb. In this city are twenty pariſhes, and eighteen churches, ſome chapels of eaſe, beſides the cathedral and collegiate church. Dublin is the ſee of an archbiſhop, erected in the year 1152; it was a biſhopric in the ſeventh century, and, in 1214, the biſhopric of Glandalough, which was founded in the ſixth century, was incorporated with Dublin. The ſee of Dublin has, therefore, two cathedrals, both within the city: Chriſtchurch, founded for regular canons, and converted into a collegiate church for a dean and chapter by Henry VIII. in 1541; and St. Patrick, for thirteen, now twenty-two, prebendaries. The univerſity was firſt projected in 1311, but did not flouriſh till the reign of queen Elizabeth, who granted it a charter. James I. endowed it with large eſtates in the province of Ulſter. Charles I. was likewiſe a benefactor, and, in the year 1637, granted it a new charter and ſtatutes. It conſiſts of a chancellor, a vice-chancellor, provoſt, vice-provoſt, twenty-two fellows, and five royal profeſſorſhips of divinity, common law, civil law, phyſic, and Greek; beſides theſe, three others were founded by ſir Patrick Dun, of phyſic, chirurgery, and pharmacy; there are likewiſe profeſſorſhips of mathematics, oriental languages, oratory, hiſtory, and natural philoſophy: the number of ſtudents is uſually about four hundred, including ſeventy on the foundation. Many other public buildings and laudable inſtitutions decorate and dignify the city of Dublin. The cuſtom-houſe is a magnificent ſtructure. It has four handſome fronts, all differing from each other; the ſouth, next the river Liffey, is of Portland ſtone, in the centre of which is erected a cupola, of very beautiful architecture, terminating upon the top by a finely ſculptured figure of commerce leaning upon her bales and her anchor. Another elegant and well-conſtructed pile, contains the courts of public juſtice, or, as they are called, in Dublin, the *four courts*, i. e. the courts of chancery, king's-bench, common-pleas, and exchequer, all opening into a moſt beautiful circular hall, richly decorated by architectural and ſtuccoed ornaments, highly picturеſque and emblematic of thoſe courts of juſtice. The hall is covered by a dome, and above that riſes a cupola, which, from its deſign, forms an external elevation, not only partially beautiful to the building, but generally beautiful to the *tout enſemble* of the whole city. This edifice is enriched with ſome ſtatues, excellently ſculptured; the principal of which is a fine figure of Moſes, which ſtands upon the top of the pediment, over a very chaſte and beautiful inverted ſemi-circular colonnade, or portico, of a fancied order, nearly Corinthian, in the act of promulgating the law. Immediately attached to this building, are all the ſubordinate offices dependent upon and belonging to the reſpective courts. In Trinity college two beautiful buildings have lately been erected, each having a portico of columns in the Corinthian order. The one is an amphitheatre for public examinations, in which are ſome excellent portraits of literary characters, painted by eminent artiſts, ſome by the late ſir Joſhua Reynolds; as alſo a very fine monument to the memory of the late doctor Baldwin, formerly provoſt of this univerſity, executed in Italy, by an Iriſh ſculptor, Hewetſon; it poſſeſſes much animation, ſpirit, and correctneſs; the expence was two thouſand guineas. The other building, which ſtands directly oppoſite, and which is exactly ſimilar externally, is a beautiful chapel. The library is ſpacious, grand, and valuable, adorned with many buſtos in white marble. Here is alſo what is called the anatomy-houſe, a moſt curious and wonderful production of human ingenuity, of no leſs magnitude, labour, and ſcience, than a cabinet of wax models, large as life, and coloured as in nature, repreſenting all the ſtages of geſtation, from conception to the birth of the child, moſt exquiſitely executed, and long ſanctioned by the moſt able profeſſors, as an unrivalled production of excellence and illuſtration. What is called the royal hoſpital of Kilmainham, is a large, plain, brick building, forming a hollow ſquare, finely elevated, at the weſtern extremity of Dublin, amidſt a well-planted piece of ground, inhabited by invalid officers and ſoldiers; for whoſe aid, together with a ſmall penſion from the crown, it was eſtabliſhed and founded, ſimilar to Chelſea hoſpital. In a part of this building, is a commodious ſuite of apartments, occupied by the commander in chief of the army in Ireland (for the time being), at which place the chief governor, or lord lieutenant, was frequently entertained. Another capital charity is the Blue-coat hoſpital, founded for the maintenance and education of the ſons of decayed free citizens of Dublin. The next hoſpital which claims our notice is that inſtituted for the relief of poor lying-in-women. It was founded by Dr. Moſs, and continues to be patronized by almoſt every benevolent lady in Ireland (Dublin in particular), as well as by the humane public. The number of women under this deſcription relieved in this houſe, has been, in forty years, 37,615; and the number of children born there in that ſpace of time, 38,291; viz. 20,082 boys, and 18,209 girls. Of theſe women, 667 had twins; eleven had three, and one had four children at a birth.

There are, beſides, a great number of inferior charities in this capital; but their external appearance does not claim the attention of travellers. There is, however, one whoſe inſtitution is very recent, and whoſe growth has been wonderfully rapid, as if foſtered by the providential and merciful dew of heaven. This is the orphan-houſe for deſtitute female children, a receptacle of plain and humble architecture. This inſtitution was opened upon the firſt day of January 1790, in conſequence of a truly pious and charitable woman, who, in the daily habit of ſeeking out wretchedneſs for the purpoſe of adminiſtering relief, diſcovered a number of deſtitute infants, at different times, expoſed to periſh in ditches and upon dunghills. With her own private purſe ſhe began to form an aſylum againſt ſuch barbarity; which was ſoon perfected by the humane public. Here are, beſides theſe, fourteen other hoſpitals, chiefly ſupported by voluntary contributions. The churches in Dublin (which has each its parochial ſchool), exhibit no external beauty, nor yet much internal decoration. St. Patrick's cathedral, from its antiquity, is worth inveſtigation; and its ſteeple is much loftier than any of the others.

The city of Dublin has been rapidly improving ſince the union of the ſiſter kingdoms. Within the laſt two years, there has been completed a very noble undertaking, namely, docks of great magnitude, erected by the company of undertakers of the grand canal. The *two*, or rather *one* great floating-dock, (there being no lock dividing them,) the only diviſion being a drawbridge of a peculiarly light, yet durable, conſtruction, is capable of containing eight hundred ſail of merchant-ſhips, and give ſufficient ſpace for each to carry on their trade with ample room; there are beſides attached to this dock, three graving docks for building or repairing ſhipping; the dimenſions of the largeſt is 180 feet long by ſixty feet wide; and they appear to be built upon the ſame improved conſtruction as that of the great dock at Portſmouth, finiſhed about the year 1795. The walls which incloſe, or, in other words, the embankments of theſe docks, are built in the moſt perfect and durable manner, and reflect infinite honour upon the ſpirit of the grand canal company of Dublin. That inland navigation is now ſo far completed, as to form a perfect water-carriage from St. George's Channel, or the Iriſh Sea, on the eaſtern ſide of Dublin, into the river Shannon, which empties itſelf into the Atlantic Ocean at the weſtern ſide of Ireland, and thus completely interſects the whole kingdom through its centre. Theſe docks were opened, upon the 23d of April, 1796, (being St. George's day,) with much pomp and ceremony.

The general appearance of the city of Dublin, is extremely beautiful, from the number of public buildings, &c.

&c. the principal ſtreets are well paved and lighted, and the flagged way on either ſide, with ſome few exceptions, is broad and tolerably clean. The places which form ſquares, are St. Stephen's Green, in the centre of which is an equeſtrian ſtatue of George the Second, finely executed in copper, and elevated upon a large pedeſtal; the ground in this ſquare is one mile in circumference. Merrion-ſquare is delightfully ſituated; moſt of the houſes having a view of Dublin bay and Wicklow mountains; the centre is incloſed by an iron paliſado, erected upon a handſome cut-ſtone plinth and baſe, and a neat ſhrubbery running round the whole, immediately within-ſide the railing; the houſes are all of a very large ſize; much uniformity has been preſerved in building them; and the appearance altogether is highly improved by Leinſter-houſe, and lawn, forming the weſt ſide of this ſquare. Rutland-ſquare, from its lofty trees and handſome walks, ſituated upon the declivity of a hill, adds much to the beauty of Dublin; and Mountjoy-ſquare is beautifully ſituated, and commands various delightful proſpects.

Hoſpitality reigns throughout Dublin with as much profuſion as in the reſt of the kingdom; the people of faſhion can no where be found more refined and ſplendid. The only public entertainment is a badly-attended theatre, open about eight months in the year. Vice ſeems not to have arrived at that pitch of audacity in Dublin, as in London; a courtezan would not be ſuffered to mix with the company in the lower boxes of the theatre, they muſt go aloft; nor is the Cyprian tribe there either proportionably numerous, or alluring; the Iriſh women are characteriſtically induſtrious and virtuous.

The Phœnix park, belonging to the crown, and which takes its name from a lofty pillar in white marble, of the Corinthian order, with a phœnix on the top, is ſituated at the weſtern extremity of Dublin, extending weſtward upwards of three miles, and about two from north to ſouth; in this park is the phœnix lodge, which was purchaſed by government about the year 1782, for the ſummer reſidence of the lord lieutenants. And here alſo is the ſalute battery, on which is erected twenty-two pieces of cannon, which are fired upon all occaſions of public rejoicing; and a little to the weſtward is the magazine of ammunition for his majeſty's forces, a ſtrong fortification, always occupied by an officer's guard of the royal Iriſh artillery, and latterly conſiderably augmented. In the eaſtern part of this park there has been, a few years ſince, erected a ſimple but beautiful building, an infirmary for the ſoldiery, which is moſt pleaſingly ſituated upon an elevated piece of ground, and adds much to the *tout enſemble* of this charming ſpot. This extenſive place is the Hyde Park of Dublin, being open to the public, and much frequented by equeſtrians, as well as pedeſtrians; and here are performed all military reviews.

The caſtle of Dublin is ſituated nearly in the centre of the city: it was not uſed as a palace, or reſidence of the viceroy, till the reign of Elizabeth, when it was repaired and beautified by ſir Henry Sidney, lord deputy. The parliament houſe, now diſuſed, is a magnificent building, erected between the years 1729 and 1739, at the expence of 40,000l. The Royal Exchange coſt likewiſe 40,000l. and was ten years in building, from the year 1769 to the year 1779. The royal college of phyſicians was eſtabliſhed in 1679; the royal college of ſurgeons in 1785; the academy for the advancement of ſcience, polite literature, and antiquities, in 1786. Other ſocieties are for ſoldiers' orphans; the marine ſociety; ſociety for promoting the linen and hemp manufacture; for improving agriculture, &c. The houſe of induſtry alſo merits regard, as being the beſt regulated, and perhaps the moſt productive, in coming nearer the original deſign, than any other in Europe. The civil government of Dublin is executed by a lord mayor, recorder, two ſheriffs, twenty-four aldermen, and a common-council, formed of repreſentatives from the twenty-five corporations. The mayor tries all offences, even capital ones, except murder and treaſon, and matters of property for any ſum under twenty pounds. A new police, lately eſtabliſhed by act of parliament, under a chief and three aſſiſtant commiſſioners and four diviſional juſtices, who are aldermen of the city, conſiſts of forty horſe, and four hundred foot, well armed, trained, and clothed, ſtationed in watch-houſes, and patrolling the ſtreets every night. Beſides the ſilk, woollen, and worſted, manufactures carried on in that quarter of the ſuburbs called *the earl of Meath's liberty*, and conſiderably improved within theſe few years, other branches of uſeful manufacture are eſtabliſhing in different parts of the metropolis; and though the trade in Dublin has heretofore conſiſted chiefly in the importation of foreign commodities, yet now that the reſtriction of its woollen and moſt other goods are removed, it is expected that the daily enlargement of the export trade will cauſe a proportional increaſe of opulence. Dublin is remarkably well ſupplied with proviſions; with coals, chiefly from Scotland and Cumberland, and with water from the Liffey, by machines curiouſly conſtructed at Iſland-bridge on the north, and from a fine reſervoir on the ſouth. The atmoſphere being chiefly moiſt and wet, contributes to give the ſtreets a dirty appearance. Lat. 53. 21. N. lon. 6. 15. W. Greenwich.

The vicinity of Dublin is rich in cultivation, and majeſtically adorned with ſeats and noble manſions. From the weſtern gate of the Phœnix park, the approach commands a view of a moſt beautiful valley, taking in the villages of Chapel-izod and Palmerſtown, through which the river Liffey grandly glides, forming different caſcades, and the whole terminated by the finely-ſituated houſe of lord Donoughmore. Proceeding to the top of Knockmaroon hill, a village about three miles from Dublin, we have a moſt delightful proſpect; and, deſcending more to the weſtward, we enter one of the moſt beautifully-ſituated roads perhaps in the world, called the *low road* to Lucan, being about four miles in length; it is through a winding valley on the right hand of which is, for the moſt part, a very high hill, richly cultivated, and from its ſouthern aſpect is extenſively planted with ſtrawberries, which fruit it produces in great abundance, and in conſtant ſucceſſion, from May until September, both months incluſive. The road is ſhadowed by plantations of oak, elm, and aſh trees; and all along the left hand, from Knockmaroon, is the river Liffey ſilently flowing its courſe, the grandeur of which is ſometimes interrupted by mill-weirs croſſing the river, but which amply compenſate the feaſt of the eye, by the caſcades which they form; and hence it is that the navigation of the river Liffey is in this part impeded. Farther to the left hand, and to the end of this road, beyond the river, the ground riſes in a gradual aſcent; in ſome parts next the water are mills, in others bleach-greens for linens; but, for the moſt part, the ſide of the hill preſents the highly decorated improvements of lord Leitrim, lord Carhampton, and lord Pery, which terminating by a bridge, we arrive at the village of Lucan, ſituated between ſix and ſeven miles weſt from Dublin. Here is the celebrated Lucan ſpa, much reſorted to, and deemed extremely efficacious in ſcorbutic and nervous complaints; the ſpa has lately been decorated, and is now ſheltered by a building, forming a ninegon, neatly executed; and upon the top of the pump is placed a handſome urn. There is a rural thatched ſeat for the water drinkers; near which is Lucan Houſe, finiſhed in 1780, in an elegant ſtyle, enriched with medallions from the deſigns of Angelica Kauffman. About a mile to the weſt is a neat and beautiful village, called Leixlip, inhabited by an humble ſet of people, who, in addition to their induſtry in huſbandry, let lodgings in the ſummer ſeaſon, to ſuch as reſort there for the benefit of the Lucan ſpa. In a part of this demeſne is a moſt grand water-fall, called the *ſalmon leap*, about eighteen feet high; the top of the ridge is paſſable when the water is low, and with the aſſiſtance of a ruined arch, a

communication is formed with the oppoſite ſide of the river; the breadth of the whole is about 180 feet. In floods which fall from the mountains, this cataract's height is ſometimes increaſed to thirty feet. The ſalmon generally begin to run in March or April, and to return in Auguſt and September, when many perſons frequent this place to ſee them leap. Soon as they arrive at the bottom of the fall, they riſe juſt above the water for near half a minute, as if to obſerve the height and diſtance; then ſinking, they preſently dart ſtraight up from the ſurface, ſhaking their fins and tails with a quick motion, and often clear the leap at the firſt ſpring; but frequently the force of the falling water throws them back upon the ſhelving rocks, from whence they leap back again, and wait ſome time before they make a ſecond attempt. On the 25th of Auguſt, 1797, one hundred ſalmon were ſeen to leap this fall in the ſpace of two hours. Theſe fiſh are taken in great abundance, and the citizens of Dublin are at all times ſupplied with ſalmon at a very low price. Upon a richly planted hill, oppoſite the fall, is erected a very handſome Gothic temple, which commands a full view of the ſalmon leap, and adds much to the beauty of this charming ſcene.

About eight miles from Dublin, is that grand promontory, the Hill of Howth, magnificently placed in St. George's channel; this is the firſt land which appears to the mariner when ſteering direct from Holyhead, Parkgate, or Liverpool, for the bay of Dublin: upon the ſummit of this hill is erected a very excellent light-houſe, whoſe brightneſs affords much ſafety to all the ſhipping ſteering thither by night. Many perſons aſſert, that they have ſeen the Welch mountains with the naked eye from the ſummit of this hill upon a clear day, being a diſtance of twenty-one leagues.

DUB'LIN, a townſhip of the American States, in Cheſhire county, New Hampſhire, on a branch of Aſhuelot river, and north of the Great Monadnock, containing 901 inhabitants. It is twenty-eight miles ſouth-eaſt of Charleſtown, and eighty-two weſt of Portſmouth: incorporated in 1771.

DUB'LIN, a pleaſant town of North America, in Philadelphia county, Pennſylvania, ten miles north-eaſt of Philadelphia, and as far ſouth-weſt of Briſtol. Alſo, a townſhip in Huntingdon county, in Pennſylvania.

DUB'NO, a town of Poland, in the palatinate of Volhynia: twenty-four miles ſouth-ſouth-eaſt of Lucko.

DUB'NO, a town of Poland, in the palatinate of Belcz; forty miles north of Belcz.

DOBO'JA, a town of Lithuania, in the palatinate of Brzeſc: ten miles weſt-ſouth-weſt of Brzeſc.

DUBOI'S, (William), an extraordinary example of corrupt elevation; the ſon of an apothecary at Brive-la-Gaillarde, in Limoſin. He was born in 1656, and received the rudiments of education in the ſchool of his birth-place. He early diſtinguiſhed himſelf for quickneſs of parts and vivacity of temper, attended with a great propenſity to falſehood. He went young to Paris, and entered into the college of St. Michael; but ſuch was his indigence, that he was obliged for his ſupport to ſerve the principal as his valet. After having acquired ſome knowledge of philoſophy and the languages, he ſucceſſively occupied the poſts of preceptor in different families, till at length he was recommended to M. de Saint-Laurent, ſub-governor to the young duke de Chartres, afterwards the regent duke of Orleans. This was the circumſtance which introduced Dubois to the path of fortune. By his ſupple and inſinuating diſpoſition he ingratiated himſelf with Saint-Laurent, who cauſed him to be decently clad, and then placed him with the young prince as teacher of the elements of the Latin language. Dubois performed his duty with credit, and at the ſame time acquired the favour of ſome of the young nobles who had places about the prince; ſo that, upon the death of Saint-Laurent, he was made preceptor and reader, with a conſiderable ſalary. He gave ſatisfaction at court by the attention he paid towards bringing forward his pupil in his ſtudies, and at the ſame time he ſecured an aſcendancy over his mind by corrupting his principles. He accompanied the duke de Chartres in his campaigns in Flanders, where he diſplayed conſiderable intrepidity, and rendered himſelf agreeable to the officers by dextrous flattery and lively converſation. Such was his influence over the duke, that he was the perſon chiefly employed by the court in order to induce him to marry the king's natural daughter, madame de Blois; and his ſucceſs in this negociation was rewarded by the abbacy of St. Juſt. In 1717 he was ſent as ambaſſador plenipotentiary into England, where he ſigned the triple alliance. On his return he was made miniſter and ſecretary of ſtate for foreign affairs, and he acquired the entire management of that department. The archbiſhopric of Cambray, one of the richeſt in the kingdom, becoming vacant, Dubois wiſhed to obtain it; and he was conſecrated archbiſhop in a pompous ceremony, at which the regent himſelf and all his court aſſiſted. This ſhameful profuſion of court favours was aggravated by his elevation to the cardinalate in the next year, 1721, not without a long reſiſtance on the part of pope Innocent XIII. whoſe forced compliance was thought to have ſhortened his days. The cardinal was admitted into the council of regency in 1722, and ſoon after was declared firſt miniſter of ſtate. He alſo thought it ſuitable to his dignity to be admitted among the members of the French academy, and his vanity led him to make a point of being received by the title of *monſeigneur*, which had been given to no academician before him. Thus arrived at the ſummit of power and place, rolling in opulence, and having ſeen every thing great by rank and title crouch beneath his meanneſs, he was attacked by a fatal diſeaſe, the conſequence of his early debaucheries, which, after a painful chirurgical operation, put a ſpeedy end to his life. He died in Auguſt, 1723, at the age of ſixty-ſeven. A moſt magnificent mauſoleum (the maſter-piece of the ſculptor Couſtou) was erected for him in the church of St. Honoré. After the enumeration of all his titles and employments, the inſcription ends thus: "What are all theſe titles and honours but the changing bow of heaven, and the vapour that melts into air! Paſſenger, intreat of Heaven, for the deceaſed, more ſolid and more ſubſtantial bleſſings." Dubois was a man of parts, but not of abilities equal to the great poſts he occupied. He was haſty and impatient, purſuing the buſineſs of the moment with an ardour which obliterated every thing elſe. His papers were never kept in any order; ſo that he uſed frequently, in ſearching after any thing he wanted, to ſwear exceſſively. One of his clerks told him, "Your eminence had better hire a man to ſwear for you, and then you will gain ſo much time." No man had ever a more corrupt heart; and ſuch was his contempt of virtue, that he ſcorned to practiſe hypocriſy. Yet he had little enjoyment of his wonderful elevation, and was uſed to ſay to Fontenelle, with whom he loved to converſe, "I wiſh I lived in a ſecond floor at Paris, with an old nurſe, and only five hundred crowns a-year!"

DUBO'S (Charles-Francis), a French eccleſiaſtic, born in 1661, in the dioceſe of St. Flour in Auvergne. He was ſent for education to Paris, where, after he had gone through a courſe of claſſical learning and philoſophy, he devoted himſelf to the ſtudy of theology, and took his degrees in the college of the Sorbonne, with uncommon reputation. He became a favourite of M. Barillon, biſhop of Luçon, who made him principal archdeacon of his church. After the death of the biſhop, ſeveral other prelates wiſhed to attach him to their intereſts, but he choſe to continue his connection with the ſee of Luçon; and on a vacancy taking place in the deanery, he was unanimouſly elected to that dignity by the chapter, under very honourable circumſtances. In that ſituation he remained until his death, in 1724, in the ſixty-fourth year of his age. He lived honoured and beloved by all ranks;

ranks; and his loſs was much lamented by the poor, to whom he had been a kind and active benefactor. He reſumed the publication of the celebrated Luçon Conferences, which had been commenced by M. Louis, ſubdean of Luçon, but after the appearance of five volumes was ſuſpended for about ten years. M. Dubos added ſeventeen volumes to that collection, which were publiſhed in 12mo, at different periods, and left materials in the hands of his executors for at leaſt fifteen volumes more. He was alſo the author of "A Sketch of the Life of M. Barillon, Biſhop of Luçon," publiſhed in 1700, 12mo, to which are annexed ſome ſmall treatiſes, the productions of that prelate.

DUBO'S (John-Baptiſt), abbot of Reſons, an eſteemed French writer, born in 1670, at Beauvais, of which place his father was a merchant and magiſtrate. He was ſent young to Paris for the ſtudy of civil law, hiſtory, and politics. He made himſelf known in 1695 by his Hiſtory of the four Gordians proved and illuſtrated by Medals, 12mo; in which he attempted to prove the exiſtence of a fourth of this imperial family, in addition to the three uſually reckoned. But though he diſplayed erudition and ingenuity in ſupport of this opinion, it has not been received by the learned. He ſoon after attracted the notice of M. de Torci, miniſter for foreign affairs, who took him into his office, and employed him in various negociations abroad. He was ſent on a ſecret miſſion to England, in order to diſpoſe the nation to make peace with France. For that purpoſe he wrote a work intitled The Intereſts of England ill underſtood in the preſent War, Amſt. 1704, which was much applauded by the French miniſtry, and was circulated with great induſtry by the Jacobite party, but made little impreſſion upon the Engliſh nation. It is remarkable for a prediction of the future ſeparation of the North-American colonies, in caſe England ſhould become maſter of that continent. In the midſt of his political engagements he found leiſure to publiſh, in 1709, a Hiſtory of the League of Cambray againſt the Venetian Republic, of which an improved edition appeared in 1728, in two vols. 12mo. an acute and well-written work. His Critical Reflections on Poetry and Painting, 1719, two vols. 12mo. (ſeveral times reprinted,) gained him high reputation as an elegant writer and a man of taſte. It procured him an entrance into the French academy in 1720, and that body elected him their perpetual ſecretary in 1722, in the place of Andrew Dacier. He next employed himſelf in elaborate enquiries relative to early French hiſtory, which produced his Critical Hiſtory of the Eſtabliſhment of the French Monarchy in Gaul, three vols. quarto, 1734; reprinted in 1743, with additions and corrections, in two vols. quarto, and four vols. 12mo. He died in March, 1742.

DUBOV'KA, a town of Ruſſia, in the government of Saratov, on the weſt ſide of the Volga: ſixty miles ſouth of Kamiſchin.

DUBOV'KA, a fort of Ruſſian Tartary, in the government of Caucaſus, on the Malwa: twelve miles weſt of Kizliar.

DU'BRAVITZ, a town of European Turkey, in the province of Moldavia: thirty-ſix miles north-weſt of Galatz.

DUBRAW', or DUBRAVIUS SCALA (John), a German prelate, ſtateſman, and hiſtorian, in the ſixteenth century, born at Pilſen in Bohemia. He was educated in Italy, where he received the degree of doctor of laws; and afterwards entered into the ſuite of Staniſlaus biſhop of Olmutz in Moravia. After the death of Zanbeck biſhop of Olmutz, he was raiſed to that ſee, which he enjoyed about ſix years. At different periods he was nominated ambaſſador to Sileſia and to Bohemia, and he was made preſident of the chamber appointed by the imperial court to conduct proceſſes againſt ſuch perſons as had joined in the proteſtant league at Smalcalde. He died in 1553. Dubraw was the author of various works; and, among others, of a Hiſtory of Bohemia, in thirty-three Books, publiſhed in 1552, which is commended for fidelity and accuracy. The beſt editions of this hiſtory are, one publiſhed by Thomas Jourdaine in 1574, with the addition of genealogical tables, and chronological and hiſtorical notes; and another publiſhed at Frankfort in 1688, accompanied with the Hiſtory of Bohemia, by Æneas Sylvius.

DU'BRIS, anciently a town of Britain; now DOVER, from the *Dovoria* of the lower age.

DUBRO'WA, a town of Lithuania, in the palatinate of Wilna: ſeventy-four miles eaſt-ſouth-eaſt of Wilna.

DUBROWI'CA, a town of Lithuania, in the palatinate of Brzeſc: forty-ſix miles ſouth-eaſt of Brzeſc.

DUC (Fronton du, in Latin *Fronto Ducæus*), a learned French Jeſuit, born at Bourdeaux, in 1558. He entered as a novice in the order at Verdun, in 1577, and ſoon recommended himſelf to his ſuperiors by the talents which he diſcovered, and his indefatigable application to the different ſtudies which were aſſigned him, particularly the belles-lettres, and the Latin and Greek languages. In 1597, he was ſent to teach theology in the Jeſuits' college, at Bourdeaux; and it was at this place that he began to communicate to the public the fruits of his laborious ſtudies. His firſt production of importance was a Latin tranſlation of The Works of St. Chryſoſtom, in ſix vols. folio, with notes. He was one of the moſt learned men and ableſt critics of his day, and was at the ſame time unaſſuming, modeſt, and pious. His correſpondence was courted by the moſt diſtinguiſhed literary characters among the proteſtants, as well as in his own communion, and they entertained not only a great reſpect, but a high eſteem, for his character. He died in 1624. Beſides his edition of Chryſoſtom's works already mentioned, and the treatiſes in a controverſy with M. Mornay du Pleſſis, he publiſhed *Bibliotheca Veterum Patrum, ſeu Scriptorum Eccleſiaſticorum, Græco-Latinus, &c.* in 1624, in two vols. folio; *L'Hiſtoire tragique de la Pucelle de Dom-Remy, outrement d'Orleans, departie par Actes, &c.* 1581, quarto; and a vaſt number of new editions of ancient authors, particularly the Greek and Latin fathers, with notes and corrections, of which a particular detail is given in father Niceron's Memoirs.

DUC (Nicholas le), a French prieſt, in the dioceſe of Rouen, at firſt ſettled on a benefice at Trouville en Caux, which he quitted in order to remove to Paris. He was for fifteen years vicar of St. Paul's, in that city; but in 1731, being accuſed of Janſeniſm, and interdicted by the archbiſhop from engaging in his clerical functions, he devoted himſelf entirely to a ſtudious life. To his labours were the public indebted for a conſiderable part of the tranſlation of Preſident de Thou's Hiſtory, in 16 vols. 4to. He was alſo the author of a work intitled *L'Année Eccleſiaſtique*, in 15 vols. 12mo; of tranſlations of ſome of cardinal Bona's religious treatiſes, &c.

DU'CA, a town of Italy, in the kingdom of Naples, and province of Bari: ſix miles north-weſt of Bari.

DU'CAL, *adj.* Pertaining to a duke: as, a *ducal* coronet.

DUCA'PE, *ſ.* A ſort of ſilk uſed for womens garments. *Bailey.*

DUCA'REL (Andrew Coltee), a diſtinguiſhed antiquary, born in 1713, at Caen, in Normandy. He came to England with his father at an early age, and was educated at Eton ſchool, whence he removed to St. John's college, Oxford. He took the degree of bachelor of laws in that univerſity, and, after leaving it in 1742, became a member of the college of Doctors'-commons in 1743. He made a tour in his native country in 1752, of which he publiſhed an account in 1754, afterwards reprinted in an enlarged form under the title of Anglo-Norman Antiquities, folio, 1767. In 1755 he was elected commiſſary or official of the peculiar juriſdiction of the collegiate church of St. Catharine, near the Tower of London. He was made librarian of the palace of Lambeth

beth in 1757; and in the next year was appointed commiſſary and official of the city and dioceſe of Canterbury. He had been admitted into the ſociety of antiquaries in 1737, and was one of the firſt fellows nominated upon its incorporation in 1755. To this body he addreſſed A Series of above two hundred Anglo-Gallic or Norman and Aquitaine Coins of the ancient Kings of England, exhibited in ſixteen Copper-plates, and illuſtrated in twelve Letters, quarto, 1757. In making this collection he had the aſſiſtance of M. de Boze, keeper of the king of France's medals. He printed, in 1760, A Biographical Account of Browne Willis, the Antiquary, read before the ſociety. Having been elected into the royal ſociety in 1762, he contributed to its memoirs a letter to prove that the cheſnut is indigenous to England, and an account of the early cultivation of botany in this country. In 1763 he was appointed by the commiſſioners of the treaſury, in conjunction with ſir Joſ. Ayloffe and Mr. Aſtle, to methodiſe the records in the ſtate-paper-office in Whitehall, and in the augmentation-office. He contributed to ſeveral antiquarian works in the enſuing years; and in 1779 he had a large ſhare in the Account of Alien Priories, two vols. 8vo, printed by Mr. Nichols. In 1782 he publiſhed The Hiſtory of the Royal Hoſpital and Collegiate Church of St. Catharine, 4to, with plates. He publiſhed, in 1783, Some Account of the Town, Church, and Archiepiſcopal Palace, of Croydon, 4to; and in the Bibliotheca Topographica Britannica he gave The Hiſtory and Antiquities of the Archiepiſcopal Palace of Lambeth, from its Foundation to the Year 1785. He alſo contributed largely to the Hiſtory of the Pariſh of Lambeth, publiſhed in 1786. He continued his application to his favourite ſtudies till his death, which happened at his houſe in South Lambeth, in May, 1785.

DU'CAS, a learned Greek, who wrote an hiſtory of what paſſed under the laſt emperors of Conſtantinople, till the ruin of that city. This work, which is much eſteemed, was printed at the Louvre, in 1649, with the Latin tranſlation and notes of Boillaud.

DUCAS'SE (Francis), a celebrated French canoniſt, native of the dioceſe of Leictoure. His firſt eccleſiaſtical promotion was the appointment of grand-vicar and official of Carcaſſone. Afterwards he became canon, archdeacon, and official, of Condom, where he died in 1706. He is repreſented to have been profoundly ſkilled in ſcriptural learning, the writings of the fathers, and the works of ancient and modern canoniſts; and in his conduct and manners to have conducted himſelf with credit to his character and profeſſion. He was the author of two treatiſes, much eſteemed by canon-lawyers; the firſt intitled *De la Juriſdiction Eccleſiaſtique contentieuſe*, 8vo, 1695; and the other *De la Juriſdiction voluntaire*, 8vo, 1697.

DU'CAT, *ſ.* [from *duke*.] A coin ſtruck by dukes: in ſilver, valued at about four ſhillings and ſixpence; in gold, at nine ſhillings and ſixpence:

I cannot inſtantly raiſe up the groſs
Of full three thouſand *ducats*. *Shakeſpeare.*

The origin of ducats is referred to Longinus, governor of Italy; who, revolting againſt the emperor Juſtin the Younger, made himſelf duke of Ravenna, and called himſelf *Exarcha*, i. e. without lord or ruler; and, to ſhow his independence, ſtruck pieces of money of very pure gold in his own name, and with his own ſtamp, which were called *ducati*, ducats.

DUCATOO'N, *ſ.* A ſilver coin, ſtruck chiefly in Italy; particularly at Milan, Venice, Florence, Genoa, Lucca, Mantua, and Parma. They are valued at about four ſhillings and eightpence ſterling. There is alſo a gold ducatoon, ſtruck chiefly in Holland: it is equivalent to twenty florins, of one ſhilling and elevenpence halfpenny the florin.

DUCE, or DEUCE, *ſ.* [*deux*, Fr. of *duo*, Lat.] The two on cards or dice.

DUCE *take you*, [probably from *bueȝ*, Sax. a ſpectre.] The devil take you.

DUCENA'RIUS, *ſ.* in antiquity, an officer in the Roman army, who had the command of two hundred men. In the inſcription at Palmyra, the word *ducenarius*, in Greek δεκεναρίος, occurs very often.

DUCENTE'SIMA, *ſ.* in antiquity, a tax of the two hundredth penny, exacted by the Romans.

DU'CES TE'CUM, *ſ.* in law, a writ commanding a perſon to appear at a certain day in the court of chancery, and to bring with him ſome writings, evidences, or other things which the court would view. So *ſubpœnas duces tecum*, are often ſued out at common law, to compel witneſſes to produce, on trials at *niſi prius*, deeds, bonds, bills, notes, books, or memorandums, &c. which are in their cuſtody or power, and which relate to the iſſue in queſtion. But if they are in the poſſeſſion or power of the adverſe party or his attorney, it is cuſtomary to give notice to the attorney to produce them, and on proof made in open court, before the judge of niſi prius, of ſuch notice, the court generally compels the attorney, or his client, to produce the ſame, if material. If not produced, parol evidence may be given of their contents.

DUCES TECUM LICET LANGUIDUS, a writ directed to the ſheriff, upon a return that he cannot bring his priſoner without danger of death, he being *adeo languidus*; then the court grants a habeas corpus, in the nature of a *duces tecum licet languidus*. But this is now out of uſe; for where the perſon's life would be endangered by removal, the law will not permit it to be done.

DU'CEY, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Avranches: one league and a half ſouth-ſouth-eaſt of Avranches.

DU'CHAL (James), an eminent Iriſh nonconformiſt divine, born moſt probably at or near Antrim, in 1697. His collegiate ſtudies he purſued at the univerſity of Glaſgow, where he continued till he was of a proper ſtanding to take the degree of maſter of arts. Soon afterwards he entered upon the work of the miniſtry, and had his firſt ſettlement with a ſmall congregation at Cambridge. To the diligence with which, during this period, he cultivated ethics and divinity, and other branches of learning more immediately connected with his profeſſion, may in a conſiderable degree be attributed the reputation by which he was afterwards diſtinguiſhed among the Iriſh nonconformiſt divines. Whilſt he was at Cambridge he publiſhed, in 1728, three valuable ſermons, intitled The Practice of Religion recommended, in 8vo. Upon the death of Mr. Abernethy, in 1740, he became that gentleman's ſucceſſor, and ſettled with the proteſtant diſſenting congregation in Wood-ſtreet, Dublin. In 1752, Mr. Duchal publiſhed a very excellent collection of diſcourſes, abounding in judicious and pointed reaſoning, ſound philoſophy, and liberality of ſentiment. It is intitled Preſumptive Arguments for the Truth and Divine Authority of the Chriſtian Religion; in ten Sermons: to which is added, a Sermon upon God's Moral Government, 8vo. Soon after the appearance of this work, the author had the degree of doctor in divinity conferred upon him by the univerſity in which he had been educated. He died in 1761, deeply regretted by numerous friends. His character appears to have been truly eſtimable for piety, morality, modeſty, candour, and benevolence. Since his death three volumes of his ſermons have been publiſhed, taken, for the greateſt part, indiſcriminately from the vaſt maſs which he left behind him. Beſides ſermons, Dr. Duchal is ſaid to have been the author of various occaſional publications, both in England and Ireland, which moſt probably related to the theological controverſies of the times: and in the ſecond volume of The Theological Repoſitory may be found two eſſays by him, one On the Obligation of Truth, and the other On the Doctrine of Atonement.

DUCHA'T (Jacob le), an eſtimable man of letters, born at Metz, in 1658. His father was a commiſſary at war, of a family from Troyes in Champagne, which had become refugees on account of proteſtantiſm. Duchat ſtudied law at Straſburg, and purſued it profeſſionally till the revocation of the edict of Nantes. He then retired to Berlin, where he was made counſellor of the upper court of French judicature, and member of the Royal Academy of Sciences. He lived in celibacy, devoted to the purſuit of literature and the ſociety of his friends, and died in 1735. Duchat was well acquainted with the old French authors who wrote previouſly to the reign of Henry IV. He gave editions of ſeveral of them, enriched with notes and anecdotes, of which the principal are: 1. *Confeſſion Catholique du Sieur de Sancy*, 1693, 1720. 2. *La Satyre Menippée*, 1696, 1714. 3. *Les Oeuvres de Rabelais*, 5 vols. 8vo. 3 vols. 4to. 1715. 4. *Les Aventures du Baron de Feneſte*, 1729. 5. *Les Quinze Joies du Mariage*, 1734. 6. *L'Apologie pour Herodote*, 1735. After his death were publiſhed *Ducatiana*, 2 vols. 8vo, a compilation of his remarks, &c.

DUCHE' DE VANCY (Joſeph Francis) a French poet, born at Paris, in 1668. He was brought up to letters, and wrote ſome poems, which ſo much pleaſed madame de Maintenon, that ſhe made choice of him to compoſe ſacred poems for the young ladies of St. Cyr. He was of an amiable character, and cheriſhed in ſociety, which he enlivened by an extraordinary talent for declamation. He was admitted into the academy of inſcriptions and belles-lettres, and died in 1704, at the age of thirty-ſeven. He compoſed, in imitation of Racine, ſome tragedies from ſcripture ſubjects; of which his Abſalom contained ſome pathetic ſcenes, which gave it a permanent place on the ſtage. He alſo wrote a collection of Ediſying Hiſtories. Of the pieces he wrote at an early period, the beſt is his Iphigenia in Tauris, an opera in the grand ſtyle, which, according to Voltaire, affords a lively idea of the beſt parts in the Greek tragedies.

DU'CHESS, or DUTCHESS, [*ducheſſe*, Fr.] The lady of a duke. A lady who has the ſovereignty of a dukedom:

The gen'rous god who wit and gold refines,
And ripens ſpirits as he ripens mines,
Kept droſs for *ducheſſes*, the world ſhall know it,
To you gave ſenſe, good humour, and a poet. *Pope.*

The only remedy for theſe evils, was concluded to be the eſpouſals of the *dutcheſs* of Britanny and the king of France. *Hume.*—A title of dignity for a female:

What think you of a *dutcheſs?* have you limbs
To bear that load of title? *Shakeſpeare.*

DU'CHESS COUNTY, a county of the American States, in the ſtate of New York, on the eaſt ſide of Hudſon river. It has the ſtate of Connecticut on the eaſt, Weſt Cheſter on the ſouth, and Columbia county on the north. It is about forty-eight miles long and twenty-three broad, and contains fifteen townſhips, of which Poughkeepſie and Fiſh Kill are the chief. It contains 45,266 inhabitants; and ſends ſeven repreſentatives to the aſſembly of the ſtate. In 1792, a remarkable cavern was diſcovered in this county, at a place called by the Indians Sepaſcot, at Rhynbeck. A lad, by chance, paſſing near its entrance, which lies between two huge rocks, on the declivity of a ſteep hill, on prying into the gloomy receſs, ſaw the top of a ladder, by which he deſcended about ten feet, and found himſelf in a ſubterraneous apartment, more capacious than he choſe to inveſtigate. He found, however, that it had been the abode of perſons, who, probably, during the American war, had taken ſhelter here, as bits of cloth and pieces of leather were ſcattered about its floor. Like many other caverns in the United States, it poſſeſſes a petrifying quality; and the water, which is conſtantly percolating through the roofs of its apartments, has formed a variety of tranſparent and beautiful ſtalactites. But what is moſt to be admired is the ſkeleton of a large ſnake, turned into ſolid ſtone by the petrifying quality of the water, yet having all its parts as perfect and complete as in real life.

DU'CHESS (La), a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra: eleven miles ſouth-ſouth-weſt of Aquila.

DU'CHY, *ſ.* [*duché*, Fr.] A territory which gives title to a duke, or has a duke for its ſovereign.

DU'CHY COURT, *ſ.* A court wherein all matters belonging to the duchy or county palatine of Lancaſter are decided. See the article CHANCELLOR of the DUCHY of LANCASTER, vol. iv. p. 87.

DUCHOVTSCHI'NA, a town of Ruſſia, in the government of Smolenſk: twenty-four miles north of Smolenſk, and 300 ſouth-ſouth-eaſt of Peterſburg.

DUCK, *ſ.* [*ducken*, Dut. to dip.] A water-fowl, both wild and tame. See ANAS, vol. i. p. 515.

The *ducks*, that heard the proclamation cry'd,
And fear'd a proſecution might betide,
Full twenty mile from town their voyage take,
Obſcure in ruſhes of the liquid lake. *Dryden.*

A word of endearment, or fondneſs:

Will you buy any tape or lace for your cap,
My dainty *duck*, my dear-a? *Shakeſpeare.*

A declination of the head; ſo called from the frequent action of a duck in the water:

Back, ſhepherds, back; enough your play
Till next ſunſhine holyday;
Here be without *duck* or nod,
Other trippings to be trod. *Milton.*

A ſtone thrown obliquely on the water, ſo as to ſtrike it and rebound.—Neither croſs and pile, nor *ducks* and drakes, are quite ſo ancient as handy-dandy. *Arbuthnot.*

To DUCK, *v. n.* To dive under water as a duck:

Let the labouring bark climb hills of ſeas
Olympus high, and *duck* again as low
As hell's from heaven. *Shakeſpeare.*

To drop down the head, as a duck:

When at a ſkirmiſh firſt he hears
The bullets whiſtling round his ears,
Will *duck* his head aſide, will ſtart,
And feel a trembling at his heart. *Swift.*

To bow low; to cringe. In Scottiſh, *duyk*, or *juyk*, to make obeiſance, is ſtill uſed:

The learned pate
Ducks to the golden fool. *Shakeſpeare.*

To DUCK, *v. a.* To put under water.

DUCK, a river of North America, in Tenneſſee, which riſes on the north-weſt ſide of the Cumberland mountain. It runs a north-weſt courſe, and empties into the Tenneſſee in north lat. 36. It is 200 yards wide five miles from its mouth, which is fifty-ſeven miles weſterly of Naſhville; and is boatable ninety miles.

DUCK ISLAND, a ſmall iſland in the Atlantic, near the coaſt of Main, in North America, belonging to the American States. Lat. 44. 45. N. lon. 67. 43. W. Greenwich.

DUCK'S-FOOT. See PODOPHYLLUM.

DUCK'S-MEAT. See LEMNA.

DUCK'CREEK, a town of the American States, in the ſtate of Delaware, now named SALISBURY.

DUCK'COY, *ſ.* Any means of enticing and enſnaring.—Seducers have found it the moſt compendious way to their deſigns, to lead captive ſilly women, and make them the *duckcoys* to their whole family. *Decay of Piety.*

DUCK'ER, *ſ.* A diver; one that ducks another. A cringer.

DUCK'INGSTOOL, *ſ.* A chair in which ſcolds are tied,

tied, and put under water. See the article CASTIGATORY, vol iii. p. 884.—Reclaim the obſtinately opprobrious and virulent women, and make the *ducking ſtool* more uſeful. *Addiſon.*

DUCK'LEGGED, *adj.* Short legged:

Ducklegged, ſhort waiſted, ſuch a dwarf ſhe is,
That ſhe muſt riſe on tiptoes for a kiſs. *Dryden.*

DUCK'LING, *ſ.* A young duck; the brood of the duck:

Ev'ry morn
Amid the *ducklings* let her ſcatter, corn. *Gay.*

DUCK'STEIN, *ſ.* [Germ.] A white calcareous ſtone, formed by the depoſition of chalk from water, in which it is diffuſed. It is generally formed on branches or roots of trees, and ſtones of different kinds, and differs from the ſtalactites in its mode of formation, this laſt being depoſited by water in the act of evaporation as it tranſudes through the roofs of caverns.

DUCK'TRAP, a town of the American States, in the diſtrict of Maine, where a poſt-office is kept, in Hancock county, containing 278 inhabitants; twelve miles from Belfaſt, and thirty-two from Penobſcot.

DU'CLER, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Caudebec: three leagues and a half weſt-ſouth-weſt of Rouen.

DU'CLOS (Charles Dineau), an eminent French writer, born in 1705, ſon of a hatter at Dinant in Britanny. He received a liberal education at Paris, where he ſoon made himſelf known as a writer, and was admitted into the academy of inſcriptions in 1739, and into the French academy in 1747. Of the latter he was made perpetual ſecretary on the death of Mirabaud. His native place nominated him its firſt magiſtrate in 1744; and, when the king, in recompence for the patriotic zeal diſplayed by the province of Britanny, propoſed to confer honours on ſome of its members who ſhould be recommended, Duclos was unanimouſly nominated by the third eſtate, and was in conſequence ennobled by letters patent. He was alſo penſioned, and obtained the poſt of hiſtoriographer of France. It was ſaid of him, that he was at the ſame time *droit & adroit*, honeſt and dextrous. He wrote ſeveral novels, which are ingenious and intereſting, though the incidents and characters are rather fanciful than natural. The beſt of theſe is, *Confeſſions du Comte de* . . . . . His Hiſtory of Louis XI. 3 vols. 12mo. 1745; and Supplement, 1 vol. 1746, is a work of curious reſearch, written in a conciſe and elegant ſtile, but too much in the ſententious manner of Tacitus. His moral work, intitled *Conſiderations ſur les Mœurs de ce Siècle*, is much eſteemed for the truth and correctneſs of its maxims, and the ingenuity of its diſcuſſions. His Remarks on the Grammar of the Port Royal, and ſeveral diſſertations in the Memoirs of the Academy of Belles Lettres, do honour to his judgment and erudition. He had a large ſhare in the Dictionary of the French Academy; and, ſince his death, there have appeared under his name, Secret Memoirs of the Reigns of Louis XIV. and Louis XV. in 2 vols. 8vo. 1791, which are accounted authentic, and contain many free and curious particulars of the periods treated of. The following he recommends as the beſt maxims of human life: "Mankind are ſo much indebted to each other, that they owe mutual attention; they owe each other a politeneſs worthy of themſelves, worthy of thinking beings, and varied according to the different ſentiments that ſhould dictate it. The politeneſs of the great, therefore, ſhould be that of humanity; and that of inferiors gratitude, if the great deſerve it; that of equals eſteem and mutual ſervices; far from endeavouring to encourage incivility, it is much to be wiſhed, that the politeneſs ariſing from ſoftneſs of manners ſhould be added to that which proceeds from goodneſs of heart."

"The moſt pernicious effect of the common politeneſs of the world is, that it teaches us to do without thoſe virtues which it imitates. Were we but taught by our education to be humane and benevolent, we ſhould either poſſeſs politeneſs, or could do very well without it. We ſhould not, perhaps, have that politeneſs which announces itſelf by the graces, but we ſhould have that which announces the honeſt man and the man of honour. We ſhould then have no occaſion to have recourſe to mere appearances. Inſtead of being artificial to pleaſe, it would then be ſufficient that we were good men; inſtead of being diſſemblers to flatter the weakneſs of others, it would be enough for us only to be indulgent to them. Thoſe to whom we behaved in this manner would neither be rendered inſolent nor corrupted by it; they would only be grateful and become better."

It was an obſervation of Duclos, "That rogues always leagued together, whilſt honeſt men kept themſelves iſolated." "Impious and profligate writings (ſaid he) are read once for their novelty, and, except on account of the bad principles they contain, they would never have been taken the leaſt notice of; like thoſe obſcure criminals whoſe names are known only by their crimes and their puniſhments." Duclos died in 1772. He was a man of much integrity, a faithful friend, and a patron of merit.

DUCT, *ſ.* [*ductus*, Lat.] Guidance; direction.—This doctrine, by faſtening all our actions by a fatal decree at the foot of God's chair, leaves nothing to us but only to obey our fate, to follow the *duct* of the ſtars, or neceſſity of thoſe irony chains which we are born under. *Hammond.*—A paſſage through which any thing is conducted: a term chiefly uſed by anatomiſts.—It was obſerved that the chyle, in the thoracic *duct*, retained the original taſte of the aliment. *Arbuthnot.*

DUCTABI'LITY, *ſ.* Eaſineſs of belief, the quality of being eaſily led.

DUC'TABLE, or DUCTIBLE, *adj.* [from the Lat. *duco*, to lead.] Eaſy of belief, eaſy to be led, ductile.

DUC'TILE, *adj.* [*ductilis*, Lat.] Flexible; pliable:

Thick woods and gloomy night
Conceal the happy plant from human ſight:
One bough it bears; but, won'drous to behold!
The *ductile* rind and leaves of radiant gold. *Dryden.*

Eaſy to be drawn out into length, or expanded.—All bodies *ductile* and tenſile, as metals, that will be drawn into wires; wool and tow, that will be drawn into yarn or thread; have the appetite of not diſcontinuing ſtrong. *Bacon.*—Tractable; obſequious; complying; yielding:

He generous thoughts inſtils
Of true nobility; forms their *ductile* minds
To human virtues. *Philips.*

DUC'TILENESS, *ſ.* Flexibility; ductility:

I, when I value gold, may think upon
The *ductileneſs*, the application;
The wholeſomeneſs, the ingenuity,
From ruſt, from ſoil, from fire, ever free. *Donne.*

DUCTI'LITY, *ſ.* Quality of ſuffering extenſion; flexibility. Obſequiouſneſs; compliance.—Yellow colour and *ductility* are properties of gold: they belong to all gold, but not only to gold; for ſaffron is alſo yellow, and lead is *ductile*. *Watts.*—This term is almoſt excluſively applied to ſuch bodies as are capable of being beaten, preſſed, drawn, or ſtretched forth, without breaking; or by which they are capable of great alterations in their figure and dimenſions, and of gaining in one way what they loſe in another. Such are metals, which, being urged by the hammer, gain in length and breadth what they loſe in thickneſs; or, being drawn into wire through holes in iron, grow longer as they become more ſlender. Such alſo are gums, glues, reſins, and ſome other bodies; which, though not malleable, may yet be denominated ductile, in as much as, when ſoftened by water, fire, or ſome other menſtruum, they

may be drawn into threads. Some bodies are ductile both when they are hot and cold, and in all circumſtances: ſuch are metals, and eſpecially gold and ſilver; other bodies are ductile only when they have a certain degree of heat; ſuch as glaſs and wax; others again are ductile only when cold, and brittle when hot; as ſome kinds of iron, viz. thoſe called by workmen redſhot, as alſo braſs, and ſome metallic alloys.

The cauſe of ductility is very obſcure; as depending much on hardneſs, a quality whoſe nature we know but little about. It is true, it is uſual to account for hardneſs from the force of attraction between the particles of the hard body; and for ductility, from the particles of the ductile body being, as it were jointed, and entangled with each other. But without dwelling on any fanciful hypotheſes about ductility, we may inform ourſelves of ſome truly amazing circumſtances and phenomena of it, in the inſtances of gold, glaſs, ſpider's webs, &c. obſerving, however, that the ductility of metals decreaſes in the following order: gold, ſilver, copper, iron, tin, lead.

Gold is ſaid to be the moſt ductile of all bodies; of which the gold-beaters and gold-wire-drawers furniſh us with abundant proofs. Merſenne, Rohault, Dr. Halley, &c. have made computations of it; but they truſted to the reports of the workmen. M. Reaumur, in the *Memoires de l'Academie Royale des Sciences*, anno 1713, took a ſurer way; he made the experiment himſelf. A ſingle grain of gold, he found, even in the common gold-leaf, uſed in moſt of our gildings, is extended into thirty-ſix and a half ſquare inches; and an ounce of gold, which, in form of a cube, is not half an inch either high, broad, or long, is beat under the hammer into a ſurface of 146 and a half ſquare feet; an extent almoſt double to what could be done in former times. In Merſenne's time, it was deemed prodigious, that an ounce of gold ſhould form 1600 leaves; which, together, only made a ſurface of 105 ſquare feet. But the diſtenſion of gold under the hammer (how conſiderable ſoever) is nothing to that which it undergoes in the drawing-iron. There are gold leaves in ſome parts ſcarcely the $\frac{1}{360000}$ part of an inch thick; but $\frac{1}{360000}$ part of an inch is a conſiderable thickneſs, in compariſon of that of the gold ſpun on ſilk in our gold thread. To conceive this prodigious ductility, it is neceſſary to have ſome idea of the manner in which the wire-drawers proceed. The wire and thread we commonly call gold-thread, &c. (which is only ſilver-wire gilt, or covered over with gold,) is drawn from a large ingot of ſilver, uſually about thirty pounds weight. This they round into a cylinder, or roll, about an inch and a half in diameter, and twenty-two inches long, and cover it with the leaves prepared by the gold beater, laying one over another, till the cover is a good deal thicker than that in our ordinary gilding; and yet, even then, it is very thin; as will be eaſily conceived from the quantity of gold that goes to gild the thirty pounds of ſilver: two ounces ordinarily do the buſineſs; and, frequently, little more than one. In effect, the full thickneſs of the gold on the ingot rarely exceeds $\frac{1}{400}$ or $\frac{1}{500}$ part; and ſometimes not $\frac{1}{1000}$ part of an inch. But this thin coat of gold muſt be yet vaſtly thinner: the ingot is ſucceſſively drawn through the holes of ſeveral irons, each ſmaller than the other, till it be as fine or finer than a hair. Every new hole leſſens its diameter; but it gains in length what it loſes in thickneſs; and, of conſequence, increaſes in ſurface: yet the gold ſtill covers it; it follows the ſilver in all its extenſion, and never leaves the minuteſt part bare, not even to the microſcope. Yet, how inconceivably muſt it be attenuated while the ingot is drawn into a thread, whoſe diameter is 9000 times leſs than that of the ingot.

M. Reaumur, by exact weighing, and rigorous calculation, found, that one ounce of the thread was 3232 feet long; and the whole ingot 1,163,520 feet, Paris meaſure, or ninety-ſix French leagues; equal to 1,264,400 Engliſh feet, or 240 miles Engliſh; an extent which far ſurpaſſes what Merſenne, Furetiere, Dr. Halley, &c. ever dreamt of. Merſenne ſays, that half an ounce of the thread is 100 toiſes, or fathoms long; on which footing, an ounce would only be 1200 feet; whereas M. Reaumur finds it 3232. Dr. Halley makes ſix feet of the wire one grain in weight, and one grain of the gold ninety-eight yards; and, conſequently, the ten thouſandth part of a grain, above one-third of an inch. The diameter of the wire he found one-186th part of an inch; and the thickneſs of the gold one-154,500th part of an inch. But this, too, comes ſhort of M. Reaumur; for, on this principle, the ounce of wire would only be 2680 feet. But the ingot is not yet extended to its full length. The greateſt part of our gold-thread is ſpun, or wound on ſilk; and, before it is ſpun, they flat it, by paſſing it between two rolls, or wheels of exceedingly well poliſhed ſteel; which wheels, in flatting it, lengthen it by above one-ſeventh. So that our 240 miles are brought to 274. The breadth, now, of theſe laminæ, or plates, M. Reaumur finds, is only one-eighth of a line, or one-ninety-ſixth of an inch; and their thickneſs one-3072d. The ounce of gold, then, is here extended to a ſurface of 1190 ſquare feet; whereas the utmoſt the gold-beaters can do, we have obſerved, is to extend it to 146 ſquare feet. But the gold, thus exceedingly extended, how thin muſt it be! From M. Reaumur's calculus, it is found to be one-175,000th of a line, or one-2,100,000th of an inch; which is ſcarcely one-thirteenth of the thickneſs of Dr. Halley's gold. But, he adds, that this ſuppoſes the thickneſs of the gold every where equal, which is no ways probable; for in beating the gold-leaves, whatever care they can beſtow, it is impoſſible to extend them equally. This we eaſily find, by the greater opacity of ſome parts than others; for, where the leaf is thickeſt, it will gild the wire the thickeſt.

M. Reaumur, computing what the thickneſs of the gold muſt be where thineſt, finds it only one-3,150,000th part of an inch. But what is the one-3,150,000th part of an inch? Yet this is not the utmoſt ductility of gold; for, inſtead of two ounces of gold to the ingot, which we have here computed upon, a ſingle one might have been uſed; and, then, the thickneſs of the gold, in the thineſt places, would only be the 6,300,000th part of an inch. And yet, as thin as the plates are, they might be made twice as thin, yet ſtill be gilt; by only preſſing them more between the flatter's wheels, they are extended to double the breadth and proportionably in length. So that their thickneſs, at laſt, will be reduced to one-thirteen or fourteen millionth part of an inch. Yet, with this amazing thinneſs of the gold, it is ſtill a perfect cover for the ſilver: the beſt eye, or even the beſt microſcope, cannot diſcover the leaſt chaſm, or diſcontinuity. There is not an aperture to admit alcohol of wine, the ſubtileſt fluid in nature, or even light itſelf, unleſs it be owing to cracks occaſioned by repeated ſtrokes of the hammer. And, if a piece of this gold-thread, or gold-plate, be laid to diſſolve in aquafortis, the ſilver will be all excavated, or eat out, and the gold left entire, in little tubules. It ſhould be obſerved, that gold, when it has been ſtruck for ſome time by a hammer, or violently compreſſed, as by gold-wire-drawers, becomes more hard, elaſtic, and ſtiff, and leſs ductile, ſo that it is apt to be cracked or torn: the ſame thing happens to the other metals by percuſſion and compreſſion. But ductility and tractability may be reſtored to metals in that ſtate, by annealing them, or making them red-hot. Gold ſeems to be more affected by percuſſion and annealing, than any other metals.

As to the ductility of ſoft bodies, it is not yet carried to that pitch. The reader, however, muſt not be ſurpriſed that, among the ductile bodies of this claſs, we give the firſt place to the moſt brittle of all other, glaſs. We all know that, when well penetrated with the heat of the fire, the workmen can figure and manage glaſs like ſoft wax; but, what is moſt remarkable, it may be drawn, or ſpun out into threads, exceedingly fine and long. Our ordinary ſpinners do not form their threads of ſilk, flax,

or the like, with half the eaſe and expedition that glaſs-ſpinners do threads of this brittle matter. We have ſome of them uſed in plumes for children's heads, and divers other works, much finer than any hair, and which bend and wave like it with every wind. Yet nothing is more ſimple and eaſy than the method of making them: there are two workmen employed; the firſt holds one end of a piece of glaſs over the flame of a lamp; and, when the heat has ſoftened it, a ſecond operator applies a glaſs hook to the metal thus in fuſion; and, withdrawing the hook again, it brings with it a thread of glaſs, which ſtill adheres to the maſs: then, fitting his hook on the circumference of a wheel about two feet and a half in diameter, he turns the wheel as faſt as he pleaſes; which, drawing out the thread, winds it on its rim; till, after a certain number of revolutions, it is covered with a ſkain of glaſs-thread.

The maſs in fuſion over the lamp diminiſhes inſenſibly: being wound out, as it were, like a pelotoon, or clue of ſilk, upon the wheel; and the parts, as they recede from the flame, cooling, become more coherent to thoſe next to them; and this by degrees: the parts neareſt the fire are always the leaſt coherent, and, of conſequence, muſt give way to the effort the reſt make to draw them towards the wheel. The circumference of theſe threads is uſually a flat oval, being three or four times as broad as thick: ſome of them ſeem no bigger than the thread of a ſilk-worm, and are ſurpriſingly flexible. If the two ends of ſuch threads be knotted together, they may be drawn and bent, till the aperture, or ſpace in the middle of the knot, doth not exceed one-fourth of a line, or one-forty-eighth of an inch diameter. Hence M. Reaumur advances, that the flexibility of glaſs increaſes in proportion to the fineneſs of the threads; and that, probably, had we but the art of drawing threads as fine as a ſpider's web, we might weave ſtuffs and cloths of them for wear. Accordingly he made ſome experiments this way; and found he could make threads fine enough, viz. as fine, in his judgment, as ſpider's thread, but he could never make them long enough to uſe in a loom. The ductility and fineneſs of the ſpider's web, ſurpaſſes all that has been ſtated above; and ſome of them are ſo fine, as ſcarcely to be diſcerned without a microſcope. See the article ARANEA, vol. ii. p. 31.

DUC'TION, *ſ.* The act of leading. *Not much uſed.*

DUD, a town of Africa, in the country of Moſambique, where the king reſides.

DU'DA, a town of Lithuania, in the palatinate of Wilna: twenty-eight miles eaſt-north-eaſt of Lida.

DU'DAIM, *ſ.* in botany. See CUCUMIS.

DUD'DEN, a river of England, which runs into the Iriſh ſea, about three miles ſouth from Dalton, in Lancaſhire.

DU'DEN, a town of Aſiatic Turkey, in the province of Caramania: ten miles north of Satalia.

DU'DEN, a river of Aſiatic Turkey, which runs into the ſea near Satalia.

DU'DENHOFEN, a town of Germany, in the circle of the Upper Rhine, and county of Hanau Munzenberg: ſeven miles ſouth of Hanau.

DU'DERSTADT, a town of Germany, in the circle of the Lower Rhine, and territory of Eichsfield; containing three churches; ceded to the elector of Mentz in 1365, by Otho, ſon of Henry, duke of Brunſwick. The principal trade is in beer and tobacco: forty-ſix miles north weſt of Erfurt, and twenty weſt of Nordhauſen.

DUD'GEON, *ſ.* [*dolch*, Germ.] A ſmall dagger:

It was a ſerviceable *dudgeon*,
Either for fighting or for drudging. *Hudibras.*

Malice; fullenneſs; malignity; ill will.—The cuckoo took this a little in *dudgeon*. *L'Eſtrange.*

Civil *dudgeon* firſt grew high,
And men fell out they knew not why. *Hudibras.*

DU'DITH (Andrew), a learned Hungarian prelate, born at Buda in 1533. Being deſcended from a noble and opulent family, he enjoyed all the advantages of a liberal education, and ſoon diſtinguiſhed himſelf by the brightneſs of his parts, and the proficiency which he made in the different branches of literature. He was ſent to Breſlau in Sileſia, to be initiated in claſſical learning, and to become acquainted with the German tongue. At eighteen years of age he was removed to Verona, where he made ſuch a rapid progreſs in the Latin and Greek languages, in the ſtudy of eloquence, and in other departments of the belles-lettres, that he acquired very high reputation among the Italian literati. From Italy he went to France, to make himſelf maſter of the Hebrew and the other oriental languages. From Paris he returned again to Italy, and ſtudied for ſome years at Padua. When, in the year 1554, cardinal Pole was nominated papal legate to the court of England, Dudith was engaged by him to become one of his train, and recommended himſelf to the notice and eſteem of queen Mary and her ſiſter Elizabeth. Not long afterwards he returned into his native country, and was appointed provoſt of Oberbaden, and canon of Gran. Here he tranſlated into Latin, The Judgment of Dionyſius Halicarnaſſenſis on the Hiſtory of Thucydides, and laid the foundation of ſome other literary works. In 1560, Dudith repaired to the court of Vienna, where his merits occaſioned his being appointed one of the privy-councillors to the emperor Ferdinand II. and were, in a ſhort time, further honoured by his nomination to the biſhopric of Tina in Dalmatia. In 1662, he was deputed by the clergy of Hungary to be one of their repreſentatives in the council of Trent. The emperor afterwards ſent him his ambaſſador into Poland, to the court of Sigiſmund Auguſtus; and on his return tranſlated him to the biſhopric of five churches. After the death of Ferdinand, his ſon and ſucceſſor, Maximilian II. who entertained the ſame opinion of his character and abilities with his father, ſent him alſo as his ambaſſador into Poland. By this time Dudith had undergone a revolution in his religious opinions, and was determined to withdraw from the communion of the church of Rome. This event drew on his head the thunders of the Vatican; but he treated them with contempt, and, retaining ſtill the eſteem and confidence of the emperor, was appointed his reſident in Poland, where he publicly profeſſed the proteſtant religion. From hence he returned to Breſlau, where he died in 1589, in the ſixtieth year of his age. Dudith was unqueſtionably one of the moſt learned and eminent men of the ſixteenth century. His life was regular and virtuous, his manners polite and conciliating, and his benevolence warm and unconfined. He was the author of numerous treatiſes in controverſy, phyſics, and poetry. His Diſcourſes pronounced at the Council of Trent, An Apology for the Emperor Maximilian II. A Treatiſe in Favour of the Marriage of the Clergy, together with ſome other pieces, and his Life by Reuter, were publiſhed in quarto, in 1610. The principal of his other works are, A Treatiſe on Comets, with Diſſertations on the ſame Subject, 1579; *Epiſtolæ Medicinales*, publiſhed in the *Epiſtolæ Philoſophicæ, Medicæ, & Chymicæ*, of Laurence Scholzius, 1598; Latin Poems, inſerted in the two volumes of The Beauties of German Poetry; *Notæ Duplices in Fauſti Socini Diſputationem de Baptiſmo Aquæ, &c.* 1613, 8vo. and other controverſial pieces, letters, &c.

DUDLEY, an ancient town in Worceſterſhire, diſtant 120 miles from London, with a market on Saturdays; fairs May 8, Auguſt 5, October 2. The inhabitants have an extenſive manufacture for nails and other iron-wares. Here are three charity ſchools, one for fifty boys, another for fifty girls, and the other a free grammar ſchool. At a little diſtance from the town are the ruins of Dudley priory, built in 1160. It is ſituated on the road from Birmingham to Bridgnorth, ten miles from the former, and ſixteen from the latter. Dudley caſtle is adjacent to the town, though in the county of Stafford. It was originally built in the year 700, but was demoliſhed by Hen-

ry II.

ry II. The modern caſtle is a ſpacious building, with trenches hewn out of the rock, and ſtands on a lofty hill, having an extenſive proſpect into five counties, and a great part of Wales. Oldbury chapel is one mile eaſt of Dudley caſtle, where Tame has its riſe. Near it is a Roman camp, and the portway paſſed near it.

DUD'LEY, a townſhip of the American States, in Worceſter county, Maſſachuſetts, containing 1114 inhabitants: eighteen miles ſouthward of Worceſter, and fifty-five miles ſouth-weſt of Boſton.

DUD'LEY (Edmund), an eminent lawyer and ſtateſman, in the reign of Henry VII. who, with ſir Richard Empſon, another lawyer of the ſame complexion, aſſiſted in filling that rapacious monarch's coffers by arbitrary proſecutions of the people on old penal ſtatutes. They were beheaded on the acceſſion of Henry VIII. to pacify the clamours of the people for juſtice.

DUD'LEY (John), duke of Northumberland, ſon of the above, a ſtateſman; memorable in the Engliſh hiſtory for his unſucceſsful attempt to place the crown on the head of his daughter-in-law, lady Jane Grey, who fell a victim to his ambition, was born in 1502, and beheaded in 1553. Ambroſe his eldeſt ſon was a brave general and able ſtateſman under queen Elizabeth; and received the appellation of *the good earl of Warwick*. Henry, the duke's ſecond ſon, was killed at the ſiege of St. Quintin. Robert, the third ſon, was created earl of Leiceſter; and was one of queen Elizabeth's favourites. His fourth ſon was the unfortunate lord Guildford Dudley, whoſe only crime was his being the huſband of lady Jane Grey, for which he was beheaded in 1554.

DUD'LEY (Robert), earl of Leiceſter, third ſon of John duke of Northumberland, above-mentioned, born anno 1532. He was admitted early into the ſervice and favour of Edward VI. but with the reſt of his family fell into diſgrace at the acceſſion of Mary; no ſooner, however, did Elizabeth ſucceed, than he was received at court as a principal favourite; in a ſhort ſpace he was maſter of the horſe, knight of the garter, and privy-counſellor, and was propoſed by queen Elizabeth (though probably not ſeriouſly) as a proper huſband for the queen of Scots, an offer which was generally thought to have been made, to afford Elizabeth an excuſe for taking him herſelf; the death of Dudley's lady at this period gave riſe to many dark ſuſpicions; ſhe was conducted by her huſband to the houſe of a domeſtic at Cumnor, in Berkſhire, where, as it was ſaid, after ſome attempts to poiſon her had proved inefficacious, ſhe was firſt ſtrangled, and then thrown from a high ſtair-caſe, that her death might appear to have been occaſioned by the fall. In 1564, he was created baron Denbigh, and earl of Leiceſter, and elected chancellor of the univerſity of Oxford; about this time he married the dowager baroneſs of Sheffield, but afterwards, fearing it would occaſion the diminution of his influence over Elizabeth, he exerted himſelf by various means to induce his lady to deſiſt from her pretenſions; finding her, however, immoveable, he recurred to his former expedient of poiſon, which the ſtrong conſtitution of the lady ſo far reſiſted as to enable her to eſcape with the loſs of her hair and nails; ſhe had a ſon whom Leiceſter called his baſe ſon, but to whom he left the bulk of his fortune. In 1575, the queen paid him a viſit at Kenilworth, where he entertained her ſeventeen days, at the expence of ſixty thouſand pounds. At this period appeared a pamphlet written with great force, entitled, A Dialogue between a Scholar, a Gentleman, and a Lawyer, in which the whole of Leiceſter's conduct was inveſtigated with equal truth and bitterneſs; the queen herſelf cauſed letters to be written from the privy-council, denying the charges, and vindicating her favourite's innocence; the pamphlet, however, was not the leſs read nor credited. In 1585, he was ſent as generaliſſimo to the Low Countries, where his conduct was ſuch a tiſſue of inſolence and caprice, that he was recalled, but loſt nothing in his miſtreſs's favour, who conſulted him on the arduous affair of Mary, queen of Scots, and it is reported his advice was to have recourſe to his old expedient poiſon. He died in September 1588, after having been appointed lieutenant-general under the queen, of the army aſſembled at Tilbury. With one of the blackeſt hearts, this man affected great regularity in religious duties; he was thoroughly converſant in the Latin and Italian languages, ſpoke well, and wrote at leaſt equal to any man of his time.

DUD'LEY (ſir Robert), natural ſon of Robert earl of Leiceſter, mentioned in the preceding article, born at Sheen in 1573. He was educated at Chriſt church college, Oxford, and acquired the character of one of the moſt learned and accompliſhed among the young men of quality in England. His enterpriſing diſpoſition prompted him to undertake a voyage of adventure and diſcovery; and he planned an expedition at his own expence to the South Seas, with a ſmall ſquadron under his own command, in 1594, and ſailed up the river Oronoque; in which expedition he took and deſtroyed ſeveral Spaniſh ſhips. An account of it, written by himſelf, was publiſhed in Hackluyt's collection. He was preſent at the taking of Cadiz in 1596, and diſtinguiſhed his courage in that glorious action, ſo as to obtain the honour of knighthood. He now made an attempt to eſtabliſh the legitimacy of his birth; but was oppoſed by the counteſs-dowager of Leiceſter, who found means to put a ſtop to his proceedings. In conſequence of this diſappointment, he reſolved to take up his reſidence at Florence, where he was made chamberlain to the wife of the grand duke Coſmo II. ſiſter to the emperor Ferdinand. Through her intereſt he was created a duke of the holy Roman empire, and thereupon aſſumed his grandfather's title of Northumberland, and was afterwards enrolled among the Roman nobility. He is ſaid to have been of great uſe to the duchy of Tuſcany, by means of various projects for improving navigation and commerce; and, in particular, the draining of the moraſs between Piſa and the ſea, and the improvement of the port of Livorno, or Leghorn, and raiſing it to a free port, is imputed to him by the Engliſh writers. He publiſhed a large work, entitled *Del Arcano del Mare*, &c. in two volumes folio, Flor. 1630 and 1646, full of charts, plans, and ſchemes, and ſuggeſting a great variety of projects relative to maritime affairs, which are ſaid to diſplay great extent of knowledge and fertility of invention. He died at his ſeat near Florence in 1649, leaving a numerous foreign poſterity. Among the various talents and inventions of this ſingular character, he is ſaid to have been the firſt who broke ſetting-dogs.

DUD'MAN, *ſ.* A malkin, a ſcare-crow; a hobgoblin, a ſpright. *Bailey.*

DUE, *adj.* The part. paſſ. of *owe*; [*dû*, Fr.] Owed; that which any one has a right to demand in conſequence of a compact, or for any other reaſon.—Mirth and cheerfulneſs are but the *due* reward of innocency of life. *More.*—There is a reſpect *due* to mankind, which ſhould incline even the wiſeſt of men to follow innocent cuſtoms. *Watts.*—Proper; fit; appropriate.—Opportunity may be taken to excite, in perſons attending on thoſe ſolemnities, a *due* ſenſe of the vanity of earthly ſatisfactions. *Atterbury.*—Exact; without deviation:

And Eve within, *due* at her hour, prepar'd
For dinner ſavoury fruits. *Milton.*

Conſequent to, occaſioned or effected by. *Proper, but not uſual.*—The motion of the oily drops may be in part *due* to ſome partial ſolution made by the vinous ſpirit, which may tumble them to and fro. *Boyle.*

DUE, *adj.* Exactly; directly; duly. The courſe is *due* eaſt, or *due* weſt:

Like the Pontic ſea,
Whoſe icy current, and compulſive courſe,
Ne'er feels retiring ebb, but keeps *due* on
To the Propontic and the Helleſpont. *Shakeſpeare.*

DUE, *ſ.* That which belongs to one; that which may be juſtly claimed.—The *due* of honour in no point omit. *Shakeſpeare.*

I take this garland, not as given by you,
But as my merit and my beauty's *due*. *Dryden.*

Right; juſt title:

The key of this infernal pit by *due*,
And by command of heaven's all-powerful King,
I keep. *Milton.*

Whatever cuſtom or law requires to be done.—They pay the dead his annual *dues*. *Dryden.*—Cuſtom; tribute; exactions; legal or cuſtomary perquiſites.—In reſpect of the exorbitant *dues* that are paid at moſt other ports, this deſervedly retains the name of free. *Addiſon.*

"He who loſes his DUE, gets no thanks." Spoken of thoſe who unpardonably neglect their own affairs, and thus ſuffer others to defraud or impoſe upon them. The Latins ſay, *Bona nomina male ſiunt, ſi non exigas.* High Germ. *Eine gute ſchuld verdirbt, die man nicht bald erwirbt.* The Spaniſh ſay, *Ni tomes cohécho, ni perdas derécho:* Take no bribe, nor loſe no due.

To DUE, *v. a.* To pay as due; perhaps for *endow:* found only in this ſingle paſſage:

This is the lateſt glory of their praiſe,
That I thy enemy *due* thee withal. *Shakeſpeare.*

DU'E CASTEL'LI, a town of the Italian republic, in the department of the Mincio, on the river Molinella, where an obſtinate battle was fought, in the beginning of September, 1796, between a detachment of Auſtrians, from the city of Mantua, and the French republican army; the latter remained maſters of the field: five miles north-eaſt of Mantua.

DU'E TOR'RE, a town of Italy, in the kingdom of Naples, and province of Bari: ſix miles ſouth-ſouth-weſt of Bari.

DU'EFUL, *adj.* Fit:

All which that day in order ſeemly good
Did on the Thames attend, and waited well
To do their *ducful* ſervice, as to them befel. *Spenſer.*

DUE'GNAS, or DUENNAS, a town of Spain, in the province of Leon, on the Piſuerga, on the frontiers of Old Caſtile: three leagues ſouth of Palencia.

DU'EL, *ſ.* [*duellum*, Lat.] In our ancient law this was a legal fight between perſons in a doubtful caſe, for the trial of the truth. See the article BATTEL, vol. ii. p. 809. But this kind of duel is diſuſed; and what we now call a duel, is a fighting between two, upon ſome quarrel precedent; wherein, if a perſon is killed, both the principal and his ſeconds are guilty of murder, whether the ſeconds fight or not. *Hawk. P. C.* 47, 51. If two perſons quarrel over night, and appoint to fight the next day; or quarrel in the morning, and agree to fight in the afternoon; or ſuch a conſiderable time after, by which it may be preſumed the blood was cooled; and then they meet and fight a duel, and one kill the other, it is in the eye of law wilful murder. 3 *Inſt.* 52. And whenever it appears, that he who kills another in a duel, or fighting on a ſudden quarrel, was maſter of his temper at the time, he is guilty of murder; as if after the quarrel he fall into another diſcourſe, and talk calmly thereon; or allege that the place where the quarrel happens is not convenient for fighting; or that his ſhoes are too high, if he ſhould fight at preſent, &c. *Kel.* 56. 1 *Lev.* 180. If one challenge another, who refuſes to meet him, but tells him that he ſhall go the next day to ſuch a place about buſineſs, and then the challenger meets him on the road, and aſſaults the other; if the other in this caſe kill him, it will be only manſlaughter; for here is no acceptance of the challenge, or agreement to fight: and if the perſon challenged refuſeth to meet the challenger, but tells him that he wears a ſword, and is always ready to defend himſelf; if then the challenger attack him, and is killed by the other, it is neither murder nor manſlaughter, if neceſſary in his own defence. *Kel.* 56. See the article CHALLENGE TO FIGHT, vol. iv. p. 76.

DUEL is alſo uſed for any contention between two:

Victory and triumph to the Son of God.
Now ent'ring his great *duel*, not of arms,
But to vanquiſh by wiſdom helliſh wiles. *Milton.*

To DU'EL, *v. n.* To fight a ſingle combat.—He muſt at length, poor man! die dully at home, when here he might ſo faſhionably and genteely have been *duelled* or fluxed into another world. *South.*—The challenging and fighting with a man is called *duelling*. *Locke.*

To DU'EL, *v. a.* To attack or fight with ſingly:

Who ſingle
Duell'd their armies rank'd in proud array,
Himſelf an army, now unequal match
To ſave himſelf againſt a coward arm'd,
At one ſpear's length. *Milton.*

DU'ELLA, *ſ.* The third part of an ounce. *Scott.*

DU'ELLER, *ſ.* A ſingle combatant.—They perhaps begin as ſingle *duellers*, but then they ſoon get their troops about them. *Decay of Piety.*

DU'ELLIST, *ſ.* A ſingle combatant:

Henceforth let poets, ere allow'd to write,
Be ſearch'd like *duelliſts* before they fight. *Dryden.*

One who profeſſes to ſtudy the rules of honour:

His bought arms Mung not lik'd; for his firſt day
Of bearing them in field, he threw 'em away;
And hath no honour loſt, our *duelliſts* ſay. *Ben Jonſon.*

DUEL'LO, *ſ.* [Ital.] The duel; the rule of duelling.—The gentleman will for his honour's ſake, have one bout with you: he cannot by the *duello* avoid it. *Shakeſ.*

DUEN'NA, *ſ.* [Span.] An old woman kept to guard a younger.—I felt the ardour of my paſſion increaſe as the ſeaſon advanced, till in the month of July I could no longer contain: I bribed her *duenna*, was admitted to the bath, ſaw her undreſſed, and the wonder diſplayed. *Arbuthnot.*

DUE'REN, or DUREN, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers, one of the handſomeſt and richeſt in the duchy, ſurrounded with walls in 1124, and conſidered as an imperial town. It is a place of ſome trade, and has a manufacture of cloth: ſeven miles ſouth-ſouth-eaſt of Juliers. Lat. 50. 52. N. lon. 24. E. Ferro.

DUE'RO, DOUERO, or DOURO, a river which riſes near Agreda, in Spain, and taking its courſe weſtwardly, paſſes Oſma, Aranda-de-Duero, Toro, Zamora, &c. in Spain; reaching the borders of Portugal, it paſſes by Miranda, when, taking a direction ſouth-weſt, it ſeparates the province of Tra-los-Montes from Spain, till, a little below Eſpadacenta, it again takes a weſterly courſe acroſs the kingdom of Portugal, having the province of Tra-los-Montes, and Entre-Duero-e-Minho, on the north, and Beira on the ſouth, and diſcharges its waters into the Atlantic a little below Oporto.

DUE'ROZHOF, a town of Germany, in the duchy of Carniola: four miles eaſt of Gurkfield.

DUE'SME, a town of France, in the department of the Cote d'Or: ten miles weſt of Chatillon ſur Seine.

DU'ET, *ſ.* [from *due*, Ital. two.] A ſong or air in two parts.

DUF'FEL, a free town of Brabant, between Malines and Liere: four miles from the latter.

DUF'HORN, a village of Germany, in the circle of Lower Saxony, and principality of Luneburg, having a very celebrated medicinal ſpring: three miles ſouth of Walſrode.

DUG, *ſ.* [*deggia*, Iſlan. to give ſuck.] A pap; a nipple; a teat: ſpoken of beaſts, or in malice or contempt of

of human beings.—They are firſt fed and nouriſhed with the milk of a ſtrange *dug*. *Raleigh*.

Then ſhines the goat, whoſe bruitiſh *dugs* ſupply'd
The infant Jove, and nurſt his growing pride. *Creech*.

It ſeems to have been uſed formerly of the breaſt, without reproach:

As mild and gentle as the cradle-babe,
Dying with mother's *dug* between its lips. *Shakeſpeare*.

DUG, *pret.* and *part. paſſ.* of *dig*.—They had often found medals, and pipes of lead, as they *dug* among the rubbiſh. *Addiſon*.

DUFRES'NY (Charles Riviere), a man of various talents, but chiefly known as a comic writer, born at Paris in 1648. He paſſed for a grandſon of Henry IV. and is ſaid to have reſembled him. He diſplayed a general taſte for the arts, without having ſtudied any. He wrote and ſet ſongs, made curious landſcapes, and excelled in laying out gardens; which talent procured him from Louis XIV. (to whom he was a ſervant of the bed-chamber) the office of comptroller of the royal gardens. He had alſo the patent for the manufacture of looking-glaſſes. Such, however, was his extravagance, that he was reduced to ſell all his places and privileges. Dufreſny, after quitting the court, began to write for the ſtage in company with Regnard. Though he did not attain to the excellence of this writer, he compoſed many pieces which agreeably entertained the public. His reputation was high enough to have induced D'Alembert, in his academical eulogy of Deſtouches, to give a refined and elaborate compariſon of his ſubject and Dufreſny, with reſpect to their comic talents. He died poor, in 1724. His works were collected in 1731, in 6 vols. 12mo. Beſides his dramatic pieces, they contain cantatas ſet by himſelf, ſongs, ſerious and comic amuſements, hiſtorical anecdotes, &c. in all which are ſtrokes of a lively and ſingular imagination.

DUG'DALE (ſir William), an eminent Engliſh antiquary, ſon of a Warwickſhire gentleman of Shuſtoke near Coleſhill, where he was born in 1605. He was educated at the free-ſchool in Coventry, and received inſtructions in law and hiſtory under his father, after whoſe death he purchaſed Blythe-hall in Shuſtoke, and there fixed his reſidence. His acquaintance with ſome gentlemen attached to antiquarian purſuits, engaged him in ſimilar ſtudies, and he began to make collections for a hiſtory of his native county. In 1638 he viſited London, and was introduced to ſir Henry Spelman, and other learned antiquaries. Through their recommendation he obtained a purſuivant's place in the herald's office, where he came to reſide in 1640. He made uſe of the opportunities this afforded him, to enlarge his collections from the records in the Tower and other repoſitories. He ſucceeded to the place of Cheſter-herald in 1644. He continued at Oxford till its ſurrender in 1646, where he employed himſelf in ſearching the Bodleian and other libraries, and laying up materials for the Monaſticon, in which he was engaged along with Mr. Roger Dodſworth. This great work afterwards employed them both in London; and Dugdale paying a viſit to Paris with lord Hatton in 1648, obtained the peruſal of the collections of Andrew du Cheſne, whence he copied many things relative to the priors alien in England. The firſt volume of the *Monaſticon Anglicanum*, or Account of all the Religious Houſes in England, from their Foundation to their Diſſolution, was publiſhed in 1655, folio. This, and the ſecond volume, publiſhed in 1661, were entirely written by Dodſworth; but Dugdale took great pains in methodizing and digeſting them. The third volume did not appear till 1673. We are told that the publication of the Monaſticon produced the effect of cauſing many law-ſuits, in conſequence of the old writings it brought to light; and that it gave great alarm and offence to the puritans, as tending to bring back popery. Two volumes of additions were printed by John Stephens in 1722 and 1723; and Mr. Peck promiſed another volume, which has never appeared. The whole is a valuable collection of national matter, and is now become ſcarce. In 1656, Dugdale publiſhed his Antiquities of Warwickſhire illuſtrated, folio, a work of twenty years labour, and characterized by Mr. Gough as "ſtanding at the head of all our county hiſtories." A ſecond edition of it by William Thomas, D. D. appeared in 1730, in 2 vols. He employed his reſidence in London, during the printing of this work, in collecting materials for a Hiſtory of St. Paul's cathedral in London, publiſhed in 1658, folio. Upon the reſtoration he was advanced to the office of Norroy king of arms. His induſtry was next employed in the Hiſtory of Embanking and Draining of divers Fens and Marſhes, both in foreign Parts and in this Kingdom, 1662, folio. He edited, in 1664, the ſecond volume of Sir Henry Spelman's Councils, and the ſecond part of his Gloſſary. A compilation which he had made from his frequent examinations of records, &c. relative to the Engliſh courts of juſtice, their forms, rules, and offices, with chronological tables of all the principal law offices, appeared in 1666, under the title of *Origines Judiciales*, folio: this is recommended by biſhop Nicolſon as an uſeful introduction to the legal hiſtory of England. Another great performance in which he appeared as a genealogiſt and hiſtorian, was the Baronage of England, or an Account of all the Families of Nobility, in 3 vols. folio, 1675, 1676. This work has incurred ſome ſevere criticiſms from his brother antiquaries, on account of numerous miſtakes and deficiencies; yet it is allowed by candid judges to poſſeſs great merit as a foundation for an hiſtorical peerage, which after-reſearches might render more perfect. In 1677, he was advanced to the higheſt heraldic poſt, that of Garter principal king of arms; to which was joined the honour of knighthood; an honour, which the ſmallneſs of his eſtate rendered him unwilling to accept. He proceeded in publiſhing the fruits of his various enquiries; of which were, 1. A ſhort View of the late Troubles in England, with a perfect Narrative of the Treaty of Uxbridge, 1681, folio. 2. The ancient Uſage in bearing Arms, with a Catalogue of the Nobility, and of Knights of the Garter and Baronets, 1681, 8vo. 3. A perfect Copy of all Summons of the Nobility to the great Councils and Parliaments, from 49 Hen. III. to the preſent Times, 1685, folio. He compiled a number of other volumes, which he left in manuſcript to the univerſity of Oxford, and the herald's college. This very induſtrious writer, who appears to have had a conſiderable ſhare of worldly trouble, died at his houſe of Blythe-hall, in his eighty-firſt year, in February 1686. He left a ſon, John, who alſo belonged to the heraldic profeſſion, and was knighted. He had a daughter, married to the well-known Elias Aſhmole.

DUG'GA, or TUGGA, a town of Africa, in the kingdom of Tunis: ſeventy miles ſouth-weſt of Tunis.

DUGIN'SKOI, a cape of Ruſſian Siberia, in the ſea of Ochotſkoi. Lat. 59. 15. N. lon. 167. E. Ferro.

DU'GNY, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Verdun: three miles ſouth of Verdun.

DU'GUET (James Joſeph), a French prieſt, much eſteemed among the favourers of the Janſeniſt tenets, born at Montbriſon, near Lyons, in 1649. He early diſcovered an aſtoniſhing ſtrength of memory and aptitude at acquiring learning; and after paſſing through the uſual preliminary courſes, he was ſent to Saumur, to ſtudy theology. In 1671, he was appointed by the fathers profeſſor of philoſophy in their college at Troyes; where the admirable and ſucceſsful manner in which he diſcharged the duties of that office, did ample juſtice to the diſcernment of thoſe who had ſelected him for it. It was while he retained this profeſſorſhip that he eſtabliſhed his celebrated eccleſiaſtical conferences, which were attended with crowded audiences, and procured him a high reputation for extenſive knowledge, judgment, and piety.

He

He died at Paris in 1733, in the eighty-fourth year of his age. The ſtyle of his writings is commended in general, for perſpicuity, purity, and elegance. Among the various productions of his fertile pen, are, 1. Commentaries on the Works of Six Days, and on the Book of Geneſis, in ſix vols. 12mo. compoſed at the requeſt of the celebrated Rollin. 2. An Expoſition of the Book of Job, in four vols. 12mo. 3. An Expoſition of Seventy-five Pſalms, in ſix vols. 12mo. 4. An Expoſition of the Prophecies of Iſaiah, of Jonas, and Habakkuk, in ſeven vols. 12mo. 5. An Expoſition of the Books of Kings, of Eſdras, and of Nehemiah, in ſeven vols. 12mo. 6. An Expoſition of the Song of Songs, and of the Book of Wiſdom, in two vols. 12mo. 7. Rules for the Underſtanding of the Sacred Scriptures, in 12mo. 8. Of the Education of a Prince, in 4to. and in four vols. 12mo. 9. Eccleſiaſtical Conferences, in two vols. 4to. conſiſting of ſixty-ſeven diſſertations on the writers, the councils, and the diſcipline, of the firſt ages of the church. 10. A Treatiſe on the Principles of the Chriſtian Faith, in three vols. 12mo. 11. A Collection of Letters on Piety and Morality, in nine vols. 12mo. Together with a vaſt number of religious and devotional tracts, controverſial pieces, reſolutions of caſes of conſcience, &c.

DU'HAM, a town of Bohemia, in the circle of Boleſlaw: twenty miles weſt-north-weſt of Jung Buntzlau.

DUHOKUN'DA, a town of Africa, in the kingdom of Jemarrow.

DUIL'LIA LEX, *ſ.* was enacted by M. Duillius, a tribune, in the year of Rome 304. It made it a capital crime to leave the Roman people without its tribunes, or to create any new magiſtrate without a ſufficient cauſe. Another Duillian law paſſed in 392, to regulate the intereſt for money lent.

DUIL'LIUS (C. ſurnamed *Nepos*), the firſt Roman who obtained a naval victory, was conſul before Chriſt 260. After his colleague Cn. Corn. Scipio had been taken at ſea by the Carthaginians in the firſt Punic war, he proceeded with a new-built Roman fleet to Sicily in queſt of the enemy. Conſcious of the ſuperiority of the Carthaginians in naval ſkill, he employed a machine invented by an engineer, called the *corvus*, or crow, by means of which he could grapple with the enemy's veſſels as they approached, and thus convert the combat into a ſort of land-fight. Through the aid of this contrivance he entirely defeated the Punic fleet, taking eighty ſhips, and deſtroying thirteen. This victory was ſo important, that Duillius was received at Rome with the greateſt applauſe, and enjoyed a triumph. A naval column was erected in the forum to his memory; which was ſtanding in Pliny's time, and was found again, with its inſcription, in 1560. Duillius alſo obtained from the people the diſtinction of being accompanied with torches and muſic whenever he returned by night from an entertainment.

DUI'NA, or DUNA, a river of Ruſſia, which riſes from a lake, ſixteen miles north-eaſt from Toropetz, in the province of Pſkov, paſſes by Veliz, Suraz, Vitepſk, Polotſk, Dinaburg, Riga, &c. and empties itſelf into the Baltic at Riga. This river formed the boundaries between Ruſſia and Poland, as ſettled in the year 1773.

DUIN'GEN, or DUIN, or DUDINGEN, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg: eighteen miles ſouth-eaſt of Hameln.

DUI'NO, or DOINO, or TYBEIN, a ſea-port town of Germany, in the duchy of Carniola: eight miles north-weſt of Trieſte, and 174 ſouth-ſouth-weſt of Vienna. Lat. 45. 55. N. lon. 31. 32. E. Ferro.

DU'ISBURG, a town of Germany, in the circle of Weſtphalia, and duchy of Cleves, ſituated near the eaſt bank of the Rhine; formerly imperial and Hanſeatic; it yet enjoys great privileges, and has a voice and ſeat at the provincial diets. It contains two churches, three convents, and an univerſity, founded for proteſtants, in 1655. It is a ſtaple for iron manufactures and cloth: fourteen miles north of Duſſeldorp, and twenty-nine ſouth eaſt of Cleves. Lat. 51. 28. N. lon. 24. 9. E. Greenwich.

DU'ISBURG (Peter de), an ancient chronicler, native of the town of that name in the duchy of Cleves. He flouriſhed towards the beginning of the fourteenth century, and was a prieſt of the Teutonic order in Pruſſia. He wrote in Latin a Chronicle of Pruſſia from 1226 to 1325, which has been continued by an anonymous writer to 1426. The learned Hartknock gave an edition of the original in 1679, Frankf. 4to. illuſtrated by nineteen diſſertations, which throw great light upon the hiſtory of Pruſſia.

DU'ITZ, or DUYTZ, a town of Germany, in the circle of Weſtphalia, and duchy of Berg, on the eaſt ſide of the Rhine, oppoſite Cologn, chiefly inhabited by Jews, who are not permitted to dwell at Cologn, or even enter that city, without permiſſion.

DUKA'NA, a river of Ruſſian Siberia, which, united with the Ancha, forms the Juna.

DUKE, *ſ.* [*duc*, Fr. *dux*, Lat.] One of the higheſt order of nobility in England, in rank a nobleman next to the royal family. The title of *duke* is originally a Roman dignity, denominated *a ducendo*, leading or commanding. Accordingly the firſt dukes, *duces*, were the *ductores exercituum*, commanders of armies. Under the emperors, the governors of provinces in war-time were intitled *duces*. In after-times the ſame denomination was alſo given to the governors of provinces in time of peace. The firſt governor under the name of *duke* was a duke of the Marchia Rhætica, or Griſons, whereof mention is made in Caſſiodorus; and there were afterwards thirteen dukes in the eaſtern empire, and twelve in the weſtern. The Goths and Vandals, upon their over-running the provinces of the weſtern empire, aboliſhed the Roman dignities wherever they ſettled. But the Franks, &c. to pleaſe the Gauls, who had long been uſed to that form of government, made it a point not to change any thing therein: and accordingly they divided all Gaul into duchies and counties; and gave the names ſometimes of dukes, and ſometimes of counts, *comites*, to the governors thereof. In England, during the Saxon times, as Camden obſerves, the officers and commanders of armies were called dukes, *duces*, after the Roman manner, without any other addition. After the Conqueror came in, the title lay dormant till the reign of Edward III. who created his ſon Edward, firſt called the *Black Prince*, duke of Cornwall; which hath ever ſince been the peculiar inheritance of the king's eldeſt ſon during the life of his father; ſo that he is *dux natus, non creatus*. After whom there were more made, in ſuch manner as that their titles deſcended to their poſterity. See the article HERALDRY.

DUKE's COUNTY, a county of the American States, in Maſſachuſetts, comprehending Martha's Vineyard iſland, Chabaquiddick iſland, Norman's iſland, and the Elizabeth iſlands; ſituated on the ſouth-eaſt coaſt of the ſtate. The number of inhabitants by the cenſus of 1796, is 3265. They ſend three repreſentatives, and, in conjunction with Nantucket iſland, one ſenator, to the general court. The chief town is Edgarton.

DUKE OF GLOUCESTER ISLAND, an iſland in the South Pacific Ocean. Lat. 19. 11. S. lon. 140. 11. W. Greenwich.

DU'KEDOM, *ſ.* The ſeigniory or poſſeſſions of a duke.—The cardinal never reſigned his purple for the proſpect of giving an heir to the *dukedom* of Tuſcany. *Addiſon.*—The title or quality of a duke.

DUKE'E, or DUKI, a town of Aſia, in the country of Candahar, in the road from Candahar to Moultan: 180 miles ſouth-eaſt of Candahar.

DU'KLA, a town of Poland, in the palatinate of Sandomirz: ſixty miles ſouth-ſouth-weſt of Sandomirz.

DUKO'VA, a town of Lithuania, in the province of Minſk: ſixteen miles ſouth-eaſt of Minſk.

DU'LAS, a river of Wales, in the county of Caermarthen, which runs into the Briſtol Channel, four miles ſouth-eaſt of Kidwelly.

DU'LAS, a river of Wales, in the county of Caermarthen, which runs into the Towy, about one mile and a half ſouth-ſouth-weſt of Langadok.

DU'LAS, a river of Wales, in the county of Brecknock, which runs into the Wye, near Hay.

DU'LAS, a river of Wales, in the county of Radnor, which runs into the Ithon, near Llanbeder.

DU'LAS, a river of Wales, in the county of Montgomery, which runs into the Severn, near Llanidios.

DU'LAS, a river of Wales, in the county of Montgomery, which runs into the Severn, near Newtown.

DU'LAS, a river of North Wales, in the iſland of Angleſea, which runs into the Iriſh Sea, forming a bay and harbour at its mouth, with a village of the ſame name: ten miles north-weſt of Beaumaris.

DULA'SHE, a river of South Wales, in the county of Caermarthen, which runs into the Towy, ſeven miles above Caermarthen.

DUL'BRAINED, *adj.* Stupid; doltiſh; fooliſh:

This arm of mine hath chaſtis'd
The petty rebel, *dulbrain'd* Buckingham. *Shakeſpeare.*

DULCAMA'RA, *ſ.* in botany. See SOLANUM.

DULCAR'NON, *ſ.* [Arab.] A certain propoſition, found out by Pythagoras, upon the account of which he ſacrificed an ox to the gods, in token of thankfulneſs. Whence Chaucer, &c. uſe it to ſignify any knotty point or queſtion. *Bailey.*

To be at DULCAR'NON, *v. n.* To be nonpluſſed; to be at one's wits end.

DUL'CET, *adj.* [*dulcis*, Lat.] Sweet to the taſte; luſcious:

From ſweet kernels preſs'd,
She tempers *dulcet* creams; nor theſe to hold
Wants ſhe fit veſſels pure. *Milton.*

Sweet to the ear; harmonious; melodious:

I ſat upon a promontory,
And heard a mermaid, on a dolphin's back,
Uttering ſuch *dulcet* and harmonious breath,
That the rude ſea grew civil at her ſong. *Shakeſpeare.*

DULCIFICA'TION, *ſ.* The act of ſweetening; the act of freeing from acidity, ſaltneſs, or acrimony.—In colcothar, the exacteſt calcination, followed by an exquiſite *dulcification*, does not reduce the remaining body into elementary earth. *Boyle.*

To DUL'CIFY, *v. a.* [*dulcifier*, Fr.] To ſweeten; to ſet free from acidity, ſaltneſs, or acrimony of any kind.—Spirit of wine *dulcifies* ſpirit of ſalt. *Arbuthnot.*

DULCI'GNO, a town of European Turkey, in the province of Albania, on the coaſt of the Adriatic, containing about 7000 or 8000 ſouls. The harbour ſerves as a retreat for corſairs: fifteen miles ſouth-weſt of Scutari. Lat. 42. 23. N. lon. 36. 42. E. Ferro.

DULCI'LOQUY, *ſ.* [from the Lat. *dulcis*, ſweet, and *loquor*, to ſpeak.] A ſoft and ſweet manner of ſpeaking.

DUL'CIMER, *ſ.* [*dolcimello*, Skinner.] A muſical inſtrument played by ſtriking the braſs wires with little ſticks.—Ye hear the ſound of the cornet, flute, harp, ſackbut, pſaltery, *dulcimer*, and all kinds of muſic. *Dan.* iii. 5.—In Beverly minſter is an elegant ſculpture-example of a female figure playing on the dulcimer.

DULCI'NO, [Ital.] A ſmall kind of baſſoon.

DULCI'NUS, a bold leader of a religious ſect who oppoſed the authority of the church of Rome in the fourteenth century, was a native of Novara, in the duchy of Milan. The original founder of this ſect, who are ſometimes called by the name of the ſect of the *Apoſtles*, and ſometimes by that of *Dulciniſts*, was Gerard Sagarelli, who was burnt alive for his hereſy at Parma, in the year 1300. Upon the cruel death of Sagarelli, Dulcinus became the head of his followers, and not only publicly profeſſed his opinions, but took up arms to defend himſelf and fellow-believers againſt their perſecutors. The conſequence was, a dreadful ſtruggle for more than two years, between the Dulciniſts and the ſupporters of the papal intereſts, which terminated in the overthrow of the former, and the capture of their leader after he had ſignaliſed his courage and intrepidity in ſeveral obſtinate and bloody battles. He was put to death at Vercelli, in the moſt barbarous manner, in the year 1307. The tragical end of Dulcinus was not immediately followed by the entire extirpation of his ſect, of which there were ſome remains in France, in Germany, and in other countries, until the beginning of the fifteenth century.

DUI'CIS RA'DIX, *ſ.* in botany. See GLYCYRRHIZA.

DULCI'SONANT, *adj.* [*dulciſonans*, Lat.] Sounding ſweetly.

DUL'CITUDE, *ſ.* [*dulcitudo*, Lat.] Sweetneſs.

To DUL'CORATE, *v. a.* [from *dulcis*, Lat.] To ſweeten.—The ancients, for the *dulcorating* of fruit, do commend ſwine's dung above all other dung. *Bacon.*—To make leſs acrimonious.—Turbith mineral, as it is ſold in the ſhops, is a rough medicine; but, being ſomewhat *dulcorated*, firſt procureth vomiting, and then ſalivation. *Wiſeman.*

DULCORA'TION, *ſ.* The act of ſweetening.—Malt gathereth a ſweetneſs to the taſte, which appeareth in the wort: the *dulcoration* of things is worthy to be tried to the full; for *dulcoration* importeth a degree to nouriſhment. *Bacon.*

DUL'HEAD, *ſ.* A blockhead; a wretch fooliſh and ſtupid; a dolt.—This people be fools and *dulheads* to all goodneſs; but ſubtle, cunning, and bold in any miſchief. *Aſcham.*

DU'LIA, *ſ.* [δουλεια.] An inferior kind of adoration.—Paleotus ſaith, that the ſame worſhip which is given to the prototype may be given to the image; but with the different degrees of latria and *dulia*. *Stillingfleet.*

DULI'CHIUM, in ancient geography, an iſland of the Ionian ſea, oppoſite the Achelous. It was part of the kingdom of Ulyſſes. *Martial.*

DUL'KEN, or DULCKEN, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers: twenty miles north-north-weſt of Juliers.

DULL, *adj.* [*dwl*, Welſh; dole, Sax. *dol*, mad, Dut.] Stupid; doltiſh; blockiſh; unapprehenſive; indocile; ſlow of underſtanding.—He that hath learned no wit by nature, nor art, may complain of groſs breeding, or comes of a very *dull* kindred. *Shakeſpeare.*—Blunt; obtuſe:

Meeting with Time, ſlack thing, ſaid I,
Thy ſcythe is *dull*; whet it, for ſhame. *Herbert.*

Unready; awkward.—Memory is ſo neceſſary to all conditions of life, that we are not to fear it ſhould grow *dull* for want of exerciſe, if exerciſe would make it ſtronger. *Locke.*—Hebetated; not quick.—This people's heart is waxed groſs, and their ears are *dull* of hearing. *Matt.* xiii. 15.—Sad; melancholy. Sluggiſh; heavy; ſlow of motion:

Thenceforth the waters waxed *dull* and ſlow,
And all that drunk thereof did faint and feeble grow. *Spenſer.*

Groſs; cloggy; vile:

She excels each mortal thing
Upon the *dull* earth dwelling. *Shakeſpeare.*

Not exhilarating; not delightful: as, *to make dictionaries is* dull *work*. Not bright: as, *the mirror is* dull, *the fire is* dull. Drowſy; ſleepy:

I'll not be made a ſoft and *dull*-eyed fool,
To ſhake the head, relent, and ſigh, and yield
To Chriſtian interceſſors. *Shakeſpeare.*

To DULL, *v. a.* To ſtupify; to infatuate:

Thoſe drugs ſhe has
Will ſtupify and *dull* the ſenſe awhile. *Shakeſpeare.*

To blunt; to obtund.—Borrowing *dulls* the edge of induſtry. *Shakeſpeare.*—This entrance of the battle did whet the courage of the Spaniards, though it *dulled* their ſwords.

Bacon.—To ſadden; to make melancholy. To hebetate; to weaken:

Now forc'd to overflow with brackiſh tears,
The troublous noiſe did *dull* their dainty ears. *Spenſer.*

To damp; to clog.—Prayers were ſhort, as if darts thrown out with a ſudden quickneſs, leſt that vigilant and erect attention of mind, which in prayer is very neceſſary, ſhould be waſted or *dulled* through continuance. *Hooker.*—To make heavy, or ſlow of motion.—Uſury *dulls* and damps all induſtries, wherein money would be ſtirring, if it were not for the ſlug. *Bacon.*—To fully brightneſs.—The breath *dulls* the mirror. *Bacon.*

DULLAE'RT (Heyman), a Dutch painter of merit, born in 1636 at Rotterdam, where his father was a picture-merchant. He early diſplayed a lively genius, and made a proficiency in languages and the ſciences, but his peculiar turn was to painting. His father ſent him to the ſchool of Rembrandt, and he caught the manner and ſtyle of his maſter ſo happily, that their works are ſcarcely diſtinguiſhable. Dullaert painted with a free and bold pencil, and in an admirable tone of colouring; but the delicate ſtate of his health would not allow him to apply cloſely, whence his pieces are rare. One of the fineſt is a hermit on his knees, in Rembrandt's beſt manner. He amuſed himſelf with muſic and poetry, in both of which he excelled. He died in 1684.

DUL'LARD, *ſ.* A blockhead; a dolt; a ſtupid fellow; a dunce.—What! mak'ſt thou me a *dullard* in this act? *Shakeſpeare.*

DUL'LY, *adv.* Stupidly; doltiſhly.—It is not ſufficient to imitate nature in every circumſtance *dully*, literally, and meanly; but it becomes a painter to take what is moſt beautiful. *Dryden.*—Slowly; ſluggiſhly.—The air, if it be moiſt, doth in a degree quench the flame, and howſoever maketh it burn more *dully*. *Bacon.*—Not vigorouſly; not gaily; not brightly; not keenly:

Not that I think thoſe pantomimes,
Who vary action with the times,
Are leſs ingenious in their art
Than thoſe who *dully* act one part. *Hudibras.*

DUL'MEN, or DULMAN, a town of Germany, in the circle of Weſtphalia, and biſhopric of Munſter: thirteen miles ſouth-weſt of Munſter.

DUL'NESS, *ſ.* Stupidity; weakneſs of intellect; indocility: ſlowneſs of apprehenſion.—Nor is the *dulneſs* of the ſcholar to extinguiſh, but rather to enflame, the charity of the teacher. *South.*

Shadwell alone my perfect image bears,
Mature in *dulneſs* from his tender years. *Dryden.*

Want of quick perception.—Nature, by a continual uſe of any thing, groweth to a ſatiety and *dulneſs* either of appetite or working. *Bacon.*—Drowſineſs; inclination to ſleep:

Here ceaſe more queſtions;
Thou art inclin'd to ſleep. 'Tis a good *dulneſs*,
And give it way. *Shakeſpeare.*

Sluggiſhneſs of motion. Dimneſs; want of luſtre. Bluntneſs; want of edge.

DULO'CRACY, *ſ.* [of δουλος, a ſervant, and κρατος, power, Gr.] A government where ſervants and ſlaves have ſo much licence and privilege, that they domineer.

DUL'VERTON, a ſmall town of Somerſetſhire, on the borders of Devonſhire, with a bridge on the Dunſbrook, near its fall into the Exe; 169 miles from London, twenty-four from Barnſtaple, and twenty-ſeven from Bridgewater. It is a place of good accommodation; and has a market on Saturdays, and fairs on July 10 and November 8. There are ſome lead-mines near this town; but the ore is hard and barren, and the lead that comes from it harder than that of the Mendip-hills. Here is likewiſe a manufactory of coarſe woollen cloth and blankets.

DUL'WICH, a delightful village of Surrey, in the pa- of Camberwell, on the borders of Kent, five miles from London, celebrated for its medicinal waters, called the *Sydenham wells*. Here is alſo a noble charity, called Dulwich college, founded in 1614, by Mr. Edward Alleyn, who named it *the College of God's Gift*. This gentleman was an actor in the reign of queen Elizabeth, and the principal performer in many of Shakeſpeare's plays. He founded this college for a maſter and wardens, who were always to be of the name of Alleyn or Allen, with four fellows, three of whom were to be divines, and the fourth an organiſt; and for ſix poor men, as many poor women, and twelve poor boys, to be educated by two of the fellows. When the boys arrive at a proper age, they are ſent to the univerſities, or placed out apprentices. Mr. Alleyn conſtituted for viſitors, the churchwardens of St. Botolph, Biſhopſgate; St. Giles, Cripplegate; and St. Saviour, Southwark; who, upon occaſion, were to appeal to the archbiſhop of Canterbury, before whom all the members were to be ſworn at their admiſſion. To this college belongs a chapel, in which the founder himſelf is buried.

The Dulwich waters are remarkably clear, obſcurely brackiſh, and taſte a little bitter in the throat. A gallon at one time yielded two, at another three, drams of ſolid matter, containing a ſmall portion of calcareous earth, and a vitriolated magneſia, mixed with a portion of marine ſalt. From one to two pints in a morning is a doſe.

DU'LY, *adv.* Properly; fitly; in the due manner.—In the body, when the principal parts, as the heart and liver, do their offices, and all the inferior ſmaller veſſels act orderly and *duly*, there ariſes a ſweet enjoyment upon the whole, which we call health. *South.*—Regularly; exactly:

Seldom at church, 'twas ſuch a buſy life;
But *duly* ſent his family and wife. *Pope.*

DUM FU'IT IN'FRA Æ'TATEM, in law, a writ whereby an infant who had made a feoffment of his lands, when he came of full age, might recover thoſe lands and tenements which were ſo aliened: and within age, he might enter into the land, and take it back again, and by his entry he ſhould be remitted to his anceſtor's right. *New Nat. Br.* 426. If the huſband and wife alien the wife's land, during the nonage of both of them, the wife at her full age after the death of the huſband, ſhall have a writ of *dum fuit infra ætatem. M.* 14 *Edw.* III. By this writ to the ſheriff, he ſhall command A. that he render to B. who is of full age, two meſſuages and lands, &c. which B. demiſed to him, while he was within age, as he ſaith; or into which the ſaid A. hath not entered, but by C. to whom the ſaid B. the ſame demiſed, &c. *F. N. B.* 477.

DUM NON FU'IT COM'POS MEN'TIS, in law, a writ that lay where a man not of ſound memory aliened any lands or tenements, againſt the alienee. And he ſhall allege that he was not of ſane memory, but being viſited with infirmity, loſt his diſcretion for a time, ſo as not to be capable of making a grant, &c. *New Nat. Br.* 449.

DU'MA, a town of Arabia: 240 miles weſt of Cathem.

DU'MA, a town of Germany, in the circle of Weſtphalia, on a river of the ſame name, which ſoon after runs into the Wipper: fourteen miles ſouth-ſouth-eaſt of Duſſeldorp.

DU'MAH, [from the Hebrew, ſignifying ſilence.] A city of Paleſtine, in the tribe of Judah: ſituated in the mountains. *Joſh.* xv. 52.

DU'MAH, (*Iſaiah* xxi. 11.) A city of the Iſhmaelites, ſo named, it is thought, from *Dumah*, ſon of Iſhmael. *Gen.* xxv. 14.

DU'MAL, *adj.* [from the Lat. *dumus*, a buſh.] Pertaining to briars, buſhy.

DU'MAS (Hilary), a French eccleſiaſtic and doctor of the Sorbonne, in the ſeventeenth and beginning of the eighteenth century. Although we are not furniſhed with any particulars reſpecting his life and character, he is entitled to this brief notice on account of his being the author of a well-written Hiſtory of the Five Propoſitions of

of Janſenius, publiſhed in 1702, in three volumes 12mo. This work has been attributed to the celebrated father Tellier; but is diſtinguiſhed by greater temper and moderation than are diſplayed in any known writings of that jeſuit. Abbé Dumas was alſo the author of a tranſlation of Thomas à Kempis's treatiſe On the Imitation of Jeſus Chriſt, and other pieces, in leſs eſtimation than his hiſtory.

DU'MARING, a town of the iſland of Borneo, on the eaſt coaſt. Lat. 2. 10 N. lon. 117. 30. E. Greenwich.

DUMB, *adj.* [דום, he was ſilent; *dumbs*, Gothic; *bumbe*, Saxon; *dum*, Daniſh; *dom*, Dutch, dull.] Mute; incapable of ſpeech. See the article DEAF AND DUMB, vol. v. p. 627.—It hath pleaſed himſelf ſometime to unlooſe the very tongues even of *dumb* creatures, and to teach them to plead in their own defence, leſt the cruelty of man ſhould perſiſt to afflict them. *Hooker.*

They ſpake not a word;
But like *dumb* ſtatues, or unbreathing ſtones,
Star'd each on other. *Shakeſpeare.*

Depriv'd of ſpeech.—Some poſitive terms ſignify a negative idea: blind implies a privation of ſight, *dumb* a denial of ſpeech. *Watts.*

They ſung no more, or only ſung his fame;
Struck *dumb*, they all admir'd the godlike man. *Dryden.*

Mute; not uſing words.—Nothing is more common than for lovers to complain, relent, languiſh, deſpair, and die in *dumb* ſhew. *Addiſon.*

Her humble geſtures made the reſidue plain,
Dumb eloquence perſuading more than ſpeech. *Roſcomm.*

Silent; refuſing to ſpeak:

The good old ſeer withſtood
Th' intended treaſon, and was *dumb* to blood;
Till tir'd with endleſs clamours, and purſuit
Of Ithacus, he ſtood no longer mute. *Dryden.*

To DUMB, *v. a.* To ſilence.—Deep clerks ſhe *dumbs*. *Pericles.*

"As DUMB as a fiſh."—A proverb founded on a ſuppoſition that fiſh are mute and emit no ſound, the contrary of which has been abundantly proved by modern ichthyologiſts. The Latins ſay: *Magis mutus quam piſcis.* The Gr. Ἀφωνοτερος των ιχθυων. The Fr. *Muet comme un poiſſon.*

DUMB-DISCOUR'SIVE, *adj.* Silently pleading:

There lurks a ſtill and *dumb-diſcourſive* devil.
That tempts moſt cunningly. *Shakeſpeare.*

DUMBAR'TON, or LENOX, a county of Scotland, bounded on the north by the counties of Argyle and Perth, on the eaſt by the counties of Perth and Stirling, on the ſouth by Lanerkſhire and Renfrewſhire, and on the weſt by Argyleſhire, from which it is for the moſt part divided by Loch Long, in the form of a creſcent, the horns lying north and ſouth, and the concave ſide to the eaſt; about forty-five miles in length, and from ſix to fifteen in breadth. The eaſtern part is fertile in corn, the other parts feed great flocks of ſheep; but the principal riches ariſe from the fiſheries in the lochs in and about its coaſts. Loch Lomond, Loch Long, and Loch Garte are the chief; the principal town is Dumbarton. It ſends one member to the imperial parliament.

DUMBAR'TON, a town of Scotland, and capital of Dumbartonſhire, ſituated on the north coaſt of the Clyde, at the mouth of the Leven. It is ancient, large, but not well built, and defended by a caſtle, ſituated cloſe to the river, on a vaſt rock, formerly deemed impregnable, and now the reſidence of a garriſon. There is in this town a conſiderable crown and bottle glaſs manufactory, which employs upwards of one hundred hands. Extenſive print-fields in the neighbouring pariſhes alſo employ ſome of the inhabitants of Dumbarton. This town was erected into a royal burgh by king Alexander II. in 1221; it has a good harbour, where large brigs lie ſafe in all weathers. About two thouſand tons of ſhipping belong to this place, which employ many ſeamen. The town is entirely free of all impoſts, or borough taxes; but is by no means in a flouriſhing or increaſing ſtate, owing to the letters of deaconry preventing ſtrangers from working at their trades without coſtly entries; the number of ſouls is about two thouſand: thirteen miles weſt of Glaſgow, and eight north-weſt of Paiſley. Lat. 55. 58. N. lon. 1. 27. W. of Edinburgh.

DUMBLA'NE, a town of Scotland, in the county of Perth, formerly the ſee of a biſhop, founded by David I. part of the cathedral, which yet remains, ſerves for a pariſh church. In 1715, a battle was fought near this town, between the troops of George I. under the command of the duke of Argyle, and the troops of the chevalier prince Charles, under the command of the earl of Mar. About five hundred were killed on each ſide, but the victory was doubtful: four miles north of Stirling, and twenty-one ſouth-weſt of Perth.

DUMB'LY, *adv.* Mutely; ſilently; without words.

DUMB'NESS, *ſ.* Incapacity to ſpeak. Omiſſion of ſpeech; muteneſs.—There was ſpeech in their *dumbneſs*, language in their very geſture: they looked as they had heard of a world ranſomed, or one deſtroyed. *Shakeſpeare.* Refuſal to ſpeak; ſilence:

'Tis love, ſaid ſhe; and then my downcaſt eyes,
And guilty *dumbneſs*, witneſs'd my ſurprize. *Dryden.*

Dumbneſs, or a total defect of ſpeech, is the natural conſequence of deafneſs from infancy; and is the cauſe of that want of intelligence or inexpanſion of the reaſoning faculty, obſervable in perſons who grow up in it. Language is not merely the expreſſion of thought, it is alſo the medium of thinking: without which man would ſcarcely be a rational being. Under the article DEAF and DUMB, vol. v. p. 627, we have ſtated various methods adopted by different perſons for teaching ſuch unfortunate perſons to ſpeak and read. And we there noticed a new and benevolent inſtitution on a large ſcale, the ASYLUM, founded in 1792, at Bermondſey near London, for the ſupport and education of the deaf and dumb children of the poor, who are admitted from nine years of age till fourteen. The modes of inſtruction adopted on this occaſion, have been kindly communicated to us by Mr. Watſon, maſter and teacher in the above inſtitution; the principles of which we ſhall preſent to our readers in his own words.

"Sight, the moſt noble and refined of all the external ſenſes, is not only of infinite importance for the correct notions with which it furniſhes us of things from without, but is alſo, in a great meaſure, capable, as far as language is concerned, of ſupplying the place of *hearing*, the ſenſe next to it in refinement and importance, by admitting, as that ſenſe does, of arbitrary ſigns aſſociable in the underſtanding, with the impreſſions tranſmitted, through its own medium, or the medium of the other ſenſes to the ſenſorium, by external objects, or, with the operations of the mind itſelf. Hence *words*, which are the ſigns alluded to, are objects either of the *eye* or *ear*; for they are either *viſible characters* or *audible ſounds*, and derive their ſignification in either caſe from being aſſociated or linked with our ſenſations, or our ideas, by which ſort of connection the one ſuggeſts the other.

Children who hear, firſt learn the *meaning* of a word in this way, *i. e.* by *hearing* it frequently applied to ſome perſon or thing which had already attracted their notice; and then, by imitation, learn to ſpeak it. Thus it becomes, as it were, a part of themſelves, and enlarges the ſphere of their conceptions; and, by uſing it at pleaſure, they diſcover that they have not only the ready means of raiſing images in their own minds, but alſo in the minds of others. One ſtep leads on to another, and the confidence and exertion of the little learners increaſe with their ſucceſs; till they can imitate, almoſt, any articulation as ſoon as they hear it. This is a ſhort ſketch of the

natural

natural proceſs of learning a language by thoſe who hear: with thoſe who are deaf, the proceſs neceſſarily differs; but, if properly managed, the reſult will be the ſame, *i. e.* they will learn to imitate, not the articulations they *hear*, but thoſe they *ſee* and *feel*. Children who hear, learn words, as it were, *en gros*, while thoſe who are deaf muſt purſue a more detailed method, and begin, not with *words*, but with their conſtituent parts. Thus, inſtead of ſhewing them *words*, and endeavouring to make them pronounce or comprehend *them*, we begin with the moſt ſimple ſounds, and do not attempt to combine theſe till the act of producing them ſeparately becomes familiar.

The firſt ſtep in the proceſs of teaching a deaf and dumb perſon to ſpeak, is to obtain a clear and diſtinct ſound from the throat, as of *a*, heard in the word *wall*, &c. To effect this, and to habituate the pupil to connect the ſound when he has learnt to produce it, with the letter, from henceforth to be its repreſentative, it is diſtinctly traced on paper, and he is made to obſerve it for a minute; he then looks up with anxiety, as if he would enquire what he is to do with it. The ſound is then fully and ſlowly pronounced, or uttered, and the learner made to look attentively at the poſition and motion of the mouth, and to feel the aſtriction of the muſcles of the larynx, by placing his hand upon the throat, carefully making him perceive the beginning and concluſion of the ſound, which he can eaſily do by the vibratory motion excited in the parts during its continuance, and which of courſe ceaſes with it. Having made theſe obſervations for a ſhort time, he will ſeldom fail to attempt an imitation of what he has been obſerving, and that, for the moſt part, ſucceſsfully. When the contrary happens, nothing more is requiſite than patient and good-natured perſeverance; for, if he perceive that his failure has excited chagrin or diſappointment in his teacher, he will make another effort with great reluctance.

The ſound, once acquired, muſt be practiſed for a ſufficient length of time, to avoid the danger of loſing it; great care being neceſſary all through his progreſs never to proceed to a new ſound till the preceding has become familiar, and unattended with doubt as to the manner of producing it. A contrary practice would lead to confuſion and endleſs vexation; while too much pains cannot be taken to keep the learner in good humour, and to make him ſuppoſe that he is doing well beyond expectation: nothing is more diſcouraging than to put him back. In the ſame manner we teach the other ſimple ſounds, which are but few in number, yet, by combination, are ſuſceptible of great variety.

The vowels being acquired, we proceed to the conſonants, in their order, teaching only the *powers* of them; and that through the means of *ſeeing* and *feeling*, as in the vowels, always applying the ſcholar's finger to the muſcles concerned in their formation, and employing his eyes in alternately obſerving the letter, and the poſitions and motions of the external organs of ſpeech. By theſe means deaf and dumb perſons not only learn to ſpeak themſelves, but acquire wonderful facility in knowing what others ſay, by the help of the eyes only.

The power of the conſonants, it may be neceſſary to obſerve, mean only the poſition and action of the organs employed in their formation, without the addition of any diſtinct vocal ſound; for, though it is neceſſary to ſound in the throat in the formation of many of them, yet the ſound is ſo confined by the poſition of the organs, as not to partake of the nature of any of the open ſounds repreſented by the vowels. Thus, for inſtance, by cloſing the lips, ſounding gently in the throat, forcing them aſunder by the emiſſion of the breath, and carefully avoiding to let any of it paſs through the noſe, we have the power of *b*. After the ſame manner is formed the power of *p*, but without ſound in the throat. Theſe formations muſt be ſlowly and carefully pointed out to the learner, with the precautions above noticed, till all the conſonants be gone through, and properly acquired. It is evident, when the power of a conſonant is attained, that it need only to be joined with the vowels to form ſyllables, as *ba*, *be*, *ab*, *eb*, &c. theſe the learner will pronounce almoſt at ſight. From the eaſieſt combinations we proceed to the moſt complex; and, by practice, he will ſoon acquire readineſs in pronouncing the longeſt polyſyllables.

This may ſerve to convey a general idea of the method purſued in teaching the dumb to ſpeak; a work of labour and nicety, it is true, on the part of the teacher; and what has been ſaid may alſo obviate the miſtake in a notion, taken up by ſome uninformed perſons, that the proceſs is attended with pain on the part of the learner; on the contrary it is an amuſement to him; and, were it otherwiſe, the importance of the acquiſition would well repay him for ſome pains. The very habit of regarding written or printed characters as the ſigns of certain mechanical actions of the organs of ſpeech, paves the way for conſidering combinations of thoſe actions or characters as the ſigns of things, *i. e.* ſignificant *words* written or articulate. We, who hear, conſider words as ſounds; the deaf, when taught to ſpeak, regard them as actions. In the inſtruction of the deaf and dumb, ſpeech is of the utmoſt importance; it not only ſerves them as it does others, to communicate their thoughts, when they have acquired a knowledge of language, but it contributes much to that acquiſition, by greatly facilitating the retention of words in the memory.

The learner having attained the uſe of ſpeech, in a certain degree, which is to be carefully and daily improved by practice: he is ſhewn words of the moſt familiar ſort at firſt; that is to ſay, only the names of perſons or things, (nouns,) or of actions, (verbs,) that can readily be ſhewn with the words; as, for inſtance, the parts of the body, and ſuch common articles of furniture as ſurround him, the names of the perſons of the family, and actions ſignified by the words *walk*, *run*, *eat*, *play*, &c. Having got a pretty good ſtock of ſuch words, and the meaning of them being perfectly underſtood, we proceed to conſider the perſons, things, or actions, deſignated by them in their relations to other perſons or things, of the ſame, or different ſorts; this furniſhes us with opportunities of declining or varying the words according to the relations we perceive in the things they ſignify either by ſome addition or alteration in the word itſelf, or by ſome other word joined with it. This brings into uſe prepoſitions, conjunctions, adverbs, auxiliary verbs, &c. Things have attributes or qualities, (adjectives,) the table is round, or ſquare, one is large, another is ſmall; an apple is ſweet or ſour, &c. Theſe attributes are perceived by ſome of our ſenſes as exiſting in the ſubjects; hence we eaſily underſtand the words that deſignate them.

There is a natural propenſity in the human mind to generalize and claſſify its perceptions: after a number of examples of the application of the word ſweet, for inſtance, to an apple, to an orange, ſugar, &c. a perſon who had been deaf and dumb will be prepared to underſtand the word ſweetneſs, having already begun to conſider the quality abſtractedly, and ſo on for other abſtract terms, as goodneſs, truth, juſtice, &c. After this ſimple and natural manner are the deaf and dumb brought to ſpeak, read, write, and underſtand a language.

The firſt year of a learner's progreſs is nearly conſumed in acquiring the pronunciation and orthography of words, *i. e.* a vocabulary, conſiſting of a variety of nouns, or the names of animals and things; and alſo verbs, all eaſily ſhewn to him; and their variations or declenſions. Where the capacity is good, at the end of this period he will be fit to enter upon the exemplification of the uſes and application of the words he has learnt, in the conſtruction of ſuch ſimple ſentences as are neceſſary to expreſs his rude thoughts. His reaſon and his knowledge of language go on expanding together, mutually unfolding each other, till he becomes capable of taking ſome part in the tranſactions and duties of that ſociety, on which he originally

promiſed to be a heavy and helpleſs burthen. His mind aſſumes the appellation of rational; for it is fitted for the reception and cultivation of uſeful knowledge; and all the conſoling and exalted views that Chriſtianity opens to mankind, break in upon his ſoul through the channel that has been opened!"

The ſucceſs which attends Mr. Watſon's mode of inſtruction, is beyond the conception of any one who has not been an eye-witneſs of the readineſs of his ſcholars, who anſwer both by ſpeech and writing with wonderful facility. If you aſk one of them a queſtion in a flow and diſtinct manner, letting the deaf youth ſee the motion of your lips and mouth, you immediately receive an anſwer in the ſame manner, and without any ſign or interference from the maſter. Sometimes they will imitate the motion of your lips as you ſpeak, and thus repeat the queſtion, as it were, to themſelves. Thoſe who have been ſome time in the ſchool will open a book, and read diſtinctly any paſſage you point out, as well and as diſtinctly as ſchoolboys in general do; which was very ſatisfactorily obſerved by the editor of this work. A gentleman put his watch to the ear of one of the pupils. The youth ſhook his head; he heard nothing. The edge of the watch-caſe was then put againſt his teeth. "Now do you hear it?" ſays the gentleman: "I feel it," replies the boy. The children are of both ſexes. Some pieces are publicly recited by them at the anniverſary meeting of the patrons of the inſtitution. May ſuch an inſtitution never want patrons!

DUM'DAH, a town of Hindooſtan, in the Ruttunpour country: ſixty-ſix miles ſouth-weſt of Ruttunpour, and 112 eaſt of Nagpour.

DUMEI'DSJ, a town of Arabia, in the country of Yemen: thirty-ſix miles north-north-eaſt of Chamir.

DUMFERM'LINE. See DUNFERMLINE.

To DUM'FOUND, *v. a.* To confuſe; to ſtrike dumb.—They had like to have *dumfounded* the juſtice; but his clerk came in to his aſſiſtance. *Spectator.*

DUMFRI'ES, a county of Scotland, bounded on the north by the counties of Lanerk, Peebles, and Selkirk, on the eaſt by Roxburgſhire, on the ſouth by the Frith of Solway, which divides it from England, and the county of Kircudbright, and on the weſt by Airſhire. The country is generally mountainous, with ſome fertile valleys on the ſides of the rivers called *Nithſdale*, or *Niddiſdale*, *Annandale*, and *Eſkdale*; about fifty miles in length, and from ten to thirty broad. The principal towns are Dumfries and Annan; and the chief rivers are the Eſk, the Annan, and the Nid. It ſends one member to the Imperial parliament.

DUMFRI'ES, a town of Scotland, and capital of the county to which it gives name, ſituated on an eminence, near the river Nid, about ten miles from its mouth, in the Solway Frith; with a reſpectable grammar-ſchool, and an infirmary. It is a royal borough, and aſſiſts, with ſome other towns, to ſend a member to the Imperial parliament. About eight or ten coaſting veſſels belong to this town, beſides ſeveral which are employed in the Baltic, and in the wine trade. Forty years ago, a conſiderable tobacco trade was carried on at Dumfries. At an average of four years, 1250 hogſheads were then annually imported. It is alleged, that the importation was conſiderably greater, and that in conſequence of the detection of ſome attempts at ſmuggling, the trade in this article came to be diſcouraged. The coaſting veſſels bring in lime, coals, and merchant goods of various ſorts; they export potatoes and grain. About a mile eaſtward from the town is a craig, or rock, curiouſly hollowed, known by the name of the *Maidenbower Crag*. It is ſaid to have been famous in the times of druidiſm; and may have received its name from being the ſcene of ſome rites practiſed as a teſt of virginity. The preſent population of the town, as appears from an enumeration lately taken, may be fairly eſtimated at 5600 ſouls: twenty-one miles north-eaſt of Kircudbright, and fifty-three ſouth-ſouth-weſt of Edinburgh. Lat. 55. 8. N. lon. 4. 25. W. Greenwich.

DUMFRIE'S, a port of entry and poſt town of the American States, in Virginia, and chief town of Prince William county, ſituated on the north ſide of Quantico creek, four miles above its entrance into the Potowmack, and ten miles from Colcheſter. Its public edifices are an epiſcopal church, a court-houſe, and jail. The exports from this port for one year, ending the 30th of September 1794, amounted in value to 85,635, dollars: twenty-eight miles north by eaſt of Fredericſburg, and 185 ſouth-weſt of Philadelphia.

DUM'ME, a river of Germany, in the circle of Upper Saxony, and marquiſate of Brandenburg, which runs into the Jetze, at Wuſtro.

DUM'MER, a townſhip of the American States, in Grafton county, New Hampſhire, incorporated in 1773. It is to the ſouth-weſt of lake Umbagog, on the waters of Upper Amonooſuck and of Androſcoggin rivers.

DUM'MER SEA, a lake of Germany, in the circle of Weſtphalia, and county of Diepholz, about twelve miles in circumference: four miles ſouth of Diepholz.

DUM'MERSTON, a townſhip of the American States, in Windham county, Vermont, north of Brattleborough, containing 1501 inhabitants.

DUMMOO'DA, a river of Hindooſtan, which runs into the Hoogly, twenty-eight miles below Calcutta.

DUMO'NT (John), baron of Carleſcroon, an hiſtorical and political writer, after ſerving ſome time in France, became a refugee in Holland, and was made hiſtoriographer to his imperial majeſty. He died about 1726. His principal works are: 1. *Mémoires Politiques pour ſervir à l'Intelligence de la Paix de Ryſwick*, 4 vols. 12mo. 1699. 2. *Voyages en France, en Italie, en Allemagne, en Malte, & en Turquie*, 4 vols. 12mo, 1699. 3. *Corps univerſel diplomatique du Droit des Gens*, 8 vols. folio, 1726; this contains all the treaties of alliance, peace, and commerce, from the peace of Munſter to 1709. 4. *Lettres Hiſtoriques, depuis Janvier, 1652, juſqu'en 1710.* He publiſhed ſeveral other collections and compilations. His ſtile is flat and incorrect; but his works contain very uſeful matter.

DUMO'SÆ, *ſ.* [from *dumus*, Lat. a buſh.] In botany, the nineteenth order in Linnæus's Fragments; and the forty-third of the natural orders in his Genera Plantarum.

DUMO'SE, *adj.* [from the Lat *dumus*, a briar.] Full of briars, full of buſhes.

DUMO'SITY, *ſ.* The ſtate of being overgrown with buſhes. *Scott.*

DUMP, *ſ.* [from *dom*, Dut. ſtupid.] Sorrow; melancholy; ſadneſs; a ditty or other ſong:

Viſit by night your lady's chamber window
With ſome ſweet conſort; to their inſtruments
Tune a deploring *dump*: the night's dead ſilence
Will well become ſuch ſweet complaining grievance.
Shakeſpeare.

Play me ſome merry *dump* to comfort me. *Romeo and Juliet.*—Abſence of mind; reverie. *Locke* uſes *dumps* ſingularly.—This ſhame *dumps* cauſes to well-bred people, when it carries them away from the company. *Locke.*

DUMP'ISH, *adj.* Sad; melancholy; ſorrowful.—The life which I live at this age is not a dead, *dumpiſh*, and ſour, life; but cheerful, lively, and pleaſant. *Herbert.*

DUMP'ISHLY, *adv.* In a melancholy manner.

DUM'PLING, *ſ.* [from *dump*, heavineſs.] A ſort of pudding.—Pudding and *dumpling* burn to pot. *Dryden.*

DUM'PLING-EATER, *ſ.* One that eats dumplings.—Nor can he fail of cuſtom, who has hung out a ſign to all true *dumpling-eaters*. *Arbuthnot.*

DUN, *adj.* [dun, Sax.] A colour partaking of brown and black.—Such as might ariſe from a mixture of light and darkneſs, or from white and black; that is, a grey, or *dun*, or ruſſet brown. *Newton.*—Dark; gloomy:

Come thick night!
And pall thee in the *dunneſt* ſmoke of hell. *Shakeſpeare.*

To DUN, *v. a.* [dunan, Sax. to clamour.] To claim a debt with vehemence and importunity.—Borrow of thy back, and borrow of thy belly; they'll never aſk thee again. I ſhall be *dunning* thee every day. *Bacon.*

When thou *dunn'ſt* their parents, ſeldom they,
Without a ſuit before the tribune, pay. *Dryden.*

DUN, *ſ.* A clamorous, importunate, troubleſome, creditor:

Thus, while my joyleſs minutes tedious flow,
With looks demure, and ſilent pace, a *dun*,
Horrible monſter! hated by gods and men,
To my aerial citadel aſcends. *Philips.*

DUN, or BURGH, *ſ.* The name of an ancient tower of a circular form, common in the Orkney and Shetland iſles, the Hebrides, and northern parts of Scotland. The latter term points out the founders, who at the ſame time beſtowed on them their name of *borg*, a defence or caſtle; and the Highlanders univerſally apply to theſe places the Celtic name *dun*, ſignifying a hill defended by a tower. They are confined to the countries once ſubject to the crown of Norway. With few exceptions, they are built within ſight of the ſea, and one or more within ſight of the other; ſo that, on a ſignal by fire, by flag, or by trumpet, they could give notice of approaching danger, and yield a mutual ſuccour. Along the Orkney and Shetland ſhores, they almoſt form a chain; and by that means not only kept the natives in ſubjection, but were ſituated commodiouſly for covering the landing of their countrymen, who were perpetually roving on piratical expeditions. No buildings ſimilar to theſe are to be found, except in Scandinavia. On the mountain Swal-Berg, in Norway, is one; the Stir-biſkop, at Upſal in Sweden, is another; and Umſeborg, in the ſame kingdom, is a third.

DUN, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Stenay, on the Meuſe: five leagues north-north-weſt of Verdun, and two ſouth of Stenay.

DUN PALLETEAU', a town of France, in the department of the Creuze, and chief place of a canton, in the diſtrict of La Souterraine: four leagues north-weſt of Gueret.

DUN LE ROY, a town of France, and ſeat of a tribunal, in the department of the Cher, on the Auron. It contains about 1500 inhabitants: fourteen miles ſouth-ſouth-eaſt of Bourges, and fifteen weſt of Sancois.

DU'NA, *ſ.* in old records, a bank of earth thrown out of a ditch.

DU'NAMOND, a town of Ruſſia, in the government of Riga, ſituated at the mouth of the Duina: it formerly belonged to the duchy of Courland, and was taken by the Swedes, commanded by count Mansfield, during their war with the Poles. It was again taken by the Swedes, in 1618, while Sigiſmond, king of Poland, and by birth-right king of Sweden, was contending with Guſtavus Adolphus, who had been called to the throne by the voice of the ſenate. In 1700 it was taken by the Poles, commanded by general Flemming; but the next year the Swedes, commanded by their king, Charles XII. took it after a long ſiege. The czar, Peter the Great, after taking Riga, in 1710, made himſelf maſter of this place: fifteen miles north-weſt of Riga, and twenty north of Mittau. Lat. 57. 5. N. lon. 41. 27. E. Ferro.

DU'NAN POINT, a cape on the ſouth-weſt coaſt of the iſland of Skye. Lat. 57. 9. N. lon. 3. 5. W. Edinburgh.

DUNBAR', a ſea-port town of Scotland, on the north-eaſt coaſt of the county of Haddington, on the German ſea, with a good harbour: the chief trade of the place is the Greenland and herring fiſhery; formerly defended by a caſtle, ſituated on a cliff above the ſea, but now in ruins, to which Edward II. fled after his defeat at Bannockburn; but, being purſued, he was compelled to proceed to Berwick in an open boat. In 1297, the Scots were defeated near Dunbar by the Engliſh, under the command of earl Warenne, with great ſlaughter. In 1650, the troops of Charles II. were defeated near this town by Oliver Cromwell: twenty miles weſt of Edinburgh. Lat. 56. N.

DUNBAR' (William), an early Scottiſh poet of conſiderable merit, born, probably, about 1465, at Salton in Eaſt Lothian. He ſeems to have travelled in his youth in the quality of a preaching friar of the Franciſcan order. He returned to Scotland about 1490, and diſtinguiſhed himſelf as a poet; and died about 1530. He wrote a number of pieces, ſerious and comic, in which he diſplayed facility of invention, and great force and richneſs of deſcription. One of his principal poems is the Thiſtle and Roſe, a kind of viſion, the ſubject of which is the marriage of James IV. of Scotland with Margaret daughter of Henry VII. of England. The Golden Terge, a moral allegory, in which the ſhield of reaſon is employed to reſiſt the attacks of the amorous paſſion. Another of his longer pieces is the Daunce, which is a viſion of heaven and hell in a comic ſtile of painting. There are many more, printed in the collection of ancient Scottiſh poems by ſir David Dalrymple, 1770.

DUNBAR'TON, a townſhip of the American States, in Hillſborough county, New Hampſhire, incorporated in 1765, and containing 917 inhabitants: nine miles ſouth of Concord, and fifty-three weſt of Portſmouth.

DUNBE'ATH, a river of Scotland, in the county of Caithneſs, which runs into the German ocean, eight miles north-eaſt from the Ord of Caithneſs.

DUN'CAN (William), a learned Scotch profeſſor of philoſophy, born at Aberdeen in 1717. His grammatical education he received in his native town; and, in 1733, he entered a pupil at the mariſchal college of Aberdeen. He left the univerſity in 1739, and removed to London, where for ſeveral years he was chiefly employed in different literary undertakings. The firſt is a well-executed tranſlation of thoſe ſelect orations of Cicero which occur in the common Dauphin edition, accompanied with ſhort but judicious explanatory notes. Another work, which has deſervedly met with a favourable reception, is, The Elements of Logic, originally written to form a part of Dodſley's Preceptor, publiſhed in 1748. Theſe elements are drawn up with that judgment, perſpicuity, and conciſeneſs, that juſtly entitle them to be recommended as one of the beſt introductions to the ſtudy of philoſophy and the mathematics in the Engliſh, or perhaps any other, language. The laſt production of Mr. Duncan is a tranſlation of Cæſar's Commentaries, which was firſt publiſhed in 1752, in one volume, folio, adorned with a variety of beautiful illuſtrative engravings; and has ſince appeared in octavo. In the ſame year Mr. Duncan was appointed by the king profeſſor of philoſophy in the mariſchal college of Aberdeen. Owing to increaſing infirmities, and the duties of his profeſſorſhip, he was prevented from completing ſome works which he had undertaken; among which was a new tranſlation of Plutarch's Lives, and the continuation of Dr. Blackwell's Court of Auguſtus. He died in 1760, in the forty-third year of his age.

DUN'CAN BAY, a bay on the north coaſt of the iſland of Jamaica. Lat. 18. 31. N. lon. 77. 23. W. Greenwich.

DUNCAN'NON, a fort and village of Ireland, in the county of Wexford, on the eaſt coaſt of Waterford harbour: ſeven miles eaſt ſouth-eaſt of Waterford.

DUN'CANSBOROUGH, a townſhip of the American States, in Vermont, on the weſt ſide of lake Memphremagog.

DUN'CANSBY HEAD, a cape of Scotland, at the north-eaſt extremity of Great Britain, in the county of Caithneſs. Lat. 58. 33. N. lon. 0. 19. E. Greenwich.

DUNCE, *ſ.* [A word of uncertain etymology; perhaps from *dum*, Dutch, ſtupid.] A dullard; a dolt; a thickſcull; a ſtupid, indocile, animal.—I never knew this.

this town without *dunces* of figure, who had credit enough to give riſe to ſome new word. *Swift.*

Dunce at the beſt, in ſtreets but ſcarce allow'd
To tickle, on thy ſtraw, the ſtupid crowd. *Dryden.*

DUN'CHURCH. See DIMCHURCH.

DUN'COMBE (William), an ingenious writer, born in London in 1690. After a ſchool education, he was entered at ſixteen as a clerk in the navy-office. He had, however, acquired a taſte for literature, and made his firſt appearance in a tranſlation of an ode of Horace, printed in the Wit's Horace. He next publiſhed ſeparately a verſion of the Carmen Seculare, which was ſoon followed by one of Racine's Athaliah. In 1725 he quitted the navy-office, and thenceforth devoted himſelf to a life of literary leiſure and domeſtic friendſhip. He married in 1726 the ſiſter of Mr. Hughes, the poet, of whoſe works he afterwards became the editor. It is needleſs to particulariſe all the pieces written by Mr. Duncombe, conſiſting of letters, eſſays, tranſlations, &c. printed in the public papers and other collections, or ſeparately. One of his principal performances was the tragedy of Lucius Junius Brutus, chiefly taken from Voltaire, but with material alterations. In 1757 and 1759 he publiſhed, with the aſſiſtance of his ſon, an entire verſion of Horace, with notes, in two volumes: of this, an improved edition appeared in four volumes, 12mo. 1764. After a long life calmly ſpent in virtuous and innocent purſuits, he died in 1769.

DUN'COMBE (John), only ſon of the preceding, born in 1729. He was entered of Corpus-chriſti-college, Cambridge, in 1745, and diſtinguiſhed himſelf by a great proficiency in polite literature. He became fellow of his college, and afterwards took orders, and obtained a rectory in the city of Canterbury. In 1766 he obtained a preachership in the cathedral of Canterbury, and was appointed maſter of St. John's hoſpital in that city, and that of St. Nicholas, Harbledow; and was afterwards preſented to the vicarage of Herne, near Canterbury. He wrote a very conſiderable number of poems, which have appeared in various collections, as thoſe of Dodſley, Pearch, and Nichols; and ſeveral in a ſeparate form. Of theſe, one of the beſt known is The Feminead, a commemoration of female excellence. Their general character is eaſe and elegance, with a ſprightly vein of humour when the ſubject called it forth. He wrote alſo a variety of proſe eſſays in periodical works. Beſide his ſhare in the tranſlation of Horace, he publiſhed three ſermons, and ſome antiquarian papers in the Bibliotheca Topographica. He alſo edited various works; of which were The Correſpondence of John Hughes, Eſq. The Earl of Corke's Letters from Italy; and Archbiſhop Herring's Letters. He cloſed his uſeful and benevolent life in 1785.

DUNDA'LK, a ſea-port town of Ireland, in the county of Louth, ſituated on a bay of the Iriſh Sea: manufactures of muſlin and linen have been eſtabliſhed here, and are in a flouriſhing ſtate. It is an ancient borough; thirty-nine miles north of Dublin. Lat. 53. 59. N. lon. 6. 23. W. Greenwich.

DUNDE'E, a large and flouriſhing ſea-port town of Scotland, in the county of Angus, ſituated on a river on the north ſide of the Frith of Tay, which is here between two and three miles wide. The harbour is good, and capable of receiving veſſels of 300 tons; in 1792, there were 116 veſſels belonging to the port, navigated by 698 men, and meaſuring 8550½ tons. Of theſe, thirty-four were employed in the foreign, and ſeventy-eight in the coaſting, trade, and four in the whale fiſhery. The chief manufactures are glaſs, coarſe linen, ſail-cloth, cordage, thread, buckram, tanned leather, ſhoes, hats, &c. A ſugar-houſe has lately been erected, with conſiderable ſucceſs. The number of inhabitants is about 22,000. In the latter end of Auguſt, 1651, Dundee, which was held by the royaliſts, under the command of general Lumſdaine, was ſummoned to ſurrender by general Monk, who commanded the parliament forces; and, on the governor's refuſal, was taken by ſtorm on the 1ſt of September. According to the account publiſhed at the time, the governor was killed, with between ſeven and eight hundred ſoldiers and townſmen, and fourſcore women. The town was given up to be plundered by the ſoldiers and ſeamen. There were at the time about one hundred ſhips in the harbour, about forty pieces of ordnance, many arms, and ſtore of ammunition: thirty miles north of Edinburgh. Lat. 56. 27. N. lon. 3. 3. W. Greenwich.

DUNDUKO'VA, a ſettlement of Ruſſian Siberia, in the government of Tobolſk: 300 miles north-north-eaſt of Turuchanſk. Lat. 70. 16. N. lon. 113. E. Ferro.

DU'NES, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Valence: three leagues ſouth-eaſt of Agen.

DUNFERM'LINE, a town of Scotland, in the county of Fife, with ſome conſiderable manufactures of linen; and contains about 5000 inhabitants. It is remarkable for a royal palace, in which Charles I. king of England was born, and the princeſs Elizabeth, his ſiſter, mother of the princeſs Sophia, from whom the preſent royal family of Great Britain derive their deſcent: thirteen miles north-weſt of Edinburgh. Mr. Campbell, in his Journey from Edinburgh, &c. publiſhed in 1802, gives a very pleaſing account of the ſtrictneſs with which the ſabbath is obſerved in this town; and of the general piety and longevity of its inhabitants.

DUNG, *ſ.* [ꝺunȝ, Sax.] The excrement of animals uſed to fatten ground.—For *dung*, all excrements are the refuſe and putrefactions of nouriſhment. *Bacon.*—See the articles HUSBANDRY and MANURE.

To DUNG, *v. a.* To manure with dung:

There, as his dream foretold, a cart he found,
That carried compoſt forth to *dung* the ground. *Dryden.*

DUN'GALA, or DONKALA, a kingdom of Africa, ſituated chiefly on the weſt ſide of the Nile, in the country of Nubia. It owes its name to a populous town built on the river Nile, ſaid to contain 10,000 houſes of wood. Lat. 20. 20. N. lon. 30. 37. E. Greenwich.

DUNGAN'NON, a town of Ireland, in the county of Tyrone, near which are coal-mines: twenty-five miles north-north-weſt of Newry, and thirty-ſix ſouth-ſouth-eaſt of Londonderry.

DUNGAR'VAN, a ſea-port town of Ireland, on the ſouth coaſt, in the county of Waterford, ſituated in a bay of the Atlantic, to which it gives name: twenty-one miles weſt-ſouth-weſt of Waterford. Lat. 52. 5. N. lon. 7. 39. W. Greenwich.

DUNG'CART, *ſ.* A cart to carry dung.

DUNGENE'SS, a cape of England, on the coaſt of Kent, in the Engliſh Channel. Lat. 50. 55. N. lon. 0. 47. E. Greenwich.

DUNGENE'SS POINT, a cape in the eaſtern entrance in the Straits of Magellan. Lat. 52. 28. S. lon. 68. 28. W. Greenwich.

DUN'GEON, *ſ.* [from *donjon*, the tower in which priſoners were kept, whence all priſons eminently ſtrong were in time called *dungeons.*] A cloſe priſon: generally ſpoke of a priſon dark or ſubterraneous:

Now from the north
Of Norumbeque, and the Samoed ſhore,
Burſting their brazen *dungeon*, arm'd with ice,
And ſnow, and hail, come ſtormy guſt and flaw. *Milton.*

DUNG'FORK, *ſ.* A fork to toſs out dung from ſtables.—*Dung forks* and paddles are common every where. *Mortimer.*

DUNG'HILL, *ſ.* An heap or accumulation of dung.—Two cocks fought a duel for the maſtery of a *dunghill.* *L'Eſtrange.*—Never enter into a league of friendſhip with an ingrateful perſon; that is, plant not thy friendſhip upon a *dunghill:* it is too noble a plant for ſo baſe a ſoil. *South.*—Any mean or vile abode:

Perhaps

Perhaps a thouſand other worlds, that lie
Remote from us, and latent in the ſky,
Are lighten'd by his beams, and kindly nurſt,
Of which our earthly *dunghill* is the worſt. *Dryden.*

Any ſituation of meanneſs:

The poor he raiſeth from the duſt,
Ev'n from the *dunghill* lifts the juſt. *Sandys.*

A term of reproach for a man meanly born.—Out, *dunghill!* dar'ſt thou brave a nobleman? *Shakeſpeare.*

DUNG'HILL, *adj.* Sprung from the dunghill; mean; low; baſe; vile; worthleſs:

His *dunghill* thoughts, which do themſelves enure
To dirty droſs, no higher dare aſpire. *Spenſer.*

DUNG'ING, *part. adj.* Manuring; making rich with dung; voiding excrements.

DUNG'MEER, *ſ.* A pit, where dung, weeds, &c. are mixed to lie and rot together ſome time, for improvement in huſbandry.

DUNG'Y, *adj.* Full of dung; mean; vile; baſe; low; odious; worthleſs:

We need no grave to bury honeſty:
There's not a grain of it, the face to ſweeten
Of the whole *dungy* earth. *Shakeſpeare.*

DUNG'YARD, *ſ.* The place of the dunghill.—Any manner of vegetables caſt into the *dungyard. Mortimer.*

DU'NIO, *ſ.* in old records, a double, a ſort of baſe coin leſs than a farthing.

DUNK, an iſland on the north-eaſt coaſt of New Holland. Lat. 17. 20. S. lon. 145. 30. E. Greenwich.

DUN'KELD, a town of Scotland, in the county of Perth, ſeated on the river Tay, in a ſituation truly romantic, under and among very high and almoſt inacceſſible craggs, part naked and part wooded. It is the chief market town of the Highlands, and has been greatly improved with buildings by the dukes of Athol. It is a place of great antiquity, and was the capital of ancient Caledonia.

DUN'KIRK, or DUNKERQUE, [from *dun*, a hill, and *kirk*, a church.] A ſea-port of France, in the department of the North, and chief place of a canton, in the diſtrict of Bergues. It is the moſt eaſterly harbour on that ſide of France which is oppoſite to Great Britain. It was only a ſmall village, inhabited by fiſhermen, till St. Eloy, biſhop of Noyon, built a church there in the ſeventh century. In 980, it was ſurrounded with walls, by Baldwin III. ſurnamed *the Young*, count of Flanders, and many inhabitants induced to reſide there by particular privileges and immunities granted them by him and his ſucceſſors. In 1388, it was attacked and burnt by the Engliſh. The Spaniſh emperor Charles V. who held it as a part of Flanders, erected a caſtle for its defence. In 1558, it was taken by the French, but retaken by the Spaniards in 1585. In the year 1646, it was taken by the French, aſſiſted by the navy of Holland, commanded by Van Trump. In 1655, a league being made between the protector Cromwell and the French, againſt the Spaniards, twelve Engliſh men of war blocked up the port; but to little purpoſe, as the privateers continued to ſail out and in, and to make many rich captures. Two years after, the two courts having determined to undertake the ſiege of this obnoxious place, Cromwell ſent over 6000 men to reinforce the French army under marſhal Turenne. Mardyke was taken in October, 1657, and delivered up to the Engliſh commiſſary, who placed a ſufficient garriſon in it. Not long after, the marquis of Caracena, at the head of 6000 Spaniards, attempted to retake it; but met with ſo warm a reception, that he was obliged to retire with the loſs of one-fixth of his force. Next ſpring, Lockhart arrived with freſh troops from England to join Turenne, and the ſiege of Dunkirk was opened by 22,000 men on the 1ſt of June, 1658. The lines of circumvallation and countervallation began on the weſt at the ſea, and continued to the ſtrand on the eaſt ſide, which being left dry at low tide, was defended by palliſadoes. Cromwell took care alſo to prevent all ſuccour from the ſea by means of a powerful fleet. The marquis of Leyda commanded the Spaniſh garriſon in the town, and don John of Auſtria, and the prince of Condé, then in rebellion, were encamped at Furnes. The trenches were opened on the 4th of June, by two ſeparate attacks, one on the ſide of the gate of Nieuport, by the French; the other near Fort Leon, by the Engliſh: the garriſon made ſeveral bold, but unſucceſsful, ſorties; and the beſiegers puſhed their works with ſuch vigour, that in five days they made a lodgment in the covert way. As this place was of the utmoſt importance to the Spaniards, they determined to relieve it, if poſſible, by attacking the enemy in their intrenchments. To this effect their army appeared in ſight on the 13th of June, and, although it was unprovided with artillery and tools for an encampment, pitched its tents within two cannon ſhot of the French lines. Turenne perceiving clearly what their intentions were, and being informed by deſerters of their want of cannon, took all neceſſary precautions againſt the garriſon, and marched out of his intrenchments before daybreak to attack the Spaniards with a ſuperior force. His infantry amounted to 9000 men, his cavalry to 6000; the Spaniards had only 6000 of each. After the French had cannonaded the enemy, the Engliſh began the attack with great intrepidity, and routed the whole left wing; ſoon after the marſhal, at the head of the French corps, totally defeated, and drove out of the field, the reſt of their army, notwithſtanding all the valour and efforts of the great Condé. Though deprived of all hopes of relief, the garriſon held out, with great obſtinacy, for ten days. Louis XIV. came from Mardyke to ſee it march out, and after taking poſſeſſion, delivered up the city to the Engliſh; ſo that, by a ſingular combination of circumſtances, Dunkirk belonged in the ſame day, at different times, to the three greateſt powers of Europe. The Engliſh being peaceable poſſeſſors of Dunkirk by the peace of the Pyrenees, ſet about repairing the fortifications without loſs of time. They began to build a citadel on the ſite of Fort Leon, a crown-work on the eaſt ſide, and ſeveral other works were planned. But Louis XIV. whoſe miniſters were too ſolicitous for the proſperity of French commerce to let any opportunity ſlip of increaſing or ſecuring it, ordered his ambaſſador, the count de Eſtrades, to treat with lord Clarendon for the purchaſe of Dunkirk. After ſome dirty bartering, Charles II. conſented to yield it up, with all its appurtenances, ammunition, and artillery, for 5,000,000 livres Tournois. Thus, in 1662, did Dunkirk paſs for ever under the dominion of the French monarchs. Louis XIV. now made it one of the ſtrongeſt places in Europe, and rendered the harbour commodious. By an article of the treaty of peace ſigned with the Engliſh at Utrecht, it was agreed, that all the fortifications ſhould be demoliſhed, and the harbour filled up. This article was renewed in every ſubſequent peace, till the peace of 1783, after the American war. Since that time the harbour has again been cleared, and the fortifications repaired. In 1694, ſir Cloudeſly Shovel bombarded Dunkirk; but after having thrown in 1200 bombs, retired without having done any conſiderable damage. In 1793, the Engliſh army, under the duke of York, attempted to beſiege it, but were compelled to retire. It is the moſt important town and harbour on the whole coaſt; and, having been declared a free port, had a great deal of commerce. By means of a ſluice forty-two feet wide, the baſon within the town will hold forty ſhips of the line always floating. Dunkirk is divided into Old and New Town. The city is large and commodious, well ſupplied with proviſions of all kinds; the buildings ſpacious, and laid out in ſeveral elegant ſquares. The number of inhabitants is eſtimated at 25,000. It is thirty-ſix poſts and three-quarters north of Paris. Lat. 51. 2. N. lon. 20. 2. E. Ferro.

DUNLA'VIN,

DUNLA'VIN, a town of Ireland, in the county of Wicklow: ten miles north-eaſt of Athy, and twenty weſt of Wicklow.

DUNLE'ER, a town of Ireland, in the county of Louth; an ancient borough: ſeven miles north of Drogheda.

DUNMAN'AWAY, a town of Ireland, in the county of Cork: twenty-three miles ſouth-weſt of Cork.

DUNMAN'NUS BAY, a bay of the Atlantic, on the ſouth-weſt coaſt of Ireland, in the county of Cork, about fourteen miles in length, and from one to three broad, ſouth of Bantry Bay, affording a ſafe harbour. Lat. 51. 30. N. at its mouth. lon. 9. 40. W. Greenwich.

DUNMO'RE BAY, a bay of the Atlantic, on the weſt coaſt of Ireland, in the county of Clare. Lat. 52. 44. N. lon. 9. 35. W. Greenwich.

DUNMO'RE HEAD, a cape on the weſt coaſt of Ireland, in the county of Kerry. Lat. 52. 6. N. lon. 10. 10. W. Greenwich.

DUN'MOW, a pleaſant healthy town in the county of Eſſex, diſtant from London thirty-ſeven miles. It has a market on Saturdays for corn and other articles, and two annual fairs, on the 6th of May and 8th of November. It is a borough, chartered by Philip and Mary, and Elizabeth, governed by a bailiff and twelve burgeſſes; but ſends no members to parliament. The church is a ſpacious Gothic building, and exhibits a chaſte ſpecimen of that ſtyle of architecture. In the town is a manufacture of baize. Dunmow is very ancient, ſuppoſed to be the old Cæſaromagus, and in the road from hence to Colcheſter, are the remains of an old Roman cauſey. Here was formerly a priory, founded in 1104, by lady Juga, who built a church alſo. The collegiate church was a large ſtately fabric, the roof ſuſtained with rows of columns, whoſe capitals are ornamented with oak-leaves, elegantly carved, ſome of which ſtill remain. The part which now makes the pariſh-church, was the eaſt end of the choir, with the north aiſle. Under an arch in the ſouth wall, is an ancient tomb, ſaid to contain the body of the foundreſs, lady Juga. Near the ſame ſpot is a monument of Walter Fitzwalter, a powerful baron in the reign of Henry III. who died in 1198. The much-celebrated cuſtom inſtituted at Dunmow by him, relative to giving away a flitch of bacon to any pair who married without repenting, in any part of England, is now diſcontinued; but, for the ſatisfaction of the curious, we ſhall here preſerve the ſubſtance of the oath which uſed to be taken on thoſe occaſions:

You ſhall ſwear by the cuſtom of your confeſſion,
That you never made any nuptial tranſgreſſion,
Since you were married man and wife,
By houſehold brawls or a contentious ſtrife;
Or otherwiſe, in bed or at board,
Offended each other in deed or in word;
Or, ſince the pariſh-clerk ſaid amen,
Wiſh'd yourſelves unmarried again;
Or, in a twelvemonth and a day,
Repented not in thought any way;
But continued true and in deſire,
As when you join'd hands in holy choir.
If to theſe conditions, without all fear,
Of your own accord, you will freely ſwear,
A gammon of bacon you ſhall receive,
And bear it hence with love and good leave.

The flitch was expreſsly the reward of this uncommon connubial agreement; though *gammon* is put in the formula, perhaps as more ſuitable to the doggrel verſes. The flitch was for many years, at different times, claimed and received; but being eventually found to produce falſe ſwearing, idleneſs, and diſorder, it was judged prudent to aboliſh the cuſtom.

In the vicinity of Dunmow is Felſtead charity-ſchool, for eighty children of the county of Eſſex, and an almshouſe for ſix poor people, with handſome weekly allowances of malt, meat, and money, fewel, paſture for ſix cows, &c. Every year ſuch poor of this pariſh as received not collection, have ſix barrels of white herrings, beſides ſome cades of red. The ſchool has produced ſeveral eminent ſcholars, and is in a flouriſhing ſtate.

DUN'NER, *ſ.* [from *dun.*] One employed in ſoliciting petty debts.—They are ever talking of new ſilks, and ſerve the owners in getting them cuſtomers, as their common *dunners* do in making them pay. *Spectator.*

DUN'NET, a town of Scotland, in the county of Caithneſs, ſituated on the eaſt ſide of a bay, to which it gives name. In 1791, the number of inhabitants was about 1400. Dunnet-bay affords excellent flounders and haddocks; and is ſometimes frequented by ſhoals of herrings in July and Auguſt. But their continuance in the bay, or even their coming to it, has hitherto been reckoned ſo uncertain, that no extenſive fiſhery has been attempted: five miles eaſt of Thurſo. Lat. 58. 32. N. lon. 0. 1. W. Edinburgh.

DUN'NET HEAD, a cape on the north coaſt of Scotland, and county of Caithneſs. It conſiſts of ſeveral hills, with ſome bold rocks towards the ſea, from one hundred to four hundred feet high: three miles and a half north of Dunnet.

DUNNO'SE, a cape or promontory on the ſouth-eaſt coaſt of the Iſle of Wight, in the Engliſh Channel: about ſeventeen leagues weſt from Beachy-head. Lat. 50. 33. N. lon. 1. 14. W. Greenwich.

DUNNOT'TAR, a village of Scotland, in the county of Kincardine, where are the remains of a caſtle, ſituated on a rock near the ſea, ſuppoſed to have been built during the conteſt between Baliol and Bruce; before the uſe of artillery, ſuppoſed to have been impregnable. In 1661, the regalia of Scotland were depoſited here, to preſerve them from the Engliſh army; and a garriſon, with ſuitable ammunition, obtained for their defence by earl Mariſchal, proprietor of the caſtle; the command of the garriſon was intruſted to Mr. Ogilvie, of Barras, as the earl had joined the king's forces in England. The ſiege was turned into a blockade, and, though frequently ſummoned, the governor held out for ſeveral months; till preſſed by famine and the mutiny of the garriſon, he found means to convey the regalia to a place of ſecurity, and then capitulated on honourable terms. In 1685, this caſtle was employed as a priſon for a body of preſbyterians, and a number of them confined during the warmeſt ſeaſon of the year in one vault, which is ſtill to be ſeen, called the *whigs' vault*. A grave-ſtone in the church-yard of Dunnottar is placed over a number of them who died under the confinement: about a mile ſouth-weſt from Stonehaven.

DUNROSSNESS', a town of Scotland, ſituated in the ſouthern part of the iſland of Shetland: twenty-eight miles ſouth of Lerwick.

DUNS (John), commonly called *Duns Scotus*, a celebrated ſcholaſtic divine, who flouriſhed towards the cloſe of the thirteenth and the beginning of the fourteenth century, ſuppoſed to have been born at Dunſtance, near Alnwick, in Northumberland. When young, he was admitted into an inſtitution belonging to the Franciſcan friars at Newcaſtle; whence he was ſent by them to Merton-college, Oxford. In that ſeminary, of which he was afterwards made a fellow, he applied himſelf with uncommon diligence to his ſtudies, and acquired a high reputation for his proficiency in ſcholaſtic theology, civil and canon law, logic, metaphyſics, and the different branches of mathematical learning. About the year 1301 he was appointed to the divinity chair in the univerſity of Oxford; and, by the fame of his great learning and talents, attracted prodigious crowds of ſcholars from all parts to attend his lectures. About the year 1304, he was ſent by his ſuperiors to Paris, where he was admitted to the higheſt honours in the univerſity of that city, and appointed profeſſor and regent in the theological ſchool. In that ſituation he diſtinguiſhed himſelf ſo much by his great acute-

neſs in diſputation, that he acquired the title of *the moſt ſubtle doctor*. At firſt Duns Scotus was a follower of Thomas Aquinas; but differing from his maſter on the ſubject of divine grace, he formed a diſtinct ſect, which ſoon became numerous, particularly among the members of the order to which he belonged. By this ſeparation, the catholic ſchoolmen became claſſed under the denominations of Thomiſts and Scotiſts, who maintained the opinions of their reſpective heads with wonderful ardour and virulence of controverſy. One of the diſtinguiſhing tenets of which Duns Scotus was a ſtrenuous advocate, if not the firſt propounder, was that of the immaculate conception of the Virgin Mary; which the Dominicans, and the other adherents to the ſchool of Aquinas, conteſted with as much heat and bitterneſs as they ever diſplayed againſt the moſt obnoxious and heretical dogma. The Franciſcans, on the contrary, and the other Scotiſts, ſupported that doctrine with equal warmth and unchriſtian animoſity towards their opponents. In 1308, Duns Scotus was ſent by the head of his order to teach theology at Cologne; at which city he was received with the moſt ſolemn pomp and high-raiſed expectations. He did not, however, live to gratify theſe expectations, being cut off, moſt probably by a ſtroke of apoplexy, according to ſome writers in the forty-third, but according to others in the thirty-fourth, year of his age. Paul Jovius, and ſome other writers, relate a ſhocking tale concerning him: that he was buried while in a ſwoon, and died miſerably, after having recovered ſtrength ſufficient to turn himſelf in his grave. But the beſt hiſtorians conſider this account to be fabulous. He left behind him numerous works, ſome of which were printed ſeparately, at different periods; but the moſt complete collection of the whole, together with the life of the author, was publiſhed by Lucas Waddingus, at Lyons, in 1639, in 12 vols. folio.

DUNSE, a town of Scotland, in the county of Berwick, containing 2324 inhabitants. About a mile from the town is a medicinal ſpring, called *Dunſe Spaw*, firſt diſcovered in 1747, and lately repaired at the expence of a gentleman who was cured of a complaint in his ſtomach: ten miles weſt of Berwick, and twenty-nine ſouth-eaſt of Edinburgh.

DUN'SETS, *ſ.* in old records, a people that dwell on hilly places.

DUN'SICAL, *adj.* Dull; ſtupid; incapable of learning. *Scott.*

DUN'SICALLY, *adv.* In the manner of a dunce. *Scott.*

DUNS'KERRY, a ſmall iſland near the north coaſt of Scotland: four miles eaſt-ſouth-eaſt of Farout Head.

DUN'STABLE, a pleaſant town of Bedfordſhire, thirty-three miles from London, the ſame from Northampton, eighteen from Newport Pagnel, and nine from Woburn. It ſtands on a chalky hill, at the entrance of the Chiltern, where the old Roman Watling-ſtreet is croſſed by the Ickneld-ſtreet. Not far from it alſo, on the deſcent of the Chiltern-hills, is an area of nine acres, with a deep ditch and rampart round it, ſaid to be a Daniſh work, called Maiden-bower. This town, having been ruined by the Danes, was rebuilt by Henry I. who made it a royal borough; but it never ſent members to parliament, though once ſummoned. Edward I. erected a croſs here, in memory of his queen Eleanor. Several of the Lollards were martyred here in the reigns of Henry V. and VII. The church is part of a priory, built in 1132; and archbiſhop Cranmer was the laſt prior, who here pronounced the ſentence of divorce againſt queen Catherine. Here is a good charity-ſchool. The town is populous, abounding with excellent accommodations, it being a great thoroughfare to the counties in the north and north-weſt, and conſequently to Scotland and Ireland. This place was once famous for brewing; and, at this time, the women carry on a great manufacture of hats, and utenſils made of ſtraw, in which, it is ſaid, they excel all the world. This part of the country was formerly very woody, and, with the faſtneſſes in the Chiltern-hills, was a harbour for great gangs of highwaymen; to curb whom, Henry I. built Kingſbury, promiſing great privileges to ſuch of his ſubjects as were willing to come and ſettle here. In the reign of Henry VII. William Tillſworth was burnt here for denying the pope's ſupremacy; with this remarkable circumſtance of cruelty, that his only daughter was compelled to ſet fire to the faggots. The market is on Wedneſdays, for corn, ſtraw, plat, and hats. There are four fairs, viz. Aſh-Wedneſday, 22d of May, 12th of Auguſt, and 12th of November; for horſes, and all ſorts of cattle.

DUN'STABLE, a townſhip of the American States, in Hillſborough county, New Hampſhire, on the weſt ſide of Merrimack river, below the town of Merrimack, and ſeparated by the ſtate line from Pepperel and Dunſtable in Middleſex county, Maſſachuſetts. It was incorporated in 1746, contains 632 inhabitants, and lies about forty miles north-weſt of Boſton.

DUN'STABLE, a townſhip of the American States, in Maſſachuſetts, in the northern part of Middleſex county, and on the ſouthern bank of Merrimack river: thirty-ſeven miles north-weſterly of Boſton.

DUN'STAN, [of ðun, a hill, and ſtan, a ſtone, Sax.] A proper name.

DUN'STAN, a ſaint in the Romiſh calendar, archbiſhop of Canterbury in the tenth century, born at Glaſtonbury in Somerſetſhire, in 925. He was the nephew of Athelm archbiſhop of Canterbury, who took care to have him educated in the beſt literature of his time; and, when he had finiſhed his ſtudies, recommended him to the patronage of king Athelſtan, by whom he was ſent for to court. He obtained ſuch favour with the king, that he preſented him with ſome lands near Glaſtonbury; and, in the reign of Edmund, the ſucceſſor of Athelſtan, was made abbot of that monaſtery. In the reign of Edred, the ſucceſſor of Edmund, Dunſtan's intereſt at court conſiderably increaſed, until he became prime miniſter, favourite, and confeſſor to the king, who, to gratify him, undertook the rebuilding of Glaſtonbury church and monaſtery, in a very ſumptuous and magnificent ſtyle. In the mean while Dunſtan, who was a true monk in ſpirit as well as intrigue, left no meaſures untried to promote the intereſts of his fraternity; and, by his credit with the king, procured the appointment of ſeveral of that order to eccleſiaſtical benefices, to the prejudice of the ſecular clergy. This conduct expoſed him to the reſentment of that body, in which they were joined by many of the courtiers, who were provoked by the haughty and overbearing demeanour which he aſſumed. The king's countenance, however, ſupported his favourite againſt the effects of their enmity; and the idle tales of the monks obtained for him, among the credulous populace, the reputation of a great ſaint, who was frequently favoured with divine revelations. In theſe circumſtances, when the eccleſiaſtical patronage in the kingdom was wholly in his power, the king ſuddenly died, and Dunſtan's ambition met with a ſevere diſappointment. On the acceſſion of Edwy, his council determined to reverſe what had been done in favour of the monks, who filled the country with the bittereſt invectives, and excited in the populace an apprehenſion that religion was in danger. Whether Dunſtan was the prime mover of theſe complaints is not now apparent; but they were made the ſubject of a charge againſt him, and he was baniſhed the kingdom. He retired to a monaſtery in Flanders, where he availed himſelf of the influence of the monks over the minds of the Engliſh populace, and the general opinion of his great ſanctity, to excite inſurrections againſt the government of Edwy. Inſtigated by their intrigues, and the repreſentations which they propagated againſt the moral and religious character of the king, great numbers of malcontents collected together, of whom Edgar, the king's brother, who maintained a cloſe connection with Dunſtan, was declared the head and protector. By their means Edgar was ſoon enabled to conquer

conquer the greateſt part of England north of the Thames; and on the death of Edwy, which took place in a ſhort time afterwards, to become maſter of the whole of his dominions. No ſooner was Edgar in poſſeſſion of kingly power, than he recalled Dunſtan, and promoted him to the ſee of Worceſter. Some time afterwards he inveſted him with the management of the biſhopric of London; and upon a vacancy taking place in the archiepiſcopal ſee of Canterbury, about the year 959, procured his election to that dignity. As, however, there were circumſtances attending his election which rendered it not perfectly canonical, Dunſtan was ſent to Rome, to receive the ſanction of the pope to his appointment, and to be inveſted there with the pall. The pope, who was fully appriſed of his influence at the court of Edgar, and ſatisfied with the proofs which he had given of his devotion to the intereſts of the church of Rome, and his zeal in the cauſe of the monks, readily confirmed his election, and conſtituted him his legate in England. Armed with this power, he returned to his native country, where the king committed to him and his choſen friends the management of all the eccleſiaſtical affairs of England, and thus enabled him to give to the Romiſh ſee an authority and juriſdiction of which the Engliſh clergy had been before in a conſiderable degree independent. The meaſures to which he had recourſe for this purpoſe were, his former practice of placing monks in the vacant eccleſiaſtical benefices, in the room of the ſecular clergy, and the ejection of many of the latter from their livings, in order that he might beſtow them on his tried adherents. Among his pretences for theſe meaſures he alleged the ſcandalous lives of the ſecular clergy, of which there was too much reaſon for complaint, and the opportunity that would be afforded of introducing a reformation into the church, by placing it under the government of men who by their profeſſion were ſolely devoted to objects of ſpiritual concern. But one principal motive which influenced him was, that of rendering the papal power paramount and abſolute in the Engliſh church; for it ſhould be mentioned that, at this period, the Engliſh clergy had not yielded implicit ſubmiſſion to the pretended ſucceſſors of St. Peter. For theſe ſervices the church of Rome and the monks have been unbounded in the commendations which they have beſtowed upon Dunſtan; and they have invented tales of numerous miracles ſaid to have been wrought by him, or in his favour, in order to raiſe the opinion of the excellence and ſanctity of his character. Dunſtan maintained his intereſt at court during the whole of the reign of Edgar; and on the death of that prince, in 975, by his influence raiſed his ſon Edward to the throne, in oppoſition to the wiſhes of many of the nobles, who were inclined to chooſe his ſon Ethelred. As Edward was in his minority, Dunſtan aſſumed to himſelf the regency of the kingdom, and acted with uncontrolled authority in church and ſtate, until the murder of the king, in 979. On that event, Ethelred, who was the only ſurviving prince of the royal family, was called to the throne, and crowned by the legate. Under the reign of this prince, Dunſtan appears to have enjoyed little credit or influence; and he is reported to have been ſo much mortified by the contempt in which his threatenings of divine vengeance were held by the king, in the inſtance of a diſpute reſpecting the prlvileges of the church, that he retired to his archbiſhopric, where he died of grief and vexation in the year 988.

DUNS'TANG, a town of Lithuania, in the palatinate of Wilna: twenty-eight miles north-eaſt of Wilkomierz.

DUNS'TER, a ſmall market-town in Somerſetſhire, ſituated about two miles ſouth-eaſt of Minehead, twenty from Taunton, and 164 from London; formerly a borough, and of conſiderable trade in the clothing branch; but its only manufacture now is kerſeys. The church, which is large, with a handſome tower, was built in the reign of Henry VII. Adjacent to the town ſtands on an eminence, that ancient and delightful ſeat, Dunſter-caſtle, the reſidence of Ralph lord Mohun, in the reign of William the Conqueror, being then one of the ſix great baronies, in which family it remained for ſeveral centuries. The caſtle conſiſts of two wings and three towers, commanding a fine proſpect of a vale bounded by the Severn. The market is on Fridays, and one fair on Whit-Monday.

DU'NUM, *ſ.* A Celtic term, denoting a hill or eminence, and which often occurs to form the names of towns, to ſignify their high ſituation, places of ſtrength or citadels, hills or eminences, &c. See DUN.

DU'NUM, anciently a town of Ireland; now thought to be *Down-Patrick*, in the county of Down.

DUN'WICH, an ancient town in the county of Suffolk, ſituated on the ſea coaſt, ninety-eight miles from London, eleven north-eaſt of Saxmundham, and four ſouth-eaſt of Blythburgh. Its ſcite is extremely pleaſant, having an extenſive view of the German ocean. This place however is greatly reduced by the encroachment of the ſea, ſeven of its pariſhes out of eight having been deſtroyed: and the encroachment ſtill making, will probably in a few years oblige the conſtituent body to betake themſelves to a boat, whenever the king's writ ſhall ſummon them to the exerciſe of their elective functions; for the right of election is in the freemen, inhabiting *within* the remains of the borough. It ſent members *ab origine*. The corporation conſiſts of two bailiffs, and twelve capital burgeſſes. Dunwich, though now a poor place, is of the moſt early note of any town in Suffolk. In 630 it was an epiſcopal ſee, afterwards divided into two ſees, namely, one here, the other at North-Elmham; but William the Conqueror transferred them firſt to Thetford, then to Norwich. From the coins, &c. found here, particularly an urn dug out of the cliff in 1786, with fragments of other urns, it is ſuppoſed to have been a Roman ſtation; but, though ſir Henry Spelman mentions a report that here was once fifty-two churches and monaſteries, yet the ſea has ſwallowed up all except All-Saints. In the ſixteenth century it was a populous place, and had a mint. The free-burgeſſes gave king John 300 marks of ſilver for his charter, beſides ten falcons and five gerfalcons; and they alſo gave him 200 marks and 500 eels for the grant of wrecks. The remains of the above-mentioned church, an old chapel, and an old palace, are the only marks now left of its former greatneſs. Here is one fair on the 25th of July; and a market on Saturdays.

DU'O, *ſ.* in muſic, a ſong or compoſition, to be performed on two parts only, one ſung, the other played on an inſtrument, or by two voices. Duo is likewiſe when two voices ſing different parts, as accompanied with a third, which is a thorough baſs. It is ſeldom that uniſons and octaves are uſed in duos, except at the beginning and end.

DUODE'CIMAL, *adj.* Belonging to croſs-multiplication.

DUODE'CIMALS, *ſ.* The rule of croſs-multiplication, by which builders' work is calculated. See ARITHMETIC, vol. ii. p. 181.

DUODE'CIMO, *adj.* [*duodecimus*, Lat.] Belonging to the number twelve.

DUODE'CIMO, *ſ.* A book in which one ſheet is ſo folded as to make twelve leaves, or twenty-four pages.

DUODE'CUPLE, *adj.* [*duo* and *decuplus*, Lat.] Conſiſting of twelves.—Griſeplius, a learned Polander, endeavours to eſtabliſh the *duodecuple* proportion among the Jews, by comparing ſome paſſages of ſcripture together. *Arbuthnot.*

DUODE'NA, *ſ.* in old records, a jury of twelve men.

DUODE'NUM, [from *duodenus*, Lat. conſiſting of twelve.] An inteſtine ſo named, becauſe it was ſuppoſed not to exceed the breadth of twelve fingers; but as the ancients diſſected only animals, this is probably not very exact. See the article ANATOMY, vol. i. p. 613.

To DUP, *v. a.* To do up: thence to open by lifting up any thing.—Will they not *dup* the gate to-day? *Damon and Pythias.*

Then up he roſe, and don'd his cloths,
And *dupt* the chamber-door:
Let in the maid, that out a maid
Never departed more. *Shakeſpeare.*

DUPA'GE, a lake of North America, on the ſouth-eaſt ſide of Plein river, or rather an enlargement of the channel of that river, five miles from its mouth. Plein and Theakiki there form the river Illinois.

DUPA'TY, a diſtinguiſhed magiſtrate, and a man of letters, born at Rochelle, was firſt advocate-general to the parliament of Bourdeaux, and afterwards preſident-à-mortier. He acquired great honour by his firmneſs and eloquence at the revolution in the magiſtracy which took place in 1771. He defended with ſucceſs three criminals of Chaumont, who had been condemned to be broken on the wheel, and publiſhed a memoir on this occaſion, which was much admired for its ſtrength and feeling. His Hiſtorical Reflections upon Criminal Laws diſplay a humane and enlightened mind. He was long occupied in promoting a reform in this point, and contended with zeal againſt the obſtacles which ancient prejudice threw in his way. He ſpent the latter part of his life at Paris, and made himſelf known as a man of letters by his Academical Diſcourſes, and his Letters on Italy. He died in 1788.

DUPE, *ſ.* [*dupe*, Fr. from *duppe*, a fooliſh bird, eaſily caught.] A credulous man; a man eaſily tricked.—An uſurping populace is its own *dupe*, a mere underworker, and a purchaſer in truſt for ſome ſingle tyrant. *Swift.*

Firſt ſlave to words, then vaſſal to a name,
Then *dupe* to party; child and man the ſame. *Dunciad.*

To DUPE, *v. a.* To trick; to cheat:

The throne a bigot keep, a genius quit;
Faithleſs through piety, and *dup'd* through wit. *Pope.*

DUPIN' (Louis Ellis), a French prieſt, and celebrated eccleſiaſtical hiſtorian, born at Paris, in 1657. After being initiated in the elements of grammar, he was placed under the tuition of M. Lair, rector of the univerſity of Paris, and ſoon diſtinguiſhed himſelf by his attachment to the ſtudy of the belles-lettres, and the ſciences. Having gone through the courſes of claſſical learning and of philoſophy in the college of Harcourt, he was admitted to the degree of maſter of arts in 1672; on which occaſion he particularly recommended himſelf to notice by the able manner in which he performed the cuſtomary collegiate exerciſes. Soon afterwards he determined on embracing the eccleſiaſtical profeſſion, and to prepare himſelf for it diligently attended the courſe of theological lectures at the Sorbonne. When he had finiſhed that courſe, he cloſely applied himſelf to the ſtudy of the hiſtory of the councils, and the works of the Greek and Latin fathers. In 1680, he took his degree of bachelor of the Sorbonne, in his examination for which he had the honour of ſtanding in the higheſt rank of meritorious candidates; in the ſame year he was licenſed to officiate as a prieſt; and was afterwards appointed profeſſor in the College Royal. In 1684 he received the bonnet of doctor of the Sorbonne, and immediately afterwards employed himſelf on the production of his grand and valuable work entitled *Bibliothéque univerſelle des Auteurs Eccleſiaſtiques, &c.* or, Hiſtory of Eccleſiaſtical Writers: containing an Account of the Authors of the ſeveral Books of the Old and New Teſtaments; and the Lives and Writings of the Primitive Fathers, &c. This work has undergone a variety of impreſſions in France, Holland, and England, in octavo, quarto, and folio, and will always be conſulted with great advantage by the ſtudent in eccleſiaſtical hiſtory. Having joined with thoſe doctors of the Sorbonne who ſubſcribed to the celebrated Caſe of Conſcience, relative to the diſputes concerning the opinions of Janſenius, he expoſed himſelf to the reſentment of the pope, and of the court of France. The conſequence was, that in 1703, he was deprived of his profeſſorſhip, and baniſhed to Chatelleraut; whence he was not permitted to return to Paris before he had retracted the meaſure which he had taken; and even then was not reinſtated in his profeſſorſhip. He met with much trouble, on account of the correſpondence which he held with Dr. Wake, archbiſhop of Canterbury, relative to a project for uniting the churches of England and France. In the beginning of the year 1719, his papers were ſeized by order of the government, and innumerable calumnies were propagated to his prejudice; but as no charge could be eſtabliſhed againſt him, excepting that of great candour and moderation, and a deſire to heal the diviſions in the Chriſtian world, his enemies were diſappointed, and he was permitted to ſpend his few remaining days in peace. He died at Paris in the ſixty-ſecond year of his age, deeply regretted both by his friends and the public in general. Beſides his grand work already mentioned, M. Dupin was the author of, 1. Prolegomena to the Bible, in 3 vols. 8vo. 1699. 2. *De Antiqua Eccleſiæ Diſciplina Diſſertationes Hiſtoricæ*, 4to. 1686. 3. *Liber Pſalmorum cum Notis quibus eorum ſenſus literalis exponitur*, 8vo. 1693. 4. The Book of Pſalms tranſlated into French from the Hebrew, with Notes, 12mo. 1691. 5. *Notæ in Pentateuchum*, 2 vols. 8vo. 1701. 6. Hiſtorical, Chronological, and Critical, Diſſertations on the Bible, 8vo. 1711. 7. *Sancti Optati Afri, Milevitani Epiſcopi, Opera*, folio, 1700, with a preface, notes, the hiſtory of the Donatiſts, the ſacred geography of Africa, &c. by M. Dupin. 8. *Joannis Gerſoni Doctoris & Cancellarii Pariſienſis Opera, &c.* 5 vols. folio. 9. A Bibliotheque of Hiſtorians, after the manner of the Bibliotheque of Eccleſiaſtical Writers, 2 vols. 8vo. 1707. 10. An Abridgment of the Hiſtory of the Church, from the Beginning of the World, 4 vols. 12mo. 1712. 11. Profane Hiſtory, from the earlieſt Date to the preſent Time, 6 vols. 12mo. 1714 and 1716. 12. The Hiſtory of the Jews, 7 vols. 12mo. 13. An Hiſtorical Treatiſe on Excommunications, &c. 2 vols. 12mo. 1715. 14. A Defence of the Monarchy of Sicily, with illuſtrative Documents and Proofs, 12mo. 1716. 15. A Philoſophical and Theological Treatiſe on the Love of God, 8vo. 16. A Philoſophical and Theological Treatiſe on Truth, 12mo. publiſhed after the author's death, in 1731. Beſides the works above-mentioned, and other leſſer tracts, M. Dupin had a conſiderable ſhare in the editions of Moreri's Dictionary, which appeared in 1712 and 1718.

DUPI'NO, or DUBLIN, a town of Poland, in the palatinate of Poſnania: forty-four miles ſouth of Poſen.

DU'PLE, *adj.* [*duplus*, Lat.] Double; one repeated. In arithmetic a *duple ratio* is that in which the antecedent term is double the conſequent; or, where the exponent of the ratio is 2. Thus, 6 to 3 is in a duple ratio. *Sub-duple ratio*, is that in which the conſequent is double the antecedent; or, in which the exponent of the ratio is ½. As in 3 to 6, which is in ſub-duple ratio.

DUPLE'IX (Scipio), a French hiſtorian, born in 1569, at Condom. He became known to queen Margaret of Navarre, who brought him to Paris in 1605, and made him her maſter-of-requeſts. He afterwards obtained the poſt of hiſtoriographer of France, and laudably employed many years in reſearches into the ancient records of his country. The fruits of theſe were, his Memoirs of the Gauls, 4to. 1619, a work in conſiderable eſteem for its matter, though ill written. This conſtituted the firſt part of his Hiſtory of France, of which there are two editions; the firſt of five volumes folio, the ſecond of ſix volumes. The narration is brought down to the year 1645. He wrote alſo a Roman Hiſtory, 3 vols. folio; a Courſe of Philoſophy; and the Liberty of the French Tongue. He died in 1661, at the age of ninety-two.

To DU'PLICATE, *v. a.* [*duplico*, Lat.] To double; to enlarge by the repetition of the firſt number or quantity.—And ſome alterations in the brain *duplicate* that which is but a ſingle object to our undiſtempered ſentiments. *Glanville.*—To fold together.

DU'PLICATE,

DU'PLICATE, *adj.* *Duplicate* ratio is the proportion of ſquares. Thus, in a rank of geometrical proportions, the firſt term to the third is ſaid to be in a *duplicate* ratio of the firſt to the ſecond, or as its ſquare is to the ſquare of the ſecond: ſo in 2, 4, 8, 16, the ratio of 2 to 8 is a *duplicate* of that of 2 to 4, or as the ſquare of 2 to the ſquare of 4. *Phillips. Harris.*—It has been found, that the attraction is almoſt reciprocally in a *duplicate* proportion of the diſtance of the middle of the drop from the courſe of the glaſſes, viz. reciprocally in a ſimple proportion, by reaſon of the ſpreading of the drop, and its touching each glaſs in a larger ſurface; and again reciprocally in a ſimple proportion, by reaſon of the attractions growing ſtronger within the ſame quantity of attracting ſurface. *Newton.*

DU'PLICATE, *ſ.* Another correſpondent to the firſt; a ſecond thing of the ſame kind.—Nothing is more needful for perfecting the natural hiſtory of bodies, than the ſubjecting them to the fire; to which end I have reſerved *duplicates* of the moſt conſiderable. *Woodward.*

DU'PLICATE, *ſ.* in law, is uſed for the ſecond letters-patent, granted by the lord chancellor, in a caſe wherein he had before done the ſame; which were therefore thought void. But it is more commonly a copy or tranſcript of any deed or writing, account, &c. or a ſecond letter, written and ſent to the ſame party and purpoſe as a former, or a copy of diſpatches for fear of a miſcarriage of the firſt, or for other reaſons. 4 *Car.* II. c. 10. It is alſo the name of the diſcharge, given by the quarter ſeſſions, &c. to an inſolvent debtor, who takes the benefit of an act, for relief of inſolvent debtors, with reſpect to the impriſonment of their perſons.

DUPLICA'TION, *ſ.* The act of doubling.—What great pains hath been taken concerning the quadrature of a circle, and the *duplication* of a cube, and ſome other mathematical problems! *Hale.*—The act of folding together. A fold; a doubling.—The peritonæum is a ſtrong membrane, every where double; in the *duplications* of which all the viſcera of the abdomen are hid. *Wiſeman.*

The *duplication of a cube*, is finding out the ſide of a cube that ſhall be double in ſolidity to a given cube: which is a celebrated problem, cultivated by the ancient geometricians upwards of 2000 years ago. It was firſt propoſed by the oracle of Apollo at Delphos; which, being conſulted about the manner of ſtopping a plague then raging at Athens, returned for anſwer, that the plague ſhould ceaſe when Apollo's altar, which was cubical, ſhould be doubled. Upon this they applied themſelves in good earneſt to ſeek the duplicature of the cube, which from thence was called the *Delian problem*. This problem cannot be effected geometrically, as it requires the ſolution of a cubic equation, or requires the finding of two mean proportionals, viz. between the ſide of the given cube and the double of the ſame, the firſt of which two mean proportionals is the ſide of the double cube, as was firſt obſerved by Hippocrates of Chios. For, let a be the ſide of the given cube, and z the ſide of the double cube ſought; then it is $z^3 = 2a^3$, or $a^2 : z^2 :: z : 2a$; ſo that, if a and z be the firſt and ſecond terms of a ſet of continued proportionals, then $a^2 : z^2$ is the ratio of the ſquare of the firſt to the ſquare of the ſecond, which, it is known, is the ſame as the ratio of the firſt term to the third, or of the ſecond to the fourth, that is, of z to $2a$; therefore z being the ſecond term, $2a$ will be the fourth. So that z, the ſide of the cube ſought, is the ſecond of four terms in continued proportion, the firſt and fourth being a and $2a$, that is, the ſide of the double cube is the firſt of two mean proportionals between a and $2a$. Eutocius, in his Commentaries on Archimedes, gives ſeveral ways of performing this by the meſolabe. In Pappus, too, are found three different ways; the firſt according to Archimedes, the ſecond according to Hero, and the third by an inſtrument invented by Pappus, which gives all the proportions required. The ſieur de Comiers has likewiſe publiſhed a demonſtration of the ſame problem, by means of a compaſs with three legs. But all theſe methods are only mechanical. See *Valerius Maximus*, lib. viii. alſo *Eutocius's Com.* on lib. ii. *Archimedes de Sphæra & Cylindro*; and *Pappus*, lib. iii. prop. 5. and lib. iv. prop. 22.

DU'PLICATURE, *ſ.* A fold; any thing doubled.—The lympheducts, either dilacerated or obſtructed, exonerate themſelves into the foldings, or between the *duplicatures* of the membranes. *Ray.*

DUPLI'CITY, *ſ.* [*duplicis*, Lat.] Doubleneſs; the number of two.—Do not affect *duplicities* nor triplicities, nor any certain number of parts, in your diviſion of things. *Watts.*—Deceit; doubleneſs of heart or of tongue.

DU'PLIN, a county of the American States, in Wilmington diſtrict, North Carolina, bounded caſt by Onſlow, and ſouth-weſt by Sampſon. The number of inhabitants 5662. The chief town is Sarecto, on the north-eaſt branch of Cape Fear.

DUPON'DIUS, *ſ.* in antiquity, a weight of two pounds, or a money of the value of two aſſes. See As, vol. ii. p. 249.

DUP'PA (Brian), a reſpectable Engliſh prelate, born at Lewiſham in Kent, in 1588–9. He was educated at Weſtminſter ſchool; whence he was elected ſtudent of Chriſtchurch college, Oxford, in 1605. He took his degree of bachelor of arts in 1609; and in 1612 was choſen a fellow of All-Souls college. In 1619, he was choſen one of the proctors to the univerſity of Oxford, which office he paſſed through with reputation and general reſpect. He was made chaplain to the earl of Dorſet, by whoſe intereſt with the king he was appointed to the deanery of Chriſtchurch, Oxford, in 1629. To this church and college he was, during his reſidence in it, and at his death, a liberal benefactor. In 1634, he was conſtituted chancellor of the church of Sarum, and ſoon afterwards made chaplain to Charles I. who, in 1638, appointed him tutor to Charles prince of Wales, and afterwards to his brother the duke of York. In 1638, Dr. Duppa was preſented to the rectory of Petworth in Suſſex, and in the ſame year nominated to the biſhopric of Chicheſter. In 1640, he was tranſlated to the ſee of Saliſbury; but was prevented from deriving any benefit from it by the civil war of Charles I. Biſhop Duppa joined the king at Oxford, and frequently attended him during his impriſonment in the Iſle of Wight. According to ſome writers he was not only privy to the compoſition of the *Eikon Baſilike*, but alſo contributed his aid towards it. It is certain that great confidence was placed in him by the king, who entruſted him with the delicate buſineſs of ſupplying the vacant biſhoprics; which office he retained under Charles II. After the reſtoration, his ſteady loyalty was rewarded by a tranſlation to the rich biſhopric of Wincheſter, in 1660. He was alſo made lord almoner, and appointed one of the viſitors of the univerſity of Oxford. About the year 1661, he began to erect an hoſpital for the maintenance of poor people at Richmond; and projected other works of piety and charity, which he was prevented from completing by his death, which took place in 1662, in the ſeventy-fourth year of his age. He was the author only of a few ſermons and devotional pieces; and of a collection of verſes in praiſe of Ben Jonſon and his works.

DUPRAT'. See Prat.

DUPRE' DE ST. MAUR (Nicolas Francis), born at Paris about the cloſe of the ſeventeenth century, brought up for the long robe, and obtained a place of maſter of accompts. He was greatly reſpected, as well for his official conduct, as for his literary talents and ſocial qualities. He was one of the firſt of the French men of letters who acquired a taſte for Engliſh literature, and endeavoured to promote it among their countrymen. For this purpoſe he undertook a tranſlation of Milton's Paradiſe Loſt in proſe, the ſpirit and elegance of which rendered it popular, though doubtleſs it could convey but a very imperfect idea of the great original. This work

gained him admiſſion into the French academy in 1733. He alſo wrote an Eſſay on the Monies of France, 4to. 1746, containing many curious reſearches, and much eſteemed. Inquiries into the Value of Monies and the Price of Corn, 12mo. 1761; an uſeful performance. M. Dupré died in 1775, at a very advanced age.

DUQUEL'LA, a province of Africa, in the empire of Morocco, about twenty-five leagues in length, and twenty broad; exceedingly fertile in corn and paſtures.

DUQUE'SNE, a river of the iſland of Grenada, which runs into the ſea, in a bay to which it gives name.

DUQUE'SNE POINT, a cape on the weſt coaſt of the iſland of Grenada. Lat. 12. 17. N. lon. 61. 29. W. Greenwich.

DU'RA, [from the Heb. ſignifying *duration*.] The name of a place, ſituated in the province of Babylon, where king Nebuchadnezzar ſet up his golden image. *Dan.* iii. 1.

DU'RA MA'TER, *ſ.* [from *durus*, Lat. hard, and *mater* a mother.] A membrane ſurrounding the brain, and called *dura*, from its comparative hardneſs with the *pia mater*, and *mater* from its being the ſource of all the other membranes. See ANATOMY.

DURABI'LITY, *ſ.* [*durabilis*, Lat.] The power of laſting; continuance; endurance.—Stones, though in dignity of nature inferior unto plants, yet exceed them in firmneſs of ſtrength, or *durability* of being. *Hooker.*—Our times upon the earth have neither certainty nor *durability*. *Raleigh.*

DU'RABLE, *adj.* [*durabilis*, Lat.] Laſting; having the quality of long continuance.—The glories of her majeſty's reign ought to be recorded in words more *durable* than braſs, and ſuch as our poſterity may read a thouſand years hence. *Swift.*—Having ſucceſſive exiſtence:

Time, though in eternity, applied
To motion, meaſures all things *durable*
By preſent, paſt, and future. *Milton.*

DU'RABLENESS, *ſ.* Power of laſting; continuance.—A bad poet, if he cannot become immortal by the goodneſs of his verſe, may by the *durableneſs* of the metal that ſupports it. *Addiſon.*

DU'RABLY, *adv.* In a laſting manner.—There indeed he found his fame flouriſhing, his monuments engraved in marble, and yet more *durably* in men's memories. *Sidney.*

DURA'KA, a ſmall iſland of Arabia, in the Red Sea, about four leagues from the coaſt. Lat. 16. 48. N. lon. 41. 31. E. Greenwich.

DURAKO'VA, a town of Ruſſia, in the government of Archangel, on the coaſt of the White Sea: ſixty-eight miles weſt of Archangel.

DURAMPOU'R, a town of Hindooſtan, in the country of Guzerat, forty-five miles ſouth-ſouth-eaſt of Surat, and ninety-ſix north-north-eaſt of Bombay. Lat. 20. 32. N. lon. 73. 14. E. Greenwich.

DU'RANCE, *ſ.* [from *dureſſe*, Law Fr.] Impriſonment; the cuſtody or power of a jailor; a priſon.—A poor, innocent, forlorn, ſtranger, languiſhing in *durance*, upon the falſe accuſations of a lying, inſolent, woman. *South.*—Endurance; continuance; duration:

Sick nature at that inſtant trembled round,
And mother earth ſigh'd as ſhe felt the wound:
Of how ſhort *durance* was this new made ſtate;
How far more mighty than heav'n's love, hell's hate.
Dryden.

DURAN'CE, a river of France, which riſes on the borders of Piedmont, paſſes near Embrun, Siſteron, Manoſque, Pertuis, Cavaillon, &c. and runs into the Rhone, a little below Avignon.

DURA'ND (William), an eminent juriſt, born in 1237 at Puymoiſſon in Provence. He went young to Bologna, where he ſtudied the canon law under Bernardo du Parma. After taking his doctor's degree, he began to teach, firſt at Bologna, and then at Modena. At the age of thirty-four he publiſhed his famous work entitled *Speculum Juris*, which was ſo much eſteemed that it acquired him the ſurname of *Speculator*. The learned Baldus uſed to ſay, that without poſſeſſing that book a man could not deſerve the name of a lawyer. The cardinal of Oſtia took Durand as his aſſeſſor in deciding cauſes, and made him ſo advantageouſly known at the court of Rome, that he was employed by pope Clement IV. and four ſucceeding pontiffs, in important and honourable charges. Gregory X. made him his legate at the council of Lyons in 1274. He ſuſtained various governments in Italy, and was raiſed to the dignity of count of Romagna. In 1285, Honorius IV. appointed him to the ſee of Mende, but he was prevented by buſineſs from taking poſſeſſion of his biſhopric till 1290. Four years afterwards he was recalled into Italy, and made marquis of the march of Ancona, and again count of Romagna, which provinces he governed during the tumults of the Guelf and Ghibelline factions. He died at Rome in 1296, and a magnificent monument was erected to his memory in the church of St. Maria s. Minerva. Beſides his Speculum, he wrote *Rationale Divinorum Officiorum*, a work of celebrity in its time; and alſo a Commentary on the Canons of the Council of Lyons; and an Abridgement of the Gloſſes and Text of the Canon Law.

DURA'ND (William), nephew of the preceding, was made archdeacon of Mende, and became biſhop of that ſee, in which he remained until his death, in 1328. His name is now chiefly recollected on account of his being the author of a work highly eſteemed in the catholic world, which treats "of the manner of holding a general council," and preſents us with a vaſt number of regulations made by councils, and the fathers, for reforming the abuſes and diſorders of the popes and court of Rome, of the prelates, the eccleſiaſtics, and religious orders. It is ſpoken of as a very uſeful work, on account of the information which it conveys, and the valuable advice which it ſuggeſts.

DURA'ND DE ST. POURCAIN (William), a learned French prelate, in the fourteenth century, born in the town indicated by his ſurname, in the dioceſe of Clermont. He acquired very high reputation by the proficiency which he made in theological and philoſophical ſtudies. In 1313 he was created doctor in divinity by the univerſity of Paris, and ſome time afterwards obtained the ſituation of maſter of the ſacred palace at Rome, where his office called him to deliver public lectures on ſacred literature. In 1318 he was nominated biſhop of Puy; and in 1326 tranſlated to the biſhopric of Meaux, by pope John XXII. He made himſelf ſo famous by his acuteneſs and perſeverance in diſcuſſing the moſt crabbed and difficult topics in ſcholaſtic theology, that he obtained the title of *the moſt reſolute doctor*. At firſt he was a follower of Thomas Aquinas, but he afterwards adopted the opinions of the Scotiſts, which he defended with equal abilities and zeal. He was the author of *Commentaria ſuper Libros IV. Sententiarum*, of which the beſt edition was publiſhed in folio, in 1571; *Liber de origine Juriſdictionum, ſeu de eccleſiaſtica Juriſdictione, & Tractatus de Legibus*, printed in 4to. in 1571; and other treatiſes, many of which are to be met with in a collection of his works publiſhed under the care of Dr. Merlin, in 1515.

DURAN'GO, a town of North America, in the province of New Biſcay, the ſee of a biſhop, ſuffragan of the archbiſhop of Mexico. The air is healthy, and the land about it fertile in corn, maize, and fruit: 335 miles north-north-weſt of Mexico. Lat. 24. 10. N. lon. 87. 15. W. Ferro.

DURAN'GO, a town of Spain, in the province of Biſcay: about three leagues from the ſea coaſt, and four eaſt of Bilboa.

DURAN'TA, *ſ.* [ſo named by Linnæus in memory of Caſtor Durantes, phyſician to pope Sixtus V. He publiſhed Herbarium, 1584. Plumier named the genus *Caſtorea*.] In botany, a genus of the claſs didynamia, order angioſpermia,

permia, natural order perſonatæ, (vitices, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, tubular, ſomewhat truncated, five-cleft. Corolla: one-petalled; tube longer than the calyx, ſomewhat curved; border patulous, five-parted, nearly equal, rounded. Stamina: filaments four, the two longer ones within the tube; antheræ roundiſh. Piſtillum: germ inferior, roundiſh; ſtyles filiform, length of the ſtamens; ſtigma thickiſh. Pericarpium: berry roundiſh, covered by the calyx. Seed: kernels four, two-celled.—*Eſſential Character.* Calyx, five-cleft, ſuperior; berry four-ſeeded; ſeeds two-celled.

Species. 1. Duranta Plumieri, or ſmooth duranta: fruiting calyxes twiſted. This grows fifteen feet high, with alternate branches, erect or reclining; ſpines awl-ſhaped, oppoſite, but very frequently wanting; leaves lanceolate, ſmooth, two inches long; flowers ſlightly ſweet-ſmelling, very many, blue, on very ſhort peduncles; fruit yellow; the calyx alſo then becoming yellow, and like a berry, the whole being changed, and different from its former ſhape.

Linnæus originally made two ſpecies of this, and Miller continues them diſtinct, adding a third, under the name of *Durantia erecta*, which is probably our ſecond ſpecies D. Elliſia. Native of South America, and the Weſt-India iſlands.

2. Duranta Elliſia, or Brown's duranta: fruiting calyxes erect. This ſhrub is a fathom in height or more, branched, and even. The ſpecific character of this and the preceding, taken from the contorſion of the calyx above the fruit, is vague and inſufficient; ſince the differences occur frequently in the ſame raceme. They are therefore in all probability not ſpecifically diſtinct. Jacquin alſo remarks, that it is extremely like the firſt ſpecies, except that the fruiting calyx is not twiſted in the upper part, but continues convergent and erect. Notwithſtanding this approximation, Dr. Patrick Browne made it a diſtinct genus, under the name *Elliſia*, from Mr. Ellis the ingenious author of a treatiſe on Zoophites, or plant-like marine productions of an animal nature. He ſays that this ſhrub riſes frequently to the height of ſix or ſeven feet; that the leaves are very like thoſe of green tea; and that the branches, though ſometimes beſet with thorns, are often otherwiſe. Native of the Weſt Indies. In Jamaica frequent in hedges, between Kingſton and St. Jago de la Vega.

3. Duranta Mutiſii, or Mutis's duranta: leaves elliptic, quite entire. This differs no otherwiſe from the two other ſpecies than in the leaves. Native of South America, and found there by Mutis.

Propagation and Culture. Theſe plants, being natives of warm countries, require a ſtove to preſerve them in England; they are propagated by ſeeds, which ſhould be ſown in ſmall pots, and plunged into a hot-bed of tanner's bark; and when the plants are fit to remove, they muſt be planted each into a ſeparate ſmall pot filled with light earth, and plunged into the hot-bed again, obſerving to ſhade them till they have taken new root, then they muſt be treated in the ſame manner as other plants from the ſame country. They may alſo be increaſed by cuttings, which put out roots very readily. They thrive beſt during winter in a temperate heat; for when they are too tenderly treated, their ſhoots are apt to be weak, and then they are attacked by vermin. In ſummer, place them in a warm ſheltered ſituation in the open air.

DURAN'TE ABSEN'TIA *Adminiſtration*, *ſ.* in law, is an adminiſtration granted when the executor is out of the realm, to continue in force until his return. And, DURANTE MINORE ÆTATE *Adminiſtration*, is becauſe an infant cannot act as executor until ſeventeen, during which minority this adminiſtration is granted. See the article EXECUTOR.

DURAN'TI (John Stephen), an honourable martyr to the violences of the league in France, ſon of a counſellor of the parliament of Toulouſe. He was brought up to the bar, and diſtinguiſhed himſelf by his eloquence. In 1563 he was made capitoul, or firſt magiſtrate. He afterwards became advocate-general; and in 1581 was nominated by the king preſident of the parliament of Toulouſe. He was warmly attached to the royal cauſe; and when the maſſacre of the duke and cardinal of Guiſe in 1589 had inflamed the rage of the leaguers, eſpecially at Toulouſe, he employed all the force of his eloquence to appeaſe the people. The rage of the crowd was for a moment checked, and a profound ſilence enſued; when a villain fired a muſquet at him, which brought him down; and while his hands were raiſed in prayer for his murderers, the mob ruſhed upon him, and pierced him with a thouſand wounds. Such was his unhappy end, at the age of fifty-five, in February, 1589; and thus was he rewarded for the pains he had taken at his own hazard to free Toulouſe from the plague; for his conſtant oppoſition to hereſy; and for numerous benefits which he had conferred upon the religious orders, and upon the poor of the city. He was a great friend to letters, and had collected a fine library, which was diſperſed after his death. He is conſidered as the real author of a learned and excellent work *De Ritibus Eccleſiæ*, which has been attributed to Peter Danes, biſhop of Lavaur.

DU'RAS, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the diſtrict of Marmande, on the Drot: three leagues and a half north of Marmande.

DURA'TION, *ſ.* [*duratio*, Lat.] A ſort of diſtance or length, the idea whereof we get, not from the permanent parts of ſpace, but from the fleeting and perpetually periſhing parts of ſucceſſion. *Locke.*—Power of continuance. —*Duration* is a circumſtance ſo eſſential to happineſs, that if we conceived it poſſible for the joys of heaven itſelf to paſs from us in an inſtant, we ſhould find ourſelves not much concerned for the attainment of them. *Rogers.*—Length of continuance.—Ariſtotle, by greatneſs of action, does not only mean it ſhould be great in its nature, but alſo in its *duration*. *Addiſon.*

DURATO'N, a river of Spain, which runs into the Duero, near Penafiel.

DURAZZA'NO, a town of Italy, in the kingdom of Naples, and province of Lavora: ſixteen miles north-eaſt of Naples.

DURAZ'ZO, a ſeaport town of European Turkey, in Albania, anciently named *Epidamnus* and *Dyrrachium*, ſtrong and populous, with a good harbour; the ſee of a Greek biſhop: eighty-eight miles ſouth-ſouth-eaſt of Raguſa. Lat. 41. 42. N. lon. 37. 2. E. Ferro.

DUR'BAN, a town of France, in the department of the Aube, and chief place of a canton, in the diſtrict of La Graſſe: four leagues and a half ſouth-weſt of Narbonne.

DUR'BEN, a town of the duchy of Courland: twenty-four miles ſouth-ſouth-weſt of Goldingen.

DUR'BION, a river of France, which runs into the Moſelle, near Chatel ſur Moſelle, in the department of the Voſges.

DURBUN'GA, a town of Hindooſtan, in the country of Bahar: forty-eight miles north-eaſt of Patna, and fifty-eight ſouth-weſt of Amerpour.

DUR'BUY, a town of the Netherlands, in the duchy of Luxembourg, and capital of a county of the ſame name, on the river Ourte, taken by France, in the year 1681, but reſtored in 1692: twenty miles north of Baſtogne.

DURCK'HEIM, or TURCKHEIM, a town of Germany, in the circle of the Upper Rhine, and county of Linange: fourteen miles weſt of Manheim, and fourteen north of Landau.

DUR'DEN, *ſ.* in old records, a copſe, a thicket in a valley.

To DURE, *v. n.* [*duro*, Lat.] To laſt; to continue; to endure.—The delights and pleaſures of the world are moſt pleaſing while they *dure*. *Raleigh.*

DU'REFUL, *adj.* Laſting; of long continuance; durable. *Not in uſe*;

The

The *dureful* oak, whoſe ſap is not yet dry'd,
Is long ere it conceive the kindling fire;
But when it once doth burn, it doth divide
Great heat, and makes his flames to heaven aſpire. *Spenſ.*

DU'RELESS, *adj.* Without continuance; fading; tranſitory; ſhort. *Not in uſe.*—Yet were that aptitude natural, more inclinable to follow and embrace the falſe and *dureleſs* pleaſures of this ſtage-play world, than to become the ſhadow of God. *Raleigh.*

DURELL' (John), a learned divine of the church of England in the ſeventeenth century, born at St. Helier's, in the iſle of Jerſey, in 1626. He was entered at Merton college, Oxford, in 1640, and continued there two years, when the interruptions ariſing from that city's being made a garriſon during the civil wars, induced him to retire into France, and to become a member of the Sylvanian college at Caen in Normandy. At that place he took the degree of maſter of arts in 1644. Afterwards he aſſiduouſly applied himſelf to the ſtudy of divinity at Saumur, under the celebrated Moſes Amyrault, profeſſor of theology in that proteſtant univerſity: and, in 1647, returned to his native country, where he remained for ſome time among his relations. Upon the reſtoration of Charles II. he came to England, and was inſtrumental in procuring the eſtabliſhment of the new epiſcopal French church at the Savoy, London, in which he firſt preached in 1661, and continued to officiate there for ſome years with great acceptability and applauſe. In 1663 he was made a prebendary in the cathedral church of Saliſbury; and in the following year was appointed to a canonry of Windſor. In 1668 he was inſtalled into the fourth prebend of Durham, and was beſides preſented with a rich donative. In 1669–70 he was created doctor in divinity by the univerſity of Oxford; which was ſucceeded by a preſentation from the crown to the deanery of Windſor in 1667, and to the valuable living of Witney in Oxfordſhire. He died in 1683, in the 58th year of his age. Dr. Durell publiſhed, among other things, 1. *Theoremata Philoſophiæ rationalis, moralis, naturalis, & ſupernaturalis, &c.* 4to. 1664. 2. A French and Latin Tranſlation of the Common-Prayer Book, upon the Review of it at the Reſtoration. 3. The Liturgy of the Church of England aſſerted, in a Sermon, preached (in French) at the Chapel of the Savoy, and tranſlated into Engliſh, 4to. 1662. 4. A View of the Government and Public Worſhip of God in the Reformed Churches of England, 4to. 1662; and 5. A Vindication of the Church of England againſt the unjuſt Accuſations of the Schiſmatics, 4to. 1669.

DURELL' (David), a learned divine of the church of England, born in the iſland of Jerſey in 1728. After paſſing through the uſual courſe of grammar learning, he was entered of Pembroke college, Oxford, where he took his degree of maſter of arts in 1753. Being afterwards choſen a fellow of Hertford college, he removed thither, and became principal of the ſame on the reſignation of Dr. William Sharpe, in 1757. In 1760, Mr. Durell was admitted to the degree of bachelor in divinity; and in 1763, to that of doctor in the ſame faculty. In the year before that in which he took his laſt degree he publiſhed his firſt learned work, entitled The Hebrew Texts of the parallel Prophecies of Jacob and Moſes relating to the Twelve Tribes, with a Tranſlation and Notes, and the various Sections of near forty Manuſcripts, to which are added the Samaritan-Arabic Verſion of thoſe paſſages, and part of another Arabic Verſion, made from the Samaritan Text; a Map of the Land of Promiſe; and an Appendix, containing four diſſertations on points connected with the ſubject of theſe prophecies, 4to. In this work, the author's proficiency in oriental literature, and his abilities and judgment in elucidating the ſenſe of the ſacred ſcriptures, were diſplayed in a manner that reflected great honour on his talents and induſtry, and raiſed high the expectations which were formed of his future ſervices in the province of biblical criticiſm. In 1767 Dr. Durell was appointed to a prebend in the metropolitan church of Canterbury, which, excepting his preſentation to the vicarage of Tycehurſt in Suſſex, was the laſt preferment that he lived to receive. In 1772 he again gratified the theological world by the publication of ſome learned and valuable Critical Remarks on the Books of Job, Pſalms, Eccleſiaſtes, and Canticles, in 4to. after which he died in 1775, only in the 48th year of his age.

DU'REN. See DUEREN.

DU'RER (Albert), a painter of diſtinguiſhed genius, born at Nuremberg in 1471, the ſon of a goldſmith of that city. His father wiſhed to bring him up to his own profeſſion, but his decided inclination for painting prevailed, and he was entered as a pupil of Michael Wolgemuth. He alſo received inſtruction in engraving; and he was well verſed in the collateral ſtudies of geometry, anatomy, and architecture. For improvement he travelled through Germany, Flanders, and the Venetian ſtates; but he had not the advantage of ſtudying the choice remains of ancient art in Rome and Florence, and his ſtyle never ceaſed to indicate this deficiency. He followed no particular model, but formed a manner for himſelf. His imagination was fertile, his compoſition grand, his drawing correct, his execution delicate and finiſhed, but he wanted grace, and retained ſomewhat of the Gothic hardneſs. He was alſo negligent of the coſtume, and introduced German dreſſes and figures on all occaſions. His works acquired him great diſtinction, and he poſſeſſed the favour of the emperors Maximilian, Charles V. and Ferdinand. He was alſo well known to the learned; and Eraſmus has mentioned him with honour. He was himſelf a writer, and publiſhed valuable works on geometry, perſpective, fortification, and the proportions of the human body. The Italians eſteemed him, and improved by him, and Raphael interchanged portraits with him. He was a member of the council of Nuremberg, where he died in 1528. His principal works are in the different cabinets of Germany, and at his native city. A bearing of the croſs, in which he has introduced portraits of the ſenators of Nuremberg, is much admired; as likewiſe the firſt battle of Alexander and Darius, a piece of moſt finiſhed execution. Albert Durer was alſo an excellent engraver, and is more known by his prints than his pictures. Several of theſe were copied by Marc-Antonio of Venice, who counterfeited his name, an injury of which he complained to the Venetian ſenate.

DU'RESS, *ſ.* [*dureſſe*, Fr. *durities*, Lat. conſtraint.] Impriſonment; ſeverity; compulſion. In law, whatever is done with a view to ſave either life or limb, is conſidered as done by the higheſt neceſſity and compulſion. Therefore if a man through fear of death or mayhem is prevailed upon to execute a deed, or do any other act, theſe, though accompanied with all requiſite ſolemnities, may be afterwards avoided, if forced upon him by a well-grounded apprehenſion of loſing his life, or even his limb, in caſe of non-compliance. 2 *Inſt.* 483. And the ſame is alſo a ſufficient excuſe for the commiſſion of many miſdemeanors. The conſtraint a man may be under in theſe circumſtances, is of two ſorts, *dureſs of impriſonment*, where a man actually loſes his liberty; and *dureſs per minas*, (by threats,) where the hardſhip is only threatened and impending. If a man be under dureſs of impriſonment, or illegal reſtraint of liberty, until he ſeals a bond, he may allege this dureſs, and avoid the extorted bond. But if a man be lawfully impriſoned, and either to procure his diſcharge, or on any other fair account, ſeals a bond or deed, this is not by dureſs of impriſonment, and he is not at liberty to avoid it. 2 *Inſt.* 482. *Dureſs per minas*, is either for fear of loſs of life, or elſe for fear of mayhem, or loſe of limb. And this fear muſt be upon ſufficient reaſon. A fear of battery, (or being beaten,) though never ſo well grounded, is no dureſs; neither is the fear of having one's houſe burned, or one's goods taken away and deſtroyed; becauſe in theſe caſes, ſhould the threat be performed, a man may have ſatisfaction by recovering equivalent damages; but no ſuitable atone-

ment can be made for the loſs of life or limb. 1 *Comm.* 131, 6.

In time of war or rebellion, a man may be juſtified in doing many treaſonable acts by compulſion of the enemy or rebels, which would admit of no excuſe in time of peace. 1 *Hal. P. C.* 50. This, however, ſeems only, or at leaſt principally, to hold as to poſitive crimes, ſo created by the laws of ſociety; and which therefore ſociety may excuſe; but not as to natural offences ſo declared by the laws of God. Therefore though a man may be violently aſſaulted, and hath no other poſſible means of eſcaping death, but by killing an innocent perſon; this fear and force ſhall not acquit him of murder, for he ought rather to die himſelf than eſcape by ſuch means. But in ſuch a caſe he is permitted to kill the aſſailant; for there the law of nature and ſelf-defence have made him his own protector. 4 *Comm.* 30.

It has been adjudged, that if a man makes a deed by dureſs done to him by taking of his cattle, though there be no dureſs to his perſon, yet this ſhall avoid the deed, 2 *Danv. Abr.* 686. If a perſon threaten another to make a deed to a third perſon, it is by dureſs, and void; as if ſuch third perſon had made the threatening. 2 *Inſt.* 482. And where a man is impriſoned until he makes a bond at another place; if afterwards he doth it when at large, the bond is by dureſs, and void. If a perſon be arreſted upon an action at the ſuit of another, and the cauſe of action is not good, if he make a bond to a ſtranger, it is not dureſs; though if he make it to the plaintiff, it is, and being ſued upon the bond, he may plead it was made by dureſs, and avoid it: alſo the party ſhall have an action for the falſe impriſonment. 1 *Lil. Abr.* 494. If the arreſt is under colour of legal proceſs, the action muſt be ſpecial action on the caſe, not an action of treſpaſs *vict armis.*

If one impriſoned make an obligation by dureſs, and after he is at large takes a defeaſance upon it, this will eſtop him to ſay it was made per dureſs. And where A. and B. by dureſs to B. ſeal a bond or deed, it may be good as to A. that was never threatened. 3 *Hen.* VI. 16. 43 *Edw.* III. 10. 2 *Danv.* 686. A man ſhall not avoid a deed by dureſs of a ſtranger; for it hath been held that none ſhall avoid his own bond for the impriſonment or danger of any other than of himſelf only. *Cro. Jac.* 187. Yet a ſon ſhall avoid his deed by dureſs of the father: and the huſband ſhall avoid a deed made by dureſs of the wife; though a ſervant ſhall not avoid a deed made by dureſs of his maſter, or the maſter the deed ſealed by dureſs of his ſervant. 2 *Danv.* 686. If a man is taken by virtue of a proceſs iſſuing out of a court that hath not power to grant it; or in cuſtody on a falſe charge of felony, and for his enlargement and diſcharge gives bond, this may be avoided, as taken by dureſs. 4 *Inſt.* 97.

A ſtatute merchant may be avoided by *audita querela*, becauſe it was made by dureſs or impriſonment. A will ſhall be avoided by dureſs or menace of impriſonment. A feoffment made by dureſs is voidable, but not void. But no averment ſhall be taken againſt a deed inrolled, that it was made by dureſs. 2 *Danv.* 685. A marriage had by dureſs is voidable; and, by 31 Hen. VI. c. 9. obligations obtained of women by force, to marry the perſons to whom made, or otherwiſe, unleſs for a juſt debt, are declared void. If a perſon executes a deed by dureſs, he cannot plead *non eſt factum*, becauſe it is his deed; though he may avoid it by ſpecial pleading, and judgment *ſi actio, &c.* 5 *Rep.* 119. Records may not regularly be ſaid to be made by dureſs, and therefore ſhall not be avoided by this plea or pretence. 2 *Shep. Abr.* 319.

DU'RET (Louis), a learned phyſician of the ſixteenth century, native of Burgundy. He ſtudied at Paris, and became phyſician to the king, and profeſſor-royal; and died at Paris in 1586, at the age of fifty-nine. Duret diſtinguiſhed himſelf by his zeal for the doctrines of Hippocrates, and his learned explanations of the works of that father of medicine. He publiſhed, *Adverſaria ſ. Scholia in Jacobi Hollerii l. de morbis internis*, 1571, 8vo. His principal work did not appear till after his death: its title is, *Hippocrates Coacæ Prænotiones interprete & enarrante L. Dureto*, Par. 1588, folio. He wrote alſo, *In Magni Hippocrates l. de Humoribus purgandis, & in l. iii. de Diæta Acutorum Commentarii*, publiſhed by P. Giradet in 1631, 8vo.

DUR'FORT, a town of France, in the department of the Gard: ſeven miles ſouth-weſt of Alais.

DUR'FORT, a town of France, in the department of the Aude: ſeven miles ſouth-weſt of Caſtlenaudary.

DUR'FORT, a town of France, in the department of the Arriege: five miles north-weſt of Pamiers.

DUR'GAN, a town of Aſiatic Turkey, in the province of Natolia: forty-eight miles ſouth-eaſt of Caſtamoni.

DUR'GEN, *ſ.* [ꝺꝛeonȝ, Sax.] A dwarf; a little, thick, ſhort, perſon. *Bailey.*

DUR'GUT, a town of Aſiatic Turkey, in the province of Natolia: eighteen miles eaſt of Smyrna.

DUR'HAM, a maritime county of England, with the privileges of a palatinate; bounded on the north by Northumberland, on the eaſt by the German Sea, on the ſouth by Yorkſhire, from which it is divided by the river Tees, and on the weſt by Weſtmoreland and Cumberland. Its ſhape is triangular; and, during the Saxon heptarchy, this county made part of the kingdom of the Northumbrians. It is forty miles long from eaſt to weſt, thirty-five broad from north to ſouth, and 160 in circumference; containing 920 ſquare miles, or 588,800 ſquare acres; divided into four wards, having 120 pariſhes, twenty-one vicarages, 223 villages, one city, and nine market towns; the whole ſuppoſed to contain about 100,000 inhabitants. It is uſually called the *Biſhopric of Durham*, or the *County Palatine of Durham*, from the great power poſſeſſed by its biſhop. When he comes in perſon to any of the courts of judicature, he ſits chief in them, thoſe of aſſize not excepted, and even when judgment of blood is given; though the canons forbid any clergyman to be preſent, the biſhops of Durham did and may ſit in their purple robes on the ſentence of death. All dues, amercements, and forfeited recogniſances, in the courts of the palatinate, and all deodands, belong to the biſhop. If any forfeits are made, either of war or by treaſon, outlawry or felony, even though the ſoil be the king's, they fall to the biſhop here, as to the king in other places. All the tenures of land here originate from the biſhop, as lord paramount in chief. Hence he grants charters for erecting boroughs and incorporations, markets, and fairs; incloſing foreſts, chaces, and warrens; licences to embattle caſtles, build chapels, found chantries and hoſpitals, and diſpenſations with the ſtatute of mortmain. All incloſed eſtates, as well as moors, or waſtes, to which no title can be made, eſcheat to him. He grants the cuſtody of ideots and lunatics, and had the cuſtody of minors while the cuſtom of wards and liveries ſubſiſted. Beſides the dependance of leaſehold or copyhold tenants on him, if any freeholders alienated their land without his licence, they were obliged to ſue out his patent of pardon; and all money paid for ſuch licences belongs to him. In the article of military power, the biſhop of Durham had anciently his thanes, and afterwards his barons, who held of him by knight's ſervice, as the reſt of the hailwerk folk held of them by inferior tenures. On alarms he convened them as a parliament, with advice to aſſiſt with their perſons, dependants, and money, for the public ſervice at home and abroad, and all levies of men or money were made by the biſhop's commiſſion, or by writs in his name out of the chancery at Durham; for he had power both to coin money and levy taxes, and raiſe and arm ſoldiers in the biſhopric from ſixteen to ſixty years old. But now the militia of this county has been long on the ſame footing with the reſt of the kingdom, under the lord-lieutenant. The only difference here is, that that office has generally, though not always, been borne by the biſhop. The admiralty juriſdiction in this county belongs alſo to the biſhop,

ſhop, who holds the proper courts by his judges, and appoints by his patents a vice-admiral, regiſter, and marſhal, or water-bailif, and other officers, and has all the privileges, forfeitures, and profits, incident to this power, as royal fiſhes, ſea wrecks, duties for ſhips arriving in his ports, &c. This county, for its ſize, is, perhaps, one of the moſt hilly in the kingdom; the hills are, in general, covered with verdure to the top, and have not been unaptly called *the Apennines of England*. Many of them contain lead and iron ores, coals, lime-ſtone, free-ſtone, marble, &c. The eaſt and north-eaſt parts of the county are particularly rich in coal-mines, lying in horizontal ſtrata from three to ſix feet thick, and extending many miles through the country. Near Wolſingham are found beautiful black ſpotted marble, and the large grey mill-ſtone for grinding corn. Grind-ſtones are found a little to the ſouth of the river Tyne, and not far from Newcaſtle; theſe form an article of exportation to moſt parts of the habitable globe. There are alſo ſeveral quarries of fire-ſtone, immenſe quantities of which are exported to be uſed in ovens, furnaces, &c. Near the river Tees the land is rich, conſiſting of a loamy clay, and is generally fertile near the other rivers; but the other parts are not ſo good. The climate is very uncertain, and the harveſt hazardous; wheat, barley, oats, peaſe, muſtard, are the chief productions; beans are ſeldom raiſed in the weſtern part of the county. The principal manufactures are tammies, carpets, huckabacks, cotton in various forms, ſail-cloths, ſalt, ſteel, glaſs, ropes, pottery, iron works, iron founderies, copperas, paper, &c. Durham is the capital. The towns are Stockton, Sunderland, Barnard Caſtle, Darlington, Stanhope, Hartlepool, Biſhops Auckland, Walſingham, and Sedgefield. The principal rivers are the Tees, Tyne, Were, Tame, Lune, Darwent, Gaundleſs, and Skern. The moſt noted places are, Sunderland Point and Hartlepool Point; the Tees Mouth and Tynemouth Harbour and Bar; the Lune and Teeſdale Foreſts; Oxenhall Pits, with the Cataract of the Tees river. It ſends only four members to parliament, viz. two for the county, and two for the city. The air of the county is healthy, but ſeverely cold in winter.

The moſt remarkable ſeats in this county are, Axwell Park, near Newcaſtle; Biſhop Auckland Park; Brancepeth Caſtle, near Durham; Gateſhead Park, near Newcaſtle; Gibſide, near Newcaſtle; Hardwick, near Sedgefield; Helton le Hale; Hilton Caſtle, near Sunderland. Lambton Houſe, near Durham; Lumley Caſtle, near Durham; Raby Park, near Staindrop; Ravenſworth Caſtle, near Newcaſtle. Stanhope Caſtle. Streatham Caſtle, near Barnard Caſtle. Whitworth, near Biſhop Auckland, Windleſton, near Biſhop Auckland; and Wilton Caſtle, near Biſhop Auckland.

The biſhopric of Durham was diſſolved, and the king to have all the lands, &c. by 7 Edw. VI. But this act was afterwards repealed, and the biſhopric newly erected, with all juriſdiction eccleſiaſtical and temporal annexed to the county palatine. The juſtices of the county palatine of Durham may levy fines of lands in the county: and writs upon proclamation, &c. are to be directed to the biſhop. 5 *Eliz.* c. 27. 31 *Eliz.* c. 2. Writs to elect members of parliament in the county palatine of Durham ſhall go to the biſhop or his chancellor, and be returned by the ſheriff, &c. 25 *Car.* II. c. 9. The courts called *palatine*, were extended to two other counties beſides Durham, as well as the royal franchiſe of Ely; and are a ſpecies of private courts of a limited local juriſdiction, having at the ſame time an excluſive cognizance of pleas in matters both of law and equity. *Finch R.* 452. In all theſe, as in the principality of Wales, the king's ordinary writs iſſuing under the great ſeal out of chancery do not run; that is, they are of no force. For as originally all *jura regalia* were granted to the lords of theſe counties palatine, they had of courſe the ſole adminiſtration of juſtice by their own judges appointed by themſelves, and not by the crown. It would therefore be incongruous for the king to ſend his writ to direct the judge of another's court in what manner to adminiſter juſtice between the ſuitors. But when the privileges of theſe counties palatine were abridged by 27 Hen. VIII. c. 24. it was alſo enacted, that all writs and proceſs ſhould be made in the king's name, but ſhould be teſted or witneſſed in the name of the owner of the franchiſe. Wherefore all writs whereon actions are founded, and which have current authority here, muſt be under the ſeal of the reſpective franchiſes; the two former of which, Cheſter and Lancaſter, are now united to the crown, and the two latter, Durham and Ely, under the government of their ſeveral biſhops. And the judges of aſſiſe who ſit therein, ſit by virtue of a ſpecial commiſſion from the owners of the ſeveral franchiſes, and under the ſeal thereof, and not by the uſual commiſſions under the great ſeal of England. See the article COUNTY, vol. v. p. 289.

DUR'HAM, a very ancient city, capital of the county of the ſame name, ſituated on ſeven hills, and ſurrounded by others more lofty. It has been whimſically compared to a crab, the body being repreſented by the centre of the town, the cathedral, &c. and the claws, by the ſeveral ſtreets branching every way, in curve lines. Its name is ſaid to be derived from its ſituation: it is called in Latin *Dunelmum*, which has a plain reference to the Saxon word *Dunholm*, and which is derived from *dun*, an hill, and *helme* or *holm*, a plain ſurrounded with water. In after-times it was called Dureſme, and more modernly Durham. It is ſituated near the centre of the county, in latitude 54 deg. 50 min. N. and 1 deg. 27 min. W. longitude from Greenwich: 259 miles north from London, ſixty-ſix north from York; fifteen ſouth from Newcaſtle-upon-Tyne; and 121 ſouth from Edinburgh. The dioceſe is deemed the richeſt in the kingdom; and the prebends are frequently ſtiled the Golden Prebends of Durham. The ſee contains the whole counties of Durham and Northumberland, except the juriſdiction of Hexham in the latter. It hath alſo one pariſh in the county of Cumberland. This ſee hath given to the church of Rome eight ſaints and one cardinal; and to the Engliſh nation one lord chief juſtice, five lord chancellors, three lord treaſurers, one principal ſecretary of ſtate, one chancellor to the univerſity of Oxford, and two maſters of the rolls.

The origin of this city is generally allowed to have been about the year 995, when the monks of Landisfarne, after having been harraſſed by the invaſion of the Danes, and forced to wander up and down with the relics of St. Cuthbert, were induced to fix upon this ſpot for a permanent reſidence; perhaps the natural ſtrength of the place was their principal inducement: "The topography of Dunholme, (ſays the legend,) at that tyme was more beholding to nature for fortification than fertilitie; where thick woods hindered the ſtarres from viewing the earth, and the earth from the proſpect of heaven." Another old author ſays, "All the people, following the corpſe of our holy father Cuthbert, came to Dunholm, a place ſtrong by nature but ſcarce habitable, encloſed quite round with a very thick wood, and in the middle only a ſmall plain, which they uſed to plough and ſow. The ſaid prelate, therefore, with the help of the people, and the aſſiſtance of Uthred earl of the Northumbrians, felled and grubbed up the wood, and, in a ſhort time, made the place habitable; which done, every one, as his lot fell, had a houſe aſſigned him." The foundations of this city being thus laid, its ſtrength, and the number of its inhabitants, increaſed rapidly. "The people being thus ſettled, (continues the ſame author,) the ſaid Aldwin, out of zeal to Chriſt and St. Cuthbert, began to build a handſome large church, in the place where they had depoſited the body of that holy man; and, by the zealous application of the people to ſo good a work, ſoon perfected the ſame, dedicating it to St. Cuthbert." This ſtructure was called *White Kirk*, and was dedicated by biſhop Aldwin, September 4th, 999, at leaſt the chapel or ſuch part of it as was then finiſhed; into which the body

body of St. Cuthbert was tranſlated with much ſolemnity. The remainder of the life of this pious prelate was ſpent in promoting the erection of the edifice, in which he ſpent eighteen years; and, at his deceaſe, left the weſtern tower to be finiſhed by his ſucceſſor, who alſo conſecrated it. Under the ſucceeding prelates, benefactions and riches continued to flow ſo rapidly to St. Cuthbert's ſhrine, that William de Carilepho, the ſixth in ſucceſſion from Aldwin, thinking this church not magnificent enough for the remains of ſo great a ſaint, and having brought over from Normandy the plan of a new church, he pulled down the old one, ſeventy-ſix years after its firſt erection; and in its ſtead began the preſent ſtructure; the foundation ſtones of which were laid by Malcolm king of Scotland, biſhop Carilepho, and Turgot the prior, on the 11th of Auguſt, 1093; and ſo great was the progreſs made in this work, that his ſucceſſor, Ralph Flambard, who died in 1128, lived to ſee the building carried nearly up to the roof. Other benefactors to this fabric were, biſhop Hugh Pudſey, who began a new work at the eaſt end, but, being by ſome means prevented from completing it, he erected the Gallilee at the weſt end, before the year 1194; which is ſuppoſed to have been either rebuilt, or at leaſt conſiderably altered, by cardinal Langley before 1438. Prior Melſonby, who was elected in 1233, built the ſteeple, then called the lantern, as high as the gallery; and prior Hugh of Darlington, who was elected in 1258, finiſhed the work, by erecting the upper tower, in which the bells are now hung. The eaſtern tranſept, generally called the *nine altars,* is ſuppoſed to have been finiſhed by prior Horton, who aceeded to the priory in 1289, who alſo placed the roof on the choir. The body of the church was vaulted with ſtone about 1242, by biſhop Farnham and prior Melſonby. Adjoining the ſouth aiſle of the choir, is the veſtry, built by Henry de Luceby about 1300. The whole length of this venerable pile, which is a more regular edifice than is generally to be found in ſtructures of the like age, excluſive of the Gallilee, is 411 feet; the length of the nave is 200 feet, its width ſeventy-four feet, of which the centre aiſle is twenty-eight feet: at the weſt end of the nave is a ſhort croſs aiſle or tranſept, in length ninety feet, and eighteen feet wide from the centres of the columns; over the end of which riſes the weſt towers; and by a late meaſurement found to be 138 feet in height. The middle aiſle of the nave is ſixty-nine feet and a half high: the great croſs aiſle, or middle tranſept, has an aiſle towards the eaſt at both ends, and is 170 feet in length and fifty-ſeven in width, including the aiſle. The height of the middle tower is 214 feet; the choir is 120 feet long, and equal in width to the centre aiſle of the nave: the eaſt tranſept, commonly called the nine altars, is 130 feet in length, and in width fifty-one feet: the Gallilee at the weſt end is from eaſt to weſt fifty feet, from north to ſouth eighty feet wide. The ſituation of this cathedral is extremely grand, the building ſtretching along the crown of an eminence, above eighty feet perpendicular from the ſurface of the river, which waſhes its baſe: on the weſt, this church riſes on the points of rocks, which ſhew themſelves on the ſummit of the mount, and almoſt overhang the ſtream; from the palace-green the whole north front appears at once: on entering the great north door, the viſitor is ſtruck with an awful ſolemnity. In the inſide is preſerved much of the clumſy yet venerable magnificence of the early Norman ſtile: the pillars are vaſt cylinders, twenty-three feet in circumference, ſome adorned with croſs-cut furrows; others lozenge-ſhaped, with narrow ribs or with ſpiral; above are two rows of galleries, each with round arches or openings: a row of ſmall piaſtres run round the ſides of the church, with rounded arches interſecting each other: the windows are all obtuſely pointed. In 1778, upon a ſurvey of this church, it was found to be in great want of repair, when the dean and chapter immediately began the coſtly work, which occupied almoſt twenty years; and by which this noble fabric is now reſtored to its priſtine beauty and grandeur. The whole expence of this magnificent undertaking, which coſt above 25,000l. was paid out of the chapter treaſury; an act of public magnificence reflecting the higheſt honour on that venerable and opulent body.

Beſides the cathedral, here are ſix pariſh-churches, viz. St. Oſwald's, ſituated at the head of New Elvett-ſtreet; St. Nicolas's, ſituated at the lower end of the market-place; the church of St. Mary-le-Bow, ſituated on the eaſt ſide of the Bailey; St Margaret's in Croſgate; with St. Giles's, and Little St. Mary's.

Durham caſtle is generally allowed to have been built by William the Conqueror, who, in 1072, ordered a fortreſs to be erected here, at once to ſecure the governor of this province from tumults and inſurrections, and alſo to protect the biſhop and his church. A part of this caſtle was burnt, but was ſoon repaired by biſhop Pudſey, in 1153. Biſhop Tunſtall, in 1530, built the gallery and chapel adjoining to it; he alſo erected the preſent gateway and tower, and flanked it with a ſtrong wall on either ſide; he alſo built the conduit, and ſupplied the caſtle with water. The great tower of this caſtle ſtands upon a mount forty-four feet from the level of the palace-green, and is an octagon of irregular ſides; the diameter, in the wideſt part, is ſixty-three feet four inches; the narroweſt, ſixty-one feet. It contained four tier of apartments, excluſive of the vaults. Nothing now remains but the mount, vaults, and a part of the ſhell; the upper part, having become very ruinous, was ordered to be taken down by biſhop Thurlow in 1789.

The firſt charter of incorporation was granted Jan. 30, 1565, by biſhop Pilkington, by which the city was incorporated by the name of an alderman and burgeſſes within the city of Durham and Framwell-gate. Under this the city was governed, till biſhop Matthews granted a new charter, dated 1602, whereby the burgeſſes and inhabitants were conſtituted a body politic and corporate, conſiſting of a mayor, twelve aldermen, and commonalty, with divers privileges. This charter was confirmed by James I. Feb. 15, 1606, and continued in force till 1684, when it was furrendered to biſhop Crew, who granted immediately a new charter of incorporation, dated March 7, 1634, but ſome informality having been diſcovered in the form of ſurrendering up the old charter, it was deemed illegal, and the corporation ſtill ſubſiſted under Matthews's charter till 1766, when informations having been filed in the court of king's-bench againſt ſeveral of the aldermen as being non-reſidents, or not legally qualified at the time of their election, they were ouſted from their offices. Some irregularities had alſo been committed, both on the election of the common-council, on the 3d of October, 1766, which affected the title of the mayor to his office, to which he was elected the day following, and from which he was ejected by the judgment of the court of king's bench ſoon after. From the above cauſes, as well as the natural deaths of ſome of the old aldermen, the number of aldermen was ſo reduced as not to be able to conſtitute a court; in conſequence, the charter became vacated, and the city continued under the government of a bailiff till 1780, when a new charter, dated October 2, was granted by biſhop Egerton, in which the defects of the old charters were remedied, and the powers and privileges of the corporation and citizens confirmed. Under this charter the city is now governed. The members of this corporation are, a mayor, recorder, twelve aldermen, a town-clerk, twenty-four common-councilmen, an indefinite number of freemen, and two ſerjeants at mace. The common-council are choſen from the twelve incorporated companies. The number of houſes in Durham are calculated at about two thouſand, and the number of inhabitants nine thouſand.

Many public charities dignify this city; among others, biſhop Crew left by his will, dated June 24, 1720, one hundred pounds per annum for putting out poor boys apprentices. Dr. Hartwell, in 1724, left twenty pounds per

per annum to be given to two tradeſmen of the eſtabliſhed church, who may want aſſiſtance to begin buſineſs. Biſhop Wood, of Litchfield, gave twenty pounds per annum for ever, to be diſpoſed of for the releaſe of poor debtors from the goal of Durham, whoſe debts do not exceed five pounds. He alſo gave one hundred pounds to be laid out upon a rent-charge, toward the maintenance of the poor of the corporation for ever. There are ſeveral ſmaller charities. But the principal one was that of Mr. Henry Smith, who, by his will, dated July 20, 1598, bequeathed his coal-mines, then worth one hundred pounds a-year, beſides a very conſiderable perſonal eſtate, to the corporation of this city, "that ſome good trade may be deviſed for ſetting of the youth and other idle perſons to work, as ſhall be thought moſt convenient, whereby ſome profit may ariſe to the benefit of the ſaid city, and relief of thoſe that are paſt work." This charity was ſoon after employed in eſtabliſhing a cloth manufactory, from which ſome thouſands derive their bread; and in which are made all kinds of calimancoes, ſhalloons, wildbores, durants, tammies, plain and figured ſtuffs, ſerges, Jerſeys, kerſeys, flannels, &c. They alſo make carpets, which are brought to a very great degree of perfection.

There are ſeveral coal-works in the vicinity of the city, whence the inhabitants are plentifully ſupplied at reaſonable rates. The market is held every Saturday, and is extremely well ſupplied with all kinds of corn, butcher's meat, poultry, fiſh, vegetables, and all other proviſions. Here are three fairs every year, which uſually continue three days each; the firſt day for horned cattle, the ſecond day for ſheep and ſwine, and the third for horſes: they begin the 31ſt of March, Whit-Tueſday, and September 15. On theſe occaſions the court of Pye Powder is always held by the corporation. Within theſe laſt twenty years, the fair in March has been much reſorted to by the principal horſe-dealers from the ſouth, on account of the great number of excellent horſes which are bred in the adjacent country, and which are uſually brought in for ſale at this time.

In approaching the city of Durham from the ſouth, the traveller is ſtruck with the elegance of its ſituation, and the venerable appearance of its principal buildings. The cathedral and caſtle are ſituated upon an eminence, girt by the north and ſouth Baileys, encloſed with the remains of the old city walls, and ſkirted with hanging gardens deſcending to the river Were, which ſurrounds this part of the city, in the form of an horſe-ſhoe. On the oppoſite ſide of the river, the banks are high, rocky, and ſcattered over with trees; along the brink of which the ſtreet of New Elvett is extended, and terminated by the church of St. Oſwald; at the bottom runs Old Elvett. Acroſs the bridge are the ſtreets of Claypeth and St. Giles, which climb the more diſtant eminence; the church terminating the line of buildings. The ſlopes of the hills are beautified with hanging gardens and rich meadows. Newton Hall, one of the ſeats of the late ſir H. G. Liddle, bart. with its adjacent plantations, fills the nearer back ground; behind which a fine cultivated country is diſcovered, lengthening the proſpect to the diſtance of ten miles, on which Penſher or Painſhaw Hill, with its peaked brow, is a beautiful object. To form the left wing, the banks oppoſite to the cathedral and caſtle are clothed with wood and fruit-trees; and South-ſtreet ſtretches along the ſummit. The long canal which the river exhibits to the eye in this part, is croſſed by Framwelgate-bridge, which has two elliptic arches. On the banks of the river is Crook Hall, the ſeat of Mrs. Hopper, with the woodlands of Newton Hall on the more diſtant ground; to the left of which is Aycliffe Heads, the neat villa of Francis Johnſon, eſq. Approaching this city from the eaſt, down the ſtreet of St. Giles, a noble proſpect preſents itſelf: in front the river Were forms a fine canal through a rich vale, croſſed by Elvett-bridge of five wet and many other land arches. The town crowds the ſwift riſings of the hill, pile upon pile; while the caſtle and cathedral crown the ſummit of the eminence. To the left are ſeen the banks of Elvett and the church, flanked by the diſtant foreſt of oaks and groves which hang on the margin of the river. On the right is a fine view of Newton-hall. From the north the appearance is rather more romantic. In ſhort, whoever has a taſte for beautiful proſpects will find themſelves highly gratified by the variety which preſent themſelves from the different hills with which this city is ſurrounded, as well as from the different avenues leading to it.

Beſides the many liberal charities founded in Durham, there is a very noble one in the eaſtern vicinity of the city, called Sherburn hoſpital, founded about 1180, by biſhop Pudſey, for the reception of ſixty-five lepers, with a maſter and other officers. This hoſpital is placed in a remarkably healthful ſituation, and continued under its old government till 1584, when an act of parliament paſſed whereby it was re-incorporated by the name of the Maſter and Brethren of Chriſt's hoſpital, in Sherburn, near Durham. In this hoſpital are now maintained fifteen in-brothers, who are well accommodated with every one a neat little room, a ſufficiency of good and wholeſome diet, a ſuit of clothes annually, and forty ſhillings in money. They attend divine ſervice in the chapel twice every day, where the prayers are read by the chaplain. There are alſo fifteen out-brothers, who are allowed forty ſhillings each annually; with a very pleaſant houſe, and beautiful gardens, belonging to the maſter. On the weſt of the city is an old croſs, erected by Ralph lord Nevill, in memory of a remarkable battle fought here on the 17th of October, 1346, between the Engliſh and Scotch armies, in which the latter ſuffered a total defeat, with the loſs of fifteen thouſand men killed, and ſeveral nobles, and their king David II. taken priſoner.

DUR'HAM, a townſhip of the American States, in Cumberland county, diſtrict of Maine, on the ſouth-weſt bank of Androſcoggin river, which ſeparates it from Bowdoin on the north-eaſt. It was incorporated in 1789, contains 724 inhabitants, and lies 145 miles north-eaſterly of Boſton.

DUR'HAM, a poſt town of the American States, in Strafford county, New Hampſhire, on Oyſter river, near where it joins the Piſcataque; ſixteen miles weſt of Portſmouth. It was incorporated in 1633, and contains 1247 inhabitants. It was formerly a part of Dover, which adjoins it on the north, and was called Oyſter river. On the top of a hill in this town is a rock, computed to weigh ſixty or ſeventy tons, ſo exactly poiſed on another rock as to be eaſily moved by the finger.

DUR'HAM, a townſhip of the American States, in New Haven county, Connecticut, ſettled from Guildford in 1698, and incorporated in 1708: twenty-two miles ſouth-weſt of Hartford, and eighteen miles north-eaſt of New Haven. It was called *Cagingchague* by the Indians; which name a ſmall river that chiefly riſes here, ſtill bears.

DUR'HAM, a townſhip of the American States, in Bucks county, Pennſylvania.

DU'RING, *prep.* [This word is rather a participle from *dure*; as, *during life*; *durante vita*, life *continuing*; *during my pleaſure*, my pleaſure continuing the ſame.] For the time of the continuance of; while any thing laſts.—If *during* his childhood he be conſtantly and rigorouſly kept from drinking cold liquor whilſt he is hot, forbearance grows into a habit. *Locke.*

DU'RIO, *ſ.* in botany, a genus of the claſs polyadelphia, order polyandria, natural order putamineæ, (capparides, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, pitcher-ſhaped, five-lobed; lobes rounded; deciduous. Corolla: petals five, added to the calyx, and leſs than it, concave. Stamina: filaments in five bodies, divided into ſeven, ſubulate, longer than the corolla; antheræ twiſted; (or, according to Juſſieu, filaments five, flat at the baſe, ſeven or eight-cleft at the top; the diviſions connate, ſubulate, bearing thirty-five to forty twiſted anthers. Piſtillum: germ roundiſh, ſtipitate;

pitate; ſtyle briſtle-form, length of the ſtamens. Pericarpium: pome roundiſh, on all parts muricated with many-ſided dagger points, five-celled, gaping open in five directions; cells one to five ſeeded. Seeds: large, ovate, involved in a mucoſe pulp, in a membranaceous aril.—*Eſſential Character.*—Calyx, five-cleft, pitcher-ſhaped, inferior; corolla, five-petalled, ſmall; ſtyle, one; ſtamina, in five bodies; pome, five-celled.

Durio Zibethinus, a ſingle ſpecies; it is a lofty tree with flowers below the leaves, which are alternate. Native of the Eaſt Indies. The leaves reſemble thoſe of the cherry, but are not dented at the edges, and are therefore in reality more like nutmeg leaves; the flowers are borne in looſe heads; they are large, and of a pale yellow-white colour. The fruit is the ſize of a man's head, and round or oblong; reſembling in ſome degree a rolled-up hedge-hog, with a hard bark or rind; the fleſhy part of the fruit is of a creamy ſubſtance, and of a delicate taſte; but of an unpleaſant heavy ſmell, ſomewhat reſembling that of rotten onions; and the ſmell of the breath of thoſe who eat it is infected alſo in a high degree; but when once a perſon has accuſtomed himſelf to eat this fruit, he generally conſiders it as the moſt excellent of all others.

DU'RITY, *ſ.* [*dureté*, Fr. *durus*, Lat.] Hardneſs; firmneſs.—Irradiancy or ſparkling, found in many gems, is not diſcoverable in this; for it cometh ſhort of their compactneſs and *durity*. *Brown.*

DUR'KO, a town of Aſiatic Turkey, in the province of Natolia: forty-two miles ſouth-weſt of Amaſich.

DUR'LACH, a town of Germany, in the circle of Swabia, which gives title to one of the branches of the houſes of Baden, called margrave of Baden Durlach, ſituated on the Pfinz. It contains a caſtle, with a mint, a Latin ſchool, manufactures of china-ware, cloth, and ſtuffs; the environs are fertile, eſpecially in fruit and wine: ſixteen miles ſouth of Spire, and thirty-two weſt-north-weſt of Stuttgart. Lat. 48. 59. N. lon. 26. 9. E. Ferro.

DURN'BERG, a mountain of Germany, in the circle of Bavaria, and archbiſhopric of Saltzburg: two miles ſouth-ſouth-weſt of Hallein.

DUR'NESS, a town of Scotland, in the county of Sutherland, near the north coaſt, at the bottom of a bay, formed by a river of the ſame name, called the *Kyle of Durneſs*: forty-ſix miles north-north-weſt of Dornoch. Lat. 58. 33. N. lon. 1. 21. W. Edinburgh.

DUR'NESS, a river of Scotland, which runs into the North Sea, a little to the weſt of Farout Head, forming a bay at its mouth, called the Kyle of Durneſs.

DURN'ISH, a town of Scotland, on the weſtern coaſt of the iſland of Skye.

DUR'NIUM, or DURNOVARIA, anciently a town of the Durotriges in Britain: now Dorcheſter.

DUROBRI'VÆ, anciently a town of the Catyeuchlani in Britain: now in ruins, which lie on the Nen, between Caſter and Dornford, in Northamptonſhire, on the borders of Huntingdon.

DUROBRI'VÆ, or DUROCOBRIVÆ, a town of the Trinobantes, in Britain; whoſe ruins are ſituated between Flamſtead and Redburn, in Hertfordſhire.

DUROBRI'VIS, anciently a town twenty-five miles to the weſt of Durovernum, or Canterbury, from which it appears to be Rocheſter, confirmed by the charter of foundation of the church, in which it is called *Durobrevis*.

DUROCA'SES, DUROCASSIUM, or DUROCASSÆ, anciently a town of the Carnutes, in Gallia Celtica; now Dreux.

DUROCH'SKOI, a town of Ruſſian Tartary, in the government of Irkutſch, on the borders of China, near the river Argunia: 160 miles ſouth-ſouth-eaſt of Nertchinſk.

DUROCORNO'VIUM, anciently a town of Britain; now Cirenceſter, in Glouceſterſhire, called *Corinium* by Ptolemy.

DUROCORTO'RUM, or DURICORTORA, anciently a town of the Rhemi in Belgica; now RHEIMS.

DUROI'A, *ſ.* [ſo named in memory of *Jo. Phil. Du Roi*, a phyſician at Brunſwick, author of Obſervationes Botanicæ, and Hortus Harbeccenſis.] In botany, a genus of the claſs hexandria, order monogynia, natural order rubiaccæ, (*Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, cylindric, truncate, contracted, very ſhort, ſuperior. Corolla: monopetalous; tube cylindric; border length of the tube, ſix-parted; diviſions ovate, ſpreading. Stamina: filaments none; antheræ ſix, oblong, within the tube. Piſtillum: germ inferior; ſtyle filiform, the length of the tube; ſtigmas two. Pericarpium: pome globular, umbilicate, covered with erect hairs. Seeds very many, neſtling, oval, flat, very ſmooth, incumbent, in a double row.—*Eſſential Character.* Calyx, cylindric, truncate; corolla, ſix-parted; filaments none; pome hiſpid.

Duroia eriopila, the only ſpecies, is a tree with thick unequal branches, hirſute at the end; leaves terminating, oppoſite, approximating, many, ſubpetioled, a ſpan in length, obovate, quite entire, obtuſiſh, ribbed, pubeſcent above, netted underneath. The flowers are frequently abortive; nay, there are ſome genuine male flowers without any germ. It ſhould therefore be referred rather to the claſs polygamia. Fruit ſomewhat larger than a turkey's egg, ſpherical, covered very thick with erect brown hairs; it is well-flavoured, and much eſteemed at Surinam, of which it is a native.

DUROLE'NUM, anciently a town of the Cantii in Britain; now Lenham, in Kent.

DUROLI'TUM, anciently a town of the Trinobantes; now Leiton, on the Ley, in Eſſex.

DU'ROT, a bay on the north ſide of the ſouth peninſula of the iſland of St. Domingo.

DUROTRI'GES, anciently a Britiſh nation, ſeated in that part of the country which is now called Dorſetſhire.

DUROU'R's ISLAND, an iſland in the eaſtern Indian ocean. Lat. 1. 44. S. lon. 143. 21. E. Greenwich.

DUR'ROW, a town of Ireland; ſee CASTLE DURROW.

DUR'SEY, an iſland in the Atlantic, about two miles long, and half a mile broad, ſituated near the ſouth-weſt coaſt of Ireland. Lat. 51. 33. N. lon. 10. 4. W. Greenwich.

DUR'SLEY, a ſmall town of Glouceſterſhire, formerly remarkable for its extenſive broad-cloth manufactory; and it ſtill carries on a conſiderable trade in that branch of buſineſs, and alſo in card-making. It is a borough of very great antiquity, being one of the five boroughs returned by the ſheriff of the county in the reign of Edward I. but it has long loſt the privilege of ſending members to parliament. It is now governed by a bailiff choſen annually. The town gives the title of viſcount to earl Berkeley. Here is a handſome market-houſe built in 1738, of free-ſtone; market on Thurſdays; and fairs on the 6th of May, and 4th of December. The church is large, and very ancient, with two aiſles and a tower. Contiguous to the town is a rock of ſtone, remarkable for its extreme durability: the exterior walls of the noble caſtle of Berkeley were built with it; and, although upwards of ſix centuries have paſſed ſince their erection, they do not ſhew the leaſt appearance of decay.

Kingſcot, on the eaſt ſide of Durſley, is a chapel of eaſe. Here is ſuppoſed to have been a Roman ſtation, from a multitude of Roman coins ploughed up ſome years ago, beſides a large ſtatue of ſtone, and a *Fibula Veſtiaria* of ſilver, chequered and enamelled. Ozelworth is on the ſouth-eaſt ſide of Durſley; it is remarkable for the number of foxes killed in one year, in the reign of queen Elizabeth, which amounted to 231. Slimbridge is a pariſh contiguous, twenty miles in compaſs, bounded with the Severn and Cam. It poſſeſſes the ſingular merit of having about 1000 acres of land gained from the Severn.

DURST, the preterite of *dare*.—The Chriſtians *durſt* have no images of the Deity, becauſe they would rather die than defile themſelves with ſuch an impiety. *Stillingfl.*

DUR'TAL, a town of France, in the department of the Mayne and Loire, and chief place of a canton, in the

district of Chateau-neuf: the houses are generally built of stone, and covered with slate; tanning is the chief trade: five leagues and a half north-east of Angers.

DURVES, a town of Asia, in the country of Candahar: 130 miles south-east of Candahar.

DU'RY (John), a learned Scots divine, in the seventeenth century, early educated to the ministry in his native country. Reflecting on the divisions which existed in the reformed churches, he conceived it possible to reunite the Lutherans and the Calvinists in the same tenets. He obtained the approbation of the archbishop of Canterbury, and was countenanced by Bedell bishop of Kilmore, and Hall bishop of Exeter. He soon published his plan for a re-union, which was dispersed over all protestant Europe; and opened a correspondence with learned men in different churches. Afterwards he set out on his travels to try the effect of his personal labours, and held conferences with the divines of the German evangelic union at their assembly at Frankfort, in 1634. He afterwards treated with the divines of Sweden and Denmark; traversed Holland, Germany, and Swisserland; applied to the crowned heads and princes as well as divines; consulted the universities, and communicated their answers; and spared no pains during innumerable journeys which he took until the year 1631, when he had the mortification to find that the project which he had undertaken was as far as ever from its completion. He was not discouraged, however, but still determined to persevere in his design. It was some time during the year 1661, that Mr. Dury published at Amsterdam, his work entitled *Johannis Duræi Irenicorum Tractatuum prodromus, in quo præliminares continentur Tractatus de I. Pacis ecclesiasticæ Rehoris è medio tollendis. II. Concordiæ Evangelicæ Fundamentis sufficienter jactis, &c.* After the appearance of this work, he again set about his grand design, and laboured incessantly at promoting an union among the protestant churches, until the year 1674, when he appears to have been disheartened at the failure of all his former plans, and had recourse to a new expedient, which was to re-unite all Christians. This was to labour on a new explication of the Apocalypse, which he published at Frankfort in 1675. On the dreams and chimeras to which this new expedient gave rise, he appears to have dwelt at a pleasant retreat provided for him in the country of Hesse, by Hedwige Sophia, the landgrave's consort, who had the regency of the country, and who generously supplied Dury with a maintenance till the time of his death, the precise time of which seems not to be known.

DUSK, *adj.* [*duyster*, Dut.] Tending to darkness. See DUSKY. Tending to blackness; dark-coloured:

The hills, to their supply,
Vapour and exhalation, *dusk* and moist,
Sent up amain. *Milton.*

DUSK, *s.* Tendency to darkness; incipient obscurity.—I will wait on you in the *dusk* of the evening, with my show upon my back. *Spectator.*—Darkness of colour; tendency to blackness:

Some sprinkled freckles on his face were seen,
Whose *dusk* set off the whiteness of the skin. *Dryden.*

To DUSK, *v. a.* To make duskish.

To DUSK, *v. n.* To grow dark; to begin to lose light or brightness; to have lustre diminished.

DUSK'ILY, *adv.* With a tendency to darkness or blackness.

DUS'KINESS, *s.* Tendency to darkness.—The *duskiness* and dews of the evening had rendered his walk uncomfortable. *Shenstone.*

DUS'KISH, *adj.* Inclining to darkness; tending to obscurity:

From his infernal furnace forth he threw
Huge flames, that dimmed all the heaven's light,
Enroll'd in *duskish* smoke, and brimstone blue. *Spenser.*

Tending to blackness; dark-coloured.—Sight is not contented with sudden departments from one extreme to another; therefore rather a *duskish* tincture than an absolute black. *Wotton.*

DUS'KISHLY, *adv.* Cloudily; darkly.—The sawdust burned fair, till part of the candle consumed: the dust gathering about the snast, made the snast to burn *duskishly*. *Bacon.*

DUSKY, *adj.* [from *dusk*; *duyster*, Dut.] Tending to darkness; obscure; not luminous:

Through the plains of one continual day,
Six shining months pursue their even way;
And fix succeeding urge their *dusky* flight,
Obscur'd with vapours and o'erwhelm'd in night. *Prior.*

Tending to blackness; dark-coloured; not clear; not bright.—It is not green, but of a *dusky* brown colour. *Bacon.*

When Jove in *dusky* clouds involves the skies,
And the faint crescent shoots by fits before their eyes.
Dryden.

Gloomy; sad; intellectually clouded.—While he continues in life, this *dusky* scene of horror, this melancholy prospect of final perdition, will frequently occur to his fancy. *Bentley.*

Umbriel, a *dusky*, melancholy sprite,
As ever sullied the fair face of light,
Down to the central earth, his proper scene,
Repairs to search the gloomy cave of spleen. *Pope.*

DUSK'Y BAY, a bay on the south-west coast of the southernmost island of New Zealand. Lat. 45. 40. S. lon. 166. 18. E. Greenwich.

DUS'RACH, a town of Persia, in the province of Kerman: 156 miles south of Sirgian.

DUS'SAC, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Exideuil: four miles north of Exideuil.

DUS'SEL, a river of Germany, in the circle of Westphalia, which runs into the Rhine at Dusseldorp.

DUS'SELDORP, a city of Germany, in the circle of Westphalia, and duchy of Berg, situated on the river Dussel, at its conflux with the Rhine; strong and well-built: it contains about ten thousand souls. The palace belonging to the elector-palatine is a noble edifice. This town was taken by the French revolutionists, on the 10th of September 1795, soon after which the whole duchy of Berg submitted to the troops of the republic. Lat. 51. 15. N. lon. 28. 10. E. Ferro.

DUS'SEMONT, a village of Germany, in the circle of the Upper Rhine, and county of Veldentz, on the Moselle; celebrated for its excellent wine: four miles north-west of Veldentz.

DUST, *s.* [ðurt, Saxon; *dunst*, Erse.] Earth or other matter reduced to small particles.—*Dust* helpeth the fruitfulness of trees, insomuch as they cast *dust* upon them. *Bacon.*—The grave; the state of dissolution:

The sceptre, learning, physic, must
All follow this, and come to *dust*. *Shakespeare.*

A mean and dejected state.—God raiseth up the poor out of the *dust*, to set them among princes. 1 *Sam.* ii. 8.

To DUST, *v. a.* To free from dust. To sprinkle with dust.

DUST'CART, *s.* A cart in which dust is carried out of the streets.

DU'STED, *part.* Sprinkled with dust, cleaned from dust.

DUS'TINESS, *s.* The state of being dusty. *Scott.*

DUS'TING, *part. adj.* Sprinkling with dust; cleaning from dust.

DU'STMAN, *s.* One whose employment is to carry away the dust:

The *dustman*'s cart offends thy clothes and eyes,
When through the street a cloud of ashes flies. *Gay.*

DUS'TUCK,

DUS'TUCK, *ſ.* [Indian.] A term uſed in Hindooſtan, for a paſſport, permit, or order, in the Engliſh Eaſt India Company's affairs. It generally means the permit under their ſeal, which exempts goods from the payment of duties.

DU'STY, *adj.* Filled with duſt; clouded with duſt:

Arms and the *duſty* fields I leſs admire,
And ſoften ſtrangely in ſome new deſire. *Dryden.*

Covered or ſcattered with duſt:

Even Drudgery himſelf,
As at the car he ſweats, or *duſty* hews
The palace ſtone, looks gay. *Thomſon.*

DUSZ'MIANY, a town of Lithuania, in the palatinate of Troki: twenty miles ſouth-ſouth-weſt of Troki.

DUTCH, the inhabitants of the Seven United Provinces; now the Batavian republic. For their hiſtory, ſee the article HOLLAND.

DUTCH, *ſ.* [the adjective, by ellipſis, for] The Dutch language:

Thy plays are ſuch
I'd ſwear, they were tranſlated out of *Dutch.* *Dorſet.*

DUT'CHESS, *ſ.* See DUCHESS.

DUTCH'MAN's BAY, a bay on the north coaſt of the iſland of Antigua.

DUTCH'MAN's ISLAND, an iſland of America, in the Potomack river, fourteen miles above Waſhington.

DUT'CHY, *ſ.* See DUCHY.

DU'TEOUS, *adj.* Obedient; obſequious; reſpectful to thoſe who have natural or legal authority:

A female ſoftneſs, with a manly mind;
A *duteous* daughter, and a ſiſter kind;
In ſickneſs patient, and in death reſign'd. *Dryden.*

Obſequious; obedient to good or bad purpoſes: with *to:*

I know thee well; a ſerviceable villain!
As *duteous to* the vices of thy miſtreſs,
As badneſs would deſire. *Shakeſpeare.*

Enjoined by duty; enforced by the relation of one to another. This ſenſe is not now uſed:

With mine own tongue deny my ſacred right,
With mine own breath releaſe all *duteous* ties. *Shakeſp.*

DU'THILL, a town of Scotland, in the county of Inverneſs: twenty miles ſouth-eaſt of Inverneſs.

DU'TIFUL, *adj.* Obedient; ſubmiſſive to natural or legal ſuperiors; reverent.—She died in an extreme old age, without pain, under the care of the moſt *dutiful* ſon that I have ever known or heard of. *Swift.*—Expreſſive of reſpect; giving token of reverence; reſpectful; reverential.—There would ſhe kiſs the ground, and thank the trees, bleſs the air, and do *dutiful* reverence to every thing ſhe thought did accompany her at their firſt meeting. *Sydney.*

DU'TIFULLY, *adv.* Obediently; ſubmiſſively. Reverently; reſpectfully:

He with joyful, nimble wing,
Flew *dutifully* back again,
And made an humble chaplet for the king. *Swift.*

DU'TIFULNESS, *ſ.* Obedience; ſubmiſſion to juſt authority.—Piety, or *dutifulneſs* to parents, was a moſt popular virtue among the Romans. *Dryden.*—Reverence; reſpect.—It is a ſtrange kind of civility, and an evil *dutifulneſs* in friends and relatives, to ſuffer him to periſh without reproof or medicine, rather than to ſeem unmannerly to a great ſinner. *Taylor.*

DUTKI'NA, a town of Ruſſian Siberia, in the government of Irkutſch, on the Lena: ſixteen miles ſouth of Orlenga.

DUTLIN'GEN, or TUTLINGEN, a town of Germany, in the circle of Swabia, on the Danube, over which is a bridge, belonging to the duchy of Wurtemberg, though not joined to it, ſurrounded with walls in 1274. In the year 1132, or, according to others, in 1364, Louis, count of Pfulendorf, and abbot of Reichenaw, was murdered in the church of Dutlingen, dreſſed in his ſacerdotal habit, by his own domeſtics: twenty-five miles north-weſt of Conſtance. Lat. 47. 55. N. lon. 26. 26. E. Ferro.

DU'TY, *ſ.* That to which a man is by any natural or legal obligation bound.—When ye ſhall have done all thoſe things which are commanded you, ſay, We are unprofitable ſervants: we have done that which was our *duty* to do. *Luke,* xvii. 10.—Acts or forbearances required by religion or morality. In this ſenſe it has a plural:

Good my lord,
You have begot me, bred me, lov'd me: I
Return thoſe *duties* back, as are right fit;
Obey you, love you, and moſt honour you. *Shakeſpeare.*

Obedience or ſubmiſſion due to parents, governors, or ſuperiors; loyalty; piety to parents.—God's party will appear ſmall, and the king's not greater; it being not probable, that thoſe ſhould have ſenſe of *duty* to him that had none to God. *Decay of Piety.*—Act of reverence or reſpect:

They both atone,
Did *duty* to their lady as became. *Spenſer.*

The buſineſs of a ſoldier on guard.—The regiment did *duty* there punctually. *Clarendon.*—The buſineſs of war; ſervice.—The night came and ſevered them, all parties being tired with the *duty* of the day. *Clarendon.*

See how the madmen bleed! Behold the gains
With which their maſter, love, rewards their pains!
For ſeven long years, on *duty* ev'ry day,
Lo! their obedience, and their monarch's pay! *Dryd.*

Tax; impoſt; cuſtom; toll.—All the wines make their way through ſeveral *duties* and taxes, before they reach the port. *Addiſon.*

The duties of civil life may be conſidered as the cement of ſociety. Allegiance is the duty of the people, protection the duty of the magiſtrate; yet they are reciprocally the rights, as well as duties, of each other. Allegiance is the right of the magiſtrate, and protection the right of the people.

DU'VAL (Valentine Jameray), imperial librarian, and keeper of the cabinet of coins at Vienna, born at Artonay, in Champagne, in 1695. At the age of ten he loſt his father and mother, peaſants in poor circumſtances, who left a numerous family in a ſtate of the utmoſt indigence. Two years after he wandered into Lorraine, where he was ſeized with the ſmall-pox, and muſt have periſhed for want of bread, had not a poor ſhepherd taken him to his ſheep-cot, where he had no other bed than the dung upon the ground. His hardy conſtitution got the better of the diſeaſe, and he was afterwards employed by the hermits of St. Anne, near Luneville, to watch their cattle. Among theſe hermits he learnt to read, and a few pamphlets which here fell into his hands, excited his anxious mind to a love of books. He often ſought out in the neighbouring woods ſome ſolitary corner, where he ſpent the greater part of the ſummer nights contemplating the heavens, and endeavouring to make himſelf acquainted with the celeſtial bodies. To aſſiſt him in this purſuit, he conſtructed, in the top of an oak, a kind of ſeat of wild vines and willow twigs interwoven. He purchaſed at Luneville a celeſtial chart, and a few maps of different countries. He now ſtudied geography and aſtronomy amidſt ſo many difficulties that it muſt appear wonderful how he was able, by the happy impulſe of genius alone, to overcome the moſt abſtruſe ſtudies, and to acquire a knowledge of the ſublimeſt ſciences. In order to obtain books, he laid ſnares for wild cats, foxes, and other animals; hunted many of them at the hazard of his life, and ſold their ſkins, by which he raiſed money to gratify his thirſt for knowledge. An accident procured him the protection of an Engliſhman at Luneville, the celebrated naturaliſt Forſter, through whoſe aſſiſtance the number of his books ſoon increaſed to four hundred volumes. While engaged one day in deep meditation, under a tree,

and

and ſurrounded with charts, he was ſuddenly accoſted by the young princes of Lorraine, Leopold, Clement, and Francis, afterwards the emperor Francis I. who had been out on a hunting excurſion, and loſt their way. Through their munificence the young literary peaſant was removed to the Jeſuits' college at Pont-à-Monſſon; and thus Duval, at the age of twenty-two, left the hermitage in which he had reſided four years. His ardent paſſion for ſtudy, animated by a deſire to anſwer the expectation of his generous patrons, made him redouble his diligence. He applied chiefly to hiſtory, geography, and antiquities, until at length duke Leopold appointed him his librarian, and profeſſor of hiſtory in the high ſchool. Though he had his lodging and table at court, he lived in a ſtate of perfect freedom. His lectures on hiſtory and antiquities were received with great approbation, and attended by many Engliſhmen of diſtinction, then at the court of Luneville, invited thither by Duval's high reputation. The great liberality he experienced from moſt of his ſcholars, and his habitual economy, ſoon enabled him to give a public teſtimony of his gratitude to the hermits of St. Anne, which conſiſted of an elegant houſe, built of ſtone, with a chapel, and a large tract of land. In 1738, when duke Leopold died, and the well-known change took place in regard to Lorraine, Duval removed to Florence, and became keeper of the ducal library, which had been tranſported thither from Luneville. Numiſmatics were one of his favourite purſuits, and excited in him a deſire to collect ancient coins. While engaged in this plan, the emperor Francis I. formed a reſolution of eſtabliſhing a cabinet of ancient and modern coins at Vienna, and of combining with it a collection of all the coins current in every part of the world. For this purpoſe he invited Duval to that capital, and entruſted him with the inſpection and arrangement of his new cabinet. A houſe was aſſigned to him in the imperial quarter near the palace, and he generally dined at the emperor's table once a-week. By the air of a court, however, his diſpoſition was in no manner corrupted; truth and ſincerity ſtill continued to be the diſtinguiſhing features of his character; and in 1751 he was appointed ſub-preceptor to Joſeph II. During a tour which he made to Paris in 1752, he reſolved to convert the cottage in which he had been born into a neat ſtone building, and to aſſign it for ever as a habitation for the pariſh ſchoolmaſter. He alſo cauſed wells to be dug at his own expence, as the village was very ill ſupplied with water. Duval remained free from the infirmities of age till his ſeventy-ninth year, and died in 1775, in the 81ſt year of his age. It may be ſaid, without exaggeration, that he was one of thoſe extraordinary men who ſometimes appear in the world, and who, notwithſtanding the diſadvantages of low birth, and every other obſtacle, emerge from obſcurity by the natural force of genius. After his death, M. de Koch, ſecretary of legation at Peterſburgh, collected and publiſhed his works, which one cannot read, and particularly the account of his life, written by himſelf, without entertaining great eſteem and affection for the benevolent and candid author. They are entitled, *Oeuvres de Valentin Jameray Duval, precédées des Mémoires ſur ſa Vie. Avec figures.* 2 vols. 1784-8.

DUVAL' (Andrew), a native of Pontoiſe, admitted a doctor of the Sorbonne in 1594, and the firſt profeſſor of the new theological ſchool, eſtabliſhed by Henry IV. in 1596. He died in 1638, at the age of ſeventy-four years, when he was the ſenior member of the college, and dean of the faculty of theology at Paris. He was a ſtrong advocate for what were called the ultramontane principles, which were intended to bind the French clergy in a cloſe and ſubmiſſive dependence on the court of Rome. Influenced by theſe principles, he proved a bitter perſecutor of the celebrated Edmund Richer, who was a ſpirited opponent of the unbounded eccleſiaſtical and political power which the popes aſſumed, and wrote againſt him a work, entitled, *Elenchus Libelli de eccleſiaſtica & politica poteſtate.* He alſo wrote another work, entitled, *De Suprema Romani Pontificis in Eccleſiam poteſtate*, 4to. 1614; a treatiſe againſt the proteſtant miniſter Du Moulin, with this ſtrange title, The Fire of Elias to dry up the Waters of Siloah, 1603; Commentaries on the Theology of St. Thomas Aquinas, 2 vols. folio, 1636.

DUVAL' (Peter), geographer-royal in France, born at Abbeville. He was the nephew of the famous geographer Sanſon, and taught the ſcience in which his uncle excelled, with conſiderable ſucceſs. He died at Paris in 1683, at ſixty-five years of age. He was the author of various geographical treatiſes, charts, and maps, now moſtly ſuperſeded by later and more accurate works of the ſame kind. That which ſtill maintains its reputation, bears the title of *La Geographie Françoiſe, contenant les Deſcriptions, les Cartes, & les Blaſons, de France, &c.* He alſo publiſhed ſome uſeful chronological tables, and ſome articles in genealogy and heraldry, in 4to. and 12mo.

DUUMVI'RATE, *ſ.* the office or dignity of the duumviri.

DUUMVI'RI, *ſ.* two noble patricians at Rome, firſt appointed by Tarquin to keep the Sibylline books, which were ſuppoſed to contain the fate of the Roman empire. Theſe ſacred books were placed in the capitol, and ſecured in a cheſt under the ground. They were conſulted but ſeldom, and only by an order of the ſenate, when the armies had been defeated in war, or when Rome ſeemed to be threatened by an invaſion, or by ſecret ſeditions. Theſe prieſts continued in their original inſtitution till the year of Rome 388, when a law was propoſed by the tribunes to increaſe the number to ten, to be choſen promiſcuouſly from patrician and plebeian families. They were from their number called Decemviri, and ſome time after Sylla increaſed them to fifteen, known by the name of Quindecemviri.—There were alſo certain magiſtrates at Rome, called *Duumviri perduelliones ſive capitales.* They were firſt created by Tullus Hoſtilius, for trying ſuch as were accuſed of treaſon. This office was aboliſhed as unneceſſary, but Cicero complains of their revival by Labienus the tribune. Some of the commanders of the Roman veſſels were alſo called Duumviri, eſpecially when there were two together. They were firſt created in the year of Rome, 542. There were alſo in the municipal towns in the provinces, two magiſtrates, called *Duumviri municipales.* They were choſen from the centurions, and their office was ſimilar to that of the two conſuls at Rome. They were ſometimes preceded by two lictors with the faſces. Their magiſtracy continued for five years, on which account they have been called *Quinquennales magiſtratus.*

DUX, a town of Bohemia, in the circle of Leitmeritz: fifteen miles weſt-north-weſt of Leitmeritz.

DUX'BOROUGH, a maritime townſhip of the American States, in Plymouth county, Maſſachuſetts, incorporated in 1637. It is a healthy town, abounding in maritime veſſels, and contains about 1460 inhabitants. It lies ſouth by eaſt of Plymouth, three miles acroſs Plymouth bay by water, and eight round by land, and thirty-eight ſouth eaſt by ſouth of Boſton. Within the harbour are Clarke's iſland, conſiſting of about one hundred acres of excellent land, and Sauquiſh iſland, which was formerly joined to the Gurnet, by a narrow piece of ſand; but the water has inſulated it. The Gurnet is an eminence at the ſouthern extremity of the beach, on which is a light-houſe, built by the ſtate. The Indian name of the town was Matiakeeſet, or Namakeeſet. It was ſettled by Capt. Standiſh and his aſſociates, in 1620.

DUX'BURY, a townſhip of the American States, in Hillſborough county, New Hampſhire, incorporated in 1763; firſt called Dantzick, and joined with Sutton in the enumeration of 1775.

DUX'BURY, a townſhip of the American States, in Chittenden

Chittenden county, Vermont, twenty miles ſouth-eaſt of Burlington.

DUY'VELAND, an iſland of Zealand, ſeparated from the ſouth-eaſt part of Schouwen, by a narrow paſſage; its dimenſions about three leagues by two.

DUZ'DEH, a town of Aſiatic Turkey, in the province of Natolia: twenty-eight miles weſt of Eregri.

DU'ZEY, a town of France, in the department of the Meuſe, and chief place of a canton, in the diſtrict of Eſtain: three leagues north of Eſtain.

DWALE, *ſ.* in botany. See ATROPA.

DWARF, *ſ.* [ꝺpeonȝ, Sax. *dwerg*, Dut.] A man below the common ſize of men:

They, but now who ſeem'd
In bigneſs to ſurpaſs earth's giant ſons,
Now leſs than ſmalleſt *dwarfs*, in narrow room
Throng numberleſs. *Milton.*

Any animal or plant below its natural bulk.—Saw off the ſtock in a ſmooth place; and for *dwarf* trees, graft them within four fingers of the ground. *Mortimer.*—An attendant on a lady or knight in romances:

The champion ſtout,
Eftſoones diſmounted from his courſer brave,
And to the *dwarf* awhile his needleſs ſpear he gave.
Spenſer.

It is uſed often by botaniſts in compoſition; as, *dwarf*-elder, *dwarf*-honey-ſuckle, &c.

The Romans were paſſionately fond of dwarfs, whom they called *nani* or *nanæ*, inſomuch that they often uſed artificial methods to prevent the growth of boys deſigned for dwarfs, by incloſing them in boxes, or by the uſe of tight bandages. Auguſtus's niece, Julia, was extremely fond of a dwarf called *Sonopas*, who was only two feet and an hand-breadth high. There are many curious accounts of human dwarfs, which certainly deſerve the attention of the phyſiologiſt, the philoſopher, and anatomiſt. Jeffery Hudſon, the famous Engliſh dwarf, is a ſtriking inſtance of the kind. He was born at Oakham, in Rutlandſhire, 1619; and about the age of ſeven or eight, being then but eighteen inches high, was retained in the ſervice of the duke of Buckingham, at Burleigh. Soon after the marriage of Charles I. the king and queen being entertained at Burleigh, little Jeffery was preſented by the ducheſs to the queen, who kept him as her dwarf. From ſeven years of age till thirty, he never grew taller; but after thirty, he grew up to three feet nine inches, and there fixed. Jeffery became a conſiderable part of the entertainment of the court. Sir William Davenant wrote a poem, called *Jeffreidos*, on a battle between him and a turkey-cock; yet Jeffery was employed on an embaſſy to France, from the queen of England, to her mother, Mary de Medicis; and on his return he was taken by the Dunkirkers. Jeffery, thus made of conſequence, began to think himſelf really ſo; for, feeling himſelf inſulted by Mr. Crofts, a young gentleman of family, a challenge enſued: and Mr. Crofts coming to the rendezvous armed only with a ſquirt, the high-minded little creature was ſo enraged, that a real duel enſued; and the appointment being on horſeback with piſtols, to put them more on a level, Jeffery, with the firſt fire, ſhot his antagoniſt dead. This happened in France, whither he had attended his miſtreſs in the troubles. He was again taken priſoner by a Turkiſh rover, and ſold into Barbary. He probably did not remain long in ſlavery: for at the beginning of the civil war, he was made a captain in the royal army; and in 1644 attended the queen to France, where he remained till the reſtoration. At laſt, upon ſuſpicion of his being privy to the Popiſh plot, he was ſeized in 1682, and confined in the Gatehouſe, Weſtminſter, where he ended his life, in the 63d year of his age.

In the Memoirs of the Royal Academy of Sciences, a relation is given by the count de Treſſau, of a dwarf called *Bebe*, kept by the late Staniſlaus, king of Poland, and who died in 1764, at the age of twenty-three, when he meaſured only thirty-three inches. At the time of his birth, he meaſured only between eight and nine inches. But that the ſize and ſtrength of the intellectual powers are not affected by the diminutiveneſs or tenuity of the corporeal organs, is evident from a ſtill more ſtriking inſtance of littleneſs, deſcribed by the ſame nobleman, in the perſon of M. Borulawſki, a Poliſh gentleman, whom he ſaw at Luneville, and who, at the age of twenty-two, meaſured only twenty-eight inches. Yet this miniature of a man was in no reſpect deficient, at that age, in mental powers and attainments; but is deſcribed by the count as poſſeſſing all the graces of wit, united with a ſound judgment and an excellent memory. He continued to grow till he was about thirty, when he attained the height of three feet two inches. At forty-one years of age, he married a woman of the middle ſize, and had three children, neither of them dwarfs.

Dr. Guthrie, in his Antiquities of Ruſſia, gives the following remarkable deſcription of a dwarf. "One woman, in the houſe of a venerable nobleman, formerly attached to Peter the Great, and whom I have the honour of frequently ſeeing, particularly engaged my attention. The emperor took pleaſure in viewing this dwarf, and uſed to call her his puppet, which the little creature is ſtill proud of relating. From an inſcription under her portrait, in the poſſeſſion of her preſent maſter, it appears that ſhe was firſt made priſoner of war in Poland by prince Mentchicoff; after whoſe diſgrace ſhe came into the hands of the princeſs of Heſſe-Homburg; and, when *ſhe* died, general Betſkoy, the princeſs's heir, took her as a part of his inheritance. The inſcription ſhews her to be nearly a century old. She is ſtill briſk and lively, having the full uſe of her eyes, legs, and teeth, with an infantine voice when ſhe cries, which often happens to her at the recollection of her antient court dreſs, which ſhe regrets exceedingly. Seen from behind, ſhe would be taken for a child of five or ſix years old, an age that her ſtature indicates. She is at this day, (October 15, 1794,) without any infirmity of age, after an abode of eighty years in Ruſſia."

A few years ago there was ſeen at Batavia, a native of the iſland of Bali, named Kitip, who was ſo ſmall, and at the ſame time diminiſhed in ſo ſymmetric a manner, that he deſerves to be conſidered as one of the rareſt phænomena in the animal œconomy of nature. His whole length amounted only to two feet eleven inches Engliſh meaſure; and the reduction of his body on both ſides ſo regularly alike, that the opinion of Buffon reſpecting the power of ſimple parts acting on both ſides with equal force, from which ariſe the double parts on the expanſion of the animal body, ſeems to be fully confirmed. The head, though by far too large for the body of this dwarf, and which might have ſuited one of ſix feet, exhibited in other reſpects nothing remarkable. His hair was long and black, but here and there a little grey, becauſe he had already attained to the fortieth year of his age. Like moſt of his countrymen, he had no beard. His ſkin was of a browniſh colour. His ſhoulders were broad, and his cheſt ſtrong; the belly had the uſual form, only that it was too much contracted towards the lower part. His arms were too long in proportion to the body, and a little twiſted or turned outwards; the lower part of the arms was only half as long as that above the elbow: the hands were ſhort, broad, and of a round form before. The fingers conſiſted of round ſtumps, which were totally looſe, without being ſtrongly connected with the bones of the hand behind, and which were capable of no movement. They were furniſhed with nails, and conſiſted of the third row only of the finger joints, as the firſt and ſecond were totally wanting. Each hand had ſix of theſe ſhapeleſs fingers; two ſtanding cloſe together in the place of the little finger, and the other four in the place of the thumb, the

fore, middle, and ring, finger. The bones of the hand were bent a little outwards, by which means the fiſt appeared round, and the back of it ſomewhat hollow. This ſmall cavity was of great ſervice to little Kitip, on account of the ſhortneſs and immobility of his fingers, eſpecially at the time of his meals, as he uſed the back of his hand inſtead of a ſpoon, in order to convey rice and other food to his mouth. His legs were remarkably ſhort; the feet ſeemed to have grown out from them quite ſolid; for, though their motion gave reaſon to ſuppoſe the exiſtence of the bone of the leg and iſchia, there was, however, no external appearance of them. The knees were entirely wanting. The feet were ſhort and broad. Each foot had ſix toes, ſimilar in form to the fingers, and which had grown out in the like manner, but with this difference, that they were connected with the feet by a ſmall part of their round ſurface, and that the two which ſtood in the place of the little toe adhered ſomewhat to each other. This dwarf was born of well-proportioned parents at Squoati, in the iſland of Bali, in the year 1740. He never had the ſmalleſt intercourſe with the female ſex, nor ſhowed the leaſt inclination for it. It appeared, however, that he was far from having been neglected by nature in this reſpect, and that his continence aroſe rather from an opinion he entertained, that if he denied himſelf the gratification of intercourſe with the ſex in this world, he ſhould obtain a more perfect body in the next.

Calvin Philips, an American dwarf, has lately been exhibited at New York. At the age of eight, his height was twenty-ſix inches and a half, and his weight twelve pounds, including his clothes. This phenomenon was born at Bridgewater, in the ſtate of Maſſachuſetts, on the 14th of January 1791. His father, who is about the middle ſize, was twenty-four years of age when the child was born; and his mother, rather above the ordinary ſize, was twenty-ſix, both ſound and healthy. They have had five other children, two before and three ſince the birth of the dwarf, all of them healthy, and of the uſual ſize. All the circumſtances of geſtation and parturition in the caſe of this dwarf were natural: he was ſo ſmall at his birth as ſcarcely to weigh two pounds; his thigh was not thicker than a man's thumb, and all the other parts of his body were in proportion. His mother, who is a poor woman, uſed to carry him in her boſom while ſhe was ſpinning. Notwithſtanding his diminutiveneſs, he was always while a child extremely healthy, had a good appetite, and was exempt from all the diſeaſes of infancy, except the whooping cough, which was very favourable. He was weaned at ſeven months, began to creep at nine months, and to walk at eighteen months, but he did not begin to ſpeak till he was four years of age. He got his firſt teeth at ten or eleven months, without pain or difficulty, and has ſince had the common number. From his birth, till two years old, he grew very ſlowly, afterwards more perceptibly till five, and ſince that period has altogether ceaſed to grow, which is aſcertained both by his weight, and by the ſize of his clothes, worn four years ago. He is active, playful, ſprightly, and very iraſcible, and is commonly occupied in the ſports of children, to which he is devoted in a remarkable degree. On inſpection of his body undreſſed, no deformity or deficiency appears; on the contrary, he is every way formed with the greateſt ſymmetry. His figure diſplays a pleaſing and elegant proportion, and his face, though thin and long, is made of regular and agreeable features, correſponding to his age rather than ſize, and indicating a degree of maturity, in point of evolution, much beyond his years. His complexion and hair are light, his eyes blue, and his general aſpect is delicate. His voice is ſhrill, and leſs articulate than is common at his period of life. He is reſerved to ſtrangers; but already appears to ſhew ſigns of ſexual propenſity. His mental attainments appear to fall rather ſhort of the ordinary ſtandard at his age: but his ſituation, in a variety of reſpects, has been unfavourable to improvement; and it is to be wiſhed that proper attention may be paid to the cultivation of his underſtanding, in order to aſcertain the comparative powers of his mind. In his travels, as a curious ſpectacle, this dwarf is under the charge of his maternal grandfather and grandmother. The former is a large and robuſt man, aged fifty-ſix, and the latter is about the middle ſize, and aged fifty-four. They ſay that the boy never ſuffered any injury by blows, falls, or other accidents, whether before or after his birth, and that they are unacquainted with any cauſe to which his diminutive ſize may be aſcribed.

To DWARF, *v. a.* To hinder from growing to the natural bulk; to ieſſen; to make little.—It is reported that a good ſtrong canvaſs, ſpread over a tree grafted low, ſoon after it putteth forth, will *dwarf* it, and make it ſpread. *Bacon.*

DWARF'ISH, *adj.* Below the natural bulk; low; ſmall; little; petty; deſpicable.—We ſhould have loſt oaks and cedars, and the other tall and loſty ſons of the foreſt, and have found nothing but *dwarfiſh* ſhrubs and creeping moſs, and deſpicable muſhrooms. *Bentley.*

This unheard faucineſs, and boyiſh troops,
The king doth ſmile at; and is well prepar'd
To whip this *dwarfiſh* war, theſe pigmy arms,
From out the circle of his territories. *Shakeſpeare.*

DWARF'ISHLY, *adv.* Like a dwarf.

DWARF'ISHNESS, *ſ.* Minuteneſs of ſtature; littleneſs.—'Tis no wonder that ſcience hath not outgrown the *dwarfiſhneſs* of its priſtine ſtature, and that the intellectual world is ſuch a microcoſm. *Glanville.*

To DWAULE, *v. a.* [Spelman, Sax. to wander; *dwaelen*, Dut.] To be delirious: a provincial term.

To DWELL, *v. n.* pret. *dwelt*, or *dwelled.* [*dualla*, old Teut. is *ſtay*, *delay*; *duelia*, Iſlan. to ſtay, to ſtand ſtill.] To inhabit; to live in a place; to reſide; to have an habitation.—If thy brother that *dwelleth* by thee be waxen poor, and be ſold unto thee, thou ſhalt not compel him to ſerve as a bond ſervant. *Lev.* xxv. 39.—He ſhall *dwell* alone, without the camp ſhall his habitation be. *Lev.* xiii. 46.—To live in any form of habitation.—Abraham ſojourned in the land of promiſe as in a ſtrange country, *dwelling* in tabernacles. *Heb.* xi. 9.—To be in any ſtate or condition:

'Tis ſafer to be that which we deſtroy,
Than by deſtruction *dwell* in doubtful joy. *Shakeſpeare.*

To be ſuſpended with attention; to hang upon with care or fondneſs:

Such was that face, on which I *dwelt* with joy,
Ere Greece aſſembled ſtemm'd the tides to Troy. *Pope.*

To continue long ſpeaking.—We have *dwelt* pretty long on the conſiderations of ſpace and duration. *Locke.*

He preach'd the joys of heav'n, and pains of hell,
And warn'd the ſinner with becoming zeal;
But on eternal mercy lov'd to *dwell.* *Dryden.*

To DWELL, *v. a.* To inhabit. *Not uſed:*

I ſaw and heard; for we ſometimes
Who *dwell* this wild, conſtrain'd by want, come forth
To town or village nigh. *Milton.*

DWEL'LER, *ſ.* An inhabitant; one that lives in any place:

Their cries ſoon waken all the *dwellers* near;
Now murmuring noiſes riſe in every ſtreet. *Dryden.*

DWEL'LING, *ſ.* Habitation; place of reſidence; abode.—Hazor ſhall be a *dwelling* for dragons, and a deſolation for ever. *Jer.* xlix. 33.

God will deign
To viſit oft the *dwellings* of juſt men. *Milton.*

The force of fire aſcended firſt on high,
And took its *dwelling* in the vaulted ſky. *Dryden.*

State of life; mode of living.—My *dwelling* ſhall be with the beaſts of the field. *Daniel.*

DWEL'LINGHOUSE, *ſ.* The houſe at which one lives.—A perſon ought always to be cited at the place of his *dwellinghouſe*, which he has in reſpect of his habitation and uſual reſidence; and not at the houſe which he has in reſpect of his eſtate, or the place of his birth. *Ayliffe.*

DWEL'LINGPLACE, *ſ.* The place of reſidence.—People do often change their *dwellingplaces*, and ſome muſt die, whilſt other ſome do grow up into ſtrength. *Spenſer.*

DWIN, a town and caſtle of Hungary: fourteen miles eaſt of Schemnitz.

DWI'NA, a river of Ruſſia, which riſes in the ſouthern part of the government of Vologda, and runs into the White Sea, a little to the north of Archangel, after a courſe of about 5000 miles.

To DWIN'DLE, *v. n.* [ƿpinan, Sax.] To ſhrink; to loſe bulk; to grow little.—Thy *dwindled* legs ſeem crawling to the grave. *Dryden.*

Our drooping days are *dwindled* down to nought,
Their period finiſh'd ere 'tis well begun. *Thomſon.*

To degenerate; to ſink.—Religious ſocieties, though begun with excellent intentions, are ſaid to have *dwindled* into factious clubs. *Swift.*—To wear away; to loſe health; to grow feeble.—We ſee, that ſome ſmall part of the foot being injured by a wrench or a blow, the whole leg or thigh thereby loſes its ſtrength and nouriſhment, and *dwindles* away. *Locke.*

Phyſicians, with their milky cheer,
The love-ſick maid, and *dwindling* beau, repair. *Gay.*

To fall away; to be diminiſhed; to moulder off.—Under Greenvil, there were only five hundred foot and three hundred horſe left; the reſt were *dwindled* away. *Claren.*

DWOR'ZEC, a town of Lithuania, in the palatinate of Novogrodek: eight miles ſouth of Novogrodek.

DWOR'ZYSZCE, a town of Lithuania, in the palatinate of Wilna: twenty miles ſouth of Wilna.

DYE. See DIE.

DYE, *ſ.* in architecture, the trunk of the pedeſtal, or that part between the baſe and the cornice, being ſo called, becauſe it is often made in the form of a dye or cube.

DY'ER, *ſ.* One who follows the art or profeſſion of dying cloth, &c.

DY'ER (ſir James), an eminent lawyer and judge, born about 1511, at the ſeat of his father in Somerſetſhire. He received his academical education at Broadgate-hall, Oxford, whence he removed for the ſtudy of the law to the Middle-Temple. He roſe through different offices in his profeſſion to that of chief juſtice of the common pleas in the reign of queen Elizabeth, which he held for upwards of twenty-two years with a high character for integrity and ability. His temper was placid and ſerene, and he was free from that rudeneſs and violence of invective which too often diſgrace great characters on the bench. He died at his eſtate of Howton in Huntingdonſhire, in 1581. Sir James Dyer was the author of a valuable Book of Reports, in folio, containing caſes and deciſions occurring in the reigns of Henry VIII. Edward VI. Mary, and Elizabeth. It was firſt printed in 1601, and has been ſeveral times reprinted, the beſt edition being that of 1688. It is much eſteemed for conciſeneſs and ſolidity. He alſo wrote A Reading upon Stat. 32 Hen. VIII. c. 1. of Wills, and upon two others for its Explanation, 4to. 1648.

DY'ER (John), a reſpectable Engliſh poet, ſon of an eminent ſolicitor at Aberglaſney in Caermarthenſhire, born in 1700. He was brought up at Weſtminſter ſchool under Dr. Freind, and was deſigned by his father for his own profeſſion; but, being at liberty, in conſequence of his father's death, to purſue his own inclination, he indulged in a natural taſte for painting, and became a pupil to Mr. Richardſon. He afterwards wandered about South Wales and the adjacent counties as an itinerant artiſt; but it does not appear that he ever attained diſtinction in that profeſſion. In 1727, he made himſelf known as a poet, by the publication of his Grongar Hill, which became one of the moſt popular of deſcriptive poems, and has been admitted into numerous collections. After the publication of this piece, Dyer travelled to Italy for profeſſional improvement. If he did not acquire that in any conſiderable degree, he certainly improved his poetical taſte, and laid in a ſtore of new images. Theſe he diſplayed in a poem of ſome length, written in blank verſe, and publiſhed in 1740, intitled The Ruins of Rome. It conſiſts of a ſimilar combination of deſcription and ſentiment with his Grongar Hill, but both in a more elevated and varied ſtile, proportioned to the ſuperior magnitude of the ſubject. Dr. Johnſon ſays of it, that "the title raiſes greater expectation than the performance gratifies." This, upon the whole, may be the fact; yet it contains many paſſages truly poetical, and the ſtrain of moral and political reflection is that of a benevolent and enlightened mind. The author being in a delicate ſtate of health, and by character apparently not calculated to make his way in buſy life, was adviſed by his friends to take orders; his liberal education and irreproachable manners rendering ſuch a change not unſuitable. He was accordingly ordained by Dr. Thomas, biſhop of Lincoln; and entering into the matrimonial ſtate, he ſat down on a ſmall living in Leiceſterſhire. This he exchanged for one in Lincolnſhire, to which a ſecond benefice was ſoon added. His place of reſidence was Coningſby in Lincolnſhire; but the fenny country did not agree with his health. In 1757, he publiſhed his largeſt work, The Fleece, a didactic poem, in four books. Its propoſed theme is, "the care of ſheep, the labours of the loom, and arts of trade;" the firſt part paſtoral, the ſecond mechanical, the third hiſtorical and geographical. The compaſs, therefore, is large; but many of the topics are not very well adapted to poetry. The author did not long ſurvive its publication. He died of a gradual decline in 1758, leaving behind him, beſides the reputation of an ingenious poet, the character of an honeſt, humane, and good man. His poems were printed together in one volume octavo, 1761. He was the author of a few ſmaller pieces beſides thoſe above-mentioned.

DY'ER's ISLAND, a ſmall iſland of America, in Narraganſett Bay.

DY'ER's WEED. See GENISTA and RESEDA.

DY'ING, the part. of *die*. Expiring; giving up the ghoſt. Tinging; giving a new colour.

DY'ING, *ſ.* The art of fixing or communicating any given colour to the fabric of cloth, ſilk, cotton, linen, &c. Some lexicographers include, as part of the meaning of this word, a developement of the nature and properties of thoſe colours which conſtitute the dye; but this evidently forms one of the departments of chemiſtry: thoſe, therefore, who would excel in the profeſſion of a dyer, ought to ſtudy with due attention the elements of that invaluable ſcience. The French nation, always our moſt powerful rival in commerce and manufactures, juſtly appreciating the high importance of the dying art, hath wiſely inſtituted rewards to thoſe who make uſeful diſcoveries in it; and ſucceſſively appointed thoſe eminent chemiſts Dufay, Hellot, Macquer, and Berthollet, to inveſtigate and improve the then imperfect knowledge of the properties of all the dying ingredients, ſo intimately connected with chemiſtry. Hence the late improvements in the art of dying, in the permanency of colours, in the beauty of tints, and facility of execution, are to be attributed in a great meaſure to the indefatigable reſearch of the French chemiſts. And hence, in a modern Treatiſe of Dying, a reference to theſe improvements,

provements, and to the native qualities of the ingredients to be uſed, become as much a ſubject of our enquiry, as the practical modes of operation.

The origin of the art of dying appears to be much anterior to every ancient writer with whom we are acquainted; conſequently whatever is offered upon that ſubject muſt proceed from conjecture. The colours accidentally produced by the juices of fruits and flowers, or by the ſtains of blood, might have ſuggeſted the firſt idea of this art; after which a ſpirit of emulation would naturally excite to further trials, ſuch as imitating the blue enamel of the ſky, the rich and glowing tints on the plumage of birds, the beautiful colours of the inſect tribes, and of many ſpecies of ſerpents, fiſhes, ſhells, &c. But it would ſoon be obſerved that this beauty was of ſhort duration, and that it was neceſſary to renew the tints by a freſh application of the colouring ſubſtances, until ſome experiments which mankind might eaſily make while they lived under the freedom of the early ages, or perhaps ſome fortunate accident, may at length have taught them how the colours could be fixed, by the agency of ſalts, and other ſimilar ſubſtances.

As mankind began to multiply, new wants would be created, employments would be increaſed, and thoſe devoted to the ſervice of religion would require to be diſtinguiſhed from the other claſſes of ſociety. Hence aroſe particular ranks and conditions, to which certain marks were to be aſſigned according to their functions; and for this purpoſe no better or more certain means could be found than diverſity of dreſs. In the earlieſt ages, therefore, particular colours were allotted to the leaders of armies, judges, and prieſts; and for feſtivals, funerals, and religious ceremonies. Thus, in proceſs of time, dying would not be conſidered as an art merely calculated to gratify vanity, but as an invention of the utmoſt utility to ſociety.

The firſt dye concerning which we have any authentic information, is the much-celebrated Tyrian purple. Almoſt all the ancient authors who ſpeak of this invention, aſcribe it to the hunger of a ſhepherd's dog, blended with the force of love. The dog happening to take in his mouth a ſhell-fiſh, which he found on the ſea ſide, his mouth became coloured with the purple juice it emitted. The ſhepherd's ſweetheart noticing the colour, was ſo ſtruck with it, that ſhe importuned her lover to procure her a dreſs dyed of that ſame colour. The ſhepherd ſoon found out the ſubſtance which had produced ſo beautiful a tint, and by theſe means diſcovered the art of dying purple. Some, however, aſcribe this invention to a Tyrian named Hercules, who preſented the reſult of his firſt experiment to the king of Phœnicia, who was ſo captivated with it, that he made purple one of his principal ornaments. The laſt opinion appears to be the more probable, as the former fable may have originated from a play on words; for, according to Bochart, as *dog* and *colour* are expreſſed in the Syrian language by the ſame word, the Greek writers, who borrowed this ſtory from the Syrians, and the Romans who copied from the Greeks, might eaſily have been led into an error. That a Tyrian was the inventor, is unanimouſly aſſerted by all writers; but they differ in regard to the time. Some place the invention under Phœnix, the tenth king of Tyre, or about 1500 years before the birth of Chriſt; others, in the time when Minos reigned in Crete, or about the year 1439 before the Chriſtian æra. The ſubſtance employed for making this expenſive colour, was the liquor of ſhell-fiſh, called by the Hebrews *argaman*, by the Greeks πορφυρα, and by the Romans *purpura*, *murex*, and *oſtrum*, deſcribed in the article CONCHOLOGY, with figures of the ſhells, vol. v. p. 28.

The Tyrians gave the firſt ground of their purple dye by the unprepared liquor of the *purpura*, and then improved or heightened it by a liquor, made much ſtronger. In this manner they prepared their double dyed purple, *purpura dibapha*, which was ſo called either becauſe it was immerſed in two different liquors, or becauſe it was firſt dyed in the wool, and then in the yarn. The Greeks, according to the account of Democritus, poured the liquor as it came from the fire into a veſſel, immerſed the wool in it, and ſuffered it to remain in that ſtate a day and a night. Between this method and that of the Romans there ſeems to be no eſſential difference. The latter, according to Pliny, ſuffered the wool to remain in the liquor five hours, after which they dried it; they then immerſed it in the liquor again, and continued in this manner till it had imbibed all the dye. By theſe means the wool acquired a colour like that of the amethyſt, and thence it was denominated *color amethyſtinus*. The colour called *conchylium*, or hyacinthine, was dyed almoſt in the ſame manner, only that half as much of the liquor of the *purpura* was uſed as in the former caſe: and that it was mixed with one half urine and water. This colour, therefore, was brighter and cheaper than the other. Beſides theſe, the ancients were acquainted with the method of dying with kermes, (*graines d'ecarlate*,) a ſcarlet colour, called in the Bible *tholaat ſchani* (*colorem coccineum*), which they held in high eſtimation. Whether the ſcarlet of the ancients was the ſame as ours, cannot be determined, but we are told by Pliny, that it was a very agreeable roſe colour. All theſe dyes are frequently confounded by ancient authors, who often give the name of purple to red colours; and from this circumſtance, and from that of various other colours being produced by the mixture of the before-mentioned four kinds of dye, the uncertainty which prevails on this ſubject ſeems to have ariſen.

Beſides Tyre there were other places celebrated either on account of their purple ſhell-fiſh, or their method of preparing the dye. The following are often mentioned in the works of the antients: the *Gætulian purple*, for which the ſhell-fiſh found on the Gætulian coaſt were employed. A great deal of cloth, &c. was dyed in particular in the iſland of Madura and Porto Sancto, which on that account were by the antients called the Purple Iſlands, (*Inſulæ Purpurinæ*.) Alſo the Lacedemonian purple, and the Tarentine. At firſt theſe kinds of purple were exceedingly rare at Rome, but under Auguſtus they became the faſhionable colours; though a pound of Tyrian purple wool could not be procured for leſs than a thouſand denarii, ſomewhat more than thirty-two pounds ſterling. The almoſt incredible prices at which this purple was ſold among the ancients, is to be underſtood, in general, as applicable to this kind, as the others were much cheaper. The hyacinth colour, (*color conchylius*,) is called in the Bible *thechelet*, from which the Latin word *conchylium* is ſaid to be derived. As this colour did not require ſo much purple liquor, it was not ſo dear as the former colours; and in the time of Julius Cæſar, a pound of it coſt only one hundred denarii, five pounds ſterling. It, however, was not dark red, but had a blueiſh caſt. Pliny mentions three ſhades of it, one of which he compares to the night-violet, *viola ſerotina*. The *Color Tyriamethyſtus*, was a mixture of the Tyrian purple with the amethyſt colour, as the name indicates. The *Color hyſginus*, was compoſed of the ſcarlet and Tyrian purple colours. As no ſpecimens have been preſerved of theſe colours, we muſt be contented with the deſcriptions given by Pliny and others; for it would now be fruitleſs to attempt to obtain a more accurate knowledge of them. Of their durability, Plutarch gives a remarkable inſtance in his life of Alexander. This prince, it is ſaid, found in the treaſury of the Perſian monarch a large quantity of purple, 180 years old, which ſtill retained all its beauty; and the cauſe, according to Plutarch, was, that it had been prepared with honey.

As the ancients had no colour equal to the purple in beauty, durability, and coſtlineſs, it is not ſurpriſing that they ennobled it by the particular purpoſes to which it

it was deſtined. As the power and reſpect of kings increaſed, it was made a ſymbol of majeſty; and this was carried ſo far, that in the time of the emperors it was conſidered as a particular right belonging to the princes of the imperial houſe; ſo that immediately after their birth, they were wrapped in purple ſwaddling-clothes, and by theſe means obtained, as it were, a title to the empire. Nay, it was conſidered as an almoſt indiſpenſable ceremony in the choice of an emperor, that the ſucceſsful candidate ſhould be clothed in purple; and we have inſtances of the ſoldiers, when nothing elſe was at hand, tearing the purple from their ſtandards, and wrapping it round the newly-choſen emperor. In free republican ſtates this colour was a mark of the higheſt official dignity. Thus the ſupreme magiſtrates at Rome were diſtinguiſhed by broader or narrower purple ſtripes, with which their clothes were bordered behind and before. Hence it happened that purple, which every one had been before at liberty to uſe, was by the emperors made a regality; and when aſſumed by private perſons, was puniſhed with death, as a kind of high treaſon. Many attempts have been made, with tolerable ſucceſs, to reſtore the ancient Tyrian purple dye to modern practice, and numbers of ſhells of the buccinum genus have been collected for this purpoſe; but the perfection to which other dyes have been recently brought, and the beautiful purples of modern times, render the Tyrian method unneceſſary.

The Greeks, about the period of Alexander the Great, and under his ſucceſſors, firſt began to render black, dark blue, yellow, and green, dyes, more beautiful, and to learn the art alſo, of fixing them on linen. We find, among the various companies eſtabliſhed by Numa at Rome, a dyers' company, called *collegium tinctorum*. Afterwards the art of dying continued to increaſe among the Romans, and they began to divide colours into general and particular, according as they were uſual among both ſexes, or were excluſively worn by either. Thus the ancient authors frequently ſpeak of the colours by which the four different parties at the Circenſian games were diſtinguiſhed from each other, and which, on that account, were called the *colores circenſes*. Theſe were green, aurora colour, aſh colour, and white. This colour afforded employment in particular to the *fullones*, who waſhed and ſcoured white as well as coloured clothing. For this purpoſe they employed urine, chalk, ſaltpetre, and fumigation with ſulphur. The proceſſes to be uſed were preſcribed by a peculiar law (*Lex Metellana*) iſſued by the tribune Metellus, in the year of Rome 354. They were required, in the firſt place, to waſh the clothes with Sardinian earth, then to expoſe them to the vapour of ſulphur, and to ſcour them with unadulterated Cimolian earth, (from *Cimolus*, one of the iſlands called the Sporades,) which reſtored the ſplendour of the colour that had been deſtroyed by the ſulphur. In the laſt place, they ſmoothed the pile of the cloth with the ſkin of a hedge-hog, or the fuller's thiſtle, and then preſſed it. A paſſage in St. Mark ix. 3, alludes to this proceſs. Luther tranſlates the word γναφευς (*fullo*) improperly, by making it ſignify a *dyer*.

But the art of dying was not confined merely to the Phœnicians, Hebrews, Greeks, and Romans; it was ſoon communicated to other nations, each of which employed for this purpoſe ſuch minerals and plants as their different countries produced. According to the account of Pliny and other authors, the Gauls who inhabited beyond the Alps dyed the moſt beautiful purple and other colours with herbs; but they were not acquainted with a method of fixing them. We are told alſo by Tacitus, that the German women manufactured linen dreſſes, and dyed them of a beautiful purple red colour. Pliny gives a deſcription of an ingenious mode of dying, which has a near reſemblance to our cotton printing, then practiſed by the Egyptians. They applied to the white cloth certain tinctures, more or leſs capable of imbibing the dyes, (*colorem forbentibus medicamentis*,) and which were not viſible. The cloth was then put into a boiler, containing the dye or colouring compoſition, and after it was taken out, it appeared as if painted with various colours. Theſe colours never faded; and the cloth, by the boiling, was rendered more durable. Something of the ſame kind is related by Herodotus, who informs us, that certain people, who lived near the Caſpian ſea, by means of the leaves of trees, which they bruiſed, and ſteeped in water, could form on cloth the figures of animals, flowers, &c. which were as laſting as the cloth itſelf. The art of dying was alſo in great eſteem among the Perſians at a very early period. Among the Chineſe, too, Hoang-ti, one of their earlieſt emperors, was, according to Martini, the firſt who wore a blue dreſs, as being the colour of the heavens, and a yellow one, as being the colour of the earth. He alſo cauſed dreſſes of different colours to be made in imitation of flowers and birds, that they might ſerve as marks of diſtinction to the high and the low, the rich and the poor, in his empire.

It has been a queſtion of much doubt, whether the ancients, in their modes of dying, employed what are called *mordants*. Pliny, when ſpeaking of the ſpecies of dying peculiar to the Egyptians, expreſsly ſays that the workmen began by rubbing the ſtuffs which they intended to dye, and afterward applied drugs which did not leave any ſtain, but had the property of powerfully imbibing the colours ſubſequently to be employed. It cannot therefore be doubted that the ſubſtances thus employed acted as mordants. The ancient Greek chemiſts, (whoſe manuſcripts are ſcarcely known but by their titles, given by Fabricius,) explain with much perſpicuity the neceſſity of fixing colours by mordants. They notice the fugitive and permanent colours, χρωματα φευκτα, and χρωματα αφευκτα. Many other equally forcible expreſſions occur; among which we may notice the term δηκτικα, correſponding exactly with the word mordant, being derived from the verb δηκω, *mordeo*. The Greek chemiſts moreover obſerve that ſometimes the mordants were firſt applied, (υποβαφτον, or υποδυφη,) and afterward the colour: but at other times the mordant and colour were mingled together: and the application of the mordant was regarded as ſo very eſſential by the Greeks, that the term denoting it (βαφειν) was frequently employed to ſignify the operation of dying; of which Dioſcorides furniſhes many examples.

The ancients were acquainted with but few metallic ſalts; native ſulphat of iron and of copper were, however, certainly uſed by them in dying; and the colours were formed and fixed by the gall-nuts, or by the ſeeds of a ſpecies of acacia peculiar to Egypt, or by the rind of pomegranates. Some ſubſtances poſſeſs the properties of a mordant as well as of a colouring principle; and ſeveral of theſe, ſuch as the root of the oak, and a ſpecies of lotus, called by Pliny *faba Græca*, were known and employed. The ancients alſo made uſe of various ſubſtances which by modern dyers are called alteratives, and which produce certain changes in many dyes or colours. Muriat of ammonia, or ſal ammoniac, was known to the ancients, and Pliny relates the mode by which it was prepared: but it is uncertain whether or not it was employed in dying. Even ſuppoſing it not to have been uſed, ſtill its place was ſupplied by urine; and, according to Pliny, this laſt fluid was commonly employed to form the purple dye in the manner of an alterative. Lime was alſo probably uſed by the ancients, who prepared it from marble and ſhells.

The Greeks and the Saracens were for a long time the excluſive poſſeſſors of this art, and furniſhed the weſtern world with dyed ſtuffs, and particularly purple; which, according to ſome authors, was prepared by them of a beautiful colour in the eleventh century. The public taſte, however, was at length changed, and people began to ſet as great a value on the ſcarlet as upon purple, and

at length to prefer it; and on this account, in the twelfth century, the art of dying purple in the eaſt was almoſt forgotten. And, in conſequence of the cruſades in the eleventh and following centuries, this art began to be revived in the weſt; as the Chriſtian princes who went on theſe expeditions brought back with them a great many Greek dyers. Soon after, the Italians made conſiderable progreſs in this art: for, as the cruſaders were conveyed to the Holy Land, and brought back from it, chiefly in Italian ſhips, the Italians had the beſt opportunities either of learning the art of dying beautiful colours themſelves, or of bringing back expert dyers, whom they muſt have found very neceſſary to their manufactures, which were then in high eſtimation. Indeed, ſo early as the year 1338, there were in Florence 200 cloth manufactories, which manufactured annually from 70 to 80,000 pieces of cloth, valued at 1,200,000 florins. A Florentine merchant, who about the year 1300 traded in the Levant, happening to make water on a rock covered with moſs, he obſerved that the green colour of the moſs was inſtantly changed to a beautiful blueiſh colour. Reflecting on this circumſtance, he found, after ſeveral experiments that when mixed with urine and other things, it communicated to cloth a columbine colour. This proceſs, he kept ſecret, and acquired by it a great deal of money. The invention at that period was ſo profitable to the Florentines, and excited ſo much wonder, that the family of the inventor, which ſtill exiſts in Italy, were called *Rucellai*, from the name of the moſs, which in Spaniſh is diſtinguiſhed by the appellation of *orciglia*, and the dye made from it is called *orchilla*.

After this period the manufactures in Italy increaſed ſo much, that the attention of the different governments was particularly directed to the art of dying. In 1429 there were publiſhed at Venice ſome regulations reſpecting dying, (*Mariegola dell' Arte dei Tintori*,) in which certain precepts were given, according to which dyers were to exerciſe their art. Theſe regulations were renewed in the year 1510, with a great many improvements; when John Ventura Roſetti, finding theſe precepts too imperfect, made a tour through Italy and other countries to procure further information reſpecting the art of dying, and on his return wrote, under the aſſumed name of Plictho, a book on it; the firſt, perhaps, that ever appeared on this ſubject, and which undoubtedly laid the foundation for the improvements in this art which afterward took place. The title of this work, exceedingly ſcarce even in Italy, an original edition of which is preſerved in the royal library at Gottingen, is as follows: Plictho's Art of Dying; which teaches how to give to Cloth, Linen, Cotton, and Silk, real and beautiful as well as falſe and common Dyes. Venice, 1548. 4to. This author was not acquainted either with indigo or cochineal; but he ſpeaks of Brazil wood, which he calls *verzino*, a name ſtill given to it in Italy, and from which the word *braſilis* has been derived. Thus Plictho was the firſt who exhibited this art in its full luſtre, and excited the French, Engliſh, and Germans, to apply in earneſt, in their different countries, to the improvement of ſo uſeful and extenſive a branch of manufacture.

In France, ſome progreſs towards this object had been already made by Giles Gobelin, who had learned from a German the art of dying ſcarlet; and wiſhing to eſtabliſh it in that country, he erected a dye-houſe, in the ſuburbs of Paris, on a ſmall ſtream called the *Bievre*. This undertaking was at firſt conſidered to be a work of ſo much difficulty, that no one believed he would be able to complete it, and for that reaſon his dye-houſe was called *La Folie Gobelin*, or Gobelin's Folly. Gobelin, however, continued his buſineſs; and ſcarlet dyed after his manner is to this day, in commerce, called *Gobelin's ſcarlet*. Notwithſtanding this, dying continued in a very imperfect ſtate until Colbert, the great miniſter of Louis XIV. in 1669, undertook its improvement. With this view he examined the eſtabliſhment and defects of the French dyers; and M. d'Albo, at his deſire, compoſed a ſet of regulations reſpecting dying, which were publiſhed at Paris in 1669, and 1672. The introduction to this book contains a proof of Colbert's regard for this art:—"If the ſilk, woollen, and linen manufactories, (ſays he,) are thoſe which contribute moſt to the ſupport and advancement of trade and commerce, dying, which ſupplies that variety of colours by which the moſt beautiful things in nature are imitated, may be conſidered as the ſoul of it, without which the body would be animated only by feeble life. Wool and ſilk in their natural colours, formerly raw articles of little value, now find ſale in the country, when they have received from the dyer thoſe attractions which render them valuable and agreeable to the moſt ſavage nations." About this time the dying ingredients brought to Europe from the newly diſcovered countries, eſpecially indigo and cochineal, began to be employed with great advantage. The Netherlanders, in particular, by means of them, produced more durable and livelier colours; for though they had begun, almoſt at the ſame time as the Italians, to apply to the art of dying with great zeal, and to take advantage of the troubles in the eaſt, they had never been ſo fortunate, notwithſtanding all their exertions, as to make any great progreſs in it. At laſt a Flemiſh painter named Peter Kloeck, who, during his long travels in various parts of the eaſt, had learned the art of giving the moſt beautiful colours to ſilk and woollen ſtuffs, as well as of dying ſcarlet, returned to his own country, and excited as much attention by his method as Gobelin had done at Paris.

Dying ſeems alſo to have been practiſed in England at a very early period; for in the fourteenth century Edward III. brought a great many dyers from Flanders. Under Edward IV. dyers were ſo numerous in London, that in 1472 they were firſt eſtabliſhed into a company. After the diſcovery of America, the new dye-ſtuffs began to be uſed alſo in England; but here people were at firſt ſo miſtruſtful of them, that under queen Elizabeth dying with indigo was not only limited, but the uſe of logwood was entirely prohibited, and it was burnt wherever it was found. This prohibition was afterwards repealed, and annulled under Charles II. in 1661. But, notwithſtanding the attention thus paid to dying by the government, it remained in a languiſhing ſtate till the year 1643, when a German, named Kephler, firſt brought to England his new method of dying ſcarlet; and becauſe he eſtabliſhed a dye-houſe at the village of Bow, the ſcarlet he dyed was called the *Bow dye*. At length a Fleming, named Brauer, who in 1667 came to England with his whole family, brought the art of dying woollen cloth to ſuch perfection here, that it has ever ſince retained its acknowledged reputation, and to this day challenges a ſuperiority in every foreign market.

APPARATUS OF THE DYE-HOUSE.

The moſt commodious ſituation for a dye-houſe is on the ſide of a running ſtream, with a floor made of a mixture of lime and cement, inclining towards the ſtream, that all waſhings, rincings, filth, and waſte water, may ſpeedily run off. The principal veſſels are the vats, which in large manufactories are various; ſuch as the woad vat, the indigo vat, the paſtel vat, &c. The woad vat is uſually from ten to twelve feet in diameter, and ſix or ſeven feet high; they are made of ſtaves ſix inches broad, and two inches thick; are bound with iron hoops about two or three feet aſunder, and are ſunk in the ground, for the conveniency of managing their contents; which is done by means of hooks faſtened to the end of a ſtaff, of a proper length, according to the diameter of the vat. The bottom of theſe veſſels is made with lime and cement; but this however is not eſſential, and is practiſed only where it would be difficult to make a wooden bottom ſtrong enough to ſupport the contents of ſo large a veſſel. For dying wool or ſtuff, there is ſuſpended within the veſſel an iron hoop, with a net faſtened to it, the meſhes

about

about an inch ſquare. This is called a *croſs*, and is uſed to prevent the wool or ſtuff from falling and mixing with the grounds at the bottom. Another utenſil called a *rake*, is made of a ſtrong ſemicircular piece of wood, with a long handle, and is uſed for ſtirring the vat; that is, for mixing the grounds with the liquor, and for raiſing the ſediment from the bottom. It is alſo uſed for daſhing or plunging the vat, that is, to puſh the ſurface quick and forcibly towards the bottom, which by introducing the air, forms little bubbles, or a kind of froth, by which the ſtate of the mixture or dye is to be judged of previous to the operation.

The indigo vat is generally five feet high, and at the top two feet in diameter. It grows narrower downwards, and meaſures only eight or ten inches at the bottom. It is ſunk a foot or a foot and a half in the floor, for the conveniency of working. There is a cylindrical wall built round it, as high as the vat, upon which the edge of the vat is ſupported. This wall being perpendicular, and quite ſtraight at the inſide, conſequently cylindrical, and the vat which it ſurrounds being of a conic form, it is evident there muſt be a ſpace at the bottom. In this ſpace the coal and cinders, requiſite for keeping the vat properly heated, are depoſited, and for this purpoſe there is a little door or opening to put in the coal which is puſhed all round the vat, to preſerve, as much as poſſible, an equable degree of heat. The indigo immediately falls to the bottom; but by this method of ſetting the vat, the fire is conſtantly above the indigo, ſo that it can neither burn, nor loſe any of its quality. The ſame precaution ſhould be obſerved with regard to the Dutch paſtel vats. As the fire muſt not be extinguiſhed too ſuddenly, there is fixed an iron or ſtone funnel where the coal is depoſited, reaching from the bottom to the top of the vat. This funnel, for the greater conveniency, ſhould be carried along the wall, againſt which the vat is commonly ſupported. For ſtirring the liquor of this vat, there is a rake, of a ſmaller ſize than that uſed for the paſtel vat. It may alſo be uſed with or without a croſs, ſimilar to that above mentioned. The paſtel vats are managed preciſely in the ſame manner.

Beſides the vats, there is a ſeries of boilers or coppers, of different ſizes, according to the quantity of work that is intended to be performed. They may be made either of copper or braſs; but the copper is preferable, being leſs apt to ſpot where it touches, or when the wool or ſtuff is ſuffered to remain in it for any length of time. It is alſo adviſeable to have a pewter veſſel for ſcarlet, becauſe in pewter, the worſted or ſtuffs never ſpot, whereas the contrary is much to be dreaded from a copper boiler. The dyers who make uſe of the latter for ſcarlet, take care to have a net of cords, or an open wicker baſket, in the inſide, to prevent the ſtuffs from touching the copper. The diameter of the net or baſket, being much ſmaller than the diameter of the cauldron, there conſequently remains a conſiderable diſtance between them. But notwithſtanding all theſe precautions, many are of opinion, that ſcarlet dyed in copper, is neither ſo bright nor ſo lively as when dyed in a pewter veſſel. Theſe coppers ſhould be fixed contiguous to each other, and, as nearly as poſſible, of the ſame height, ſo that the deepeſt veſſel ſhould be ſunk the loweſt. They ſhould be ſurrounded by a wall made of brick and clay, the outſide of which ſhould have a coat of plaſter; and, to preſerve the whole, the wall ſhould be coped with wheel-felloes, held together by iron cramps. The flat edge of the cauldron ſhould be nailed to the felloes with braſs nails, becauſe iron nails would ſpot the ſtuffs. Theſe felloes ſerve alſo to prevent the water, when it boils over, from carrying dirt into the copper. For the ſame reaſon a plank ſhould be fixt between the coppers, that, when two are employed at the ſame time, the liquor of the one may not fall into the other. But this caution will be needleſs where there is room enough to place the coppers at a tolerable diſtance from each other. Theſe cauldrons are heated underneath; and for the greater conveniency, the hearths of all the coppers, as well as the flues, are incloſed under the ſame chimney. The flues are openings, by which the ſmoke and part of the flame is carried off; the ſize of theſe openings, that of the hearth, and the depth of the furnace (viz. the diſtance of the bottom of the copper from the hearth where the fire is made), are determined by the ſize of the coppers; but the mantle-piece of the chimney ſhould always cover every opening, and ſhould project to the edge of the copper, in order to receive all the ſmoke, ſo that none may remain in the dye-houſe.

For the purpoſe of dying a whole piece of ſtuff, or ſeveral pieces at a time, a winch is made uſe of. This is a wooden axis with a handle, upon which axis are faſtened, four flat pieces of wood, at equal diſtances. This machine is turned with the hand, reſting the two extremes of its axis on two iron forks, fixed into holes in the wooden felloes by which the edge of the copper is ſupported. The piece to be dyed is rolled round this winch or reel, and when the whole is wound on, it is to be turned the contrary way, rolling off the ſtuff, into the copper or vat, till the whole is dyed as even as poſſible. If there are many pieces to dye of the ſame colour, the ends are ſewed together, and the reel is put through the middle, and turned as above-mentioned. To dye wool before it be ſpun, there is a kind of wooden ladder, or barrow, very broad, and as long as the diameter of the copper. The croſs-bars of this utenſil ſhould be very near each other. On this barrow, placed upon the copper, the wool is put, in order to drain, or to change the liquor. It were needleſs to mention the neceſſity of keeping this barrow and reel very clean. The ſame attention muſt be obſerved with regard to the coppers, and to all the different utenſils uſed in the art of dying; for without this attention the work will be conſtantly ſoiled, and the brightneſs of the colour tarniſhed.

A dye-houſe was erected in the year 1800, by Meſſrs. Gott and company at Leeds, on a noble and much improved plan, which not only reflects the higheſt reputation on the profeſſional abilities of the proprietors, but does honour to the age and country in which we live. In this extenſive manufactory the coppers are very numerous, and of different ſizes; and as theſe veſſels, ſome of which are very large, are diſtributed promiſcuouſly about, apparently without any order in their arrangement, in two ſpacious rooms, (each copper appearing to be inſulated, and to have no connection whatever with the others,) all of them together form a very ſtriking appearance. The rooms are paved with flat ſtones, and the brims of all the coppers, great and ſmall, are placed at the ſame height, about three feet, above the pavement. Some of theſe coppers contain upwards of 1800 gallons; and they are all heated by ſteam from only one ſteam-boiler, which is ſituated in a corner of one of the rooms. The horizontal tubes, which ſerve to conduct the ſteam from the ſteam-boiler to the coppers, are ſuſpended juſt below the ceiling of the rooms: they are made, ſome of lead, and ſome of caſt iron, and are from four to five inches in diameter. The vertical ſteam-tubes, by which the ſteam paſſes down from the horizontal ſteam-conductors into the coppers, are all conſtructed of lead, and are from three quarters of an inch to two inches and a half in diameter; being made larger or ſmaller according to the ſizes of the coppers to which they belong. Theſe ſteam-tubes all paſs down on the outſides of their coppers, and enter them horizontally at the level of their bottoms. Each copper is furniſhed with a braſs cock for letting off its contents; and it is filled with water from a ciſtern at a diſtance, which is brought to it by a leaden pipe. The coppers are all ſurrounded by thin circular brick walls, which ſerve not only to ſupport the coppers, but alſo to confine the heat. The rapidity with which theſe coppers may be heated, by means of ſteam, is truly aſtoniſhing. One of the largeſt of them, containing upwards

wards of 1800 gallons, when filled with cold water from the ciſtern, requires no more than half an hour to heat it till it actually boils! By the greateſt fire that could be made under ſuch a copper, with coals, it would hardly be poſſible to make it boil in leſs than an hour. It is eaſy to perceive that the ſaving of time which reſults from the adoption of this new mode of applying heat, will be very great; and it is likewiſe evident that it may be increaſed, almoſt without limitation, merely by augmenting the diameter of the ſteam-tube; care being taken that the boiler be ſufficiently large to furniſh the quantities of ſteam required. The ſaving of fuel is alſo very conſiderable; for, from the beſt calculation, it amounts to near two-thirds of the quantity expended, when each copper was heated by a ſeparate fire. But theſe ſavings are far from being the only advantages derived from the introduction of theſe improvements in the management of heat: there is one, of great importance indeed, which alone muſt be ſufficient to recommend the general adoption of them. As the heat communicated by ſteam can never exceed the mean temperature of boiling water by more than a very few degrees, the ſubſtances expoſed to it can never be injured by it, as is too often the caſe in manufactories where coal only is uſed.

On the PERMANENCY of DYED COLOURS.

No object in the art of dying is perhaps of ſo much importance as the *permanence* or *duration* of colour; for of what avail are the moſt beautiful tints, whether communicated to wool, ſilk, cotton, or linen, or ever ſo elegantly diverſified in figured calicoes, if thoſe tints are fugitive, and liable to fade or vaniſh by mere expoſure to light and air? It is therefore highly expedient to inveſtigate the nature and quality of all colouring matters, and of every material employed in the operation of dying, before they are committed to the vat. Theſe colouring matters are commonly called *dye-ſtuffs*, are extracted from animal, vegetable, and mineral, ſubſtances, and are found to poſſeſs very peculiar chemical properties; for beſides their ſeveral affinities with particular rays of light, they have others which render them ſuſceptible of being acted upon, and modified by a variety of chemical agents. But in reſpect of theſe affinities, colouring matters alſo differ eſſentially from each other, and muſt therefore be applied in different ways, and with very different means, to produce permanent colours on all occaſions. The art of dying is founded upon a knowledge of the particular properties and affinities of theſe matters, not only as far as they relate to the ſubſtances intended to be dyed, but alſo as far as they are connected with the operations of other agents, by which they are liable to be acted upon either during the proceſs of dying, or afterwards. Many ſpecies of animal and vegetable colouring matters ſuffer nearly ſimilar changes from the action of acids, alkalies, and other chemical agents; from which it may be preſumed, that there is ſomething of a common or ſimilar nature in the conſtitution of many of them. But though it would be highly uſeful to eſtabliſh general principles and concluſions on this ſubject, we are not yet furniſhed with the neceſſary information requiſite for ſuch a purpoſe.

Sir Iſaac Newton ſuppoſed coloured matters to reflect the rays of light; ſome bodies reflecting the more, others the leſs, refrangible rays moſt copiouſly; and this he conceived to be the true, and the only reaſon of their colours. See the article Colour, vol. iv. p. 789. Mr. Delaval, however, has maintained, in the ſecond volume of the Memoirs of the Philoſophical and Literary Society of Manchester, "that, in tranſparent coloured ſubſtances, the colouring matter does not reflect any light; and that when, by intercepting the light which was tranſmitted, it is hindered from paſſing through ſubſtances, they do not vary from their former colour to any other colour, but become entirely black:" and he inſtances a conſiderable number of coloured liquors, none of them endued with reflective powers, which, when ſeen by tranſmitted light, appeared ſeverally in their true colours; but all of them, when ſeen by incident light, appeared black: which is alſo the caſe of black cherries, black currants, black berries, &c. the juices of which appear red when ſpread on a white ground, or otherwiſe viewed by tranſmitted, inſtead of incident, light; and he concludes, that bleached linen, &c. "when dyed or painted with vegetable colours, do not differ in their manner of acting on the rays of light, from natural vegetable bodies; both yielding their colours by tranſmitting through the tranſparent coloured matter the light which is reflected from the white ground:" it being apparent, from different experiments, "that no reflective power reſides in any of their component parts, except in their white matter only," and that "tranſparent coloured ſubſtances, placed in ſituations by which the tranſmiſſion of light through them is intercepted, exhibit no colour, but become entirely black." If the cloth be black, it is clear that we cannot dye it any colour whatever; becauſe, as no light is in that caſe reflected, none can be tranſmitted, whatever dye-ſtuff we employ. If the cloth were red, or blue, or yellow, we could not dye it any colour except black; becauſe, as only red, or blue, or yellow, rays are reflected, no other could be tranſmitted. The art of dying, therefore, according to Mr. Delaval, conſiſts principally in covering white ſubſtances, from which light is ſtrongly reflected, with tranſparent coloured media, which, according to their ſeveral colours, tranſmit more or leſs copiouſly the ſeveral rays reflected from the white ſubſtances, ſince the tranſparent media themſelves reflect no light; and it is evident that if they yielded their colours by reflecting, inſtead of tranſmitting the rays, the whiteneſs, or colour of the ground on which they are applied, would not in any wiſe alter or affect the colours which they exhibit. For a complete view of this doctrine of light and colours, ſee the article Chromatics, vol. iv. p. 528, &c.

Such is undoubtedly the fact, ſo far as relates to tranſparent colouring matters, when applied to wool, ſilk, &c. *without* the interpoſition of any earthy or metallic baſis or mordant. But when any ſuch opake baſis is interpoſed, the reflection is doubtleſs made by it, rather than by the ſubſtance of the dyed wool, ſilk, &c. and more eſpecially when the baſis or mordant conſiſts of the white earth of alum, or the white oxyd of tin; which by their ſtrong reflective powers greatly augment the luſtre of colours. There are, moreover, ſome opake colouring matters, particularly the acetous and other ſolutions of iron, uſed to ſtain linen, cotton, &c. which muſt neceſſarily themſelves reflect, inſtead of tranſmitting the light by which their colours are made perceptible.

When the rays of light are ſeparated from each other by the priſm, in conſequence of their different degrees of refrangibility, they produce a perception of ſeven diſtinct colours, with their intermediate ſhades; which are all equally ſimple and primitive. There is, however, this peculiar property belonging to the red, yellow, and blue, colours, whether priſmatic or permanent; that they are incapable of being produced, like all the reſt, by the combination of any other colours. Blue and red will compoſe a purple; blue and yellow, a green; red and yellow, an orange, &c. but none of theſe, by any artifice or compoſition, will produce either the blue, yellow, or red: theſe laſt, therefore, are in all caſes ſimple or uncompounded; but all the others may be, and in reality are, ſometimes ſimple, and ſometimes compounded; not only thoſe which are merely priſmatic colours, but thoſe which exiſt naturally in bodies, or are communicated by painting, dying, &c. Iron, as has been already mentioned, will, by different degrees of oxydation, produce all poſſible varieties of colour; and theſe colours will be all ſimple or uncompounded; and ſo will the purple of gold, the green of copper, and the other colours found in the ſeveral oxyds of metals. This is alſo the caſe of the violet and purple dyed from logwood; of the green co-

louring matter of the leaves, flowers, &c. of vegetables; of the green inner bark of elder, the green juice of the berries of the rhamnus catharticus, and of the orange dyed from the quercitron bark. And among animal colours, numerous inſtances may be alleged of ſimple or uncompounded greens, oranges, purples, and violets: even the liquor of the purpura, from which the Tyrian purple was produced, paſſes quickly through all the ſhades of yellow, green, violet, and purple, upon being expoſed to the ſun in atmoſpheric air; and theſe muſt neceſſarily be deemed ſimple, not compound colours. but on the other hand, dyers, painters, &c. daily produce, orange, green, purple, and violet, by mixtures of the blue, yellow, and red.

The colouring matter with which cloth is dyed, does not cover every portion of its ſurface; but its particles attach themſelves to the cloth at certain diſtances from each other: for cloth is dyed different ſhades of the ſame colour, lighter or darker, merely by varying the quantity of colouring matter. With a ſmall quantity the ſhade is light; and it becomes deeper as the quantity is increaſed. Now this would be impoſſible, if the dye-ſtuff covered the whole of the cloth. Newton has demonſtrated, that colours are rendered faint when the rays of light which occaſion them are mixed with white rays. Conſequently, from cloth dyed of a light ſhade, a conſiderable quantity of white rays paſſes off unchanged: but this could not be the caſe if the ſtuff were covered with coloured matter; becauſe all the white rays would be decompoſed as they paſs through the coloured matter. Therefore, in light ſhades, the colouring matter does not cover the cloth; its particles adhere to it, at certain diſtances from each other; and from every part of the cloth which is uncovered, the white rays paſs off unchanged. Even when the ſhade of colour is as deep as poſſible, the colouring particles do not cover the whole of the cloth, but are at a certain diſtance from each other. This diſtance, undoubtedly, is diminiſhed in proportion to the deepneſs of the ſhade: for the deeper the ſhade, the ſmaller is the number of white rays which eſcape undecompoſed; the more, therefore, of the ſurface is covered, the ſmaller is the diſtance at which each of them is placed. A ſhade may be even conceived ſo very deep, that not a particle of white light eſcapes the action of the colouring matter; in which caſe, the diſtance between the particles of colouring matter could not exceed double that diſtance at which a particle of matter is able to act upon light.

That the particles of colouring matter, even when the ſhade is deep, are at ſome diſtance, is evident from this well-known fact; that cloth may be dyed two colours at the ſame time. All thoſe colours to which the dyers give the name of *compound*, are in fact two different colours applied to the cloth at once. Thus cloth gets a green colour, by being firſt dyed blue, and then yellow. The rays of light that paſs from green cloth thus dyed are blue and yellow; by the mixture of which it is well known that green is produced. In this caſe it is clear, that each of the colouring matters performs the very ſame office as if it were alone; and that the new colour is not produced by the combination of the two colouring matters. That part of the white light, reflected from the cloth, which paſſes through the blue colouring matter, is decompoſed, and the blue rays only tranſmitted; and that part of the white light which paſſes through the yellow colouring matter is alſo decompoſed, and only the yellow rays tranſmitted. It is clear, therefore, that both of the colouring matters equally cover the naked fibres of the cloth; conſequently the one muſt be placed in the intervals of the other: wherefore the particles of each of the colouring matters are at ſome diſtance. Now the ſame effect happens how deep ſoever the ſhade be; and it makes no difference which of the two dyes be firſt given. Nay, if one of the dyes have a ſtrong affinity for the cloth, and the other only a weak affinity, the latter will ſoon diſappear, and leave the cloth of the colour which the firſt dye gives it. The difference, then, in the ſhades of colour, and alſo the compound colours which cloth may receive, depend entirely upon the diſtance between the particles of the colouring matters attached to the cloth, and the poſſibility of partly filling up the intervals, either with the ſame colouring matter, or with a different one.

Several attempts have been made to arrange and claſs the different ſpecies of colouring matters employed for dying and callico printing; but none ſeems to accord with, or give any juſt ideas of, their ſeveral natures and properties. Mr. Berthollet, indeed, alleges many reaſons for not dividing theſe matters, as Mr. Macquer did, into extractive and reſinous, and alſo for not making their effects depend, as Mr. Pœrner has done, upon the mucilaginous, earthy, ſaline, reſinous, or oily, parts, of which they were ſuppoſed to be compounded; yet without propoſing any ſuitable arrangement of his own: nor does it appear at all neceſſary, ſince the colouring matters fall of their own accord under two general and diſtinct claſſes; the firſt including thoſe colouring matters which, when put into a ſtate of ſolution, may be permanently fixed, and made fully to exhibit their colours in or upon the dyed ſubſtance, *without* the interpoſition of any earthy or metallic baſis or mordant; and the ſecond, comprehending all thoſe colouring matters which are *incapable* of being fixed, and made to diſplay their proper colours without the *mediation* of ſome ſuch baſis or mordant. The firſt claſs, indeed, appears to conſiſt of very few articles; ſince it is much to be queſtioned whether any other dye-ſtuff at preſent known, except the liquor of the purpura and ſome other ſhell-fiſh, the genuine indigo, and paſtel or woad, will communicate a *permanent* dye to any kind of material, without the aid or action of ſome chemical baſe. Every other colouring matter beſide the above, muſt therefore rank in the ſecond claſs, and be conſidered as fugitive colours. Hence the technical phraſes adopted in the dye-houſe, of *great*, and *little*, dye. That compounded of the firſt claſs of colouring matters is called the great or *permanent* dye; and colours communicated by it are ſaid to be *faſt*, or in *grain*. That compounded from the ſecond claſs, without the agency of a chemical baſe, is termed the little or *falſe* dye: a prohibition of which, by the interference of the legiſlature, might anſwer a very deſirable purpoſe, by preventing the frauds and impoſitions of thoſe who ſell piece-goods manufactured with the *falſe* dye, for that of the permanent. This evil calls the more loudly for a remedy, becauſe, ſince the diſcovery of ſo many effectual chemical baſes or mordants, there ſeems now to be ſcarcely any colour, either ſimple or compound, but what may be rendered *permanent* through their agency: the moſt important part of dying ſeems therefore to depend on a complete knowledge and judicious application of theſe baſes.

Of MORDANTS.

All thoſe earthy and metallic ſubſtances uſually employed in a ſtate of ſolution or combination with acids, were, from that circumſtance, called by the French dyers, *mordants*, i. e. biters or corroders; and from them the term has been adopted in other countries. Some modern writers, however, prefer the term baſe, or *baſis*; whilſt others indiſcriminately make uſe of both. Almoſt the only ſubſtances uſed as mordants are, earths and metallic oxyds. Of earthy mordants, by far the moſt important and moſt generally uſed is alumina. It was uſed as a mordant in very early ages, and ſeems indeed to have been the very firſt ſubſtance employed for that purpoſe. Alumina has a very ſtrong affinity for wool and for ſilk; but its affinity for cotton and linen is a good deal weaker. It is uſed as a mordant in two ſtates; either in the ſtate of alum, in which it is combined with

ſulphuric acid and a little potaſh; or in the ſtate of acetite of alumina, in which it is combined with acetous acid. Acetite of alumina has only been introduced into dying ſince the commencement of the eighteenth century. This mordant is now prepared, by pouring acetite of lead into a ſolution of alum: a double decompoſition takes place, the ſulphuric acid combines with the lead, and the compound precipitates in the form of an inſoluble powder; while the alumina combines with the acetous acid, and remains diſſolved in the liquid. This mordant is employed for cotton and linen, which have a weaker affinity than wool for alumina. It anſwers much better than alum, the cloth is more eaſily ſaturated with alumina, and takes, in conſequence, both a richer and a more permanent colour. Beſides alumina, lime is ſometimes uſed as a mordant. Cloth has a ſtrong affinity for it; but in general it does not anſwer ſo well, as it does not give ſo good a colour. It is uſed either in the ſtate of lime-water, or of ſulphat of lime diſſolved in water.

Almoſt all the metallic oxyds have a ſtrong affinity for cloth; yet only two of them are extenſively uſed as mordants, namely, the oxyds of tin and of iron. The oxyd of tin has enabled modern dyers greatly to furpaſs the ancients in the fineneſs of their colours: by means of it alone, ſcarlet, the brighteſt of all colours, is produced. The method of producing the celebrated Tyrian purple dye is underſtood at preſent, and the ſhell-fiſh which yield the dye-ſtuff are found abundantly on the coaſts of Britain and France; but no perſon thinks of putting the ancient mode in practice, becauſe colours equally beautiful can be produced at a ſmaller price. This is owing to the employment of the oxyd of tin, which is uſed as a mordant in three ſtates; diſſolved in nitro-muriatic acid, in acetous acid, and in a mixture of ſulphuric and muriatic acids. Nitro-muriat of tin is the common mordant employed by dyers. They prepare it by diſſolving tin in diluted nitric acid, to which a certain proportion of muriat of ſoda, or of ammonia, is added. Part of the nitric acid decompoſes theſe ſalts, combines with their baſe, and fets the muriatic acid at liberty. They prepared it at firſt with nitric acid alone; but that mode was very defective; becauſe the nitric acid very readily converts tin to white oxyd, and then is incapable of diſſolving it. The conſequence of which was, the precipitation of the whole of the tin. To remedy this defect, common ſalt, or ſal ammoniac, was very ſoon added; muriatic acid having the property of diſſolving white oxyd of tin very readily. A conſiderable ſaving of nitric acid might be obtained, by employing as much ſulphuric acid as is juſt ſufficient to ſaturate the baſe of the common ſalt, or ſal ammoniac, employed. When the nitro-muriat of tin is to be uſed as a mordant, it is diſſolved in a large quantity of water, and the cloth is dipped in the ſolution, and allowed to remain till ſufficiently ſaturated. It is then taken out, and waſhed and dried. Tartar is uſually diſſolved in the water along with the nitro-muriat. The conſequence of this is a double decompoſition; the nitro-muriatic acid combines with the potaſh of the tartar, while the tartarous acid diſſolves the oxyd of tin. When tartar is uſed, therefore, in any conſiderable quantity, the mordant is not a nitro-muriat, but a tartrite of tin.

Mr. Hauſſman, to whom the art of dying lies under numerous obligations, has propoſed to ſubſtitute acetit of tin for nitro-muriat as a mordant for cotton and linen. It may be prepared by mixing together acetit of lead and nitro-muriat of tin. This mordant is preferable for theſe ſtuffs; becauſe it is much more eaſily decompoſed than the nitro-muriat. Dr. Bancroft has propoſed to ſubſtitute a ſolution of tin in a mixture of ſulphuric and muriatic acid, inſtead of nitro-muriat of tin, as a mordant for wool. This mordant, he informs us, is much cheaper, and equally efficacious. It may be prepared by diſſolving ſomewhat leſs than one part of tin in two parts of ſulphuric and three of muriatic acid, at the degree of concentration at which they are commonly ſold in this country. This mordant, like the others, muſt be diſſolved in a ſufficient quantity of water, in order to be uſed.

Iron, like tin, is capable of two degrees of oxydation; but the green oxyd abſorbs oxygen ſo readily from the atmoſphere, that it is very ſoon converted into the red oxyd. It is only the red oxyd which is really uſed as a mordant in dying. The green oxyd is, indeed, ſometimes applied to cloth; but it very ſoon abſorbs oxygen, and is converted into the red oxyd. This has a very ſtrong affinity for all kinds of cloth. The permanency of the iron ſpots or moulds on linen and cotton is a ſufficient proof of this. As a mordant, it is uſed in two ſtates; in that of ſulphat of iron, and acetit of iron. The firſt is commonly uſed for wool. The ſalt is diſſolved in water, and the cloth dipped in it. It may be uſed alſo for cotton; but in moſt caſes acetit of iron is preferred. It is prepared by diſſolving iron, or its oxyd, in vinegar, ſour beer, &c. and the longer it is kept, the more is it preferred. The reaſon is, that this mordant ſucceeds beſt when the iron is in the ſtate of red oxyd. It would be better then to oxydate the iron, or convert it into ruſt, before uſing it; which might eaſily be done, by keeping it for ſome time in a moiſt place, and ſprinkling it occaſionally with water. Of late, pyrolignous acid has been introduced inſtead of acetous. It is obtained by diſtilling wood or tar.

That ſpecies of mordant called the *aſtringent principle*, is derived from tan or nut-galls. It has a very ſtrong affinity for cloth, and for ſeveral colouring matters: it is therefore very frequently employed. An infuſion of nut galls, or of ſumach, or any other ſubſtance containing tan, is made in water, and the cloth is dipped in this infuſion, and allowed to remain till it has abſorbed a ſufficient quantity of tan. The French dyers call this operation *engallage*. Silk is capable of abſorbing a very great proportion of tan, and by that means acquires a very great increaſe of weight. Manufacturers ſometimes employ this method of increaſing the weight of ſilk. Tan is often employed alſo, along with other mordants, in order to produce a compound mordant. Oil is alſo uſed for the ſame purpoſe in the dying of cotton and linen. The mordants, with which tan moſt frequently is combined, are alumina and oxyd of iron. Beſides theſe mordants, there are ſeveral other ſubſtances frequently uſed as auxiliaries, either to facilitate the combination of the mordant with the cloth, or to alter the ſhade of colour. The chief of theſe are, tartar, acetit of lead, common ſalt, ſal ammoniac, ſulphat, or acetit of copper, &c.

Mordants not only render the dye permanent, but have alſo conſiderable influence on the colour produced. The ſame colouring matter produces very different dyes, according as the mordant is varied. Suppoſe, for inſtance, that the colouring matter be cochineal; if we uſe the aluminous mordant, the cloth will acquire a crimſon colour; but the oxyd of iron produces with it a black. Theſe changes, indeed, might naturally have been expected: for ſince the colour of a dye ſtuff depends upon its affinity for light, every new combination into which it enters, having a tendency to alter theſe affinities, will naturally give it a new colour. Now, in all caſes, the colouring matter and mordant combine together: the colour of the cloth, then, muſt be that which the particles of the dye and of the mordant, when thus combined together, exhibit. Indeed ſome mordants may be conſidered in the light of colouring matters alſo, as they always communicate a particular colour to cloth. Thus, iron communicates a brown colour, and iron and tan together conſtitute a black. In dying, then, it is not only neceſſary to procure a mordant, which has a ſufficiently ſtrong affinity for the colouring matter and the cloth, and a colouring matter which poſſeſſes the

wiſhed-for colour in perfection, we muſt procure a mordant and a colouring matter of ſuch a nature, that when combined together they ſhall poſſeſs the wiſhed-for colour in perfection. It is evident, too, that a great variety of colours may be produced with a ſingle dye ſtuff, provided we can change the mordant ſufficiently.

Every thing which tends to weaken the affinity between the mordant and the cloth, or between the mordant and the colouring matter, and every thing which tends in any way to alter the nature of the mordant, muſt injure the permanency of the dye: becauſe, whenever the mordant is deſtroyed, there is no longer any thing to cauſe the dye ſtuff to adhere; and when its nature is altered, the colour of the dye muſt alter at the ſame time. All the obſervations, then, which can be made, concerning the nature of colouring matters, and the changes to which they are ſubject, apply equally to mordants. Theſe ſubſtances, indeed, are ſcarcely liable themſelves to any alteration. They are of a much more ſimple nature, in general, than dye-ſtuffs; and therefore not nearly ſo liable to decompoſition. But when the colouring matter itſelf is altered, it comes to the ſame thing: its affinity for the mordant being now deſtroyed, there is nothing to retain it. As the permanency of a dye depends upon the degree of affinity between the mordant and the colouring matter, it is clear that a dye may want permanency, even though it reſiſt the oxy-muriatic acid, and all the other ſaline teſts propoſed by chemiſts. Theſe ſubſtances may happen to have very little action on the dye ſtuff, and therefore may not affect it; yet it may ſoon diſappear, in conſequence of its want of affinity for the mordant.

A very ingenious abſtract of this theory is given by Berthollet: According to the attraction which the colouring particles have for wool, ſilk, cotton, and linen, they unite more or leſs readily, and more or leſs intimately with each of thoſe ſubſtances; and thence ariſes the firſt cauſe of variation in the proceſſes employed, according to the nature of the ſtuff, and of the colouring ſubſtance. By the attraction which the colouring particles have for argillaceous earth and metallic calces, they form compounds with theſe ſubſtances, in which their colour is more or leſs modified, becomes more fixed, and more difficultly affected by external agents, than before. This compound being formed of principles, which have ſeparately the power of uniting with vegetable ſubſtances, and more eſpecially with animal ſubſtances, preſerves this property, and forms a triple compound with the ſtuff; and the colour which has been again modified by the formation of this triple union, acquires a greater degree of fixity, and of indeſtructibility, by external agents. The colouring particles have frequently ſo great an attraction for clay and metallic calces, that they ſeparate them from acids which held them in ſolution, and fall down with them; but the attraction of the ſtuff is ſometimes neceſſary, in order to produce this ſeparation. The metallic calces which combine with the colouring particles, modify their colours, not only by their own, but alſo by acting upon their compoſition by means of their vital air. The change which the colouring particles thereby ſuffer, is ſimilar to that occaſioned by the air, which injures all colours more or leſs. Of the two principles which compoſe the air of the atmoſphere, it is only the vital air, or oxygenous gas, which acts upon the colouring particles: it combines with them, weakens their colour, and renders it paler; but its action is principally exerted on the hydrogen, or inflammable air, which enters into their compoſition, and it then forms water. This effect ought to be conſidered as a true combuſtion, whereby the charcoal which enters into the compoſition of the colouring particles becomes predominant, and the colour commonly changes to yellow, fawn colour, or brown; or the injured part, by uniting with what remains of the original colour, produces other appearances. Light favours the combination of the colouring particles, which frequently cannot take place without its aid; and it is thus that it contributes to the deſtruction of colours. Heat promotes it alſo, but leſs powerfully than light, unleſs it has a certain degree of intenſity. To a ſimilar combuſtion are to be attributed the effects of the pale nitrous acid, of the oxygenated or aerated muriatic acid, and even of the ſulphuric acid, when they make the colour of the ſubſtances upon which they act paſs to a yellow, and even to a black. The effects of combuſtion may however be concealed by the vital air combining with the colouring particles, without acting particularly on the inflammable air. Colours are therefore more or leſs permanent, or more or leſs fixed, according to the greater or leſs diſpoſition of the colouring particles to undergo combuſtion, and to allow it to go on to a more or leſs advanced ſtage. Some ſubſtances are alſo capable of acting on the colour of ſtuffs by a ſuperiority of attraction, or by a ſolvent power; and in this conſiſts the action of acids, alkalis, and ſoap. A ſmall quantity of theſe agents, however, may ſometimes form ſupra-compounds with the ſtuff, and thereby change its colour. Metallic calces produce, in the colouring particles with which they unite, a degree of combuſtion, proportioned to the quantity of vital air which can be taken from them by theſe particles. The colours which the compounds of metallic calces and colouring particles aſſume, then, are the product of the colour peculiar to the colouring particles, and of that peculiar to the metallic calx; but the colouring particles and metallic calces muſt be conſidered in that ſtate to which they have been reduced by the diminution of vital air in the calx, and the diminution of hydrogen in the colouring particles.

Hence it follows: Firſt, That the metallic calces to which the vital air is only ſlightly attached, are not fit to ſerve as connecting mediums for the colouring particles, becauſe they produce in them too great a degree of combuſtion; ſuch are the calces of ſilver, gold, and mercury. Second, That the calces which undergo conſiderable changes of colour, by giving off more or leſs of their vital air, are alſo bad intermediums, eſpecially for light ſhades, becauſe they produce changeable colours; ſuch are the calces of copper, of lead, and of biſmuth. Third, That the calces which ſtrongly retain their vital air, and ſuffer very little change of colour by the loſs of a part of it, are beſt fitted to anſwer this purpoſe: ſuch is particularly the calx of tin, which quits its menſtruum eaſily, which has a ſtrong attraction for the colouring particles, and which affords them a baſis which is very white, and proper for giving a brightneſs to their ſhades, without altering them by the admixture of another colour. The calx of zinc poſſeſſes ſome of theſe qualities.

In order to account for the colours which reſult from the union of the colouring particles with the baſis which a mordant gives them, we muſt attend to the proportion in which the colouring particles unite to that baſis: thus the ſolution of tin, which produces a very copious precipitate with a ſolution of colouring particles, and thereby proves that the calx of tin enters in a large proportion into the precipitate, has a much greater influence on the colour of the precipitate, by the whiteneſs of its baſis, than the ſolution of zinc or that of alum, which generally produce much leſs copious precipitates. The precipitates produced by theſe two laſt ſubſtances retain very nearly the natural tint of the colouring particles. We muſt then diſtinguiſh, in the action of mordants, the combinations that may take place by their means between the colouring particles, the ſtuff, and the intermedium; the proportions of the colouring ſubſtance and intermedium; the modifications of colour, which may ariſe from the mixture of the colour of the colouring particles, and of that of the baſis to which they are united; and finally, the changes

which the colouring particles may ſuffer from the combuſtion that may be produced by the intermedium.

Aſtringents do not derive their characteriſtic property from an acid, or from any other individual principle which is always the ſame, but from the property which they poſſeſs of uniting with the calx of iron, of reducing it to the ſtate of black calx, and of acquiring themſelves a dark colour, by the combuſtion they undergo. Tan or galls, which are to be conſidered as the repreſentatives of all aſtringents, readily undergo a ſlight combuſtion, which gives them a deep brown colour; but this combuſtion, which requires but a ſmall quantity of vital air, ſoon ceaſes without injuring their properties. Galls owe their ſtability to the large proportion of charcoal they contain; and as they have the property of combining with ſome vegetable ſubſtances, with ſeveral colouring matters, and particularly with animal ſubſtances, they ſerve as intermedium for them, and impart to them their own firmneſs of colour. For more on the chemical properties of mordants, and for an explanation of the modern chemical terms in dying, ſee the article CHEMISTRY, vol. iv. p. 148—343.

Of DYING WOOL, and WOOLLEN GOODS.

The value of wool, and its fitneſs for the different kinds of manufacture, depend on the length and fineneſs of its fibres. Theſe fibres poſſeſs a conſiderable degree of elaſticity, but are by no means ſmooth. Their external conformation appears to be made up either of ſmall lamina placed over each other, in a ſlanting direction, from the root towards the end or point of each fibre, like the ſcales of fiſh, lying one over the other, in ſucceſſion, from the head to the tail; or of zones, placed one upon another, as in the horns of animals; from which ſtructure each fibre, if drawn from its root towards the point, will paſs ſmoothly through the fingers; but if it be drawn in a contrary direction, from the point towards the root, a ſenſible reſiſtance, and tremulous motion, will be felt by the fingers. This conformation diſpoſes the fibres of wool to catch hold of each other, and as they cannot recede, when acted upon by other bodies, they naturally advance, by a progreſſive motion, towards and beſide each other, from the end towards the root: a diſpoſition which is very inconvenient to ſpinning, and therefore the wool is greaſed, that the aſperities ariſing from this ſtructure of its fibres may be thereby covered, or ſheathed, as a covering of oil ſheaths thoſe of a fine file. But the wool being manufactured, and the greaſe no longer uſeful, it is removed by ſcowering, not only for the ſake of cleanlineſs, but that it may not fruſtrate the proceſs of dying. The cloth is therefore carried to the fulling mill, and there ſubjected to the action of large beetles, with fullers earth and water, by which the cloth is not only ſcowered, but its fibres, in conſequence of the ſtructure juſt deſcribed, being made to conjoin, and advance toward and beſide each other, become ſhorter, and more cloſely connected, or felted together, the warp and woof loſing in extent, but gaining proportionably in thickneſs.

The lamina, or zones, above deſcribed, afford many interſtices in the fibres of wool, ſuited to receive and contain the particles of colouring matters, when applied to them in the operation of dying; but theſe interſtices being ſmall, and the fibres of the wool naturally elaſtic, no colour can be conveyed into theſe cavities, until they are diluted by hot or boiling water; whereas ſilk, cotton, and linen, are made to receive colours without heat, as permanently as with it. And this difference manifeſtly ariſes from the ſmallneſs of the interſtices in which the colouring particles are depoſited in wool, and the elaſticity of its fibres, which make it neceſſary to dilate them by hot or boiling water; and as the colouring particles are only made to enter and depoſit themſelves by an artificial dilatation, it follows that, when this ceaſes, the filaments will again contract to their former ſize, upon the colouring matters ſo introduced, and hold them much more ſtrongly than they are likely to be held in other ſubſtances whoſe interſtices are large enough to receive colouring particles without being dilated, and which, therefore, cannot be ſuppoſed ever to contract and compreſs them in the ſame way: and this difference, joined to the ſuperior chemical attraction of animal fibres for colouring matters, will ſufficiently explain why many colours dyed upon wool and hair, prove ſo much more durable than upon cotton or linen. Wool, as is well known, is the hair of ſheep, and differs from common hair merely in fineneſs and ſoftneſs. It is naturally covered with a kind of oil, which would obſtruct the proceſs of dying, and is therefore to be removed, by what is called ſcowering; an operation ſufficiently known. Wool, when dyed in the fleece, takes up much more colouring matter than when ſpun, and much more than when wove into cloth. It is alſo more or leſs penetrated, according to the fineneſs of its own texture, and the particular nature of the colouring matter with which it is dyed. The very coarſe wool taken from the thighs and tails of ſome rams and ſheep, being never made to receive colours without difficulty; and indeed the very fineſt cloth is never thoroughly dyed ſcarlet, it being always found white within when cut. Wool taken from different breeds of ſheep, in various countries, is naturally of different colours; as white, yellow, reddiſh, and black. Formerly all the flocks in Spain, excepting thoſe of Andaluſia, were of this laſt colour, it having been preferred for wearing by the native Spaniards; and this natural browniſh black is even at this time manufactured, and worn conſtantly by ſome religious orders in Roman Catholic countries. The white wool, however, is now almoſt univerſally preferred to every other, as being ſuſceptible of receiving better colours by dying, than any of thoſe which are natural. Manufactures of wool, though ſuperfluous to man in a ſtate of nature, ſeem to be, of all others, the moſt important in civilized ſociety.

Dyers uſually conſider five colours as *primary*, or *ſimple*, viz. blue, yellow, red, black, and brown; becauſe from theſe they form all their *compound* colours, and they are conſequently the foundation of all their other proceſſes.

OF BLUE.

The only colouring matters employed in dying blue are woad, and indigo: attempts, indeed, have been made to dye with pruſſiat of iron, but they have hitherto failed. The *iſatis tinctoria*, or woad, is a plant commonly cultivated in this kingdom, and even found wild in many parts of England. Some perſons think that it was this plant with which the ancient Britons ſtained their bodies, to make them appear terrible to their enemies. When arrived at maturity, this plant is cut down, waſhed, dried haſtily in the ſun, ground in a mill, placed in heaps, and allowed to ferment for a fortnight; then well mixed together, formed into balls, which are piled upon each other, and expoſed to the wind and ſun. When it has continued for a ſufficient time, the woad is allowed to fall to a coarſe powder; and in this ſtate it is ſold to the dyers. The ſtrongeſt kind of woad is called *paſtel*.

Indigo, is a blue, extracted from the *indigofera tinctoria*, and from ſeveral other ſpecies of the ſame genus of plants, which are cultivated in the Eaſt and Weſt Indies. When the *indigofera* has arrived at maturity, it is cut a few inches above ground, placed in ſtrata in a large veſſel, and covered with water. The plants ſoon acquire heat, ferment, and diſcharge abundance of carbonic acid gas. When the fermentation is far enough advanced, the liquid, now of a green colour, is decanted into large flat veſſels, where it is conſtantly agitated till blue flocculæ begin to make their appearance. Lime water is now poured in, which cauſes the blue flocks to precipitate. The colourleſs liquid is decanted off, and the blue ſedi-

ment

ment poured into linen bags. When the water has drained from it ſufficiently, it is formed into ſmall lumps, and dried in the ſhade. In this ſtate it is ſold to the dyer under the name of *indigo*.

Dr. Roxburgh, who firſt drew the attention of manufacturers to the *nerium tinctorium*, a bay-tree very common in Hindooſtan, from the leaves of which indigo may be extracted, has given a very ſhort method of obtaining that pigment. The leaves are kept in a copper full of water, ſupported at the temperature of 160°, till they aſſume a yellowiſh hue, and the liquid acquire a deep green colour. The liquid is then to be drawn off, agitated in the uſual manner, till the blue flocculæ appear; and then the indigo is to be precipitated with lime water. This proceſs, which ſucceeds equally well with the indigofera, indicate that the plants, from which indigo may be extracted, contain a peculiar green pollen, ſoluble in water. The intention, both of the fermentation of the common method, and of the ſcalding, according to Dr. Roxburgh's method, is merely to extract this pollen. Mr. Hauſſman firſt ſhewed, that this green baſis of indigo has a ſtrong affinity for oxygen; and the ſubſequent experiments of Drs. Roxburgh and Bancroft have confirmed his obſervations, and put them beyond the reach of doubt. It gradually attracts oxygen from the air; in conſequence of which, it acquires a blue colour, and becomes inſoluble in water. The agitation is intended to facilitate this abſorption, by expoſing a greater ſurface to the action of the air. The lime water, by abſorbing a quantity of carbonic acid, with which the green pollen ſeems to be combined, greatly facilitates the ſeparation of the indigo.

The method of preparing indigo, and of applying it to the purpoſes of dying, ſeems to have been very early known in India. But in Europe, though it had been occaſionally uſed as a paint, its importance as a dye-ſtuff was not underſtood before the middle of the ſixteenth century. The Dutch were the people who firſt imported it from India, and made its importance known in Europe. It was afterwards cultivated in Mexico and the Weſt Indies with ſuch ſucceſs, that the indigo from thoſe countries was preferred to every other. In conſequence of this preference, they ſupplied almoſt the whole of the European market. But within theſe few years, the Eaſt Indian indigo, owing entirely to the enlightened exertions of ſome of our countrymen, has recovered its character, and is now imported, in very conſiderable quantities, into Great Britain. For the chemical properties of *indigo*, ſee the article CHEMISTRY, vol. iv. p. 344.

Indigo has a very ſtrong affinity for wool, ſilk, cotton, and linen. Every kind of cloth, therefore, may be dyed with it, without the aſſiſtance of any mordant whatever. The colour thus induced is very permanent; becauſe the indigo is already ſaturated with oxygen, and becauſe it is not liable to be decompoſed by thoſe ſubſtances, to the action of which the cloth is expoſed. But it can only be applied to cloth in a ſtate of ſolution; and the only ſolvent known being ſulphuric acid, it would ſeem at firſt ſight that the ſulphuric acid ſolution is the only ſtate in which indigo can be employed as a dye. The ſulphat of indigo is indeed often uſed to dye wool and ſilk blue; but it can ſcarcely be applied to cotton and linen, becauſe the affinity of theſe ſubſtances for indigo is not great enough to enable them readily to decompoſe the ſulphat. The colour given by ſulphat of indigo is exceedingly beautiful: it is known by the name of Saxon blue; becauſe the proceſs, which was diſcovered by counſellor Barth in 1740, was firſt carried on at Groſſenhayn in Saxony. The method of the original inventor was very complicated, from the great number of uſeleſs ingredients which were mixed with the ſulphat. But theſe ingredients were gradually laid aſide, and the compoſition ſimplified by others, after the nature of it, which was for ſome time kept ſecret, became known to the public. The beſt proceſs is that of Mr. Poerner: viz. One part of indigo is to be diſſolved in four parts of concentrated ſulphuric acid; to the ſolution one part of dry carbonat of potaſh is to be added, and then it is to be diluted with eight times its weight of water. The cloth muſt be boiled for an hour in a ſolution, containing five parts of alum and three of tartar for every thirty-two parts of cloth. It is then to be thrown into a water bath, containing a greater or ſmaller proportion of the diluted ſulphat of indigo, according to the ſhade which the cloth is intended to receive. In this bath it muſt be boiled till it has acquired the wiſhed-for colour. The alum and tartar are not intended to act as mordants, but to facilitate the decompoſition of the ſulphat of indigo. Bergman aſcertained that alum poſſeſſes this property. The alkali added to the ſulphat anſwers the ſame purpoſe. Theſe ſubſtances, alſo, by ſaturating part of the ſulphuric acid, ſerve, in ſome meaſure, to prevent the texture of the cloth from being injured by the action of the acid, which is very apt to happen in this proceſs.

But ſulphat of indigo is by no means the only ſolution of that pigment employed in dying. By far the moſt common method, and indeed the only method known before 1740, is to deprive indigo of the oxygen to which it owes its blue colour, and thus to reduce it to the ſtate of green pollen; and then to diſſolve it in water by means of alkalies, or alkaline earths, which in that ſtate act upon it very readily. Indigo is preciſely in the ſtate of green pollen when it is firſt extracted from the plant in the ſcalding proceſs deſcribed by Dr. Roxburgh. If, therefore, there were any method of ſtopping ſhort here, and of ſeparating the pigment while it retains its green colour, it would be preciſely in the ſtate beſt adapted for dying. Nothing more would be neceſſary but to diſſolve it in water by means of an alkali, and to dip the cloth into the ſolution. But as indigo is not brought home to us in that ſtate, the dyer is under the neceſſity of undoing the laſt part of the indigo-makers proceſs, by ſeparating again the oxygen, and reſtoring it to its original green colour. Two different methods are employed for this purpoſe. The firſt of theſe methods is to mix with indigo a ſolution of ſome ſubſtance which has a ſtronger affinity for oxygen than the green baſis of indigo. Green oxyd of iron, for inſtance, and different metallic ſulphurets. If, therefore, indigo, lime, and green ſulphat of iron, be mixed together in water, the indigo gradually loſes its blue colour, becomes green, and is diſſolved, while the green oxyd of iron is converted into the red oxyd. The manner in which theſe changes take place is obvious. Part of the lime decompoſes the ſulphat of iron; the green oxyd, the inſtant that it is ſet at liberty, attracts oxygen from the indigo, decompoſes it, and reduces it to the ſtate of green pollen. This green pollen is immediately diſſolved by the action of the reſt of the lime. In like manner indigo is diſſolved, when mixed in water, with pure antimony and potaſh, or with ſulphuret of arſenic and potaſh. The ſecond method is to mix the indigo in water with certain vegetable ſubſtances which readily undergo fermentation. During this fermentation, the indigo is deprived of its oxygen, and diſſolved by means of quicklime or alkali, which is added to the ſolution. The firſt of theſe methods is uſually followed in dying cotton and linen; the ſecond, in dying wool and ſilk.

In the dying of wool, woad and bran are commonly employed as vegetable ferments, and lime as the ſolvent of the green baſe of the indigo. Woad contains a colouring matter preciſely ſimilar to indigo; by following the common proceſs, indigo may be extracted from it. In the uſual ſtate of woad, when purchaſed by the dyer, the indigo which it contains is probably not far from the ſtate of green pollen. Its quantity in woad is but ſmall, and it is mixed with a great proportion of other vegetable matter. Before the introduction of indigo into Europe, woad alone was employed as a blue dye; and even as late as the ſeventeenth century, the uſe of indigo was reſtricted in different countries, and dyers obliged to em-

ploy a certain quantity of woad. But theſe abſurd reſtrictions were at laſt removed, and woad is now ſcarcely uſed in dying, except as a ferment to indigo. The blue colouring matter, however, which it contains, muſt, in all caſes, contribute conſiderably to the dye.

A ſufficient quantity of woad, mixed with bran, is put into the vat, filled with warm water, whoſe temperature is kept up ſufficiently to enſure fermentation. Afterwards quicklime and indigo are added. The indigo is deprived of its oxygen, and diſſolved by the lime. When the ſolution is complete, the liquid has a green colour, except at the ſurface, where it is copper-coloured, or blue, becauſe the indigo at the ſurface abſorbs oxygen from the air, and aſſumes its natural colour. The wool, or woollen-cloth, is dipped in, and paſſed through the liquid as equably as poſſible; thoſe pieces being firſt dyed which are to aſſume the deepeſt ſhade. Dyers uſually enumerate thirteen different ſhades of blue cloth, acquired by the different gradations of the colour in the vat. No part of the cloth ſhould come in contact with the ſediment, which would ſpoil the colour. When the cloth is firſt taken out of the vat, it is of a green colour; but it ſoon becomes blue, by attracting oxygen from the air. It ought to be carefully waſhed, to carry off the unconbined particles. This ſolution of indigo is liable to two inconveniences: 1. It is apt ſometimes to run too faſt into the putrid fermentation: this may be known by the putrid vapours which it exhales, and by the diſappearing of the green colour. In this ſtate it would ſoon deſtroy the indigo altogether. The inconvenience is remedied by adding more lime, which has the property of moderating the putreſcent tendency. 2. Sometimes the fermentation goes on too languid. This defect is remedied by adding more bran or woad, in order to diminiſh the proportion of quicklime.

Of YELLOW.

The principal colouring matters employed to dye yellow, are *weld*, *fuſtic*, and *quercitron bark*. The *reſeda luteola*, known in this country by the name of *weld*, is a plant which grows wild in moſt European countries. Cultivated weld has a more ſlender ſtem than the wild kind, but it is more valuable, becauſe it is richer in colouring matter. It is an annual plant, of a yellowiſh green colour, furniſhed with a great number of ſmall leaves. When ripe it is pulled, dried, tied up in parcels, and in that ſtate ſold to the dyer. Weld readily yields its colouring matter to water. The ſaturated decoction of it is brown; but when ſufficiently diluted with water it becomes yellow. Acids render its colour ſomewhat paler, but alkalies give it a deeper ſhade. When alum is added to it, a yellow coloured precipitate falls down, conſiſting of alumina combined with the colouring matter of weld. The affinity, therefore, of this colouring matter for alumina is ſo great, that it is able to abſtract it from ſulphuric acid. Its affinity for oxyd of tin is at leaſt equally great; for muriat of tin cauſes a copious bright yellow precipitate, compoſed of the colouring matter and the oxyd combined. Moſt of the metallic ſalts occaſion ſimilar precipitates, but varying in colour according to the metal employed. With iron, for inſtance, the precipitate is dark grey, and with copper browniſh green.

The *morus tinctoria* is a large tree which grows in the Weſt-India iſlands. The wood of this tree is of a yellow colour, with orange veins. The French call it *yellow wood*, (*bois jaune*;) but the Engliſh dyers have given it the name of *fuſtic*. This wood has been introduced into dying ſince the diſcovery of America. The preciſe time is not known; but that it was uſed in England ſoon after the middle of the ſeventeenth century, is evident from ſir William Petty's paper on Dying, read to the royal ſociety ſoon after its inſtitution. Fuſtic gives out its colouring matter with great facility to water. The ſaturated decoction of it is of a deep reddiſh yellow colour; when ſufficiently diluted, it becomes orange yellow. Acids render it turbid, give it a pale yellow colour, and occaſion a ſlight greeniſh precipitate, which alkalies re-diſſolve. Alkalies give the decoction a very deep colour, inclining to red; ſome time after they have been added, a yellow matter ſeparates from the liquid, and either ſwims on the ſurface, or adheres to the ſides of the veſſel. Alum, ſulphat of iron, of copper, and of zinc, produce precipitates compoſed of the colouring matter combined reſpectively with the baſes of theſe different ſalts; and the colour varies according to the ſubſtance with which this colouring matter is combined. With alumina it is yellow; with iron, yellowiſh brown; with copper, browniſh yellow; and with zinc, greeniſh brown.

The *quercus nigra*, to which Dr. Bancroft has given the name of *quercitron*, is a large tree which grows ſpontaneouſly in North America. Dr. Bancroft diſcovered, about the year 1784, that the bark of this tree contains a great quantity of yellow colouring matter, and ſince that time it has been introduced into dying with much advantage. To prepare it for the dyer, the epidermis is ſhaved off, and then it is ground in a mill. It ſeparates partly into ſtringy filaments, and partly into a fine light powder. Both of theſe contain colouring matter, and therefore are to be employed; but, as they contain unequal quantities, they ſhould be uſed in their natural proportions. Quercitron bark readily gives out its colouring matter to water at the temperature of 100°. The infuſion has a yellowiſh brown colour, which is rendered lighter by acids, and darker by alkalies. Alum occaſions a ſcanty precipitate of a deep yellow colour; muriat of tin, a copious bright yellow precipitate; ſulphat of tin, a dark olive precipitate; and ſulphat of copper, a precipitate of a yellow colour inclining to olive.

Beſides theſe yellow dye-ſtuffs, there are others occaſionally uſed by dyers. The following are the moſt remarkable: *Geniſta tinctoria*, or dyers broom: yields a very inferior yellow, and is only uſed for coarſe woollen ſtuffs. *Serratula tinctoria*, or ſaw-wort: yields a yellow nearly of the ſame nature with weld; for which, therefore, it is a good ſubſtitute. *Juglans alba*, or American hiccory: the bark of which yields a colouring matter ſimilar to that of quercitron bark, but much ſmaller in quantity. *Anotta* is a name given to a red paſte formed of the berries of the bixa orellana, a tree which is a native of America. This paſte yields its colouring matter to a ſolution of alkali in water. The ſolution affords an exceedingly beautiful yellow dye, but very fading, and incapable of being fixed by any known mordant. Turmeric is the root of the *curcuma longa*, a plant which grows both in the Eaſt and Weſt Indies. It is richer in colouring matter than any other yellow dye-ſtuff. It yields very beautiful yellows, but too fading to be of much uſe, and no mordant has any influence in contributing to their permanence.

Yellow colouring matters have all too weak an affinity for cloth, to produce permanent colours without the uſe of mordants. Cloth, therefore, before it be dyed yellow, is always prepared by combining ſome mordant with it. The mordant moſt commonly employed for this purpoſe is alumina. Oxyd of tin is ſometimes uſed when very fine yellows are wanted. Tan is often employed as a ſubſidiary to alumina, in order to fix it more copiouſly on cotton and linen. Tartar is alſo uſed as an auxiliary to brighten the colour; and muriat of ſoda, ſulphat of lime, and even ſulphat of iron, in order to render the ſhade deeper. The yellow dyed by means of fuſtic is more permanent, but not ſo beautiful as that given by weld or quercitron. As it is permanent, and not much injured by acids, it is often uſed in compound colours where a yellow is required. The mordant is alumina. When the mordant is oxyd of iron, fuſtic dyes a good permanent drab colour. Weld and quercitron bark yield nearly the ſame kind of colour; but, as the bark yields colouring matter in much greater abundance, it is much more convenient, and, upon the whole, cheaper than weld. It is probable, therefore, that it will gradually

ſuperſede

ſuperſede the uſe of that plant. The method of uſing each of theſe dye-ſtuffs is nearly the ſame.

Wool may be dyed yellow by the followin gproceſs: Let it be boiled for an hour, or more, with about one-ſixth of its weight of alum, diſſolved in a ſufficient quantity of water. It is then to be plunged, without being rinced, into a bath of warm water, containing in it as much quercitron bark as equals the weight of the alum employed as a mordant. The cloth is to be turned through the boiling liquid till it has acquired the intended colour. Then a quantity of clean powdered chalk, equal to the hundredth part of the weight of the cloth, is to be ſtirred in, and the operation of dying continued for eight or ten minutes longer. By this method a deep and lively yellow may be given, fully as permanent as weld yellow.

For very bright orange, or golden yellow, it is neceſſary to have recourſe to the oxyd of tin as a mordant. A fine orange yellow may be given to woollen cloth, by putting, for every ten parts of cloth, one part of bark into a ſufficient quantity of hot water; after a few minutes, an equal weight of murio-ſulphat of tin is to be added, and the mixture well ſtirred. The cloth acquires the wiſhed-for colour in a few minutes when briſkly turned in this bath. The ſame proceſs will ſerve for producing a bright golden yellow; only ſome alum muſt be added along with the tin. For the brighteſt golden yellow, the proportions ſufficient for dying one hundred parts of cloth are, ten parts of bark, ſeven parts of murio-ſulphat of tin, and five parts of alum. All the poſſible ſhades of golden yellow may be given to cloth merely by varying the proportion of the ingredients according to the ſhade.

In order to give the yellow that delicate green ſhade ſo much admired for certain purpoſes, the ſame proceſs may be followed, only tartar muſt be added in different proportions according to the ſhade. Thus to dye one hundred parts of cloth a full bright yellow, delicately inclining to green, eight parts of bark, ſix of murio-ſulphat, ſix of alum, and four of tartar, are to be employed. The tartar is to be added at the ſame time with the other mordants. If the proportion of alum and tartar be increaſed, the green ſhade is more lively: to render it as lively as poſſible, all the four ingredients ought to be employed in equal proportions. As theſe fine lemon-yellows are generally required only pale, ten parts of each of the ingredients will be ſufficient to dye about three hundred parts of cloth. By adding a ſmall proportion of cochineal, the colour may be raiſed to a fine orange, or even an aurora.

Of RED.

The principal colouring matters employed in dying red are, kermes, cochineal, archil, madder, carthamus, and Brazil wood. In different parts of Aſia and the ſouth of Europe, there grows a ſmall ſpecies of oak, to which Linnæus gives the name of *quercus coccifera*. On this oak reſides a ſmall inſect, of a reddiſh brown colour; in commerce it is known by the name of *kermes*. This inſect is a ſpecies of coccus: Linnæus called it *coccus ilicis*. Theſe inſects are gathered in the month of June, when the female, which alone is uſeful, is ſwelled with eggs. They are ſteeped for ten or twelve hours in vinegar to kill the young inſects contained in the eggs, and afterwards dried on a linen-cloth. In this ſtate they are ſold to the dyer. Kermes readily gives out its colouring matter to water or alcohol. It was much uſed by the ancients in dying; the colours which it produced were highly eſteemed, being inferior in price only to their celebrated purple. The colour which it communicates to cloth is exceedingly permanent, but being far inferior in beauty to thoſe which may be obtained from cochineal, it has been but little employed by dyers ſince that ſplendid pigment came into common uſe.

Cochineal is likewiſe an inſect, a ſpecies of coccus. Linnæus diſtinguiſhes it by the name *coccus cacti*. It inhabits different ſpecies of cacti, but the moſt perfect variety is confined to the *cactus coccinilifer*. The cochineal inſect was firſt diſcovered in Mexico; the natives had employed it in their red dyes before the arrival of the Spaniards. It became known in Europe ſoon after the conqueſt of Mexico; and the beauty of the colour which it communicates to cloth very ſoon attracted general attention. For many years it was miſtaken for a vegetable production, as had been the caſe alſo with the kermes. Different accounts of its real nature had indeed appeared very early in the Philoſophical Tranſactions; but the opinion of Pomet, who inſiſted that it was the ſeed of a particular plant, gained ſo much credit, that it was not entirely deſtroyed till the publication of Mr. Ellis's paper, in the fifty-ſecond volume of the Philoſophical Tranſactions. For figures of the cochineal inſect, the mode of cultivating it, and the plant on which it propagates, ſee the article Coccus, vol. iv. p. 721, &c.

The quantity of cochineal diſpoſed of in Europe is very great. Bancroft informs us, that the Spaniards annually bring to market about 600,000lbs. of it. Hitherto the rearing of the inſects has belonged almoſt excluſively to that nation. Other nations have indeed attempted to ſhare it with them, but without any remarkable ſucceſs; as the Spaniards uſe every precaution to confine the true cochineal, and even the ſpecies of cactus on which it feeds, to Mexico. Mr. Thiery de Menonville was fortunate enough to procure ſome ſpecimens of both, and to transfer them in ſafety to St. Domingo; and ſeveral ſpirited Britiſh gentlemen have lately contrived to procure the inſect; and vigorous efforts are making to rear it in the Eaſt Indies.

Cochineal readily gives out its colouring matter to water. The decoction is of a crimſon colour, inclining to violet: it may be kept for a long time without putrifying or loſing its tranſparency. Sulphuric acid gives it a red colour inclining to yellow, and occaſions a ſmall fine red precipitate. Tartar gives it a yellowiſh red colour, which becomes yellow after a ſmall quantity of red powder has ſubſided. Alum brightens the colour of the decoction, and occaſions a crimſon precipitate. Muriat of tin gives a copious fine red precipitate; ſulphat of iron, a browniſh violet precipitate; ſulphat of zinc, a deep violet; acetit of lead, and ſulphat of copper, violet precipitates. Water is not capable of extracting the whole of the colouring matter of cochineal; but the addition of a little alkali, or tartar, enables the water to extract the whole of it. See the article Chemistry, vol. iv. p. 345; and Cochineal, p. 730, of the ſame volume.

Archil is a paſte formed of the lichen roccella, pounded and kept moiſt for ſome time with ſtale urine. It gives out its colouring matter to water, to alcohol, and to a ſolution of ammonia in water. The tincture of archil is uſed for making ſpirit of wine thermometers. It is a ſingular fact, that this tincture becomes gradually colourleſs when excluded from the contact of air, and that it again recovers its colour when expoſed to the atmoſphere. The phenomenon was firſt obſerved by the abbé Nollet, and deſcribed by him in an eſſay, publiſhed among the Memoirs of the Academy of Sciences for 1742. The lichen roccella grows abundantly in the Canary Iſlands, from which it is imported and ſold to the dyers. Other lichens are likewiſe uſed to dye red, eſpecially the parellus, from which the pigment called *litmus*, and by chemiſts *turnſole*, is prepared; the omphalodes and tartareus, which are often employed in this country to dye coarſe cloths.

The *rubia tinctorum* is a ſmall well-known plant, cultivated in different parts of Europe for the ſake of its roots, which are known by the name of *madder*. They are about the thickneſs of a gooſe quill, ſomewhat tranſparent, of a reddiſh colour, and a ſtrong ſmell. They are dried, cleaned, ground in a mill, and in that ſtate uſed by dyers. Madder gives out its colouring

matter to water. The infuſion is of a browniſh orange colour; alum produces in it a deep browniſh red precipitate; alkaline carbonats, a blood-red precipitate, which is re-diſſolved on adding more alkali. The precipitate occaſioned by acetite of lead is browniſh red; by nitrat of mercury, purpliſh brown; by ſulphat of iron, a fine bright brown. After the red colouring matter has been extracted from madder by water, it is ſtill capable of yielding a brown colour.

Carthamus tinctorius is an annual plant, cultivated in Spain, Egypt, and the Levant, for the ſake of its flowers, which alone are uſed in dying. After the juice has been ſqueezed out of theſe flowers, they are waſhed repeatedly with ſalt water, preſſed between the hands, and ſpread on mats to dry. Care is taken to cover them from the ſun during the day, and to expoſe them to the evening dews, in order to prevent them from drying too faſt. Such is the method followed in Egypt. The flowers of carthamus contain two colouring matters; a yellow, which is ſoluble in water, and a red, inſoluble in water, but ſoluble in alkaline carbonats. The method of preparing them above deſcribed, is intended to carry off the yellow colouring matter, which is of no uſe, and to leave only the red. After the flowers are thus prepared, they are of a red colour, and have loſt nearly one-half of their weight. An alkaline ley readily extracts their colouring matter, which may be precipitated by ſaturating the alkali with an acid. Lemon juice is commonly uſed for this purpoſe, becauſe it does not injure the colour of the dye. Next to citric, ſulphuric acid is to be preferred, provided too great a quantity be not uſed. The red colouring matter of carthamus, extracted by carbonat of ſoda, and precipitated by lemon juice, conſtitutes the rouge employed by the ladies as a face-paint. It is afterwards ground with a certain quantity of talc. The fineneſs of the talc, and the proportion of it mixed with the carthamus, occaſion the difference between the cheaper and dearer kinds of rouge.

Brazil wood, or *fernambouc*, as it is called by the French, is the wood of the *cæſalpinia criſta*, a tree which grows naturally in America and the Weſt Indian iſlands. It is very hard; its ſpecific gravity is greater than that of water; its taſte is ſweetiſh: its colour, when freſh cut, is pale; but after expoſure to the atmoſphere, it becomes reddiſh. Brazil wood yields its colouring matter to alcohol, and likewiſe to boiling water. The decoction is of a fine red colour. The mineral acids make it yellow, and occaſion a reddiſh brown precipitate. Oxalic acid cauſes an orange red precipitate. Fixed alkali gives the decoction a crimſon colour, inclining to brown; ammonia, bright purple. Alum occaſions a copious crimſon precipitate, eſpecially if alkali is added at the ſame time. Sulphat of iron renders the decoction black. The precipitate produced by muriat of tin is roſe-coloured; that by acetite of lead of a fine deep red. The decoction of Brazil wood is fitter for dying after it has ſtood ſome time, and undergone a kind of fermentation.

None of the red colouring matters has ſo ſtrong an affinity for cloth as to produce a permanent red, without the aſſiſtance of mordants. The mordants employed are alumina and oxyd of tin; oil and tan, in certain proceſſes, are alſo uſed; and tartar and muriat of ſoda are frequently called in as auxiliaries. Coarſe woollen ſtuffs are dyed red with madder or archil; but fine cloth is almoſt excluſively dyed with cochineal; though the colour which it receives from kermes is much more durable. Brazil wood is ſcarcely uſed, except as an auxiliary; becauſe the colour which it imparts to wool is not permanent. See further, on dying ſubſtances, in the article CHEMISTRY, vol. iv. p. 343, &c.

Wool is dyed crimſon, by firſt impregnating it with alumina, by means of an alum bath, and then boiling it in a decoction of cochineal till it has acquired the wiſhed-for colour. The crimſon will be finer, if the tin mordant be ſubſtituted for alum: indeed it is uſual with dyers to add a little nitro-muriat of tin when they want fine crimſons. The addition of archil and potaſh to the cochineal, both renders the crimſon darker, and gives it more bloom; but the bloom very ſoon vaniſhes. For paler crimſons, one-half of the cochineal is withdrawn, and madder ſubſtituted in its place. Wool may be dyed ſcarlet, the moſt ſplendid of all colours, by firſt boiling it in a ſolution of murio-ſulphat of tin; then dying it pale yellow with quercitron bark, and afterwards crimſon with cochineal: for ſcarlet is a compound colour, conſiſting of crimſon mixed with a little yellow. This method was ſuggeſted by Dr. Bancroft, who firſt explained the nature of the common method. The proportions which he gives are eight parts of murio-ſulphat of tin for one hundred parts of cloth. After the cloth has been boiled in this ſolution for a quarter of an hour, it is to be taken out, and about four parts of cochineal, and two and a half parts of quercitron bark, are to be thrown into the bath. After theſe are well mixed, the cloth is to be returned again to the bath, and boiled in it, till it has acquired the proper colour.

The common proceſs for dying ſcarlet is as follows: Twelve parts of tartar are diſſolved in warm water; then one part of cochineal is added, and ſoon after ten parts of nitro-muriat of tin. When the bath boils, one hundred parts of cloth are put in, turned briſkly through the bath, boiled in it for two hours; then taken out, aired, waſhed, and dried. Into another bath eleven parts of cochineal are put; and after its colouring matter is ſufficiently extracted, twenty-eight parts of nitro-muriat of tin are added. In this bath the cloth is boiled for an hour, and then waſhed and dried. Every preceding writer on dying took it for granted, that the yellow tinge neceſſary for ſcarlet was produced by the nitro-muriat of tin, or rather by the nitric acid of that compound, and that the tartar was only uſeful in enlivening the colour. But Dr. Bancroft aſcertained, by actual experiment, that nitro-muriat of tin has no ſuch effect; that cloth, impregnated with this or any other tin mordant, and afterwards dyed with cochineal, acquires only a crimſon colour, unleſs tartar be added; that the tartar has the property of converting part of the cochineal to yellow; and therefore is the real agent in producing the ſcarlet colour. Good ſcarlet, indeed, cannot be made without tin; becauſe every other mordant ſullies the colour, and renders it dull.

OF BLACK.

The ſubſtances employed to give a black colour to woollen cloth, are red oxyd of iron and tan. Theſe two ſubſtances have a ſtrong affinity for each other; and when combined, aſſume a deep black colour, not liable to be deſtroyed by the action of air and light. Logwood is uſually employed as an auxiliary, becauſe it communicates luſtre, and adds conſiderably to the fulneſs of the black. It is the wood of the tree called by Linnæus *hæmatoxylum campechianum*, which is a native of ſeveral of the Weſt India iſlands, and of that part of Mexico which ſurrounds the Bay of Honduras. It yields its colouring matter to water. The decoction is at firſt a fine red bordering on violet, but if left to itſelf it gradually aſſumes a black colour. Acids give it a deep red colour; alkalies a deep violet, inclining to brown. Sulphat of iron renders it as black as ink, and occaſions a precipitate of the ſame colour. The precipitate produced by alum is dark red; the ſupernatent liquid becomes yellowiſh red.

Cloth, before it receive a black colour, is uſually dyed blue. This renders the colour much fuller and finer than it otherwiſe would be. If the cloth be coarſe, the blue dye may be too expenſive; in that caſe a brown colour is firſt given by means of walnut peels. Wool is dyed black by the following proceſs. It is boiled for

two

two hours in a decoction of nut-galls, and afterwards kept for two hours more in a bath compoſed of logwood and ſulphat of iron, kept during the whole time at a ſcalding heat, but not boiled. During the operation it muſt be frequently expoſed to the air; becauſe the green oxyd of iron, of which the ſulphat is compoſed, muſt be converted into red oxyd by abſorbing oxygen, before the cloth can acquire a proper colour. The common proportions are five parts of galls, five of ſulphat of iron, and thirty of logwood, for every one hundred of cloth. A little acetit of copper is commonly added to the ſulphat of iron, becauſe it is thought to improve the colour.

Of BROWN.

That favourite brown colour, with a caſt of yellow, which the French call *fauve*, and to which the Engliſh writers on dying have appropriated the word *fawn*, though in fact a compound, is commonly ranked among ſimple colours; becauſe it is applied to cloth by a ſingle proceſs. The ſubſtances employed to produce this colour are numerous; but walnut-peels are now conſidered the beſt. When firſt ſeparated from the nut, they are white internally; but ſoon aſſume a brown, or even a black colour, on expoſure to the air. They readily yield their colouring matter to water. They are uſually kept in large caſks, covered with water, for above a year, before they are uſed. To dye wool brown with them, nothing more is neceſſary than to ſteep the cloth in a decoction of them till it has acquired the wiſhed-for colour. The depth of the ſhade is proportional to the ſtrength of the decoction. The root, as well as the peel of the walnut-tree, contains the ſame colouring matter, but in ſmaller quantity. The bark of the birch, alſo, and many other trees, may be uſed for the ſame purpoſe.—It is very probable, that the brown colouring matter is in theſe vegetable ſubſtances combined with tan. This is certainly the caſe in ſumach, which is often employed to produce a brown. This combination explains the reaſon why no mordant is neceſſary; the tan has a ſtrong affinity for the cloth, and the colouring matter for the tan: ſo that the dye ſtuff and the mordant are already, in fact, combined together. In cloths, the deepeſt ſhades are commonly dyed firſt, and the lighter ones afterwards; but for woollen yarn, the light ſhades are generally dyed firſt, and the deeper ones afterwards, freſh peels being added for each parcel. Cloth and yarn ſhould be ſimply moiſtened with warm water before they are put into the copper, where they are carefully ſtirred until they have acquired the proper ſhade, unleſs they have before had an aluming.

Mr. Berthollet has dyed different patterns of wool with decoction of walnut-peels, adding to one, oxyd or calx of tin, to another, oxyd or flowers of zinc, to a third, ſemivitrified oxyd of lead or litharge, to a fourth, oxyd of iron. The quantity of decoction, weight of the pattern, time of boiling, and all other circumſtances, were equal, both with reſpect to theſe, and a pattern which was dyed as above, without any addition, and intended to ſerve as a ſtandard of compariſon; the oxyd of tin gave a more clear and bright fawn colour, than that of the ſtandard; the oxyd of zinc a colour ſtill more clear, and approaching to an aſh-coloured grey; the oxyd of lead, a colour with more of an orange caſt; and by the oxyd of iron, a greeniſh brown colour was produced.

Sumach, when employed alone, gives a fawn colour inclining to green. Red ſaunders gives a fawn colour with a browniſh caſt inclining to red; of itſelf however it affords little colour, and it is ſaid to make the wool harſh; but its colouring matter diſſolves better when it is mixed with other ſubſtances, ſuch as walnut-peels, ſumach, and galls; beſides, the colour which it gives is durable, and modifies thoſe of other ſubſtances with which it is mixed very conveniently. Soot is likewiſe uſed to give wool a fawn colour, or a brown, which is more or leſs deep, according to the proportion of that ſubſtance which is employed; but ſoot gives a fading colour, becauſe it only attaches itſelf feebly to the wool inſtead of combining with it; it renders it harſh, and leaves a diſagreeable ſmell: it is uſed however for browning certain colours in ſome very extenſive manufactories.

Of COMPOUND COLOURS.

Compound colours are produced by mixing together two ſimple ones; or, which is the ſame thing, by dying cloth firſt of one ſimple colour, and then another. The reſult is a compound colour, varying in ſhade according to the proportions of each of the ſimple colours employed. Hence compound colours are exceedingly numerous, varying almoſt to infinity, according to the proportions of the ingredients employed.

Mixtures of Blue and Yellow, or Green.—Dyers make green by the admixture of blue and yellow, and it is diſtinguiſhed into a great number of different ſhades; but it requires addreſs and experience to obtain this colour uniform and without ſpots, eſpecially in the lighter ſhades of it. It is poſſible to produce green by beginning either with the yellow or the blue dye: but the firſt method is attended with ſome inconveniences; for the blue ſoils the linen, and a part of the yellow being diſſolved in the vat, changes and makes it green; the ſecond method is therefore preferable. It is common to employ the paſtel vat, but for ſome kinds of green, ſolution of indigo in the ſulphuric acid is uſed; and then, the blue and yellow are either dyed ſeparately, or all the ingredients are mixed together, to dye by a ſingle operation. Solutions of copper with yellow ſubſtances may however be employed. The proceſſes are theſe: It is neceſſary that the blue ground be proportioned to the green which is deſired; thus for the green like that of a drake's neck, a ground of deep royal blue is given; for parrot green, a ground of ſky blue; for *verd naiſſant*, a ground of light blue. After the cloths have received the proper ground, they are waſhed in the fulling-mill, and boiled as for common welding, but for the light ſhades the proportion of ſalts is diminiſhed. Moſt commonly the cloths intended for the light ſhades are boiled firſt; and when theſe are taken out, tartar and alum are added; and this practice is purſued until we come to the cloths intended for the darkeſt ſhades, more and more tartar and alum being conſtantly ſupplied. The proceſs of welding is conducted in the ſame manner as for yellow; but a larger quantity of weld is employed, unleſs for the lighter ſhades, which, on the contrary, require a ſtill ſmaller proportion. For the moſt part, a ſucceſſion of ſhades, from the deepeſt to the lighteſt, is dyed at the ſame time, beginning with the deepeſt, and proceeding to the lighteſt: between each dip, which laſts half an hour, or three quarters, water is added to the bath. Some dyers give each parcel two dips, beginning the firſt time with the deep ſhades, and the ſecond with the light ones; in that caſe each parcel ſhould remain a ſhorter time in the bath: for the very light ſhades, care ſhould be taken that the bath does not boil. A browning with logwood, and a little ſulphat of iron, is given to the very deep greens.

But the green obtained by means of a ſolution of indigo in ſulphuric acid is known by the name of Saxon green; and it has more brightneſs, but leſs durability, than that above deſcribed. In the proceſs for it a boiling is given as for welding, and the cloth is then waſhed, ſuſtic in chips encloſed in a bag is put into the ſame bath, and boiled for an hour and a half, then taken out, and the bath cooled to a temperature which the hand can ſupport; nearly a pound and a quarter of the ſolution of indigo for each piece of cloth of eighteen ells which is to be dyed, is then added; at firſt it is to be turned with rapidity, and afterwards ſlowly: the cloth is to be taken out before the bath boils. It is a proper practice to put in only two-thirds of the ſolution at firſt, to take

out the cloth after two or three turns, and then to add the laſt third; the colour is thus rendered more uniform: if it be obſerved that the colour does not take well, a little calcined alum reduced to powder is added. Dr. Bancroft recommends the following method for Saxon blue; which many dyers prefer to the above: Six or eight parts of quercitron bark, tied up in a bag, are to be put into the dying veſſel, which ſhould contain only a ſmall quantity of warm water. When the water boils, ſix parts of murio-ſulphat of tin, and four parts of alum, are to be added. In a few minutes, the dying veſſel ſhould be filled up with cold water, till the temperature is reduced to about 130°. After this, as much ſulphat of indigo is to be poured in as is ſufficient to produce the intended ſhade of green. When the whole has been ſufficiently ſtirred, a hundred parts of cloth are to be put in, and turned briſkly for about fifteen minutes, till it has acquired the wiſhed-for ſhade. By this method, a much more beautiful colour is obtained than is given by the uſual proceſs with fuſtic. The Saxon apple-green is dyed in the bath which has ſerved for Saxon green, after one-third or one-half of it has been taken out, and after it has been cooled; the cloth is turned in it until it be on the point of boiling. Hence it is evident that a great variety of greens may be produced, not only according to the proportions of the indigo and yellow dye employed, but according to the nature of the yellow ſubſtance, which may affect the green, both as to ſhade and fixity; and the colour may be ſtill further modified by reactives of different kinds.

Mixtures of Red and Blue.—The mixture of red and blue produces violet, purple, dove-colour, panſey, amaranth, lilac, mauve, and a great number of other ſhades, determined by the nature of the ſubſtances, the red colour of which is combined with the blue, by the proportion of theſe ſubſtances, and the different ſteps of the proceſs which is employed. Hellot obſerves that ſtuff which has been dyed ſcarlet takes an unequal colour when blue is to be united with it. The blue is therefore given firſt, which, even for violet and purple, ought not to be deeper than the ſhade diſtinguiſhed by the name of ſky-blue; a boiling is given with alum mixed with two-fifths of tartar; the ſtuff is then dipped in a bath compoſed of nearly two-thirds as much cochineal as for ſcarlet, to which tartar is always added. The circumſtance which diſtinguiſhes the proceſs for purple from that for violet, is, that for the former a lighter blue ground is given, and a larger proportion of cochineal is employed. Theſe colours are frequently dyed after the reddening for ſcarlet, ſuch quantities of cochineal and tartar being added as are neceſſary: the operation is managed in the ſame way as for ſcarlet. But lilacs, pigeon's necks, mauves, &c. are commonly dipped in the boiling which has ſerved for violet, after alum and tartar have been added to it: the blue ground having been proportioned to the ſhade required, the quantity of cochineal is alſo adjuſted in a ſimilar manner: a little ſolution of tin is added for ſome reddiſh ſhades, ſuch as peach bloſſom. It is to be obſerved, that though the quantity of cochineal is diminiſhed according to the lightneſs of the ſhade required, the quantity of tartar is not leſſened, ſo that the proportion of it, compared with that of the cochineal, is ſo much the greater, as the colour required is lighter. Mr. Poerner is of opinion, that to procure the colours compoſed of red and blue, it is advantageous to employ the ſolution of indigo in ſulphuric acid, becauſe a great variety of ſhades is thus more eaſily obtained, and the proceſs is ſhorter and leſs expenſive. The colours obtained in this way are indeed much leſs durable than when the blue vat is employed; but he aſſerts, that they poſſeſs durability, when ſolution of indigo to which alkali has been added is made uſe of. He prepares a pound of cloth with three ounces of alum, by boiling it for an hour and a half, and leaving it all night in the liquor after it is cold. The bath is made with an ounce and a half of cochineal, and two ounces of tartar, boiling it for three quarters of an hour, and then adding two ounces and a half of ſolution of indigo: it is ſtirred and made to boil gently for a quarter of an hour; and by this means a very beautiful violet is produced.

Mixtures of Red and Yellow.—The colour naturally reſulting from the admixture of red and yellow, is *orange*: but its ſhades may be infinitely varied by the different proportions of the ingredients, by the yellow ſubſtances made choice of, by the preparations given to the cloth, and by the mordants added to the dye bath. Mr. Poerner deſcribes a great many varieties, which he obtained by uſing weld, ſaw-wort, dyers-weed, and other yellows, and by employing in the preparation of the cloth, or in the bath, tartar, alum, ſulphat of zinc, or ſulphat of copper. Various colours may alſo be obtained from madder united with yellow ſubſtances. It is in this way, that mor-doré and cinnamon colours are produced; theſe colours are commonly made in two baths. We begin by the maddering, preceded by a boiling with alum and tartar, as for the common maddering, and give a weld bath afterwards. But for cinnamon colours, the maddering is weaker, and a bath which has ſerved for mor-doré is generally employed. The proportions are varied, according as the red or yellow is to prevail; ſometimes galls are added, and ſometimes the colour is darkened by means of a browning. Mr. Poerner has obtained many colours from madder mixed with ſaw-wort; he prepares the cloth with different mordants, but more eſpecially with alum and tartar; he alſo adds alum and tartar to the bath. When the quantity of either of theſe ſalts is conſiderable, the colour has a deep orange caſt, becauſe acids give the colour of madder a yellow hue; but if their quantity be but ſmall, a reddiſh yellow is obtained. He has procured reddiſh brown colours, by putting ſulphat of zinc or white vitriol into the dye. It is alſo cuſtomary to employ brazil-wood with yellow ſubſtances, and ſometimes it is mixed with cochineal and madder. But when, inſtead of weld or other yellow ſubſtances, walnut-tree root, walnut-peels, or ſumach, are employed, ſnuff, cheſnut, muſk colours, &c. are produced.

Mixtures of Black with other Colours, and of Brownings.—To give cloth what is termed a *browning*, the ſtuff which has been juſt dyed is dipped in a ſolution of ſulphat of iron, to which an aſtringent has been added, and which conſequently forms a black bath; more frequently, a ſmall quantity of ſolution of iron is mixed with a bath of water, and more is added, till the dyed ſtuff dipped in it has attained the ſhade required: more rarely, ſulphat of iron is added to the dye bath, but the deſired effect is obtained with greater preciſion by dipping the dyed ſtuff in a ſolution of ſulphat of iron. Mr. Poerner often ſoaks the ſtuff in a ſolution of ſulphat of iron, to which he ſometimes puts other ingredients, and, when taken out of this mordant, it is dipped in the dye bath. The firſt mode is uſed for marones, coffee, damaſcene colours, and other ſhades of browns of the common dye; a more or leſs deep colour is given them, according to the ſhade to be obtained by the browning: a bath is then made with galls, ſumach, and alder bark, with the addition of ſulphat of iron. The ſtuffs intended for the lighteſt ſhades are dipped firſt; and when they are finiſhed, the browner ones are dipped, ſulphat of iron being added in proper proportion in each operation. It may be obſerved, that the other brownings have nothing peculiar in the proceſs. To produce ſeveral kinds of grey, a ſlight blue ground is firſt given. Mr. Poerner makes bluiſh greys, by employing the ſolution of indigo in ſulphuric acid, which he adds to a mixture of decoction of galls and ſulphat of iron, varying the ſhades by the different proportions of theſe three ingredients: and he procures other ſhades by adding ſulphat of iron to a bath conſtituted of cochineal, fuſtic, and galls. Dr. Bancroft produces livelier greys by ſubſtituting the quercitron bark for the fuſtic. But marone, and the colours which border upon it, are made with ſaunders, galls, and

a browning,

a browning, and ſometimes logwood is added: theſe colours are ſometimes made to incline towards purple and crimſon, by dying them in the remains of a cochineal bath, or by putting a little maddér or cochineal into the bath; by a little tartar the colour is rendered lighter. For hazel colours, galls, fuſtic, and logwood muſt be mixed, and more or leſs madder, with a little alum, are to be put in.

To produce a violet colour, Mr. Guhliche alums a pound of woollen ſtuff in a ſolution of two ounces of alum; he makes a bath with an ounce of cochineal, and adds an equal quantity of ſolution of iron, in which he keeps the ſtuff until it has acquired a proper ſhade. Lilacs may be dyed with the remainder. If a colour with leſs of a brown caſt be required, a ſmall quantity of ſolution of iron is employed, and an ounce of nitre muſt be introduced. Brazil-wood, the colour of which has been extracted by means of the aceto-citric or nitro-muriatic acid, may alſo be employed in the ſame manner.

A puce colour may be obtained from madder, giving a pound of woollen ſtuff a boiling in a mixture compoſed of two ounces of alum, a certain quantity of vinegar, and ſolution of iron. After a quarter of an hour's ebullition, it is left twelve hours in the mordant. A bath is made with the decoction of two ounces of white galls poured off clear from the ſediment, in which four ounces of good madder are mixed; and when it begins to grow hot, the ſtuff is dipped when taken out of the mordant, and ſuffered to remain there, gradually increaſing the heat, until it has taken the deſired colour; it is then boiled for two minutes, waſhed and dried in the ſun. The colour obtained by this proceſs is very durable. If the alum and vinegar of the mordant be omitted, a deeper brown is produced; after theſe colours the lighter ſhades are dyed. It is alſo found, that brazil and logwood employed in equal quantities, or in other proportions, give different brown colours of tolerable durability, when more or leſs ſolution of iron is mixed with a decoction of them, and the wool previouſly alumed and galled, is dyed in it; theſe colours have not, however, the durability of the former. Various ſhades of mor-doré and capucine may be given to the above colours, by dipping them, as ſoon as taken out of the dye, in a bath compoſed of annotta.

Of DYING SILK.

The fibres of ſilk are naturally covered with a kind of varniſh, or gummy ſubſtance; and almoſt the whole of what we know in Europe is tinged of a yellow colour, which it is neceſſary to remove, as well as the varniſh, for moſt of the purpoſes to which ſilk is applied. This is commonly done by ſubmitting it to the action of ſoap, in circumſtances which are already ſufficiently known. When ſilk has been freed from both its gummy varniſh and its yellow colour, it is ſometimes neceſſary to whiten it ſtill farther, by the fumes of ſulphur applied to it, and confined in a ſtove. But though ſulphureous acid gas, applied in this way, readily whitens the ſilk, and thereby renders it more fit to exhibit lively colours, a portion of ſulphur adheres to it, which muſt be removed by ſoaking and agitation, for a conſiderable time, in warm water, that it may not tarniſh the colours intended to be given by dying; an effect which ſulphur generally produces, both to thoſe of wool and ſilk. The luſtre ſo much deſired in colours dyed upon ſilk, ſeems, in a great degree, to reſult from the gloſs and poliſh of its ſurface, which acids, alkalies, and other chemical agents (particularly the ſolutions or oxyds of tin), contribute to impair, and are therefore to be ſparingly uſed. Silk, in its diſpoſition to receive and retain colours for dying, ſeems to partake of a middle nature between that of the animal and vegetable ſubſtances: by its abundance of azot and hydrogen, it poſſeſſes, like wool, a ſtrong attraction for colouring matters; but its fibres having neither a ſimilar organization, nor an equal degree of elaſticity, it is capable of imbibing colours, like linen and cotton, without any previous dilatation of its pores by hot water, but, like them, it parts with the colours ſo imbibed the more eaſily, in conſequence of this natural openneſs, or the want of contraction, in its pores; though, upon the whole, colours dyed in ſilk are more laſting than when dyed in linen and cotton, on account of its greater affinity with colouring matters, reſulting from its animal nature.

Blue Silks are uſually dyed by the following proceſs: Six parts of bran, and ſix of indigo, with nearly one part of madder, are ſtirred into a ſufficient quantity of water, in which ſix parts of common potaſh of commerce is diſſolved. The liquid is kept at a temperature proper for fermentation. When the indigo, deprived of its oxygen by the fermentation, is diſſolved by the potaſh, the liquid aſſumes a green colour. The ſilk, previouſly well ſcoured, is put into the ſolution in ſmall quantities at a time; then wrung out of the dye, and hung up in the open air, till the green colour which it has at firſt is changed into blue. Some dyers uſe the vats when grown weak to dye lighter ſhades: but the blue obtained in that caſe is leſs beautiful, and leſs permanent, than when freſh vats containing a ſmaller quantity of indigo are made uſe of: but indigo alone is incapable of giving ſilk a *deep* blue: therefore, when this is required, it is neceſſary to prepare it by previouſly giving it a ground colour. For the *Turkey* blue, which is the deepeſt, a very ſtrong archil bath is firſt prepared; and for the royal blue one of the ſame kind, but weaker. All light blues are dyed without any ground being previouſly given. There is, however, a blue made as deep as the royal blue, for the ground of which cochineal is uſed inſtead of archil, in order to render it more permanent, whence the title *bleu fin* has been given it: a blue of little durability may be given to ſilk by means of verdegris and logwood; but it might be made more laſting, by firſt giving it a lighter ſhade than is intended in a bath of this kind, afterwards dipping it in an archil bath, and in the vat after that.

Yellow Silks, of many different ſhades, are dyed either by weld, or quercitron bark, but the laſt is the cheapeſt of the two. The proportion ſhould be from one to two parts of bark to twelve parts of ſilk, according to the ſhade. The bark, tied up in a bag, ſhould be put into the dying veſſel while the water which it contains is cold, and when it has acquired the heat of about one hundred degrees, the ſilk, previouſly alumed, ſhould be dipped in, and continued till it aſſumes the wiſhed-for colour. When the ſhade required is deep, a little chalk or pearl-aſh ſhould be added towards the end of the operation. When a very lively yellow is wanted, a little murio-ſulphat of tin ſhould be added, but not too much, becauſe tin always injures the gloſſineſs of ſilk. The proportions may be four parts of bark, three of alum, and two of murio-ſulphat of tin. Silk is dyed fine orange, jonquille, and aurora, colours by annotta. The proceſs is merely dipping the ſilk into an alkaline ſolution of annotta. To produce the orange ſhade, the alkali is ſaturated with lemon juice. The colours thus produced are exceedingly beautiful, but they are apt to want permanency.

A very bright, ſhining, and durable yellow dye, very convenient for ſilk, has been lately extracted from yellow muſhrooms. Theſe are pretty large, and grow commonly under walnut and apple-trees. Its colouring matter is contained in abundance, not only in the tubular part, but alſo in the parenchyma of the body of the muſhroom. In order to extract it, the muſhroom is pounded in a mortar, and the liquor thence obtained is boiled for a quarter of an hour in water. An ounce of liquor is ſufficient to communicate colouring-matter to ſix pounds of water. When the liquor has been ſtrained, the ſtuff to be dyed is put into it, and boiled for a quarter of an hour. All kinds of ſtuff receive this colour and retain it, but on linen and cotton it is leſs bright. This colour may be modified, in a very agreeable manner, by the effect of mordants.

mordants. The proceſs ſucceeds beſt on ſilk. When this ſubſtance, after being dyed, is made to paſs through a bath of ſoft ſoap, it acquires a ſhining golden-yellow colour, which has a perfect reſemblance to the yellow of that ſilk employed to imitate embroidery in gold, and which has hitherto been brought from China, and ſold at a dear rate, as the method of dying it is unknown in Europe.

The *Rottlera tinctoria*, a plant lately diſcovered by Dr. Roxburgh on the coaſt of Coromandel, alſo affords a dye extremely elegant for yellow ſilk. The red powder which covers the capſules conſtitutes a conſiderable branch of commerce from the Circars, chiefly with the merchants of Hydrabad, and other interior parts of Hindooſtan. When the capſules are ripe, they are gathered, and the red powder is carefully collected for ſale. This powder dyes ſilk a deep yellow; or a durable orange flame-colour, of very great beauty, according to the intenſity of the mixture: alkaline ſalts enable water to extract from it a very deep blood red; and the addition of alum renders the colour brighter and more permanent.

Red Silks are uſually dyed with cochineal, or carthamus, and ſometimes with Brazil wood. Kermes does not anſwer for ſilk; madder is ſcarcely ever uſed for that purpoſe, becauſe it does not yield a bright colour. Archil is employed to give ſilk a bloom; but it is ſcarcely uſed by itſelf, unleſs when the colour wanted is lilac. Silk may be dyed crimſon by ſteeping it in a ſolution of alum, and then dying it in the uſual way in a cochineal bath. But the common proceſs is to plunge the ſilk, after it has been alumed, into a bath formed of the following ingredients: Two parts of white galls, three parts of cochineal, three-ſixteenths of tartar, and three-ſixteenths of nitro-muriat of tin, for every ſixteen parts of ſilk. The ingredients are to be put into boiling water in the order they have been enumerated; the bath is then to be filled up with cold water; the ſilk put into it, and boiled for two hours. After the bath has cooled, the ſilk is uſually allowed to remain in it for three hours longer.

The colours known by the names of poppy, cherry, roſe, and fleſh-colour, are given to ſilk by means of carthamus. The proceſs conſiſts merely in keeping the ſilk, as long as it extracts any colour, in an alkaline ſolution of carthamus, into which as much lemon juice as gives it a fine cherry colour has been poured. To produce a deep poppy red, the ſilk muſt be put ſucceſſively into a number of ſimilar baths, and allowed to drain them. When the ſilk is dyed, the colour is brightened by plunging it into hot water acidulated with lemon juice. The ſilk ought to be previouſly dyed yellow with annotta. Cherry red is produced the ſame way, only the annotta ground is omitted, and leſs colouring matter is neceſſary. When a fleſh colour is required, a little ſoap ſhould be put into the bath, which ſoftens the colour, and prevents it from taking too quickly. To leſſen the expence, ſome archil is often mixed with carthamus for dark ſhades. The ſame ſhades may be dyed by means of brazil wood, but they do not ſtand.

Silk cannot be dyed a full ſcarlet; but a colour approaching to ſcarlet may be given it, by firſt impregnating the ſtuff with murio-ſulphat of tin, and afterwards dying it in a bath compoſed of four parts of cochineal and four parts of quercitron bark. To give the colour more body, both the mordant and the dye may be repeated. A colour approaching ſcarlet may be alſo given to ſilk, by firſt dying it crimſon, then dying it with carthamus, and laſtly yellow without heat.

Black Silks are dyed nearly in the ſame manner as wool and cloth. Silk is capable of combining with a great deal of tan; the quantity given is varied at the pleaſure of the artiſt, by allowing the ſilk to remain a longer or ſhorter time in the decoction. After the galling, the ſilk is put into a ſolution of ſulphat of iron, which is uſually mixed with a certain quantity of iron filings and of gum. It is occaſionally wrung out of the bath, expoſed for ſome time to the air, and again immerſed. When it has acquired a ſufficiently full colour, it is waſhed in cold water, and afterwards ſteeped in a decoction of ſoap to take off the harſhneſs, which ſilk always has after being dyed black.

Green Silks are uſually dyed yellow firſt, by means of weld, according to the proceſs deſcribed for wool; afterwards it is dipped into the blue vat, and dyed in the uſual manner. To deepen the ſhade, or to vary the tint, decoctions of logwood, annotta, fuſtic, &c. are added to the yellow bath. Or ſilk may be dyed at once green, by adding ſuitable proportions of ſulphat of indigo to the common quercitron bark bath, compoſed of four parts of bark, three parts of alum, and two parts of murio-ſulphat of tin. Purple is firſt dyed crimſon, by means of cochineal, in the uſual way, excepting only that no tartar, nor ſolution of tin, is to be employed. It is then dipped into the indigo vat, till it has acquired the wiſhed-for ſhade. It is often afterwards paſſed through an archil bath, which greatly improves the beauty of the colour. Archil is often employed as a ſubſtitute for cochineal. The ſilk firſt receives a red colour, in the uſual way, by being dyed in an archil bath; afterwards it receives the proper ſhade of blue. The violet, or purple, given by this proceſs is very beautiful, but not very laſting. Silk may be dyed violet or purple at once, by firſt treating it with a mordant, compoſed of equal parts of nitro-muriat of tin and alum, and then dipping it into a cochineal bath, into which a proper quantity of ſulphat of indigo has been poured. But this dye is fading; the blue colour ſoon decays, and the ſilk becomes red. Marrones, cinnamons, and all the intermediate ſhades, are given to ſilk, by logwood, braſil, and fuſtic, for which the ſilk is ſcoured as uſual, alumed, and a bath prepared, by mixing decoctions of the three above-mentioned woods made ſeparately; the proportion of each is varied according to the ſhade required, but that of the fuſtic ought to prevail: this bath ſhould be of a moderate temperature. The ſilk is turned on the ſkein ſticks in the bath; and when it is taken out, if the colour be uniform, it is wrung and dipped in a ſecond bath of the three ingredients, the proportions of which are regulated according to the effect of the firſt bath, in order that the deſired ſhade may be procured. By any of theſe ſimple and eaſy preparations, ladies who reſide in the country, or live remote from a ſilk-dyer, may with great facility and certainty dye any pieces of ſilk, ribbons, gauzes, &c. ſo often required for domeſtic purpoſes.

Of DYING COTTON.

Cotton is a thread produced by a great number of herbaceous annual plants; and by ſome perennial ſhrubs or trees; but they differ from each other in the length, fineneſs, ſoftneſs, flexibility, and colours, of the cotton which they ſeverally produce. The climate is alſo ſuppoſed to have conſiderable influence on the texture and quality of the different ſpecies of cotton; that which grows neareſt the equator being generally the moſt eſteemed. There are two ſpecies which ſeem to have belonged originally to Siam; the firſt is white, and of a long fine ſtaple, capable of being ſpun into very fine threads: this ſpecies has been tranſplanted to the Weſt Indies a conſiderable time; the other is naturally of that browniſh buff colour which it retains in the pieces of cloth manufactured from it, and denominated *nankins*. The cottons of Cyprus, and other parts of the Levant, are generally whiter, and their filaments more dry and elaſtic, than thoſe of other countries; and theſe peculiarities have been ſuppoſed to render the former particularly ſuited to reflect, and permanently retain, what is called the Turkey red. See the article Cotton, vol. v. p. 263.

The ſtructure of the fibres of cotton ſeems not to have been well aſcertained. Lewenhoeck, by microſcopical examinations, found each of them to have two ſharp

ſides;

fides; and it ſeems to be owing to this circumſtance, or to their poſſeſſing ſome aſperities like the filaments of wool, that cotton greatly irritates and inflames wounds, ulcers, &c. if applied to them inſtead of lint, from which they differ totally in this reſpect; and perhaps the particular ſtructure which occaſions this difference, alſo occaſions ſome in the conformation and number of their pores, to which alone can be aſcribed the diſpoſition which cotton manifeſts to admit and retain colours better than linen, though not ſo well as wool and ſilk, becauſe its vegetable nature does not afford it equal attraction for colouring matters. M. le Pileur d'Apligny endeavoured to explain the cauſe why colours are leſs durable when dyed in ſilk, cotton, and linen, than in wool, by ſuppoſing that the pores of the three firſt of theſe ſubſtances were ſmaller than thoſe of wool; and that therefore colouring particles could not enter into them ſo eaſily and freely as into thoſe of wool. But the very reverſe of this ſuppoſition ſeems true, there being little difficulty in making ſilk, cotton, or linen, imbibe colours, even when topically applied cold, without any artificial dilatation of their pores, which is neceſſary in the dying of wool. The real difficulty, therefore, is not in making them imbibe, but in making them *retain*, the colouring particles when imbibed; becauſe, being admitted ſo readily into their undilated pores, they cannot be afterwards compreſſed and held therein by any contraction of theſe pores, as is done in thoſe of wool. We know that it requires twice as much cochineal to produce a crimſon on ſilk, as on wool; which is a proof that it can take up a greater quantity, and conſequently that its pores are at leaſt ſufficiently large and acceſſible: we know alſo, that unbleached cotton is always preferred for dying the Turkey red, it being found to retain the colour moſt permanently; doubtleſs becauſe its pores or interſtices are leſs open before than after the operation of bleaching. This is alſo the caſe of raw or unſcoured ſilk, which, as the ingenious Mr. Henry of Mancheſter obſerves, is more eaſily and permanently dyed than that which has paſſed the proceſs of whitening and ſcouring: and indeed the openneſs of the pores of cotton and linen, and their conſequent readineſs to imbibe, both colouring particles, and the earthy or metallic baſes employed to fix moſt of them, are circumſtances upon which the art of calico-printing is in a great degree founded. To prepare and diſpoſe cotton for receiving colours by dying or calico-printing, it is uſually boiled in water, with a portion of vegetable or foſſil alkali, for about two hours, and afterwards rinced in clean water; or it may be ſoaked in water, acidulated with about one-fiftieth of its weight of ſulphuric acid, and afterwards rinced thoroughly in a clear ſtream of water.

It appears, however, that what is now termed *animaliſation*, or immerſing the cotton or thread in a preparation ſaturated with ſome kind of animal matter, is by far the beſt means of inducing thoſe fabrics to receive and retain the dye. A proof of this has been recently given by Giobert to the academy of Turin, in his memoire "on the animaliſation of flax and cotton;" and another inſtance has been adduced by Van Mons, who ſtates, "that he boiled ſome potaſh and lime, in order to whiten ſome linens, into which he accidentally put a few *oyſter-ſhells*; when, to his ſurprize, he found that thoſe pieces of linen immediately took a permanent dye, from colours which, without the agency of the oyſter-ſhells, would have been carried off by mere waſhing in cold water."

Cotton may be dyed BLUE by the following proceſs: one part of indigo, one part of green ſulphat of iron, and two parts of quicklime, are ſtirred into a ſufficient quantity of water. The ſolution is at firſt green, but it gradually aſſumes a yellow colour, and its ſurface is covered with a ſhining copper-coloured pellicle. The cloth is to be allowed to remain in the ſolution for five or ſix minutes. When taken out it has a yellow colour; but, on expoſure to the atmoſphere, it ſoon becomes green, and then blue, in conſequence of the abſorption of oxygen. The indigo, in this proceſs, ſeems to be deprived of a greater quantity of oxygen than is neceſſary to reduce it to the ſtate of green pollen. Mr. Hauſſman has obſerved, that the cloth acquires a much deeper colour, provided it be plunged, the inſtant it is taken out of the dying vat, into water acidulated with ſulphuric acid. It is uſual to dip the cloth into a ſucceſſion of vats, variouſly charged with colouring matter; beginning with the vat which contains leaſt colouring matter, and paſſing gradually to thoſe which contain moſt. By this contrivance the cotton is dyed more equally than it probably would be, if it were plunged all at once into a ſaturated ſolution of colouring matter. To give cotton a very beautiful blue colour, the cold vat of Mr. Guhliche is much recommended. This vat is compoſed of a pound of indigo, three pounds of quicklime, three pounds of Engliſh vitriol, and a pound and a half of orpiment. The indigo ſhould firſt be carefully ground and mixed with water, put into a wooden vat and diluted with water to a proper degree, according to the intenſity of the colour deſired; the lime is then to be added, and the mixture well ſtirred, covered up, and left at reſt for ſome hours, when the vitriol reduced to powder is to be added, the whole well ſtirred, and the vat covered; ſome hours after, the orpiment in powder is to be thrown in, and the whole again left at reſt for ſome hours; after this, the mixture is to be ſtirred, and left to ſettle until the ſupernatant liquor appears clear, when the flower which covers it is put aſide; the cotton is then dyed, after having been previouſly dipped in warm water. When taken out of the bath, it is waſhed in a ſtream of water and dried. When the bath becomes turbid, it is left to ſettle till it grows clear, a precaution eſſentially neceſſary for lighter ſhades; and when it begins to be exhauſted, one-third of the ingredients are added, proceeding as at firſt. In proportion as the vat is exhauſted, the ſhades become lighter. This vat ſerves equally well for ſilk and thread.

To dye cotton YELLOW, it is neceſſary to begin by ſcouring it in a bath prepared with the ley of the aſhes of green wood; it is then waſhed, dried, and alumed with one-fourth of its weight of alum; after twenty-four hours it is taken out of the aluming, and dried without being waſhed. A weld bath is then prepared, with the proportion of a pound and a quarter of weld for each pound of cotton: in this the cotton is dyed, by being turned and wrought in it until it has acquired a proper ſhade; it is taken out of this bath to be ſoaked for an hour and a half, in a ſolution of ſulphat of copper or blue vitriol, in the proportion of one-fourth of the weight of the cotton; it is then thrown, without being waſhed, into a boiling ſolution of white ſoap made with the ſame proportions; after being well ſtirred, it is boiled in it for nearly an hour, then waſhed and dried. But if a ſtill deeper yellow be required, the cotton is not alumed, but two pounds and a half of weld for each pound of cotton are employed, to which a drachm of verdegris mixed with a part of the bath is added; in this, the cotton is dipped and worked, until it have acquired an uniform colour; it is then taken out of the bath, that a little ley of ſoda may be poured in; returned into the bath and kept there for a full quarter of an hour, when it is taken out, wrung, and dried very carefully. A lemon colour is dyed by the ſame proceſs, except that only one pound of weld is employed for each pound of cotton, and that the proportion of verdegris may alſo be diminiſhed, or even entirely omitted, aluming being ſubſtituted in its ſtead. The ſhades of yellow may thus be varied in many different ways. For an orange colour, anotta is uſed: this ſubſtance muſt be ground while it is kept moiſtened, boiled in water with double its weight of alkali, left to ſettle for half an hour, and the clear liquor put into a heated veſſel; in this the cotton is to be immerſed, when it will receive an orange colour. A hot ſolution of tartar is then to be poured into the bath, ſo that it may be-

come weakly acidulated: it is to be again turned in it on the ſkein ſticks, or wound upon the winch when in the piece; in this way the colour becomes more lively, and fixes better; the cotton muſt then be waſhed ſlightly, and dried by means of a ſtove.

The new method of dying cotton yellow, as recommended by Dr. Bancroft, is much more advantageous, and yields permanent and beautiful colours at a ſmaller expence. The mordant he uſes is acetit of alumina, prepared by diſſolving one part of acetit of lead, and three parts of alum, in a ſufficient quantity of water. This ſolution ſhould be heated to the temperature of 100°, the cloth ſhould be ſoaked in it for two hours, then wrung out and dried. The ſoaking may be repeated, and the cloth again dried as before. It is then to be barely wetted with lime-water, and afterwards dried. The ſoaking in the acetit of alumina may be again repeated; and if the ſhade of yellow is required to be very bright and durable, the alternate wetting with lime-water, and ſoaking in the mordant, may be repeated three or four times. By this contrivance a ſufficient quantity of alumina is combined with the cotton, and the combination is rendered more permanent by the addition of lime. The dying bath is prepared by putting twelve or eighteen parts of quercitron bark, (according to the depth of the ſhade required,) tied up in a bag, into a ſufficient quantity of cold water. Into this bath the cotton is to be put, and turned round in it for an hour, while its temperature is gradually raiſed to about 120°. It is then to be brought to a boiling heat, and the cotton allowed to remain in it after that only a few minutes. If it be kept long at a boiling heat, the yellow acquires a ſhade of brown.

Another way of dying cotton very permanent yellows, would be to imitate the method adopted for dying cotton in the eaſt. That method is indeed exceedingly tedious, but it might be very much ſhortened by carefully attending to the uſes of the ingredients. The eſſential part of the proceſs is to cauſe the alumina to combine in ſufficient quantity with the fabric, and to adhere with ſufficient firmneſs to enſure a permanent colour. This is accompliſhed by uſing three mordants; firſt oil, then tan, and laſtly alum. The combination of theſe three ſubſtances produces a mordant which enſures a very permanent colour. The cotton is firſt ſoaked in a bath compoſed of a ſufficient quantity of oil, and mixed with a weak ſolution of ſoda. Animal oil ſeems to anſwer beſt for the purpoſe. Vogler found that glue anſwered extremely well. The ſoda ſhould be cauſtic: in that ſtate it combines with the oil, and enables the cotton to abſorb it equally. It is then, after being waſhed, put into an infuſion of nut-galls, (the whiter the better.) The tan combines with the oil, while the gallic acid carries off the alkali that may remain attached to the cloth. The infuſion ought to be hot; and the cotton, after coming out of it, ſhould be dried as quick as poſſible. Care ſhould be taken that the quantity of galls do not exceed a juſt proportion compared with the oil, otherwiſe the colour will be darkened. The cotton, thus prepared, is to be put into a ſolution of alum. There is a ſtrong affinity between tan and alumina; in conſequence of which, the alum is decompoſed, and the alumina combines with the tan in ſufficient abundance. The cotton, thus prepared, is to be dyed, as above deſcribed, with quercitron bark.

Mr. Chaptal, whoſe ingenious labours have contributed exceedingly to elucidate the theory of dying, has propoſed an exceedingly ſimple and cheap method of dying cotton a fine permanent nankeen yellow. His proceſs is as follows: Cotton has ſo ſtrong an affinity for oxyd of iron, that if put into a ſolution of that oxyd in any acid whatever, it decompoſes the ſalt, abſorbs the iron, and acquires a yellow colour. The cotton to be dyed is to be put into a cold ſolution of ſulphat of iron, of the ſp. gr. 1·020; it is then wrung out, and put directly into a ley of potaſh, of the ſp. gr. 1·010, into which a ſolution of alum has been poured till it was ſaturated with it. After the cotton has remained in this bath four or five hours, it may be taken out, waſhed, and dried. By this proceſs cotton may be dyed all the different ſhades of nankeen, by varying the proportion of the ſulphat of iron. This colour has the advantage of not being injured by waſhing, and of being exceedingly cheap.

To dye cotton Red, madder is the principal ingredient, as well as for giving many other colours by different admixtures. The madder red on cotton is diſtinguiſhed into two kinds; the one is called ſimple madder red; the other, which is much brighter, is called Turkey or Adrianople red, becauſe it comes from the Levant, and has ſeldom been equalled in brightneſs or durability. The reds introduced by madder differ very much in brightneſs and permanency, according to the proceſſes employed. The great difficulty conſiſts in the application of the mordant, which is by far the moſt complicated of any in the whole art of dying. We are indebted to Mr. Vogler, of Weilburg, for ſome very intereſting experiments on this ſubject. He firſt conſiders the baſes or mordants, and afterwards the preparation of the madder bath. The firſt mordant that was tried conſiſted of a ſolution of three drachms of Roman alum in fourteen ounces of water. Cottons boiled for ſome minutes in this ſolution, and afterwards paſſed through the different madder baths, took a ſlight poppy-coloured red. The author obſerved in this, and many other experiments, that Roman alum was much better than common alum, and gave greater brightneſs to the colours. The addition of the ſmalleſt quantity of any kind of acid rendered it paler; the addition of arſenic produced no effect; ſheep and cow dung, and *album grecum*, added to the mordant, as alſo urine employed inſtead of water to diſſolve the alum, contributed to ſtrengthen the colour. Muriat of ſoda and ammoniacal muriat had more effect, but theſe ſalts rendered the colour more dull; lime-water acted very much in the ſame way. The ſubſtances which had the beſt effect were gum arabic, ſtarch, fenugreek-ſeed, and, above all, glue. The gaſtric juice, and the ſerous part of the blood of animals, act in a manner ſimilar to glue, and ſerve to animaliſe the cotton. Thread and cotton may be ſoaked alternately in a ſolution of glue and a ſolution of alum, or the glue may be diſſolved with the alum, in the proportion of from one drachm and a half to four drachms, with the quantity of alum directed. It is neceſſary to chooſe fine glue. This ſubſtance uſed with alum produces a more ſaturated colour, but without alum the red is of a duſky colour. It is alſo found that muriat and nitrat of alumina not only produce a more intenſe and durable red than alum, but the tint is pleaſanter, more eſpecially when the nitrat is employed. In general, muriats render the colour darker, more ſaturated, and more durable. Corroſive mercurial muriat produces an effect of a ſimilar kind. Having diſſolved in a ſtrong ley of pot-aſh as much powdered white arſenic as it would take up with the aſſiſtance of heat, and having mixed this ſolution, which had been diluted with two parts of water, with a ſaturated ſolution of alum, the mixture became turbid, and of the conſiſtence of jelly; it recovered its tranſparency on a ſolution of alum being gradually added. It was found that thread and cotton ſoaked for twelve hours in this mordant, when waſhed and dried, received from madder a beautiful red colour. Thread and cotton which had been for ſix hours in nitro-muriatic acid, and afterwards waſhed and dried, took from madder a more beautiful and durable colour than that which dyers obtain from anotta; even damaged madder, by means of this mordant, afforded a yellowiſh brown, that had a ſhade very agreeable.

This colour is capable of being changed into a poppy-coloured red, which may vie with the moſt beautiful colours of this hue obtained from Braſil-wood and cochineal, by firſt ſoaking the ſtuff in a ſolution of alum and common ſalt, and boiling it a ſecond time with madder. Mr. Vogler macerated for a night three drachms of pot-

aſh

aſh with an equal quantity of common madder in a pound of water; he then applied a boiling heat, and put into it ſome thread and ſome cotton; and after half a quarter of an hour's boiling, he took it out, rinſed and dried it, then ſoaked it in a ſolution of alum and common ſalt; after which he paſſed it through a ſolution of glue, and at laſt dipped it in a madder bath; when it took a full red, which was very fine. If to this preparation ſome anotta be added, a beautiful orange colour will be produced; and it is thus that the dyers in many places prepare that colour: but it is not durable.

Tan or galls diſpoſe cotton readily to receive the madder colour. Mr. Vogler's preparation for galling conſiſted of five drachms of black galls, kept for twenty-four hours in a pound of water, which was then boiled for ten minutes, and ſometimes he added ſix drachms of common ſalt. The galled cotton, after having received the mordants of alum and ſalt, took with the madder a perfectly ſaturated colour, but which was of a dark red. Cotton ſucceſſively impregnated with a ſolution of tin and glue, ſteeped in an infuſion of cochineal and galls, waſhed, and dried, and afterwards impregnated with the alum and ſalt mordant, and laſt of all dyed in a madder bath, received an uncommonly beautiful colour, which was very bright and conſiderably durable. The mordant of alum and corroſive muriat of mercury, and that of alum and ſalt, gave a colour of a deeper caſt.

The ſame gentleman was equally ſucceſsful when inſtead of galls he uſed ſeveral other vegetable aſtringents, ſuch as the ground bark of the alder and oak, the powdered bark of walnut-tree root, flowers and bark of pomegranate, the leaves, bark, and tops, of the ſumach. But the beſt ſubſtitute for galls is unqueſtionably the myrobalans, i. e. the *Phyllanthus emblica* of Linnæus. This is now commonly uſed at Mancheſter, inſtead of galls, not only in preparing the Turkey red dye, but for the aſtringent principle in many other caſes. He made many experiments with metallic and earthy ſalts, all of which, exeept the aluminous and the ſolution of tin, appeared to him to be but little adapted or entirely hurtful in the dying of red. The principal reſults are the following: A ſolution of nitrat of lead employed as a mordant, produced a very dirty red, inclining to brown. In general, ſolutions of lead uſed as mordants for thread and cotton, diſpoſe them abundantly to receive colours from all vegetable colouring ſubſtances, but they have always a dark and dirty appearance. Theſe mordants may be employed for brown or black colours; the bad brown juſt mentioned, for inſtance, will change to a perfect brown of a very beautiful ſhade, if paſſed through a mordant of alum and ſalt, and boiled a ſecond time with madder. A very fine black, by galling thread and cotton impregnated with ſalt of lead, and then putting them into a ſolution of ſulphat of copper, and boiling them in a logwood bath. Cobalt diſſolved in the nitro-muriatic acid produced a very pleaſant colour, nearly reſembling a ſaturated violet. A ſolution of ſulphat of copper gave a bad lilac, and verdegris diſſolved in vinegar produced the ſame effect; but the nitrat of copper produced a much more beautiful and ſaturated colour.

Cotton that has received the mordant of ſulphat of copper or iron, takes in the madder bath a dirty dull violet colour. Mr. Vogler having added the alkaline ſolution of arſenic juſt mentioned, to a moderately ſaturated ſolution of ſulphat of copper or iron, produced a turbid mixture which effervesced, and he rendered it tranſparent by adding ſulphat of iron. Thread and cotton impregnated with this preparation received a beautiful ſaturated puce colour, which penetrated them in a deep manner. But the nitrat and muriat of iron produced a better effect than the ſulphat and acetit, they afforded a beautiful well ſaturated violet colour. The alkaline ſolution of arſenic, mixed with earthy and metallic ſalts, generally render them better mordants for all colours. This likewiſe renders the effect of the mordants into which it enters more laſting, ſo that the ſtuff impregnated with it many years before, may be dyed without diſadvantage; a circumſtance we do not remark reſpecting any other mordant, excepting a ſolution of tin.

The madder bath is prepared in different ways by Mr. Vogler. He puts three drachms of madder into from ſixteen to eighteen ounces of water; he macerated it for twenty-four hours, then boiled it for a quarter of an hour, introduced thread and cotton, and boiled them for half a quarter of an hour; he afterwards waſhed them in two or three waters, and then dried them in the ſhade; he remarks that by long boiling the colour of the ſtuff is taken away and entirely deſtroyed. If freſh urine be ſubſtituted for water, it affords more laſting colours; but in ſummer it is liable to become putrid ſoon, ſo as to render the infuſion incapable of giving the dye. A drachm of ſheep's dung, or *album grecum*, produced the ſame effect as the urine; and three drachms of muriat of ſoda, or one drachm of ammoniacal muriat, produced a fuller but leſs bright colour. Sulphat of pot-aſh and nitre had no effect whatever. Three drachms of white ſugar afforded a more beautiful and ſaturated colour; on four drachms of long pepper being added, it was found to have become more capable of reſiſting the nitric acid. A drachm or a drachm and a half of ſtarch or gum arabic thrown into the bath juſt as it begins to boil, and before the cotton is put in, gives a finer and more ſaturated colour; one drachm of fenugreek ſeed produced very nearly the ſame effect. If from one ounce to one ounce and a half of glue, in the ſtate of jelly, be thrown into the liquor as the ebullition commences, it affords a particularly full colour, and the addition of three drachms of common ſalt not only renders the colour more laſting, but preſerves the infuſion from running into the putrid ſtate. But the moſt beautiful of all common reds upon cotton is obtained by mixing four drachms of ox-gall with the decoction: at the ſame time it ſhould be obſerved, that this colour is more eaſily deſtroyed than any other by the nitric acid. After all, Mr. Vogler confeſſes, that by his numerous proceſſes, he has not been able to obtain a red of a degree of permanency equal to that of the Adrianople, though he has much excelled in this reſpect the *falſe* Adrianople reds uſed for Siameſe and other red ſtuffs.

Of ADRIANOPLE, or TURKEY RED.

That beautiful red dye given to cotton in the Ottoman empire, is known in Europe under the name of *Turkey red*, *Levant red*, or *Adrianople red*. Many attempts have been made both in France and England to imitate this ſplendid dye, and much has been written upon it. The abbé Mazeas has publiſhed ſome experiments which afford conſiderable information; but his proceſs has not ſucceeded. Mr. Henry, of Mancheſter, has unqueſtionably approached the neareſt to perfection in England; and Mr. Gren, in the German manufactories, has ſucceeded in a very cloſe imitation. Theſe proceſſes have already appeared in the numerous Engliſh books on dying: the beſt information, therefore, left for us to give, is the genuine method and proceſſes adopted in the Grecian manufactories, where this dye firſt had its riſe, and where it is now carried on with the utmoſt celebrity. We are indebted for this information to M. C. Felix, who made a journey into the Levant on purpoſe, and ſucceeded in bringing away the entire proceſs; and this he has publiſhed in the *Annales de Chimie*, No. 92. In theſe Grecian manufactories the workmen dye at one time a maſs of ſkeins weighing thirty-five occas; each occa being equal to about fifty ounces. The firſt thing to be done is that of cleaning the cotton, for which purpoſe three leys are employed; one of ſoda, another of aſhes, and a third of lime. The cotton is thrown into a tub, and moiſtened with the liquor of the three leys in equal quantities; it is then boiled in pure water, and waſhed in running water. The ſecond bath given to the cotton is compoſed of ſoda and ſheep's dung diſſolved in water.

To facilitate the ſolution, the ſoda and dung are pounded in a mortar. The proportions of theſe ingredients are, one occa of dung, ſix of ſoda, and forty of water. When the ingredients are well mixed, the liquor expreſſed from them is ſtrained, and being poured into a tub, ſix occas of olive-oil are added to it, and the whole is well ſtirred till it becomes of a whitiſh colour, like milk. The cotton is then ſprinkled with this water, and when the ſkeins are thoroughly moiſtened, they are wrung, preſſed, and expoſed to dry. The ſame bath muſt be repeated three or four times, becauſe it is this liquor which renders the cotton more or leſs apt for receiving the dye. Each bath is given with the ſame liquor, and ought to continue five or ſix hours. It is to be obſerved that the cotton, after each bath, muſt be dried without being waſhed, as it ought not to be rinſed till after the laſt bath. The cotton is then as white as if it had been bleached in the fields.

The bath of ſheep's dung is a practice long peculiar to the Levant. It may be ſuppoſed that the dung is of no utility for fixing the colours; but it is known that this ſubſtance contains a great quantity of volatile alkali, in a diſengaged ſtate, which has the property of giving a roſy hue to the red. It is therefore probable that it is to this ingredient that the red dyes of the Levant are indebted for their ſplendour and vivacity. This much, at any rate, is certain, that the Morocco leather of the Levant is prepared with dog's dung; becauſe it has been found that this dung is proper for heightening the colour of the lack. The bath of dung is followed by the proceſs of galling. The galling is performed by immerſing the cotton in a bath of warm water, in which five occas of pulveriſed gall-nuts have been boiled. This operation renders the cotton more fit for being ſaturated with the colour, and gives to the dye more body and ſtrength. After the galling comes aluming, which is performed twice, with an interval of two days, and which conſiſts in dipping the cotton into a bath of water in which five occas of alum have been infuſed, mixed with five occas of water alcaliſed by a ley of ſoda. The aluming muſt be performed with care, as it is this operation which makes the colouring particles combine beſt with the cotton, and which ſecures them in part from the deſtructive action of the air. When the ſecond aluming is finiſhed, the cotton is wrung; it is then preſſed, and put to ſoak in running water, after being incloſed in a bag of thin cloth.

The workmen now proceed to the dying. To compoſe the colours, they put in a boiler five occas of water and thirty-five occas of a root which the Greeks call *ali-zari*, or painting colour, and which in Europe is known under the name of *madder*. The madder, after being pulveriſed, is moiſtened with one occa of ox or ſheep's blood. The blood ſtrengthens the colour, and the doſe is increaſed or leſſened according to the ſhade of colour required. Thus the ſheep's dung and the blood act as an animaliſation of the cotton. An equal heat is maintained under the boiler, but not too violent; and, when the liquor ferments, and begins to grow warm, the ſkeins are then gradually immerſed before the liquor becomes too hot. They are then tied with packthread to ſmall rods, placed croſſwiſe over the boiler for that purpoſe, and when the liquor boils well, and in an uniform manner, the rods from which the ſkeins were ſuſpended are removed, and the cotton is ſuffered to fall into the copper, where it muſt remain till two-thirds of the water is evaporated. When one-third only of the liquor remains, the cotton is taken out and waſhed in pure water.

The dye is afterwards brought to perfection by means of a bath alcaliſed with ſoda. This manipulation is the moſt difficult and the moſt delicate of the whole, becauſe it is that which gives the colour its tone. The cotton is thrown into this new bath, and made to boil over a ſteady fire till the colour aſſumes the required tint. The whole art conſiſts in catching the proper degree: a careful workman, therefore, muſt watch with the utmoſt attention for the moment when it is neceſſary to take out the cotton, and he will rather burn his hand than miſs that opportunity. It appears that this bath, which the Greeks think of ſo much importance, might be ſupplied by a ley of ſoap; and it is probable that ſaponaceous water would give the colour more brightneſs and purity. When the colour is too weak, the Levantines know how to ſtrengthen it by increaſing the doſe of the colouring ſubſtances; and, when they wiſh to give it brightneſs and ſplendour, they employ different roots of the country, and, in particular, one named *ſaffari*, ſpecimens of which have been ſent to France.

The ali-zari, which is the principal colouring matter employed in the Greek dye-houſes, is collected in Natolia, and is brought to Greece from Smyrna: ſome of it comes alſo from Cyprus and Meſopotamia. The ſuperiority of this Levantine plant to the European madder, is acknowledged by all thoſe acquainted with the art of dying, and may ariſe from two cauſes; the manner in which it is cultivated, and the method employed for its deſiccation. As the ali-zari appears to be of a weaker conſtitution than the common madder; as its branches are more delicate, its leaves ſmoother and tenderer, and its ſtem more fragile, it is ſupported by ſticks, as peaſe are among us. A well-nouriſhed ſtem acquires in this manner more conſiſtence, and ſends forth more roots. It is the woody part of the roots which affords the greateſt quantity of colouring particles. The ali-zari is not collected till the fifth or ſixth year, that is to ſay, when it has acquired its full ſtrength; while in France and Zealand, where land is of more value than in the Levant, the inhabitants wiſh to reap too ſoon, and collect the madder before it comes to complete maturity.

The method employed in the deſiccation contributes alſo to improve the quality of the ali-zari. The Levantines dry it in the open air; and this operation is eaſy in a country where great dryneſs prevails in the atmoſphere, while, in our damp climates, we are obliged to dry the madder by ſtoves. Hence it happens that the ſmoke, which mixes itſelf with the cold air, and penetrates the roots, impregnates them with fuliginous particles, which alter the colouring ſubſtance; an accident which does not take place when the madder is dried without the aſſiſtance of fire. It is, however, poſſible, that the ali-zari and madder may never produce the ſame tone of colour, notwithſtanding all the care that may be employed in the culture and drying of the latter; becauſe there may be as much difference between theſe two plants, ſo like to each other, as between the goats of Wales and thoſe of Angola. It is probable, alſo, that the ſuperiority of the ali-zari over madder may ariſe only from its ſtem being tenderer, and by its conſequently having a greater diſpoſition to transform itſelf into ſucculent roots. In that caſe, ſeveral plants of the family of the rubiæ might be ſubſtituted in its place with advantage; ſuch as the *gallium luteum* and *gallium flore albo*, found in abundance on the hills of Poitou, and the madder, which grows on both ſides of the Alps, and which has been diſtinguiſhed by the name of *rubia lævis Tourinenſium*. All theſe plants give a red as beautiful and as pure as the beſt madder; but whether the quantity of their colouring matter is equal to their beautiful quality, remains yet to be enquired.

The chief manufactories for dying ſpun cotton a Turkey red, are in Theſſaly. There are ſome at Baba, Rapſani, Tournavos, Lariſſa, Pharſalia, and in all the villages ſituated on the ſides of Oſſa and Pelion. Theſe two mountains may be conſidered as the alembics that diſtil the eternal vapours with which Olympus is crowned, and which diſtribute them throughout the beautiful valleys ſituated around them. Of theſe valleys, that of Tempe has at all times been diſtinguiſhed by the beauty of its ſhady groves and of its ſtreams. Theſe ſtreams, on account of their limpidneſs, are very proper for dying, and ſupply

ſupply water to a great number of manufactories, the moſt celebrated of which are thoſe of Ambelakia. This village, by its induſtry, communicates life and activity to all the neighbouring country. Its population, which has been tripled within theſe fifteen years, amounts at preſent to four thouſand, and all theſe people *live* by *dying*. Aqua fortis, or dilute nitric acid, is the beſt and moſt expeditious teſt for diſtinguiſhing the true Adrianople red from the falſe. If we immerſe a thread of the latter dye in it, it ſoon become pale, and in leſs than a quarter of an hour white; while the true Adrianople red will remain in it for an hour without any alteration, and, indeed, never entirely loſes its colour, but acquires an orange hue or caſt. A ſcarlet colour may be given to cotton by means of murio-ſulphat of tin, cochineal, and quercitron bark, uſed as for ſilk; but the colour is too fading to be of any value.

In order to dye cotton BLACK, it muſt be previouſly dyed blue, and ſteeped for twenty-four hours in a decoction of nut-galls. A bath is prepared, containing acetit of iron, formed by ſaturating acetous acid with brown oxyd of iron. Into this bath the cotton is put in ſmall quantities at a time, wrought with the hand for a quarter of an hour, then wrung out and aired, again wrought in a freſh quantity of the bath, and afterwards aired. Theſe alternate proceſſes are repeated till the colour wanted is given. A decoction of alder bark is uſually mixed with the liquor containing the nut-galls. It would probably contribute to the goodneſs and permanence of the colour, if the cotton, before being galled, were impregnated with oil, by being ſteeped in a mixture of alkaline ley and oil combined, as is practiſed for dying cotton red.

To give a GREEN colour to linen and cotton, they are firſt ſcoured, dyed in the blue vat, cleanſed, and dipped in the weld bath. The ſtrength of the blue and the yellow is proportioned to the colour to be obtained. As it is difficult to dye cotton velvet uniformly in the common blue vat, it is firſt dyed yellow with turmeric, and finiſhed green with the ſolution of indigo in the ſulphuric acid. But it is a matter of indifference whether the yellow or the blue be begun firſt. A proceſs for dying cotton velvet, or ſkeins of cotton, of a ſea or apple green in a ſingle bath, is deſcribed by M. d'Apligny. In it verdegris is mixed with vinegar, and the mixture kept well ſtopped fifteen days in a ſtove; four hours before uſing it, a ſolution of a quantity of *cendres gravelées*, equal in weight to that of the verdegris, is added, and the mixture is kept hot. The cotton, thread, or velvet, are prepared by being ſoaked in a warm ſolution of alum, made in the proportion of one ounce of ſalt and five quarts of water to the pound: they are then taken out, and the verdegris mixture added to the bath, into which they are returned in order that they may be dyed. The different ſhades of olive, and drake's-neck green, are made by giving the cotton a blue ground, galling it, and dipping it in a weaker or ſtronger bath from what the dyers call the *black caſk*, then in the weld bath with the verdegris, and afterwards in the bath with the ſulphat of copper; and the colour is afterwards brightened by means of ſoap. Different ſhades will be produced by the ſame ingredients, in the formation of Saxon green, according to the proceſs which is employed: if a Saxon blue be firſt given, and afterwards the yellow colour, ſeparately, the effects will be ſimilar to thoſe above-mentioned; but if the ſolution of indigo be mixed with the yellow ingredients, other reſults are obtained, for then the ſulphuric acid acts on the colouring particles, and the intenſity of the yellow is diminiſhed. If a ſucceſſion of ſhades be dyed in a bath compoſed of yellow and the ſolution of indigo, the laſt approach more and more to yellow, becauſe the particles of indigo become attached to the ſtuff in preference to the yellow ones, which therefore become predominant in the bath.

The general method of dying thread and cotton a purple or violet colour, is firſt to give them a blue ground in the vat, proportionate to the ſhade wanted, and to dry them; they are then galled, in the proportion of three ounces of galls to a pound: they are left for twelve or fifteen hours in this gall-bath, after which, they are wrung and dried again. The thread and cotton are then paſſed through a decoction of logwood, and when well ſoaked are taken out, and two drachms of alum and one drachm of diſſolved verdegris for each pound of thread and cotton, are added to the bath; the ſkeins are then re-dipped on the ſkein ſticks, and turned for a full quarter of an hour, when they are taken out to be aired; after which they are to be again completely immerſed in the bath for a quarter of an hour, then taken out and wrung. Then the vat which has been employed is emptied; half of the decoction of logwood which had been reſerved is poured in, two drachms of alum are added, and the cotton dipped afreſh, until it is brought to the ſhade required. The decoction of logwood ought to be ſtronger or weaker according to the ſhade we want: this violet ſtands the action of the air tolerably well, but cannot be compared in durability to that obtained by means of madder. In the production of violet by means of cochineal, it may be obſerved, that the woollen ſtuff has been diſpoſed to take a crimſon, by the bath, which contains alum; but the tartar added to the dye-bath, brings the colour back to red; this is a general property which acids poſſeſs. For purple, the red is rendered a little more predominant, by increaſing the quantity of the cochineal, and diminiſhing the intenſity of the blue ground. But the ſhades bordering on theſe two colours ſhould have a diſtinct red, and the ſame proportion of tartar is preſerved, though that of cochineal and the depth of the blue ground be leſſened.

The cinnamon and mor-doré colours are given to thread and cotton, by beginning the proceſs for dying them with verdegris and weld; they are then dipped in a ſolution of ſulphat of iron, wrung and dried. When dry, they are galled in the proportion of three ounces of galls to the pound, dried again, alumed as for red, and maddered. When dyed and waſhed they are put into very warm ſoapſuds, and turned until they are ſufficiently brightened; in the aluming, decoction of fuſtic is ſometimes added. For ſome colours, blue is combined with red and yellow; it is thus that olives are made. A blue ground is firſt given, then the yellow dye; and, laſtly, a ſlight maddering. The ſhade which reſults from this operation depends on the proportion of the three colours of which it is compoſed: a browning is given with a ſolution of ſulphat of iron, for the more deep ſhades. Mr. Poerner combines blue with yellow and red, by uſing the ſolution of indigo in the ſulphuric acid, to which he adds alkali. He prepares a bath with cochineal and fuſtic, adds the ſolution of indigo, and dyes the cloth in it after it has been alumed. He alſo makes a bath with fuſtic and Brazil-wood, to which he adds tartar or alum, and in this way obtains different colours inclining more or leſs to blue, red, or green. A fine olive is given to thread and cotton, as M. d'Apligny has obſerved, by boiling four parts of weld and one of pot-aſh in a ſufficient quantity of water; Brazil-wood, which has been ſteeped over night, is boiled ſeparately with a little verdegris; theſe two ſolutions are mixed in different proportions, according to the ſhade required, and the cotton or thread afterwards dipped into the liquor.

Of DYING LINEN and THREAD.

Flax and hemp, which produce us thread and linen, exhibit the ſame properties with regard to dying: and if cotton is an important object of induſtry, flax and hemp deſerve particular attention, both as a national production, and as the moſt extenſive ſource of labour for the poor. It is a manufacture adapted to every part of the country; which admits of ſubdiviſion from the fabrication of cordage to that of cambrics; which collects rural

families together in the intervals from other labours, and affords them, in ſome meaſure, the ſweets of ſociety, which preſents an opportunity of habituating infancy to labour, and of acquiring a means to render old age comfortable. At a time when we are every where employed in draining and incloſing land, and when the number of ſmall additional tracts of land muſt by theſe means every day increaſe, it is a circumſtance meriting attention, that the ſoil fitteſt for the culture of hemp is that from which the waters have been recently drained, and that this production is peculiarly adapted for the employment of ſmall cultivators.

Flax ought to undergo ſeveral preparations before it is fit to receive the dye. The firſt is ſteeping; by this the bark, which is afterwards to ſerve for ſpinning, is diſpoſed to ſeparate. The ſteeping is an operation of ſo great importance, both with regard to its influence upon the quantity and quality of the product, and the deleterious qualities it may communicate to the air, that it may not be improper to give an idea of the principles on which it may be conducted.

It appears that, in ſteeping, a glutinous liquor that holds the green colouring part of the plant in ſolution, and which unites the cortical with the ligneous part, undergoes a degree of putrefaction greater or leſs according to the method we employ; for, as M. Roſier has obſerved, carbonic acid, and inflammable gas, are diſengaged. This ſubſtance appears to reſemble greatly the glutinous part which is diſſolved in the juice expreſſed from green plants, which ſeparates from the colouring particles when it is made to undergo a heat approaching to boiling, which putrefies and affords ammoniac by diſtillation. Although this ſubſtance be held in ſolution in the juice expreſſed from plants, it appears, however, that water alone cannot ſeparate it from the cortical part; but it is on this account that hemp which has been ſteeped in a rapid ſtream, is deficient in flexibility and ſoftneſs. If the ſteeping be performed in ſtagnant and corrupted water, the hemp acquires a brown colour; but beſides this, it loſes its ſolidity, and exhales vapours which produce fatal diſorders. It appears, then, that the ſteeping is moſt advantageouſly performed in pools planted at the ſides of rivers, ſo that the water may be eaſily renewed to prevent the putrefaction from being hurtful to the hemp or injurious to health, and yet not ſufficient to prevent the degree neceſſary to render the gelatinous ſubſtance ſoluble in water. M. Roſier found that the ſteeping would be performed when the hemp is covered with a layer of earth, and he adviſes that method; M. Prozet has propoſed to diſſolve a ſmall quantity of cauſtic alkali in the water in which it is performed, to increaſe its ſolvent power, and prevent putrefaction; but it appears from the experiments of Dr. Home, that the alkali retards the operation of ſteeping, and renders the flax brittle.

While flax is ſteeping, and during the drying which ought to precede and follow it, the green colouring particles undergo a change ſimilar to that obſerved in the green ſubſtance of plants which are expoſed to the action of the air and of light; the colour changes to a yellow, to a fawn, and even to a brown, in conſequence of the combuſtion which is induced. A great part is then ſoluble in alkalies, without requiring to be any further oxygenated; ſo that by treating it with an alkaline ſolution, we can ſeparate from it a conſiderable portion of its colouring particles, which remain, perhaps, combined with a part of the gluten. It is upon the ſolution of theſe colouring particles that the proceſs publiſhed by the prince of St. Sever for obtaining fine lint from hemp is founded. He orders the hemp to be lixiviated with a ſolution of two parts of ſoda to one of lime, afterwards to impregnate it with ſoap to keep it in digeſtion, to waſh it well, and afterwards to comb it. Berthollet deſcribes an excellent proceſs for obtaining fine lint from hemp, which is the invention of a clergyman. He ſteeps the hemp as ſoon as it is taken from the earth: after ſteeping he ſeparates the bark by a particular manipulation, and by dipping it in a ſolution of black ſoap; he waſhes it with great care before drying; the colouring part, which is ſoluble only in alkalies, may ſtill be diſſolved and carried away by the water aſſiſted by a little ſoap; the lint then becomes much whiter; it divides more readily without doing ſo too much; and we have the lixiviations which ought to precede the bleaching.

Ordinary thread and cloth that is woven contain a colouring ſubſtance which may be ſeparated by ſimple lixiviations; but there is a portion of this ſubſtance that is truly combined with the vegetable fibres, and which can only be ſeparated by decompoſing it by the combuſtion it undergoes in combining with oxygen. Thread loſes by the operation of bleaching from a fourth to a third part of its weight. In order to diſpoſe thread to take on the dye, it is made to undergo the ſeveral operations of dreſſing, aluming, and galling, deſcribed under the article *cotton*; moſt, if not all, of the dyes prepared for which, may be communicated by the ſame proceſſes to linen and thread, taking care to have them firſt well cleaned and bleached.

Of all colours, the dyers experience the greateſt difficulty in communicating a full, rich, and durable *black*, to linen, and cotton; or at leaſt ſuch as will reſiſt the ſoap in waſhing. To dye linen or thread black, a ſolution of iron is uſed, which is kept in a caſk called the *black caſk*. This ſolution is prepared with vinegar, ſmall beer, or ſmall wine made from the grapes after they have been preſſed by adding water to them, which is foured with rye-meal, or ſome other ingredient, in order to procure an acid liquid at a low price. Pieces of old iron are thrown into this liquor, which is left to ſtand till wanted, but never uſed in leſs than ſix weeks or two months. To this bath aſtringents are frequently added, particularly the decoction of alder bark, which of itſelf has the property of diſſolving the oxyd of iron in a pretty large proportion. The method followed at Rouen, for dying linen and thread black, as deſcribed by M. le Pileur d'Apligny, is this: They are firſt dyed ſky-blue in the vat, then wrung out and dried. They are next galled, uſing four ounces of galls to every pound of thread, and leaving them twenty-four hours in the gall-liquor, after which they are wrung out, and then well dried. The liquor of the black caſk, in the proportion of about five quarts for every pound, is then poured into a tub, in which the thread is worked with the hand, pound by pound, about a quarter of an hour, when it is wrung out and aired. This operation is repeated twice, adding each time a freſh quantity of the black bath, which ought to be carefully ſcummed. After this it is again aired, wrung out, waſhed at the river to cleanſe it well, and then dried carefully at the time. When this thread is to be dyed, a pound of alder-bark for every pound of thread is boiled for an hour in a ſufficient quantity of water. About half the bath that ſerved for the galling, and half as much ſumach as alder-bark are then added, and the whole boiled together for two hours, and then ſtrained through a ſieve. When the liquor is cold, the thread is put into it on the ſticks, and well worked, airing it from time to time: it is then let down into the bath again, left in it twenty-four hours, wrung out, and dried as before. For the purpoſe of ſoftening this thread when it is dry, it is cuſtomary to ſoak and work it in the remains of a weld-bath that has been uſed for other colours, adding to it a little logwood. From this it is taken out and wrung, and inſtantly put into a tub of warm water, into which has been poured an ounce of olive-oil for every pound of thread. It is then wrung out and dried carefully.

The ſame author deſcribes a proceſs in which he employs madder alſo for giving linen and cotton-thread a black colour, and which he conſiders as a very fine and durable black. In this proceſs the thread is firſt to be ſcoured as uſual, galled, then alumed, and afterwards dipped

dipped in the weld-bath. When taken out of this bath, it is to be dyed in a decoction of logwood, to which a quarter of a pound of ſulphat of copper has been added for every pound of thread. After this it is to be waſhed in the river, and wrung ſeveral times, but not too hard. Finally, it is dyed in a madder-bath, in the proportion of half a pound to each pound of thread. That the black may not be liable to be diſcharged, the thread muſt be dipped in a bath of a ſolution of ſoap.

Mr. Wilſon has deſcribed the method which is followed at Mancheſter for dying linen and thread black. A galling is made with galls or ſumach; after which the ſtuff is dyed with the liquor of the bath, conſiſting of a ſolution of iron in vegetable acid, frequently compoſed of alder-bark and iron, and then dipped in a decoction of logwood with a little verdegris. This proceſs is repeated till a deep black is obtained; and it is neceſſary to waſh and dry after each of theſe different operations.

But the moſt recent, and apparently the moſt effectual, mode of dying linen and cotton thread black, is the following, invented by M. Vogler, at Weilburg. Take a quart of pure ſoft water, and mix with it two ounces, or two ounces and a half, of common aquafortis; then throw in gradually, two ounces, or two ounces and a half, of litharge. The boſtle, after being ſlightly corked, muſt be ſet in a warm place, and ſhaken from time to time. After a few days, the clear liquor may be poured off from the ſediment, into a deep earthen, leaden, or pewter, veſſel. In this clear ſolution of litharge in nitrous acid, the cotton or linen intended to be dyed, is to be immerſed, and is to macerate or ſoak therein for the ſpace of ten or twelve hours. It may then be taken out, and, after being three times waſhed in pure cold water, wringing it each time, it is to be dipped in a ſolution of glue in water. Being then again wrung, it muſt be put to dry in the ſhade; taking care that the glue-water is only wrung out, not waſhed out. Raw, unbleached, and looſely-ſpun, linen thread, or cotton yarn, that has already been ſteeped in warm ley, and afterwards well waſhed in cold water, is more proper for the preſent purpoſe, and takes the application of the mordant, and that of the colour, more readily than the ſame materials after they are knit or woven. Each ſkein is to be tied with two looſe and broad ſtrings, of tape or binding; by the help of which, the ſkeins, if they ſhould happen to be entangled, during their maceration, or dying, may be ſeparated, and brought into order again.

The glue-water, in which the linen or cotton (after it has been ſteeped in the ſolution of litharge) is to be dipped, may be prepared by reducing common carpenter's glue into a jelly or ſize, by boiling it in a pan with a ſmall quantity of water, and then diſſolving, in boiling water, ſuch a proportion of the jelly as will give to the water a ſticky or glutinous conſiſtence, leaving it, at the ſame time, ſufficiently thin and fluid. Take three quarters of an ounce of galls, well bruiſed, and boil them in a quart, or rather more, of pure water. When they have boiled for the ſpace of ſeven or eight minutes, throw in three quarters of an ounce of common ſalt; and, when that is diſſolved, put in the linen or cotton ſtuff that is to be dyed, and that has already been ſoaked in the ſolution of litharge in aquafortis, and dipped in the glue-water. When the ſtuff has been boiled in the liquor ſeven or eight minutes, it may be taken out; it is then to be three times waſhed and wrung, as before, in clean cold water, and afterwards dried in a ſhady place. The linen or cotton ſtuff, which before was white, will be found to have acquired, from the foregoing operations, a dark grey colour, with a ſhade of yellow; this may be conſidered as a good ground for a black colour.

In the place of galls, for the aſtringent principle, oak-bark, in powder, may be uſed; alſo the thin rind of the alder tree, the rind of the root of the walnut-tree, the flowers or the ſhells of pomegranates, ſumach, *(Rhus coriaria,)* the leaves of tormentil-cinquefoil, *(Potentilla argentea,)* and tormentil roots; all of which may be uſed in the ſame proportion as the galls. Common ſalt alſo poſſeſſes the power of rendering the colour more deep and permanent; but it ſhould be added when the boiling of the ſtuffs in the decoction of galls is nearly finiſhed, as it might otherwiſe impede the extraction of the colouring-matter from the galls, or render the penetration of the ſaid matter into the ſubſtance of the ſtuffs leſs ſtrong. Take three quarters of an ounce of common copperas or vitriol of iron, and the ſame quantity of common ſalt, and diſſolve them in a quart of clean hot water. Let the ſtuffs, prepared in the manner before deſcribed, with galls, or other aſtringent vegetable ſubſtances, and which have already acquired a blackiſh colour, be immerſed in this liquor. After eight or ten hours, they may be taken out; waſhed and wrung three or four times in clean cold water, and then dried in the ſhade. The advantage ariſing from the mixture of common ſalt, in this ſolution of copperas, is, not only that leſs of the ground colour is taken away, but alſo, the tints which are afterwards to be given to the ſtuff, enter them more deeply, and produce a better colour.

Boil three quarters of an ounce of campeachy or logwood, in rather more than two quarts of rain or river water. When it has boiled ſeven or eight minutes, add to the decoction a quarter of an ounce of white ſtarch; which, that it may not be clotted or lumpy, muſt be firſt well mixed in a tea-cup with a little freſh water. When this, by boiling a few minutes, is diſſolved in the liquor, the linen or cotton ſtuff, already prepared by means of the ſolution of copperas, &c. is to be put into the liquor. After it has boiled therein for ſeven or eight minutes, it may be taken out; and, being firſt waſhed and wrung two or three times in clean cold water, as before, may be dried in the ſhade. If, when the ſtuff is dry, its colour appears to be too faint, that is, if it ſhould not be of a deep and fine black colour, it muſt be again ſoaked in the ſolution of copperas, and then boiled once more in the decoction of logwood: it cannot then fail to be of the wiſhed-for fine full black: but this colour is not yet ſo fixed as to bear being waſhed in ley, or even in ſoap and water. In order to bring the colour to this degree of perfection, the dyed ſtuff muſt, in the laſt place, be treated in the following manner.

One ounce of galls, well bruiſed, or the ſame quantity of any of the aſtringent vegetable ſubſtances above-mentioned, and a full quart, or rather more, of glue-water, of ſuch a conſiſtence as to feel clammy between the fingers, are to be put over the fire: when the mixture has boiled ſeven or eight minutes, one ounce of copperas or vitriol of iron is to be added; and, when it is diſſolved, the liquor may be taken off the fire. In this decoction, as ſoon as it is cold, the linen or cotton, prepared in the manner already deſcribed, is now to be immerſed. After remaining therein for the ſpace of an hour, it may be taken out; and, having firſt been preſſed or wrung, but not waſhed, may be hung up to dry in the ſhade. Here it may be left quiet for ſome time, in order that the dye may incorporate with the ſtuff, and become fixed therein.

The decoction of logwood may be kept for ſeveral weeks after it is made, even until it has acquired a bad ſmell; as it does not thereby loſe, in the ſmalleſt degree, its colouring property, but, on the contrary, becomes more fit for uſe: The addition of white ſtarch to the decoction of logwood, promotes, in a remarkable manner, the ſolution and extraction of the colouring particles of that wood: it alſo aſſiſts in giving to the linen or cotton a deeper and more beautiful colour. For boiling the ingredients, and macerating the ſtuffs, veſſels of earth, or braſs, or of copper, may be made uſe of: they ſhould not be too wide, but the deeper they are the better, as, in ſuch, the ſtuffs to be dyed may be more conveniently immerſed, without being liable to riſe up to the ſurface of the liquor.

The bath which is diſtinguiſhed by the name of black-

caſk, is employed to give thread a great number of dark colours. In order to give a durable violet to thread, a mordant is prepared, compoſed of two parts of the bath of the black caſk, and four quarts of water for every pound; this is made to boil, and the ſcum which forms on its ſurface is removed; when no more appears, the liquor is poured into a vat, and when it is juſt warm, four ounces of ſulphat of copper and an ounce of ſalt-petre are diſſolved in it; the ſkeins are then left in it to ſoak for ten or twelve hours, wrung and dried. When they are to be maddered, they are carefully waſhed and dipped in a madder bath. If a deep violet be required, two ounces of verdegris are added to the bath; the colour is rendered ſtill deeper by galling the thread more or leſs, before it is put into the mordant, and by omitting the ſalt-petre. But, if the proportion of this laſt be increaſed, and that of the ſulphat of copper be diminiſhed, the violet inclines more to lilac. This is uſed likewiſe for cotton thread; both fabrics being dyed with the ſame ingredients, and in the ſame manner.

Among the many recent inventions for facilitating and improving the art of dying, we think it right to notice the following. Mr. Robert Frith, of Selford, in the county of Lancaſter, obtained a patent dated May 25, 1798, for a new method of dying different permanent colours upon cotton, linen, woollen, and ſilk. We ſhall give the proceſſes in his own words: "I Robert Frith do declare, that my new-invented chemical method of dying different permanent colours upon all the abovementioned fabrics, is performed in manner following; that is to ſay: To dye a permanent ſtraw or yellow colour upon cotton, linen, woollen, and ſilk, I take one pound of the beſt blue galls, and boil them in one gallon of water; if the galls be of an inferior quality, I boil one pound and a half to one gallon of water, and ſo in proportion to their quality, until I have a ſufficient quantity of liquor; or I dilute this liquor with water, according to the ſtrength or fulneſs of colour I want to dye. I work the goods in this liquor very well; after which I paſs them through aqua-fortis, killed with block tin, as follows. I take one pint of water, with one ounce of ſal-ammoniac diſſolved in it, to which I put one pint of aqua-fortis, and add to them one ounce and a half of block tin; to this preparation I mix five or ſix times its quantity of warm water, or I paſs them through ſpirits of ſalts, killed with block tin only, and diluted with the ſame quantity of water; then I waſh them well in clear water, and, if the colour is not ſufficiently full, I repeat as before, until it is, and then waſh them off in ſoap and warm water, and dry them.

Another method of dying the ſame colours.—After working the goods or cloth through the gall liquor prepared as above, I paſs them through a liquor made from aſh-wood or bark, ground or raſped, or from American oak wood or bark, ground or raſped, or from crab-tree wood or bark, or from apple-tree wood or bark, or from a liquor made from woulds, or from ſumach, or from two or more of the above woods or barks, or from all of them mixed together, according to the ſhade or fullneſs of the colour wanted, as it is impoſſible to fix an exact quantity of woods and barks for the above liquor. They muſt be regulated according to the goodneſs and ſtrength of them, and the different ſhades of colour I want to dye, making it ſtronger or weaker, as I ſee occaſion; after which I paſs them through aqua-fortis, or ſpirits of ſalts, killed with block tin as before, and diluted with water; then waſh them well in water. After which I waſh them in ſoap and warm water, and dry them; or I add the aqua-fortis, or ſpirits of ſalts, prepared as before, to the liquor made from the woods, or barks, till I can taſte the ſpirit perfectly in the liquor, in which I work the goods ten or fifteen minutes, and then waſh them as before, and dry them.

Or another way to dye the ſaid colours.—I paſs the goods through the gall liquor, prepared as before; then I add to the ſame liquor aqua-fortis, or ſpirit of ſalts, prepared as before with block tin, until I can taſte the ſpirits perfectly in the liquor; then I work them ten or fifteen minutes through this liquor again, after which I waſh them off, and dry them as before. To dye a permanent nankeen colour on cotton, or goods made of cotton, linen, woollen, and ſilk; inſtead of running the goods through a liquor made from alder wood, or bark, or mahogany wood or bark, ground or raſped, and then through aqua-fortis, killed with block tin, and diluted with water; which method of dying this colour I found out, and have practiſed, for theſe ten years paſt, but which colour had not ſufficient ſtrength to reſiſt the action of the air upon it; I now dye it as follows, which produces as permanent and beautiful a colour as any that is dyed in the Eaſt Indies, and capable of reſiſting the effects of the air upon it. I now paſs the goods through the gall liquor, prepared as before ſtated, for the other colour, or diluted with water, according to the colour wanted; then through a liquor made from alder wood or bark, ground or raſped, or mahogany wood or bark, or ſloe-tree wood or bark, or walnut-tree wood or bark, or from elm-tree wood or bark, or from poplar wood or bark, ground or raſped, or from tea, or from any two of theſe woods or barks, or tea, or from all of them. The quantity of ingredients and ſtrength of the liquor, to be proportioned to the ſhade or fulneſs of the colour I have to dye; or I mix the gall liquor with this liquor, prepared from the woods and barks, in proportion of half a pint or more, according to the colour, to one gallon of the wood or bark liquor; after which I run them through aqua-fortis, or ſpirit of ſalts, killed with block tin, as before, and diluted with five or ſix times its quantity of warm water; then waſh them in clear water, after that in ſoap and water, and then dry them.

Another method of dying the above colour.—I paſs the goods firſt through the liquors prepared from the woods or barks, or tea, as before ſtated, or any two or more of them; then through aqua-fortis, or ſpirit of ſalts, killed with block tin, as before; after which I waſh them well in water, and then run them through the gall liquor, made as before, and diluted with water, according to the ſhade the colour is wanted; then through the aqua-fortis or ſpirit of ſalts again, or ſtrong alum water, or a mixture of theſe together; after which I waſh them well in clear water, then through ſoap and warm water, and dry them.

To dye a permanent buff colour on cotton, or goods made of cotton, linen, woollen, or ſilk, I paſs the goods through the gall liquor, made as before for the other colours; then I work it through a liquor made from Engliſh oak bark, or Engliſh oak wood, ground or raſped, or from American oak bark or wood, or from alder bark or wood, or from crab-tree bark or wood, or from apple-tree bark or wood, ground or raſped, or from ſumach, or from two or more of them, mixed together, according to the ſhade or fulneſs of colour wanted; then I take out the goods, and add to the liquor aqua-fortis, or ſpirit of ſalts, killed with block tin, as before, till I can taſte the ſpirits perfectly in the liquor; then I paſs or work them well through this liquor again, for ten or fifteen minutes, after which I waſh them well in water, and, if the colour is not ſufficiently ſtrong, I repeat the ſame operation over again, until it is, and then waſh them off in warm water and ſoap, and dry them.

Another way to dye the ſame colour.—I paſs the goods through the gall liquor, made as before, or diluted with water, according to the colour I want to dye; then I work them through the liquor made from the different woods or barks, as before ſtated; then I paſs them through aqua-fortis, or ſpirit of ſalts, killed with block tin, as before, and mixed with five or ſix times its quantity of warm water; after which I waſh them well in clean water, and, if the colour is not ſufficiently ſtrong, I repeat the ſame method over again until it is; then I waſh

waſh them off through warm water and ſoap, and dry them. To dye a permanent mud, dove, or drab colour.—I take half a pint of aqua-fortis, and half a pint of clear water, in which I diſſolve one ounce of ſal-ammoniac, and mix them together, to which I add, by degrees, two ounces of ſilver; then I take, of the gall liquor, or tea, prepared as for the other colours, or diluted with water, according to the fulneſs of colour I wiſh to dye, twenty parts to one of the above ſpirits, and mix them together with a few drops of copperas water, or oil of vitriol, killed with iron and water. I work the goods through this liquor, then dry them, after which I rince them through ſtrong American pot or pearl-aſhes or leys, or from leys made of lime, or lime and aſhes mixed together; after which I waſh them well in water, and dry them.

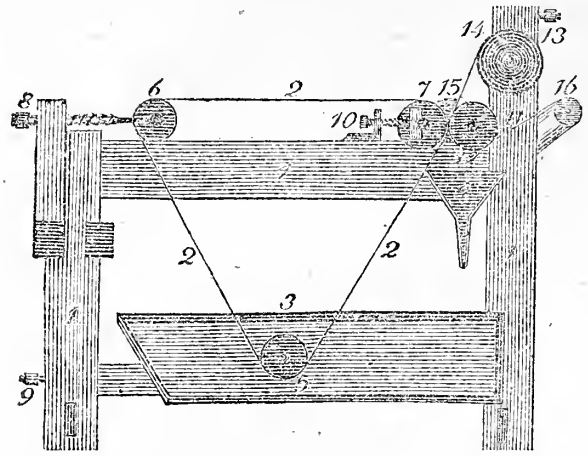
Another way to dye the above colours.—I take half a pint of aqua-fortis, and put to it half a pint of water, to which I add two ounces of quickſilver; then I take from ten to twenty parts of the gall liquor, prepared as for the other colours, to one part of the above ſpirits, adding to it a few drops of copperas water, or oil of vitriol, killed with iron and water, or aqua-fortis, killed with common tin or iron. I work the goods through this liquor, then dry them: after which I rince them through American pot or pearl-aſh leys, or lime leys, or through leys made from lime and aſhes mixed; after which I waſh them well through clear water, and dry them.

Another method of dying the abovefaid mud, dove, or drab, colours, upon cotton, or goods made of cotton, linen, woollen, or ſilk.—I take half a pint of oil of vitriol, and add to it half a pint of water, in which I mix, by degrees, one pound of common ſalt, and half a pound of manganeſe; then I take gall liquor, prepared as before for the other colours, five parts to one of the above ſpirits, or more or leſs, according to the colour I want to dye; then I add to ten or twelve parts of the above liquor, mixed, one part of the aqua-fortis, killed with ſilver, as before ſtated, or three parts of that killed with quickſilver, or in proportion as I want it for ſtrength or fulneſs of colour. I work the goods through this liquor, then dry them: after which I rince them in American pot or pearl-aſhes, or leys made from lime, or lime and aſhes mixed together; then I waſh them well, and dry them.

To dye a permanent brown colour on cotton, or goods made of cotton, linen, woollen, or ſilk.—I paſs the goods through the gall liquor, prepared as for the other colours, or I dilute it with water, according to the colour I want to dye; then I run them through the ſpirits made from oil of vitriol, common ſalt, and the manganeſe, as ſtated before; after which I paſs them through ſtrong aſh leys, and then through a ſlender liquor, made from the oxygenated muriatic acid, diſtilled from ſpirit of ſalts, manganeſe, and aſhes, or from oil of vitriol, common ſalt, and manganeſe; after which I waſh them well through clear water, and dry them."

Another ingenious invention is that of Mr. Samuel Gratrix, of Hulme, near Mancheſter, which conſiſts in a new method of dying and ſtaining colours upon cotton cloth, linen cloth, and cotton and linen cloth mixed. For this invention a patent was obtained, dated July 17, 1799; the proceſs is as follows, in the words of the patentee. "I the ſaid Samuel Gratrix do declare, that my new-invented method of dying and ſtaining different colours upon cotton cloth, linen cloth, and cotton and linen cloth mixed, is performed in the manner following; that is to ſay: To dye a black upon cotton cloth, linen cloth, and cotton and linen cloth mixed, I take tar, iron liquor of the very beſt quality, adding to each gallon thereof three quarters of a pound of fine flour, and by boiling bring it to the conſiſtency of a thin paſte. I put the liquor or paſte into a tub belonging to the machine uſed in this proceſs, a plan of which is hereunto annexed. The goods intended to be dyed are wound upon a roller, and paſſed through the liquor or paſte above-mentioned, betwixt the two other rollers, thereby completely ſtaining or dying the whole maſs or body of the cloth. I paſs them into a very hot ſtove or drying-houſe till dry. I take cows' dung, put it into a large copper of water about ſcalding hot, and mix it well together, through which I paſs the piece of cloth until it be thoroughly ſoftened. The quantity of dung, and the time neceſſary in this proceſs, depend upon the ſubſtance of the cloth, and the quantity of the paſte or liquor imbibed in it. I then waſh the goods, ſo dunged, extremely well in water. I take a quantity of madder, or logwood, or ſumach, or any two of them, or all of them mixed together, as the ſtrength of the cloth and nature of the colour may require, and put them into a copper, or tub of hot water: then enter the goods before mentioned into this liquor, and keep rincing or moving them therein, until I have brought them up to the ſtrength of colour required. I have the goods again well waſhed and dried. For dying black, it will be proper to paſs the goods a ſecond time through the above operations; adding more or leſs of the dying woods as before. If, after the above operations and the ſhade of colour is too full, or too much upon the red hue, it will be neceſſary to give them a little ſumach, and then run them through a liquor made from iron and alder bark. Another method of dying black: I take common iron liquor, and add three quarters of a pound of fine flour; and, by boiling, bring it to the conſiſtency of a thin paſte, or, inſtead of flour, I add glue or linſeed, or gum, or any two, or all of them mixed together, till it is brought to a proper thickneſs. I then paſs the goods through the machine, and follow the before-mentioned operations. To dye olives, bottle-greens, purples, browns, cinnamons, or ſnuffs, I take common iron liquor, or common iron liquor with alum diſſolved in it, or common iron liquor with alum and faccharum ſaturni diſſolved therein, in quantity of each, according to the ſhade of colour wanted, made into a paſte or liquid, by adding flour, gum, glue, linſeed, or one or more of them as before. I then put the liquor or paſte above-mentioned into the tub belonging to the machine hereto annexed, and paſs the goods ſo intended to be dyed through the machine in the ſame manner I have deſcribed for dying black. I take them from the machine, and hang them up in a very cool room, where they remain till thoroughly dry. I take cow-dung, put it into a large copper of hot water, and mix it well together; through which I paſs the cloth or goods until thoroughly ſoftened, the quantity of dung and time requiſite being proportioned as before. The goods after this proceſs being well waſhed, I take a quantity of liquor made from madder, logwood, ſumach, fuſtic, brazil, wolds, quercitron bark, peach wood, or other woods, to produce the colour wanted, or any two or more of them; and, in caſe I ſee it neceſſary, I dilute this liquor with water, acccording to the ſhade or fulneſs of colour I want to dye. I then work the goods through this liquor; after which I paſs them through cold or warm water, according to the colour, the proper application of which is well known to dyers, adding a little alum, copperas, or Roman vitriol, or two or more of them, firſt diſſolved in water. I then waſh them off in warm water, and dry them. If the colour is not ſufficiently full, I repeat the ſame operations, till it is brought to the ſhade required. To dye crimſon, red, orange, or yellow: I take red liquor, ſuch as is generally made from alum, ſaccharum ſaturni, or ſuch-like ingredients, and dilute it with water, according to the ſtrength or ſhade of colour I want to dye, bringing it to the conſiſtency of a paſte or liquid, as before deſcribed. Then paſs the cloth through the machine, which being dried in a cool room, paſs it through the operations of dunging and waſhing as before. I take a quantity of liquor, made from cochineal, madder, peach wood, brazil, logwood, wolds, fuſtic, ſumach, or any two or more of them proportioned in ſtrength to the ſhade of colour I want to dye,

and work the goods through this liquor, till I have brought them to the ſhade of colour required; after which I waſh them in cold or warm water, and dry them."



The parts of the machine are as follow: fig. 1, the frame. 2, The cloth or hatting which conveys the paſte or liquor to the piece of cloth intended to be dyed. 3. The tub made to contain the paſte. 4, Another tub, which receives the ſuperfluous liquor or paſte from the piece. 5, 6, 7, Three rollers, round which the hatting runs through the tub of liquor in order to paſs it. 8, and 9, Two ſcrews, for the purpoſe of tightening the hatting. 10, and 11, Two ſcrews which preſs the roller 7, againſt the roller 12, betwixt which the piece paſſes. 12, A roller on which the fly-wheel is fixed, which puts the machine in motion. 13, The fly-wheel. 14, The roller on which the piece is wound. 15, The piece paſsing through the liquor, and betwixt the rollers. 16, A roller which draws the piece from the machine by a ſtrap worked from a pulley.

A further improvement in the art of dying has been made by Mr. Joſeph Lewis, of Brimſcomb, in the county of Glouceſter, by means of a new method of cooling the cloth, and other piece goods, (particularly in dying black;) and a new mode of applying the fire for the purpoſe of heating the boiler, or other veſſels. This invention is ſanctioned by a patent, dated January 16, 1802. Proceſs as follows: "I the ſaid Joſeph Lewis do declare, Firſt, that my new method of cooling cloth, and other piece goods, conſiſts in paſſing the cloth from the boilers over cylinders, or rollers, erected on a ſtage adjoining or near to the boiler, and is performed in the following manner. Immediately oppoſite the roller over which the cloth turns in the boiler, a ſtage is erected of a proper width for the goods intended to be dyed. This ſtage is ſo high, that, when covered with lead, tiles, or any other material, the gutters which are placed under the eaves may be ſufficiently elevated to convey the liquor, which drops from the cloth while turned over it, back again into the boiler. At each end of the ſtage is a trough of dimenſions ſufficient to contain the whole of the goods intended to be dyed at one time, and which troughs muſt diſcharge the liquor, which runs from the cloth into them, into the ſaid gutters. The trough neareſt the dye-houſe may be placed ſo near the wall as to prevent the liquor from dropping between it and the wall. At each end of the ſtage a roller with a winch or handle is placed ſo high above the troughs as to admit of the troughs holding the whole of the goods eaſily; and between the ſaid rollers, with winches or handles, other intermediate rollers extend over the width of the ſaid ſtage, at about three feet diſtance from each other. The rollers with winches or handles are about thirty inches diameter, and it will be better if the intermediate rollers approach nearly to the ſame ſize, as in proportion to their ſize the cloth is more eaſily and expeditiouſly wound from one extremity of the ſtage to the other; though rollers ſo ſmall as to be only about four inches diameter may be uſed, where the ſtage is but ſhort, though with manifeſt diſadvantage. An opening is made through the wall of the dye-houſe between the roller over the boiler and the ſtage; and a ſmall roller is placed in that opening, to prevent the cloth from dragging on the wall; and another ſmall roller, (which may be removed at pleaſure,) between the roller over the boiler and the wall. A cord is tied or faſtened to the roller with a winch at the extremity of the ſtage, oppoſite the dye-houſe, ſufficiently long to reach to the roller above the boiler; it is faſtened by a nooſe to the goods, which are then wound over the roller at the end of the ſtage neareſt to the boiler, and likewiſe over all the intermediate rollers, till it comes to the roller round which, by turning, the cord is wound. The nooſe is then ſlipped, and the end tied to the ſaid roller; the goods are then wound on into the trough under that roller, till the whole is out of the boiler; they are then wound back into the trough at the other end of the ſtage, and ſo on backwards and forwards till the cloth is cool. A ſloping board, or frame of boards, is placed between the wall of the dye-houſe and the boiler, to ſave the liquor; but this, as well as the ſmall roller placed in the ſame ſituation, muſt be moveable, to allow the workmen room to keep the cloth abroad while turning in the boiler. A moveable gutter is likewiſe placed between the wall and the boiler, to convey the liquor which runs from thoſe under the eaves into the boiler. Three workmen are employed in dying. One of theſe is placed, when the goods are cooled, at each winch on the ſtage; and the other keeps the cloth abroad while coming out of the boiler. It is univerſally allowed that repeated cooling is eſſential in the dying of black; to accompliſh this effectually and expeditiouſly, and likewiſe to ſecure the cloth from the poſſibility of being heat-wrinkled, is the object of this part of the invention.

Secondly, My mode of applying the fire, for the purpoſe of heating the boiler, is founded on the idea, that the ſtronger the draught, (that is, the greater the quantity of air that can be made to paſs through the fire,) the greater will be the effect of the fire on the liquor, provided the heat ſo generated impings in the beſt poſſible direction againſt the boiler. To gain this advantage I place a grate exactly under the center of the boiler proportioned to its ſize, and the expedition with which it is required to boil. Brick-work is raiſed about eight inches round the grate, to contain the fuel; and a diſtance of about four inches conſequently remains between the flat brick-work and that part of the bottom of the boiler which is larger than the grate. The boiler is ſupported by three half-bricks, forming a triangle, on the flat brick-work, giving a diſtance of about twelve inches from the grate to the bottom of the boiler. The whole of the ſides of the boiler are likewiſe ſet four inches at bottom and three inches at top from the brick-work which ſurrounds it up to the cloſing, which cloſing is ſeven or eight inches below the top of the boiler. At the cloſing are four flues, at equal diſtances, taking at their entrance the form of the boiler, which (to induce the flame to ſpread) are there thirty inches by about three inches, in a boiler intended for dying, and which is ſix feet diameter at top, and as they riſe gradually become leſs than thirty inches and more than three, till they come each of them to a ſquare flue, or rather chimney, of about eight inches diameter, through which the ſmoke iſſues; or two of them may be brought into one at a convenient height, (about ſix feet above the boiler.) It may here be obſerved, that the flues or chimneys ſhould riſe immediately from the boiler, as perpendicularly as poſſible; that is, the thirty inches ſhould be reduced as gradually as the neceſſity of allowing ſufficient room for the cloth to paſs between the chimney to the cooling apparatus will permit. But where the boiler is not intended for dying, or the nature of its uſe will permit, the flues may be

be more than thirty inches at their opening, the more the better, and ſhould riſe as perpendicularly as convenient. The number of flues or chimneys is immaterial; provided they are ſo diſpoſed as to cauſe an equal diſtribution of heat round the boiler. It is very eſſential that theſe flues or chimneys ſhould be exactly of a ſize, or they will draw unequally. Where the apparatus for cooling is not uſed, there will be room for the dyer to throw the cloth from the roller, notwithſtanding the chimneys; but, if the ſituation of the chimneys ſhould prove inconvenient, an additional roller, made very ſlight, may be put up occaſionally a ſmall diſtance from the boiler; over which the cloth may be conveyed and drop at once on the utenſil uſed for carrying the cloth from the boiler. By the mode above deſcribed, you have nearly a perpendicular draught, and the flame impings with aſtoniſhing force againſt the bottom of the boiler, inſtead of being drawn horizontally upon the fire, as is the caſe where the flame paſſes into a flue immediately oppoſite the furnace door; and as it leaves the bottom claſps its ſides. The *whole* of the boiler is thus expoſed to the ſtrongeſt poſſible draught, and in the beſt poſſible direction, being completely enveloped in flame. The ſaving in fuel, and (what is often of more conſequence to the dyer) in time, I have found to be from one-third to one-half over any other mode."

Of DYING figured CHINTS, called CALICO-PRINTING.

It has been long a queſtion of conſiderable doubt, whether the Egyptians borrowed this ingenious art from the Hindoos and other inhabitants of India, or whether the latter borrowed it from the Egyptians. But if we conſider the many reaſons for believing that this art has been practiſed over the greateſt part of India during a long ſucceſſion of ages; that not only the art itſelf ſubſiſted there, but that the colouring, and other materials for exerciſing it, were the natural and peculiar productions of that country rather than of Egypt; that the Indians were highly civilized at leaſt twenty-two centuries ago, during which ſpace of time their manners ſuffered little or no change, and that their trades were carefully perpetuated in particular families; and alſo that among theſe their manufactures were undoubtedly of very great antiquity, whilſt many obvious ways exiſted by which they could eaſily be extended to Egypt, and other countries; all theſe conſiderations ſeem to decide the honour of the invention in favour of India. Major Rennel obſerves, that "a paſſion for Indian manufactures and products has actuated the people of every age, in lower Aſia, as well as in the civilized parts of Europe. The delicate and unrivalled, as well as the coarſer and more uſeful fabrics of cotton of that country, particularly ſuited the inhabitants of the temperate regions along the Mediterranean and Euxine ſeas. To this trade the Perſian and Arabian Gulfs opened an eaſy paſſage; the latter particularly, as the land carriage between the Red Sea and the Nile, and between the Red Sea and the Mediterranean, took up only a few days. It is highly probable, and tradition in India warrants the belief of it, that there was from time immemorial an intercourſe between Egypt and Hindooſtan, at leaſt the maritime parts of it; ſimilarity of cuſtoms in many inſtances, as related of the ancient Egyptians by Herodotus, exiſted in the two countries. It appears, that under the Ptolemies the Egyptians extended their navigation to the extreme point of the Indian continent, and even ſailed up the Ganges to Palibothra," from whence they borrowed the Indian arts and manufactures.

Monſ. du Fay, and the abbé Mazeas, firſt communicated to the academy of ſciences in Paris, the manner in which this operation was performed by the Indians. From theſe accounts it appears, that the cotton cloths, when brought from the weavers, *were worn next to the ſkin by the dyer and all his family*, during the ſpace of eight or ten days; after which they underwent ſeveral macerations in water with goats' dung, accompanied with frequent intermediate beatings, waſhings, and dryings, in the ſunſhine. Afterwards they were ſoaked in a mixture of the mucilaginous aſtringent fruit of the yellow myrobalans, well bruiſed, and of curdled buffaloes milk; and being thoroughly penetrated and impregnated therewith, they were taken out, and the liquor being well ſqueezed from them, were dried by expoſure to ſunſhine, and afterwards, by preſſure and friction, made ſmooth enough for being drawn upon by the pencil, with the different mordants. The firſt of theſe was an iron liquor, ſimilar to that ſince employed by the calico-printers of Europe, excepting only that, inſtead of vinegar or alegar, the iron was diſſolved by a mixture of ſour palm-wine, and of water in which rice had been boiled. This liquor was applied to the figures or ſpots intended to become black, and afterwards the aluminous mordant was applied, commonly by children, with the pencil, to the parts intended to be made red. To prepare this mordant, two ounces of alum were diſſolved in two quarts of water, and evaporated till it left only a reſiduum of eleven grains of ſea ſalt. To colour this ſolution, ſo that the ſtrokes of the pencil in applying it might be viſible, a little ſappan wood, (*cæſalpinia ſappan* of Lin.) in powder, was ſteeped in the ſolution, which being afterwards ſtrained, was thickened with gum, and applied as before-mentioned; after which the cotton ſo penciled was expoſed to the hotteſt ſunſhine, in order that the parts to which the mordants had been applied might be dried as much as poſſible; and then the cottons were thoroughly ſoaked in large pits of water, to cleanſe them from the ſuperfluous parts of the different mordants, as well as from the buffaloes milk, &c. and this being done, they were dyed in water, with certain roots anſwering nearly in their effects to thoſe of madder. Of theſe there are ſeveral ſorts uſed for dying red in different parts of India; that above-mentioned is a ſpecies of gallium, called on the coaſts of Coromandel and Malabar by the names of *chaia*, *chayaver*, and *raye de chaye*. The cottons thus penciled, and gradually made to boil in water with a ſuitable quantity of this root, were dyed *red*, where the ſolution of alum had been applied, and *black* in thoſe parts on which the iron liquor had been penciled; and after being dyed, the cottons underwent three different waſhings with goats' dung, ſoap, &c. were then bleached by being expoſed to the ſun, and watered occaſionally, to remove the ſtain on the parts intended to remain white.

It appears, that in this operation the buffalo's milk, and more eſpecially the aſtringent juice of the myrobalans, produced very important effects, by their attraction for the aluminous earth, by which they contributed greatly to decompoſe or ſeparate it from the ſulphuric acid, and conſequently to fix it more firmly in the cotton; and, being ſo fixed, it was enabled more ſtrongly to attract and retain the colouring matter of the chaia root whilſt in the dying veſſel, and thereby to produce a more permanent red in the different ſpots, figures, or deſigns, where the alum liquor had been applied. A mixture of this and of the iron liquor, acting and applied in the ways before-mentioned, produced alſo a durable purple, in the ſame dying veſſel, upon the parts impregnated therewith; and conſequently one dying with the colouring matter of a ſingle root, produced at the ſame time reds, purples, and blacks. The Eaſt-Indian method of dying blue from indigo, by covering over the ground with wax, is to prevent the action of the blue upon the white parts; becauſe, from its fixed nature, it cannot be removed or bleached out. The yellow colour employed for calico-printing in that country is undeſerving of notice, it being compoſed only of a decoction of *cadoucai-pou*, a ſpecies of galls, produced on the yellow myrobalan tree, (which give a dull yellow,) and of a ſuitable portion of alum, which, being thickened with gum, and

penciled over blue figures or deſigns, produces a green, and on white parts or grounds, a yellow colour; neither of which is ſufficiently durable.

The art of calico-printing, ſince its introduction to Europe, has been diveſted of many tedious operations and manipulations, which would have proved inſupportably expenſive here, on account of the higher price of labour, and of almoſt every thing neceſſary to human ſubſiſtence. But the greateſt European improvement in this art reſpects the aluminous mordant, and depends on the employment of ſugar or acetit of lead, or the oxyd of that metal diſſolved by diſtilled vinegar, and cryſtallized; which, within the memory of man, has been gradually brought into uſe, without any theory or even ſuſpicion of its true effect, or of the way in which it proved ſo highly uſeful. This improved aluminous mordant is now generally made for calico-printing, by diſſolving three pounds of alum in a gallon of hot water; then adding one pound, or in ſome particular caſes one pound and a half, of the acetit or ſugar of lead, ſtirring the mixture well during two or three days, and afterwards adding to it about two ounces of pot-aſh, and as many of clean powdered chalk, called carbonat of lime. The mixture being thus made, and the clear liquor decanted from the ſediment, it is afterwards thickened with flour, if intended to be printed or applied by the block, and with the gum of the Mimoſa Nilotica, *gum Arabic*; or of the Mimoſa Senegal, *gum of Senegal*, if it be intended for pencilling; and being applied in either of theſe ways to linens or cottons, it is afterwards very thoroughly dried in a room artificially heated, and then the pieces of linen or cotton, ſo printed or penciled with the mordant in queſtion, are cleanſed as perfectly as poſſible, by ſoaking and working them in a ciſtern with warm water and cow-dung, and afterwards rincing them in clean water to diſſolve the gum or flour, and ſeparate the ſuperfluous or looſe parts of the mordant, which otherwiſe would in the dying veſſel combine with the colouring matter, and greatly ſtain the grounds, or parts intended to be preſerved white. This will indeed unavoidably happen in ſome degree, notwithſtanding the moſt perfect cleanſing. But as the colouring matter which theſe grounds or parts abſorb from the dying liquor will not, when the cloths have been thoroughly cleanſed, be retained or fixed by any baſis, they are ſpeedily whitened, by being boiled in water with bran, and expoſed upon the graſs with the wrong ſide upward.

When the practice of calico-printing was firſt introduced into Europe, a conſiderable number of uſeleſs recipes for making the ſeveral mixtures employed as mordants were introduced with it. The calico-printers, without any ſyſtem or reaſonable motive, appear in different inſtances to have uſed verdegris, arſenic, corroſive ſublimate, blue vitriol, litharge, and white lead. Finding at length that only the two laſt were of any uſe, it happened that ſome dyers began to omit one, and ſome another, of theſe ingredients, until at length all the uſeleſs ones were laid aſide, though without the aid of any chemical knowledge, and without any one ever ſuſpecting, as indeed few of them do at this day, that the lead which they continued to employ occaſioned any decompoſition of the alum, or that the mordant ſo produced, did not really contain all the ingredients uſed in preparing it.

If cottons printed with the above-mentioned acetated aluminous liquor be dyed with weld or quercitron bark, inſtead of madder, this baſis will attract their colouring particles in the ſame manner, and produce permanent yellows upon the figures where the alumine was previouſly fixed; the other parts, being but ſlightly tinged, are afterwards eaſily bleached or whitened, becauſe there is no mordant to hinder the ſeparation or deſtruction of the colouring matter of theſe dying drugs. The dying of yellows, however, in this way, is an European invention; the people of India having only given them, as already mentioned, by a mixture of the decoction of the galls of mirobalans with alum. And, indeed, this practice was followed here for ſome time after the introduction of the art into Europe, excepting that inſtead of the galls of the mirobalan tree, a decoction of French berries was employed; by which, indeed, a very full bright yellow was at firſt communicated, but of ſo fugitive a nature, that the uſe of theſe berries, which in ſome degree ſtill ſubſiſts, ought to be prohibited; it being impoſſible, by any means yet known, to obtain from them a colour fit for any other purpoſe than that of *deception*. If, inſtead of the aluminous baſis, cottons or linens be impregnated with iron-liquor (acetit of iron) of different degrees of ſtrength, and dyed with madder, they will receive permanent dark browns of different ſhades, and even a full black: and if, inſtead of iron liquor alone, it be mixed in different proportions with the acetit of alumine, the mixture will produce with madder all the ſhades of flea-colour, purple, violet, &c. But when, inſtead of madder, cottons or linens are printed with iron-liquor, and dyed with weld or quercitron bark, they receive a variety of olive-brown, drab, and dove colours; and if, inſtead of iron-liquor alone, a mixture of it, with acetit of alumine, be uſed as a mordant, they will take various ſhades of olive, olive-green, &c. And, indeed, by the help of theſe two mordants only, (from iron and alumine,) uſed ſeparately, as well as mixed in various proportions, and afterwards combined with the colouring matters of madder and of weld, or (inſtead of the latter) of quercitron bark, aided by indigo, nearly all the poſſible varieties and ſhades of colour are now given in the way of calico-printing.

Hitherto the art of calico-printing has been confined almoſt ſolely to linens and cottons, which are ſuited to it, by being made ſuſceptible of a permanent union with colouring matters, and eſpecially with their baſes, by only the common warmth of the atmoſphere: and as this is alſo the caſe of ſilk, there can be no doubt but this might alſo be made the ſubject of new and beautiful embelliſhments in that way, which, if properly executed, would undoubtedly become a ſource of gratification to the public, and of profit to individuals. And lately, a ſpecies of dying or ſtaining, very much reſembling ſome parts of calico-printing, has been ingeniouſly applied to woollen ſtuffs, particularly to thoſe called kerſemeres, for waiſtcoat patterns, &c. The colours are made to penetrate and unite with the wool, by placing the ſtuff ſo to be printed, in the ſteam of boiling water, for a ſufficient length of time.

It now only remains to deſcribe the manner in which calico-printers perform the work. Some calicoes are only printed of one colour, others have two, others three, or more, even to the number of eight, ten, or twelve. The ſmaller the number of colours, the fewer are the proceſſes. 1. One of the moſt common colours on cotton-prints is a kind of nankeen yellow, of various ſhades, down to a deep yellowiſh brown or drab. It is uſually in ſtripes, flowers, or ſpots. To produce it, the printers beſmear a block, cut out into the figure of the print, with acetit of iron thickened with gum or flour; they apply it, thus charged, to the cotton; which, after being dried and cleaned in the uſual manner, is plunged into a pot-aſh ley. The quantity of acetit of iron is always proportioned to the depth of the intended ſhade. 2. For yellow, the block is beſmeared with acetit of alumina. The cloth, after receiving this mordant, is dyed with quercitron bark, and then bleached. 3. Red is communicated by the ſame proceſs, only madder is ſubſtituted for the bark. 4. The fine light blues, which appear ſo often on printed cottons, are produced, by applying to the cloth a block beſmeared with a compoſition, conſiſting partly of wax, which covers all thoſe parts of the cloth which are to remain white. The cloth is then dyed in a cold indigo

indigo vat; and, after it is dry, the wax compoſition is removed by means of hot water. 5. Lilac, brown, and blackiſh brown, are given by means of acetit of iron; the quantity of which is always proportioned to the depth of the ſhade. For very deep colours, a little ſumach is added. The cotton is afterwards dyed in the uſual manner with madder, and then bleached. 6. Dove-colour and drab, by charging the blocks with acetit of iron and quercitron bark.

When different colours are to appear in the ſame print, two or more blocks are employed, upon each of which that part of the print only is cut or engraved, which is to be of ſome particular colour. Theſe are beſmeared with different mordants, and applied to the cloth, which is afterwards dyed as uſual. Suppoſe, for inſtance, that three blocks are applied to cotton; one with acetit of alumina, another with acetit of iron, a third with a mixture of theſe two mordants, and that the cotton is then dyed with quercitron bark, and bleached. The parts impregnated with the mordants would have the following colours:

Acetit of alumina . . .	Yellow,
iron	Olive, drab, dove,
The mixture	Olive-green, olive.

If the cotton be dyed with madder inſtead of quercitron bark, the print will exhibit the following colours:

Acetit of alumina	Red,
iron	Brown, black,
The mixture	Purple.

When a greater number of colours are to appear; for inſtance, when thoſe communicated by bark and thoſe by madder are wanted at the ſame time, mordants for part of the pattern are to be applied; the cotton is then to be dyed in the madder-bath, and bleached; then the reſt of the mordants, to fill up the pattern, are added, and the cloth is again dyed with quercitron bark, and bleached. This ſecond dying does not much affect the madder colours; becauſe the mordants, which render them permanent, are already ſaturated. The yellow tinge is eaſily removed by the ſubſequent bleaching. Sometimes a new mordant is alſo applied to ſome of the madder colours; in conſequence of which they receive a new permanent colour from the bark. After the laſt bleaching, new colours may be added by means of the indigo liquor. The following table will furniſh an idea of the colours which may be given to cotton by theſe complicated proceſſes:

I. *Madder dye.*	*Colours.*
Acetit of alumina	Red,
iron	Brown, black,
Ditto diluted	Lilac,
Both mixed	Purple.
II. *Bark dye.*	
Acetit of alumina	Yellow,
iron	Dove, drab,
Lilac and acetit of alumina .	Olive,
Red and acetit of alumina .	Orange.
III. *Indigo dye.*	
Indigo	Blue,
Indigo and yellow	Green.

Thus no leſs than twelve colours may be made to appear together in the ſame print by theſe different proceſſes. If it were poſſible to procure colours ſufficiently permanent, by applying them at once to the cloth by the block or the pencil, as is the caſe with the mordants, the art of calico-printing would be brought to the greateſt poſſible ſimplicity: but at preſent this can only be done in one caſe, that of indigo; every other colour requires dying. Compoſitions, indeed, may be made by previouſly combining the dye-ſtuff and the mordants. Thus yellow may be applied at once by employing a mixture of the infuſion of quercitron bark and acetit of alumina; red, by mixing the ſame mordant with the decoction of alumina, and ſo on. Unfortunately the colours thus communicated are far inferior in permanency to thoſe produced when the mordant is previouſly combined with the cloth, and the dye-ſtuff afterwards applied ſeparately. In this way, therefore, are applied almoſt all the fugitive colours of calicoes, which waſhing, or even expoſure to the air, ſo commonly deſtroys; but which an act of the legiſlature might in future prevent, by prohibiting, under a high penalty, the uſe of falſe and fugitive dyes.

The following are the preſent exiſting laws which regulate the trade of a dyer: By 3 & 4 Edw. VI. c. 2. no dyer may dye any cloth with orchel, or with Brazil, to make a falſe colour in cloth, wool, &c. on pain of twenty ſhillings. By 23 Eliz. c. 9. dyers are to fix a ſeal of lead to cloths, with the letter M. to ſhew that they are well mathered, &c. or forfeit three ſhillings and four-pence per yard. By 23 Geo. III. c. 15. ſeveral penalties are inflicted on dyers, who dye any cloths deceitfully, and not throughout with woad, indigo, and mather; dying blue with logwood to forfeit twenty pounds. Dyers in London are ſubject to the inſpection of the dyers company, who may appoint ſearchers; and out of their limits, juſtices of the peace in ſeſſions to appoint them: oppoſing the ſearchers, incurs ten pounds penalty.

DYKE-REED, rather DYKE-REEVE, *ſ.* An officer that hath the care and overſight of the dykes and drains in fenny countries; as of deeping-fens, &c. 16 & 17 Car. II. c. 11.

DYLE, a river of the Netherlands, which riſes on the north-weſt of Namur, and joins the Scheld above Niel, after receiving from the eaſt the waters of the Dermer, the Nette or Nethe from the north, and the Senne from the ſouth.

DY'MAS, a Trojan, who joined himſelf to Æneas when Troy was taken, and was unfortunately killed by his countrymen, who took him to be an enemy, becauſe he had dreſſed himſelf in the armour of one of the Greeks he had ſlain. *Virgil.*

DY'NAMIS, *ſ.* [from δυναμαι, Gr. to be able.] With phyſicians, the power by which any medicine operates, or from whence any action proceeds.

DYNA'MICS, *ſ.* [*dynamique*, Fr. of δυναμις, Gr. power, force, &c.] That department of mechanics which relates to the motion of bodies; as ſtatics relates to the equilibrium of bodies, or where no motion is produced: the two grand diviſions of mechanics being *ſtatics* and *dynamics*; the former relating to quieſcence, and the latter to moving forces. See the article MECHANICS.

DYNANO'METER, *ſ.* an ingenious inſtrument for aſcertaining the relative ſtrength of men and animals.—When Sanctorius invented his balance, he taught us what we loſe by inſenſible perſpiration; and no one, without this diſcovery, would perhaps ever have imagined that the matter thrown out from the body is more than half what we receive as nouriſhment. Knowledge no leſs important might be acquired, had we the eaſy means of aſcertaining, in a comparative manner, our relative ſtrengths at the different periods of life, and in different ſtates of health. With this view a dynanometer was firſt invented by Graham, and improved by Dr. Deſaguliers, at London; but this machine, conſtructed of wood, was too bulky and heavy to be portable; and, beſides, to make experiments on the different parts of the body, ſeveral machines were neceſſary, each ſuited to the part required to be tried. The next improvement was the dynanometer of Cit. Leroy of the academy of ſciences at Paris. It conſiſted of a metal tube, ten or twelve inches in length, placed vertically on a foot like that of a candleſtick, and containing in the inſide a ſpiral ſpring, having above it a graduated ſhank terminating in a globe. This ſhank, together with the ſpring, ſunk into the tube in proportion to the weight acting upon it, and thus pointed out, in degrees, the ſtrength of the perſon who preſſed on the ball with his hand.

This inſtrument, though very ingenious, has not proved adequate to the purpoſe intended. Therefore, to remedy its defects, an improved dynanometer has been recently invented by M. Regnier, of the Polytechnique ſchool. Beſides the uſe which an enlightened naturaliſt may make of this machine, it may be poſſible to apply it to many other important purpoſes. For example, it may be employed with advantage to determine the ſtrength of draught cattle; and, above all, to try that of horſes, and compare it with the ſtrength of other animals. It may ſerve to make known how far the aſſiſtance of well-conſtructed wheels may favour the movement of a carriage, and what is its *vis inertiæ* in proportion to the load. We might appreciate by it, alſo, what reſiſtance the ſlope of a mountain oppoſes to a carriage, and be able to judge whether a carriage is ſufficiently loaded in proportion to the number of horſes that are to draw it. In the arts, it may be applied to machines of which we wiſh to aſcertain the reſiſtance, and when we are deſirous to calculate the moving force that ought to be adapted to them. It may ſerve, alſo, as a Roman balance to weigh burdens. In ſhort, nothing would be more eaſy than to convert this machine into an anemometer, to diſcover the abſolute force of the wind, by fitting to it a frame of a determined ſize, filled up with wax cloth; and it would not be impoſſible to aſcertain by this machine the recoil of fire arms, and conſequently the ſtrength of gunpowder.

This dynanometer, repreſented at C, in the annexed engraving, conſiſts of a ſpring twelve inches in length, bent into the form of an ellipſis; from the middle of which ariſes a ſemicircular plate of braſs, having engraved upon it the different degrees that expreſs the force of the power acting on the ſpring. The whole of this machine, which weighs only two pounds and a half, oppoſes, however, more reſiſtance than may be neceſſary to determine the action of the ſtrongeſt and moſt robuſt horſe. The ſimplicity of its mechaniſm will be better illuſtrated by the following deſcription: A, an elliptical ſpring, ſeen in perſpective, covered with leather, that it may not hurt the fingers when ſtrongly preſſed on with the hands. This ſpring is compoſed of the beſt ſteel, well welded and tempered, and afterwards ſubjected to a ſtronger proof than is indicated by its graduation, in order that it may not loſe any of its elaſticity by uſe. B, a piece of ſteel ſtrongly faſtened to the ſpring by means of a claw and ſcrews, in order to ſupport the ſemicircular plate of braſs C, mounted on the ſpring, ſeen geometrically. On this plate are engraved two arcs, one divided into myriagrammes, and the other into kylogrammes. Each of theſe arcs is ſtill farther divided by points, which expreſs the weight in pounds *de marc*; and all theſe degrees having been exactly valued by accurate weights, it thence reſults that all dynanometers of this kind may be compared with each other. D, a ſmall ſteel ſupport, adjuſted like the former to the other branch of the ſpring, and having a cleft towards its upper extremity to receive a ſmall copper lever E, which is kept in its place by a ſmall ſteel pin *a*. The whole of this mechaniſm is ſeen at H, of its full ſize. F, a ſteel index, very light and elaſtic, fixed upon its axis by a ſcrew in the centre of the braſs ſemicircle. This index has a ſmall bit of leather or cloth glued upon the ſmall circular part G, in order to render the friction on the plate eaſy, uniform, and almoſt inſenſible. It is to be obſerved, that this index is terminated by a double point, adapted to the diviſions on both the ſemicircular arcs. The firſt, divided into myriogrammes and points, expreſſing ten pounds *de marc*, ſerves for all experiments which oblige the ſpring to be *elongated* in the direction of its greater axis, as is the caſe in trying the ſtrength of the body: in a word, for all trials where it is neceſſary to draw the ſpring by the two ends. The ſecond, divided into kylogrammes and points, expreſſing pounds *de marc*, is deſtined for experiments which *compreſs* the two ſides of the ſpring, as in trying the force of the hands. I, a ſmall plate of braſs which covers the mechaniſm, to prevent it from being injured. This ſmall plate has on it alſo a divided arc, the degrees of which correſpond with thoſe of the firſt arc of the machine; and by the play of a ſmall index *b*, which is under the plate, the movements of the ſpring may be aſcertained. K, an aperture in the covering plate, through which may be introduced a ſmall turnſcrew, for the purpoſe of tightening or eaſing the index as may be neceſſary. L, a pallet of braſs, with a ſcrew, having a cap like that on the needle of the mariner's compaſs, in which the lower pivot of the lever, that puſhes round the index or handle, is made to play. This pallet, acting as a ſpring, yields to any ſudden ſhock, and prevents the derangement of the mechaniſm. M, a ſocket riveted on the plate I, in which the upper pivot of the lever turns. N, N, N, ſmall cylindric pillars that ſupport the covering plate, which is fixed to them by three ſcrews. O, an iron rack, on the lower part of which the feet muſt be placed when it is intended to try the ſtrength of a perſon's body. P, a double handle of wood, with an iron hook, to be held at the ſame time in the two hands. Q, a double hook made of iron, one end of which is to be hooked to the end of the ſpring, and the other to a rope faſtened to a poſt, as at *c*, when experiments are to be made on the ſtrength of horſes, or others, that require the dynanometer to be ſupported by hooks. R, the manner of holding the dynanometer by perſons who wiſh to aſcertain the ſtrength of the hands. S, poſition of a man when trying the ſtrength of his body. T, diſpoſition of the dynanometer to try the ſtrength of a horſe, or any other draught animal.

The effects of this machine may be thus explained: If a perſon preſſes on the ſpring with the hands, or draws it out lengthwiſe, by pulling the two extremities in a contrary direction, the two ſides of the ſpring approach each other; and in proportion as they are brought nearer, the ſmall lever of the mechaniſm puſhes before it the index, which, by the tightneſs with which it is ſcrewed in its place, will remain at the point to which it has been brought by the pin *d*, in conſequence of the force acting on the ſpring. The muſcular force of the arms, or rather the ſtrength of the hands, may be tried by laying hold of the two ſides of the ſpring neareſt to the centre, as may be ſeen in figure R; ſo that the arms may be a little ſtretched, and inclined downwards, almoſt at an angle of forty-five degrees. This poſition, which appears the moſt natural, is alſo the moſt convenient for a man to act with his full force. It is to be recollected, that the lower arc of diviſion, divided into kylogrammes, is that which ſerves to expreſs the force of the hands, and of all the actions which *preſs* the two ſides of the ſpring. The ſtrength of the hands may alſo be tried one after the other; and if an account be kept of the degree of preſſure of the right hand, and then of the left, and theſe two ſums be added together, it will be found that the ſum-total is, in general, equal to the ſtrength of both the hands when acting together.

To try the ſtrength of the body, the perſon muſt place his feet on the bottom part of the rack O; one of the ends of the ſpring is then to be placed in one of the hooks of the rack; and the hook P is to be put into the other end. In this poſition the body is perpendicular; the ſhoulders only being inclined a little forwards, to be able, in throwing back the body, to pull the ſpring with all the force which a perſon is capable of exerting. In this ſituation, repreſented by S, a man may raiſe a great weight without being expoſed to thoſe accidents which might be occaſioned by an effort made in a more conſtrained poſition.

Nothing can be more convenient than this dynanometer to aſcertain and compare the ſtrength of horſes, and that of all draught animals. The apparatus at T, ſhews in a ſufficient manner, the diſpoſitions neceſſary for experiments of that kind. The trials made by the inventer ſerve to give a very juſt idea of the abſolute force of

horſes

DYNANOMETER.

London Published as the Act directs Nov.r 12.1803. by J.Wilkes.

horſes of middling ſtrength. For this purpoſe, four horſes of middle ſize, in good health and well-conditioned, were ſubjected ſeparately and in ſucceſſion to the ſame trial. The firſt drew equivalent to thirty-ſix myriagrammes; the ſecond thirty-eight and an half; the third twenty-ſix and an half; and the fourth forty-three. The ſum of all theſe is 144 myriagrammes; and if we take the mean of this ſum, we ſhall have, for the ſtrength of ordinary horſes, thirty-ſix myriagrammes, or 736 pounds *de marc.*

DYNAS'TICAL, *adj.* Relative to mode of government.—The Hiſtory and Antiquities of Harwich and Dover-court, topographical, *dynaſtical*, and political. *Title to Dale's Harwich.*

DY'NASTY, *ſ.* [δυναστεια of δυναστευω, Gr. to be powerful, or king.] A race or ſucceſſion of kings of the ſame line or family. Such were the dynaſties of Egypt, of China, &c.

DYNDYME'NE, in heathen mythology, one of the names of the goddeſs Veſta.

DY'NISH, a ſmall iſland in the Atlantic, near the weſt coaſt of Ireland, and county of Galway. Lat. 53. 16. N. lon. 9. 44. W. Greenwich.

DYP'TYCHA, *ſ.* [Gr.] A kind of public regiſter among the ancients.

DYR'NITZ, or TYRNITZ, a town of Germany, in the archduchy of Auſtria: ſeventeen miles ſouth of St. Polten.

DYRRA'CHIUM, anciently a town on the coaſt of Illyricum, before called *Epidamnum*, or *Epidamnus*; originally built by the Corcyreans. A Roman colony. *Pliny.*

DY'SÆ, *ſ.* Inferior goddeſſes among the Saxons, being the meſſengers of the great Woden, whoſe province it was to convey the ſouls of ſuch as died in battle to his abode, called *Valhall*, i. e. the hall of ſlaughter.

DYSÆSTHE'SIA, *ſ.* [from δυς, Gr. difficulty, and αισθανομαι, to feel or perceive.] A dulneſs of ſenſation, or diſeaſe called a *faulty ſenſe*, from ſome defect of the external organs.

DY'SART, a town of Scotland, in the county of Fife, with a ſmall harbour on the north ſide of the Frith of Forth; the principal trade is in coals: eleven miles north of Edinburgh. Lat. 56. 7. N. lon. 3. 8. W. Greenwich.

DYSCINE'SIA, *ſ.* [from δυς, Gr. and κινεω, to move.] A difficulty of motion. Alſo a defect of ſome of the limbs.

DYSCOPHO'SIS, *ſ.* [from δυς, Gr. with difficulty, and κοφοω, to be deaf.] A defect in the ſenſe of hearing.

DYSECŒ'A, *ſ.* [from δυς, Gr. with difficulty, and ακουω, to hear.] The medical term for deafneſs.

DYS'CRASY, *ſ.* [from δυς, Gr. difficulty, and κερανυμι, to mix.] An unequal mixture of elements in the blood or nervous juices; a diſtemperature, when ſome bad humour or quality abounds in the body.—In this pituitous *dyſcraſy* of blood, we muſt vomit off the pituita, and purge upon intermiſſions. *Floyer.*

DYSEN'TERIC, *adj.* Belonging to a dyſentery, tending to a dyſentery, attended with a dyſentery.

DYSEN'TERY, *ſ.* [*dyſenterie*, Fr. from δυσεντερια, Gr.] A looſeneſs or flux of the bowels. See the article MEDICINE.—From an unuſual inconſtancy of the weather, and perpetual changes of the wind from eaſt to weſt, proceed epidemical *dyſenteries. Arbuthnot.*

DYSLO'CHIA, *ſ.* [from δυς, Gr. difficultly, and λοχια, the lochia.] A morbid ſuppreſſion of the lochia, or menſtrual diſcharge.

DYS'NOMY, *ſ.* [from δυς, Gr. bad, and νομος, a law.] The act of conſtituting bad laws.

DYSO'DES, *ſ.* [from δυς, Gr. bad, and οζω, to ſmell.] The diſeaſe called a *fœtid* or *ſtinking breath*. Fœſius ſays, that in Hippocrates we are to underſtand by this word, a *fœtid* diſorder of the ſmall inteſtines. Dr. Percival calls it *dyſodes pulmonica*, to which, he ſays, perſons with a narrow cheſt and ſcorbutic habit are peculiarly incident. He obſerves, that it ſeems to originate from a want of power to make a full expiration, by which too much perſpirable matter is retained, and corrupted by ſtagnation in the veſicles of the lungs. In ſuch caſes he hath found the moſt ſalutary effects from the uſe of myrrh and fixed air, internally adminiſtered. Theſe antiſeptic ſubſtances are probably carried to the lungs, and diſcharged together with the offenſive vapour, which correct, at the ſame time that they invigorate, the ſmalleſt ramifications of the bronchiæ.

DYSO'PIA, *ſ.* [from δυς, Gr. difficultly, and οπτομαι, to ſee.] An indiſtinct and difficult viſion, occaſioned by ſome natural or acquired defect in the eye. We are told, in vol. iv. of the Memoirs of the Medical Society of London, 1795, that this complaint is known in Ruſſia by a name ſignifying *hen blindneſs*. The patient loſes his ſight at ſun-ſet, and does not recover it till ſun-riſe; and is blind even during the lighteſt nights of ſummer. The diſeaſe is chiefly among the peaſants during the hay-harveſt, when they generally work all night, to avoid the ſultry heat of day, and when they ſleep leſs than uſual. M. Guthrie, M. D. at Peterſburgh, attributes the cauſe to an exhauſtion of the irritability of the retina, by exceſs of light. This temporary amauroſis goes off ſpontaneouſly; but they uſe a decoction of blue-bottle, *centaurea cyanus*, *Lin.*

DYSOREX'IA, *ſ.* [from δυς, Gr. bad, and ορεξις, appetite.] A bad or depraved appetite; a loathing of food.

DYSPEP'SIA, *ſ.* [from δυς, Gr. difficultly, and πεπτω, to concoct.] A difficulty of digeſtion; a weakneſs of the digeſtive organs.

DYSPERMATIS'MUS, *ſ.* [from δυς, Gr. difficultly, and σπερματω, to procreate.] An inability to beget children; an infirmity of the procreative members.

DYSPHO'NIA, *ſ.* [from δυς, Gr. difficultly, and φωνη, the voice.] An impeded voice; a difficulty of ſpeech; a defect of utterance.

DYSPNŒ'A, [from δυς, Gr. difficultly, and πνεω, to breathe.] A difficulty of breathing; an impeded reſpiration; a ſtate of aſthma.

DYSTHY'MIA, [from δυς, Gr. bad, and θυμος, the mind.] Inſanity; a diſorder of the mind; a ſtate of phrenzy.

DYSTI'CHIA, *ſ.* [from δυω, Gr. and στιχας, a row.] A double row of hairs on the eyelids.

DYSTO'CHIA, [from δυς, Gr. difficultly, and τικτω, to bring forth.] A difficulty of parturition; a lingering and unnatural labour.

DYSTRYACHI'ASIS, *ſ.* [Gr.] A continued defluxion of tears occaſioned by the ſhort points of the hairs growing under the eyelids.

DY'SURY, *ſ.* [*dyſuria*, Lat. from δυς, Gr. painful, and ουρον, urine.] A difficulty of voiding the urine, commonly called *ſtrangury*. For the cauſe and cure, ſee the article MEDICINE.

DYTIS'CUS, *ſ.* the water-beetle; in entomology, a genus of inſects belonging to the order of coleoptera; the antennæ are ſlender and ſetaceous; they have ſix filiform palpi or feelers; the hind feet are hairy, and formed for ſwimming; and are alſo furniſhed with claws; the under ſide of the fore feet of the males is hemiſpherical; the elytra of the female are moſtly furrowed. From the indefatigable reſearch of modern entomologiſts, no leſs than one hundred and forty-ſeven ſpecies are now aſcertained, diſtinguiſhed chiefly by their antennæ, the colour of the elytra, &c. The larvæ of the dytiſcus are often met with in water. They are oblong, and have ſix ſcaly feet. Their body conſiſts of eleven ſegments. The head is large, with four filiform antennæ and a ſtrong pair of jaws. The laſt ſegments of their body have rows of hairs on the ſides; and the abdomen is terminated by two ſpines charged with the like hairs, forming a kind of plumes. Theſe larvæ are frequently of a greeniſh variegated brown: they are lively, active, and extremely voracious: they devour and feed upon other water-inſects, and often tear and deſtroy each other. The perfect in-

ſect

ſect is little inferior to its larvæ in voraciouſneſs, but it can only exerciſe its cruelty on the larvæ; the perfect inſects, like himſelf, being ſheltered by the kind of ſcaly cuiraſs with which they are armed. This creature muſt be touched cautiouſly; for, beſides its power of giving a ſevere gripe with its jaws, it has, under the thorax, another weapon, a long ſharp ſpine, which it will drive into one's fingers by the effort it makes to move backward. The eggs of the dytiſcus are rather large, and are incloſed in a kind of ſilky duſkiſh bag, of a ſtrong and thick texture, in form round, and terminated by a long appendix or ſlender tail, of the ſame ſubſtance. Theſe bags are often found in the water, and from them are brought forth the eggs and larvæ of the inſect. Many ſpecies of the perfect inſect are commonly ſeen in ſtagnant waters, which they quit in the evening to fly about. They ſwim with incredible agility, making uſe of their hinder legs after the faſhion of oars. The elytra of the females are in general furrowed, and thoſe of the male plain: when they firſt arrive at their perfect ſtate, their elytra are almoſt tranſparent, and in many ſpecies of a beautiful dun or fire colour, mingled with ſhades of a greeniſh brown, or punctulated, or banded, grooved, or ſtriated. Five ſpecies are delineated in the engraving, common to different parts of Europe, and found in this country, viz.

Fig. 1. the marginalis: colour above ſhining raven grey, except the outward edge of the thorax and elytra, and the fore part of the head, which has a tranſverſe ſtreak or band of a dun colour, ſituate on the upper lip; the under part of the body is a mixture of yellow and brown. The elytra are exceeding ſmooth and glaſſy, with obſcure ſpots or lines, forming two longitudinal bands on the edge of each of the elytra. The ſternum underneath is forked and blunt. The legs have no other articulation than that which reſembles a hinge. The four anterior feet are ſingularly ſhaped in the males. The four firſt articulations of the tarſi are very ſhort and broad, with bruſhes underneath, which form a round ſcoop, with which the inſect lays hold of his female. The laſt joint of thoſe tarſi is long, and bears the nails. The hinder feet have their tarſi flat, bearded, ſhaped like fins, and the claws of thoſe feet are ſtraight and nowiſe hooked. The antennæ and palpi are dun coloured. This ranks among the largeſt of the ſpecies. Fig. 2, repreſents the female of the ſame inſect; the elytra ſubſtriated and brown, and black at the ends. Fig. 3, the uliginoſus; with dark poliſhed ſhining elytra; antennæ, legs, and body, ferruginous. Fig. 4, the bipuſtulatus: dark and ſhining, with two red dots on the head behind, but ſcarcely viſible to the naked eye. Fig. 5, dytiſcus Hermanni: body gibbous; head, thorax, and baſe of the ſhells, ferruginous red; elytra truncate; native of Alſace. Fig. 6, the maculatus: thorax with a paliſh brown band; body black; elytra variegated with ſpots or ſtreaks. The males in general reſemble moſt the dermeſtides, and the females the carabi.

DYVO'UR, *ſ.* otherwiſe BARE-MAN: a Scotch term for a perſon involved in debt, and unable to pay his creditors: ſynonymous with the word BANKRUPT

DZAR GURBAN, a river of Ruſſian Tartary, which runs into the Irtiſch, twenty miles eaſt of Semipolatnoi.

DZIEWIENISZ'KI, a town of Lithuania, in the palatinate of Wilna: thirty miles ſouth-ſouth-eaſt of Wilna.

DZIWATO'W, a town of Lithuania, in the palatinate of Wilna: four miles weſt of Wilkomierz.

DZONMU'REN, a river of Ruſſia, which runs into Angara: twenty-four miles north of Irkutſch.

DZU'RA, a Tartarian village of Ruſſian Siberia, in the government of Irkutſch. Lat. 56. 4. N. lon. 142. 10. E. Ferro.

DZWING'ROD, a town of Poland, in the palatinate of Kaminiec: twenty miles ſouth-weſt of Kaminiec.

E.

E, THE ſecond vowel, and fifth letter of the alphabet, poſſeſſes two ſounds; long, as in *ſcéne*, and ſhort, as in *men*. It is alſo the moſt frequent vowel in the Engliſh language; for it not only is uſed like the reſt in the beginning or end of words, but has the peculiar quality of lengthening the foregoing vowel; as, *căn, cāne*; *măn, māne*; *găp, gāpe*; *glăd, glāde*; *brĕd, brēde*; *chĭn, chīne*; *wĭp, wīpe*; *thĭn, thīne*; *nŏd, nōde*; *tăn, tāne*; *plŭm, plūme*. Yet it ſometimes occurs final, where yet the foregoing vowel is not lengthened; as, *gĭve, knowlĕdge, ĕdge, gĭve*. Anciently almoſt every word ended with *e*, as for *can, canne*; for *year, yeare*; for *great, greate*; for *need, neede*; for *flock, flocke*. It is probable that this *e* final had at firſt a ſoft ſound, like the female *e* of the French; and that afterwards it was in poetry either mute or vocal, as the verſe required, 'till at laſt it became univerſally ſilent. *Ea* has the ſound of *e* long: the *e* is commonly lengthened rather by the immediate addition of *a* than by the appoſition of *e* to the end of the word; as *mĕn, mēan*; *sĕl, sēal*; *mĕt, mēat*; *nĕt, nēat*.

The Greeks have the long and ſhort *e* which they call *epſilon* and *eta*. The French have at leaſt ſix kinds of *e*'s: the Latins have likewiſe a long and ſhort *e*; they alſo write *e* inſtead of *a*, as *dicem* for *dicam*, &c. and this is no doubt the reaſon why *a* is ſo often changed into *e* in the preter tenſe; as, *ago, egi*; *facio, feci*, &c. As a numeral, E ſtands for 250, according to the verſe,

E, *quoque ducentos et quinquaginta tenebit.*

In muſic it denotes the tone *e-la-mi*. In the kalendar it is the fifth of the dominical letters. And in ſea-charts it diſtinguiſhes all the eaſterly points: thus, E. alone denotes eaſt; E. by S. means eaſt by ſouth; and E. by N. eaſt by north.

EACH, *pron.* [elc, Sax. *elch*, Dut. *ilk*, Scot.] Either of two:

Though your orbs of diff'rent greatneſs be,
Yet both are for *each* other's uſe diſpos'd;
His to incloſe, and your's to be inclos'd. *Dryden.*

Every one of any number. This ſenſe is rare, except in poetry:

Wiſe Plato ſaid, the world with men was ſtor'd,
That ſuccour *each* to other might afford. *Denham.*

To *each* the correſpondent word is *other*, whether it be uſed of two, or of a greater number.—Let *each* eſteem *other* better than themſelves. *Phil.* ii. 3.

Lovelieſt of women! heaven is in thy ſoul;
Beauty and virtue ſhine for ever round thee,
Bright'ning *each other!* *Addiſon.*

EACH'ARD (John), an ingenious divine of the church of England, a deſcendant from a reſpectable family in Suffolk, born about 1636. After receiving a claſſical education, he was ſent to Catharine-hall in the univerſity of Cambridge, where he took the degree of bachelor of arts in 1656, was elected fellow of his college in 1658, and was admitted to the degree of maſter of arts in 1660. He publiſhed a treatiſe, intitled The Grounds and Reaſons of the Contempt of the Clergy and Religion enquired

Merian del.ᵗ

J. Pass sculp.ˢ

The Duroia eriopila, and five Species of Water Beetle.

London Published as the Act directs. Sept.ʳ 25. 1803. by J. Wilkes.

quired into, 1670. This contempt he proves to be the improper ſelection of young men who are intended for the miniſterial office, the defective ſyſtems purſued in their education, and the wrong motives which determine many parents to educate their children for the church. He blended his ſerious remarks with ſo much wit and humour, that his treatiſe drew very general attention, and paſſed through many editions. In 1671, he publiſhed Mr. Hobbes's State of Nature conſidered, in a Dialogue between Philautus and Timothy, &c. and ſoon afterwards he publiſhed ſome farther remarks on the writings of Mr. Hobbes, in A Second Dialogue between Philautus and Timothy. In theſe dialogues he did not attempt to confute the Philoſopher of Malmeſbury by ſerious argumentation, but endeavoured to expoſe his ſyſtem to ridicule by keen raillery, and lively ſallies of humour. In 1675, Mr. Eachard was choſen maſter of Catharine-hall; and in the year following was created doctor of divinity by royal mandamus. It does not appear that he afterwards produced any literary work. He died in 1697. The moſt complete edition of his works was publiſhed in 1774, in 3 vols. 12mo.

EAD, [*æd, ed,*] in compound, and *eadig* in ſimple names, denotes happineſs, or bleſſedneſs. Thus *Eadward* is a happy preſerver; *Eadulph*, happy aſſiſtance; *Eadgur*, happy power; *Eadwin*, happy conqueror; which *Macarius Eupolemus, Fauſta, Fortunatus, Felicianus*, &c. do in ſome meaſure reſemble. *Ead* may alſo in ſome caſes be derived from the Saxon *eath*, which ſignifies eaſy, gentle, mild. *Gibſon's Camden.*

EA'GER, *adj.* [eaȝor, Sax. *aigre*, Fr.] Struck with deſire; ardently wiſhing; keenly deſirous; vehement in deſire; hotly longing:

With joy th' ambitious youth his mother heard,
And, *eager*, for the journey ſoon prepar'd;
He longs the world beneath him to ſurvey,
To guide the chariot, and to give the day. *Dryden.*

It is uſed ſometimes with *of*, ſometimes with *for*, ſometimes with *on* or *after* before the thing ſought. Hot of diſpoſition; vehement; ardent; impetuous.—A man, charged with a crime of which he thinks himſelf innocent, is apt to be too *eager in* his own defence. *Dryden.*—Quick; buſy; eaſily put in action:

His Numidian genius
Is well diſpos'd to miſchief, were he prompt
And *eager on* it, but he muſt be ſpurr'd. *Addiſon.*

Sharp; ſour; acid:

With a ſudden vigour it doth poſſet
And curd, like *eager* droppings into milk,
The thin and wholeſome blood. *Shakeſpeare.*

Keen; ſevere; biting.—The fleſh ſhrinketh, but the bone reſiſteth, whereby the cold becometh more *eager*. *Bacon.*—Brittle; inflexible; not ductile. A cant word of artificers.—Gold will be ſometimes ſo *eager*, as artiſts call it, that it will as little endure the hammer as glaſs itſelf. *Locke.*

EA'GERLY, *adv.* With great ardour of deſire; with impetuoſity of inclination.—To the holy war how faſt and *eagerly* did men go, when the prieſt perſuaded them that whoſoever died in that expedition was a martyr. *South.*

How *eagerly* he flew, when Europe's fate
Did for the ſeed of future actions wait. *Stepney.*

Ardently; hotly:

Brutus gave the word too early,
Who having ſome advantage on Octavius,
Took it too *eagerly*; his ſoldiers fell to ſpoil,
Whilſt we by Antony were all enclos'd. *Shakeſpeare.*

Keenly; ſharply.—Abundance of rain froze ſo *eagerly* as it fell, that it ſeemed the depth of winter had of a ſudden been come in. *Knolles.*

EA'GERNESS, *ſ.* Keenneſs of deſire; ardour of inclination:

She knew her diſtance and did angle for me,
Madding my *eagerneſs* with her reſtraint. *Shakeſpeare.*

The *eagerneſs* and ſtrong bent of the mind after knowledge, if not warily regulated, is often an hindrance to it. *Locke.*

Juba lives to catch
That dear embrace, and to return it too,
With mutual warmth and *eagerneſs* of love. *Addiſon.*

Impetuoſity; vehemence; violence:

I'll kill thee with ſuch *eagerneſs* of haſte,
As fiends, let looſe, would lay all nature waſte. *Dryden.*

EA'GLE, *ſ.* [*aigle*, Fr. *aquila*, Lat. *ealler*, Erſe.] A well-known bird of prey, for the natural hiſtory of which ſee the article FALCO. The eagle, from being conſidered, in the heraldic ſcience, as an emblem of royalty or majeſty, has been borne as an enſign or ſtandard by ſeveral nations. According to Dr. Bryant it was one of the inſignia of Egypt; and it was alſo aſſumed by the Perſians. It was adopted by the Romans in the ſecond year of the conſulate of C. Marius. Conſtantine is ſaid to have firſt introduced the eagle with two heads, to intimate, that though the empire ſeemed divided, it was yet only one body. Others ſay, that it was Charlemagne who aſſumed the eagle as the Roman enſign, and added to it a ſecond head; but that opinion is deſtroyed, by an eagle with two heads, noted by Lipſius, on the Antonine column; as alſo by the eagle's only having one head on the ſeal of the golden bull of the emperor Charles IV. The conjecture, therefore, of F. Meneſtrier appears more probable, who maintains, that as the emperors of the eaſt, when there were two on the throne at the ſame time, ſtruck their coins with the impreſſion of a croſs, with a double traverſe, which each of them held in one hand, as being the ſymbol of the Chriſtians; the like they did with the eagle in their enſigns; and inſtead of doubling their eagles, they joined them together, and repreſented them with two heads. The eagle on medals, according to M. Spanheim, is a ſymbol of divinity and providence; and, according to all other antiquities, of empire. The princes on whoſe medals it is moſt uſually found, are the Ptolemies and the Seleucides of Syria. See HERALDRY.

EA'GLE, *ſ.* in aſtronomy; a conſtellation of the northern hemiſphere, having its right wing contiguous to the equinoctial. See AQUILA, vol. i. p. 841. There are alſo three ſtars, called by the Arabian aſtronomers, *naſr*, i. e. eagle. The firſt, *naſr ſohail*, the eagle of canopus, called alſo *ſitareh jemen*, the ſtar of Arabia Felix, over which the Arabians ſuppoſe it to preſide; the ſecond, *naſr althair*, the flying eagle; and the third, *naſr alvake*, the reſting eagle.

White EAGLE, a Poliſh order of knighthood, inſtituted in 1325, by Uladiſlaus V. on marrying his ſon Caſimire with a daughter of the duke of Lithuania. The knights of this order were diſtinguiſhed by a gold chain, to which was appended a ſilver eagle crowned.

Black EAGLE, an order of knighthood inſtituted in 1701, by the elector of Brandenburgh, on his being crowned king of Pruſſia. The knights of this order wear an orange-coloured ribbon, to which is ſuſpended a black eagle.

EA'GLE-EYED, *adj.* Sharp-ſighted as an eagle.—As he was quick and perſpicacious, ſo was he inwardly *eagle-eyed*, and verſed in the humours of his ſubjects. *Howel.*

Every one is *eagle-ey'd* to ſee
Another's faults and his deformity. *Dryden.*

EA'GLE-FLOWER, *ſ.* See BALSAMINE.

EA'GLE-ISLAND, an iſland in the Atlantic, near the weſtern coaſt of Ireland, and county of Mayo. Lat. 54. 17. N. lon. 9. 54. W. Greenwich.

EA'GLE-ISLAND, an iſland on the north-eaſt coaſt of New Holland; low, ſandy, and covered with trees. Lat. 14. 32. S.

EA'GLE-SIGHTED, *adj.* With a ſight like an eagle's:

What peremptory *eagle-ſighted* eye
Dares look upon the heaven of her brow,
That is not blinded by her majeſty? *Shakeſpeare.*

EA'GLE-SPEED, *ſ.* Swiftneſs, like that of an eagle:

Abrupt, with *eagle-ſpeed* ſhe cut the ſky,
Inſtant inviſible to mortal eye. *Pope.*

EA'GLE-STONE, *ſ.* A ſpecies of argillaceous iron ore, fancifully ſaid to be found at the entrance of the holes in which the eagles make their neſts, and affirmed by the ancients to have a particular virtue in defending the eagle's neſt from thunder.—The *eagle-ſtone* contains, in a cavity within it, a ſmall looſe ſtone, which rattles when it is ſhaken; and every foſſil, with a nucleus in it, has obtained this name. The analogy between a ſtone, thus containing another within it, or, as the fanciful writers expreſs it, pregnant with another, and a woman big with child, led people to imagine that it muſt have great virtues and effects in accelerating or retarding delivery; ſo that, if tied to the arm of a woman with child, it prevents abortion; and if to the leg, it promotes delivery. On ſuch idle and imaginary virtues was raiſed all the credit which this famous foſſil poſſeſſed for many ages. *Hill.* See the articles ÆTITES and MINERALOGY.

EA'GLE-WINGED, *adj.* With the wings of an eagle:

At his right hand Victory
Sat *eagle-wing'd.* *Milton.*

EA'GLE-WOOD, *ſ.* See EGLE.

EA'GLES, a town of the American States, in North Carolina, on the weſt ſide of the river Clarendon, or Cape Fear, oppoſite Wilmington.

EA'GLET, *ſ.* A young eagle.—This treaſon of his ſons did the king expreſs in an emblem, wherein was an eagle with three *eaglets* tyring on her breaſt, and the fourth pecking at one of her eyes. *Davies.*

EA'GRE, *ſ.* [*ægir*, in Runic, is the ocean: *eggia*, in Iſlandic, is to agitate, to incite.] A tide ſwelling above another tide, obſervable in the river Severn:

For as an *eagre* rides in triumph o'er the tide,
The tyrant paſſions hope and fear,
Did in extremes appear,
And flaſh'd upon the ſoul with equal force. *Dryden.*

EAK, *ſ.* [*obſolete*; from the Sax. æak.] Eternity. *Scott.*

EAL'DERMAN, *ſ.* [ealdɔejman, Sax.] The name of a Saxon magiſtrate; alderman.—*Ealderman* among the Saxons was as much as earl among the Danes. *Termes de la Ley.*

EAL'HORDA, *ſ.* [from the Sax.] The privilege of aſſizing and ſelling beer. *Scott. Obſolete.*

EAME, *ſ.* [eam, Sax. *oom*, Dut.] Uncle; a provincial word, ſtill uſed in ſome parts of Staffordſhire.

Daughter, ſays ſhe, fly, fly; behold thy dame
Foreſhews the treaſon of the wretched *eame!* *Fairfax.*

To EAN, *v. n.* now ſpelt YEAN; [from eanian, Sax.] To lamb:

He ſtuck them up before the fulſome ewes,
Who, then conceiving, did in *eaning* time,
Fall party-colour'd lambs. *Shakeſpeare.*

EAN'LING, *ſ.* A lamb juſt dropped:

That all the *eanlings*, that were ſtreak'd and py'd,
Should fall as Jacob's hire. *Shakeſpeare.*

EAOO'WE, or EOOA, or MIDDELBURG, one of the Friendly iſlands, in the South Pacific Ocean, which abounds with groves of fruit, and other trees, interſperſed with tracts covered with graſs. It was firſt diſcovered by Taſman, who called it *Middleburg*. Lat. 21. 24. S. lon. 174. 30. W. Greenwich.

EAR, *ſ.* [eare, Sax. *oor*, Dut.] The organ of hearing. See ANATOMY, vol. i. p. 601, 2.—His *ears* are open unto their cry. *Pſalm* xxxiv. 15.

What fire is in my *ears*? Can this be true?
Stand I condemn'd! *Shakeſpeare.*

That part of the ear that ſtands prominent.—His maſter ſhall bore his *ear* through with an awl. *Exodus.*—Power of judging of harmony; ſenſe of diſcriminating the notes in muſic.—She has a delicate *ear*, and her voice is muſic. *Richardſon.*—The head; or the perſon: in familiar language.—Better paſs over an affront from one ſcoundrel, than draw the whole herd about a man's *ears*. *L'Eſtrange.*—The higheſt part of a man; the top—A cavalier was up to the *ears* in love with a very fine lady. *L'Eſtrange.*—The privilege of being readily and kindly heard; favour.—Ariſtippus was earneſt ſuitor to Dionyſius for ſome grant, who would give no *ear* to his ſuit. *Bacon.*

They being told there was ſmall hope of eaſe,
Were willing at the firſt to give an *ear*
To any thing that ſounded liberty. *Ben Jonſon.*

Diſpoſition to like or diſlike what is heard; judgment; opinion; taſte.—He laid his ſenſe cloſer, and in fewer words, according to the ſtyle and *ear* of thoſe times. *Denham.*—Any prominences from a larger body, raiſed for the ſake of holding it.—There are ſome veſſels, which, if you offer to lift by the belly or bottom, you cannot ſtir them: but are ſoon removed, if you take them by the *ears*. *Taylor.*—The ſpike of corn; that part which contains the ſeeds.—From ſeveral grains he had eighty ſtalks, with very large *ears*, full of large corn. *Mortimer.*

The leaves on trees not more,
Nor bearded *ears* in fields, nor ſands upon the ſhore.
Dryden.

To be by the EARS; or, *to fall together by the* EARS. To fight; to ſcuffle; to quarrel. In Dutch *oorlogen*. A familiar phraſe.—Fools *go together by the ears*, to have knaves run away with the ſtakes. *L'Eſtrange.*

All Aſia now was *by the ears*,
And gods beat up for volunteers. *Prior.*

To ſet by the EARS. To make ſtrife; to quarrel; *low language.*—She uſed to carry tales from one to another, 'till ſhe had *ſet* the neighbourhood together *by the ears*. *Arbuthnot.*

Loſs of one ear is a puniſhment enacted by 5 and 6 Edw. VI. c. 4. for fighting in a church-yard; and by 2 and 3 Edw. VI. c. 15. for combinations to raiſe the price of proviſions, labour, &c. if it be the third offence, beſide pillory, and perpetual infamy, or a fine of 40l.

To EAR, *v. a.* [*aro*, Lat.] To plough; to till. *Obſolete.*—A rough valley, which is neither *eared* nor ſown. *Deuteronomy.*—Five years, in the which there ſhall neither be *earing* nor harveſt. *Gen.* xiv. 6.—The field of love, with plough of virtue *ear'd*. *Fairfax.*

To EAR, *v. n.* To ſhoot into ears.

"Wide EARS and a ſhort tongue."—The Latins ſay: *Audi multa, loquere tempeſtiva.* The Germans ſay: *Hore allea, lerne viel, ſage wenig:* Hear all, learn much, and ſpeak little. To hear, ſee, and ſay little, are evident marks of prudence, ſagacity, and good ſenſe; which it is the intent of this proverb to inculcate.

"In at one EAR and out at the other." In Italian, *Dentro da un orecchia & fuore dall' altra.* The Italians ſay likewiſe: *Havere orecchie di mercante:* To have a merchant's or tradeſman's ears. This is either ſpoken of thoſe careleſs and inattentive perſons, who in receiving admonitions, orders, or inſtructions, are too apt to forget or diſregard them; or, it is a leſſon to perſons in trade, not to notice the faults and reflections caſt upon them by petulant cuſtomers, who are ſooneſt overcome by civility and attention.

EAR-ACH, *ſ.* A pain in the ear.

EAR-KISSING, *adj.* Heard in a whiſper.—You have heard of the news abroad; I mean the whiſpered ones; for they are yet but *ear-kiſſing* arguments. *Shakeſpeare.*

EAR-PICK, *ſ.* an inſtrument of ivory, ſilver, or gold, ſomewhat in form of a probe, for cleanſing the ear. Sir Hans Sloane obſerves, that the uſe of this inſtrument muſt be very prejudicial to ſo delicate an organ, by bringing too great a flow of humours into it.

EAR-PIERCING, *adj.* Having a ſhrill ſound.—Th' *ear-piercing* fife. *Shakeſpeare.*

EAR-RING, *ſ.* Jewels ſet in a ring and worn at the ears; ornament of a woman's ear:

With gold and ſilver they increaſe his ſtore,
And gave the precious *ear-rings* which they wore. *Sandys.*

EAR-SHELL, *ſ.* A ſpecies of ſhell reſembling the form of the ear.

EAR-WAX, *ſ.* The cerumen or exudation which lubricates the inſide of the ear.—The ear being to ſtand open, becauſe there was ſome danger that inſects might creep in thereat; therefore hath nature loricated or plaiſtered over the ſides of the hole with *ear-wax*, to entangle inſects. *Ray.*

EAR'ABLE, *adj.* Arable; fit to be ploughed; tillable. *Scott.*

EARCH, a river of North Wales, which runs into the ſea, near Pwllhely, in Caernarvonſhire.

EAD'ORBURG, *ſ.* [from the Sax.] The metropolis; the chief city. *Obſolete.*

EA'RED, *adj.* Having ears, or organs of hearing. Having ears, or ripe corn.

The covert of the thrice-*ear'd* field
Saw ſtately Ceres to her paſſion yield. *Pope.*

Tilled; ploughed. *Deut.* xxi. 4.

EAR'ING, *ſ.* The act of ſhooting out in ears; the act of tilling the ground; the act of gathering the ears of corn. In ſea-affairs, that part of the bolt rope which is left open at the corner of the ſails in form of a ring.

EAR'ING-TIME, *ſ.* The time of harveſt.

EARL, *ſ.* [eorl, Saxon; *eoryl*, Erſe.] A title of nobility, formerly the higheſt of this nation, now the third:

Thanes and kinſmen,
Henceforth be *earls*, the firſt that ever Scotland
For ſuch an honour nam'd. *Shakeſpeare.*

This title ſeems to have originated with the Saxons, and is the moſt ancient of the Engliſh peerage, there being no title of honour uſed by the preſent nobility that was likewiſe in uſe by the Saxons, except this of earl, which was uſually applied to the firſt in the royal line. Verſtegan derives this word from the Dutch *ear*, i. e. honour, and *ethel* which ſignifies noble: but whencefoever it is derived, the title earl was at length given to thoſe who were aſſociates to the king in his council and martial actions; and the method of inveſtiture into that dignity was *per cincturam gladii*, without any formal charter of creation. *Dugdale's Warwickſh.* 302. William the Firſt, called the Conqueror, gave this dignity in fee to his nobles, annexing it to this or that county or province; and alloting them for the maintenance of it a certain portion of money ariſing from the prince's profits, for the pleadings and forfeitures of the provinces. *Camd.* And formerly one earl had divers ſhires under his government, and had lieutenants under him in every ſhire, ſuch as are now ſheriffs; as appears by divers of our old ſtatutes. *Cowel.*

But about the reign of king John and ever ſince, our kings have made earls of counties, &c. by charter; giving them no authority over the county, nor any part of the profits ariſing out of it; only ſometimes they have had an annual fee out of the exchequer, &c. An earl, *comes*, was heretofore correlative with *commitatus*; and anciently there was no earl but had a ſhire or county for his earldom; but of late times the number of earls very much increaſing, ſeveral of them have choſen for their titles ſome eminent part of a county, conſiderable town, village, or their own ſeats, &c. Beſides theſe local earls, there are ſome perſonal and honorary; as earl-marſhal of England; ſee titles CONSTABLE, COURT of CHIVALRY; and others nominal, who derive their titles from the names of their families. *Lex Conſtitutionis*, p. 78. Their place is next to a marquis, and before a viſcount: and as in very ancient times, thoſe who were created counts or earls, were of the blood royal, our Britiſh monarchs to this day call them in all public writings, "Our moſt dear couſin:" they alſo originally did, and ſtill may, uſe the ſtyle of *nos*. See COUNT, PEERS, SHERIFF.

EARL, a townſhip of the American States, in Lancaſter county, Pennſylvania.

EARL-MARSHAL, *ſ.* He that has chief care of military ſolemnities:

The marching troops through Athens take their way;
The great *earl-marſhal* orders their array. *Dryden.*

EARL'DOM, *ſ.* The ſeigniory of an earl; the title and dignity of an earl.—The duke of Clarence having married the heir of the earl of Ulſter, and by her having all the *earldom* of Ulſter, carefully went about redreſſing evils. *Spenſer.*

When I am king, claim thou of me
The *earldom* of Hereford. *Shakeſpeare.*

EARLE (William Benſon), a gentleman of ſingular benevolence and philanthropy of mind, deſcended from an ancient family long ſettled at Newton-Toney in Wiltſhire. He was born at Grately in Hampſhire; but reſided long in the Cloſe, Saliſbury. Poſſeſſed of literary endowments of the higheſt order; well verſed in the whole circle of the belles lettres, but particularly bleſſed with a moſt exquiſite taſte for muſic, his time and talents ſeemed devoted to theſe engaging purſuits; yet, amidſt them, he forgot not the humble and lowly among men, but was ever relieving their neceſſities, and leſſening their wants. The following bequeſts will evince the generoſity and goodneſs of his heart. To the matrons of biſhop Seth Ward's college, in the Cloſe, Saliſbury, he bequeathed the ſum of two thouſand guineas; to St. George's hoſpital, Hyde-park-corner, to Hetherington's charity for the relief of the blind, to the Philanthropic ſociety, and to the fund for the relief of decayed muſicians, a contingent legacy of one thouſand guineas each; to the three hoſpitals eſtabliſhed at Wincheſter, Saliſbury, and Briſtol, one hundred guineas each; to the reſpective pariſhes of the Cloſe, St. Edmund, St. Thomas, and St. Martin, in Saliſbury, fifty guineas each; for different charitable purpoſes in the pariſh of Grately, Hants, the ſum of four hundred guineas; and to the poor cottagers in Grately, his tenants, the fee ſimple of their cottages; and to the pariſh of North Stoke, in Somerſetſhire, thirty guineas. As a man of literature, and a friend to the arts, he bequeathed to the royal ſociety two hundred gnineas; to the ſociety of antiquaries two hundred guineas; and to the preſident of the ſociety for the encouragement of arts, manufactures, and commerce, two hundred guineas, for the purchaſe of books for the public libraries of thoſe three reſpectable ſocieties; to the Bath agricultural ſociety one hundred guineas. Wiſhing to add a beauty to the many which now adorn one of the fineſt Gothic ſtructures in the world, he bequeathed the ſum of four hundred guineas for erecting a window of painted glaſs in the great weſt nave of Saliſbury cathedral, which has ſince been magnificently completed. To encourage the art he loved, and give a grateful teſtimony of his partiality to the Saliſbury concert, he has left an annual ſubſcription of five guineas for ten years, towards its ſupport; and a farther ſum of 150 guineas for the three next triennial muſical feſtivals at Saliſbury after his deceaſe. Beſides the above public legacies, he amply remembered his friends; and bequeathed many others, with a view to encourage merit, and to reward induſtry and goodneſs. He died at Saliſbury, on the 21ſt of April, 1796; and on the 30th his remains were privately interred in the pariſh-church of Newton Toney, near thoſe of his anceſtors.

EA'RLESS, *adj.* Without any ears:

Earleſs on high ſtood unabaſh'd Deſoe,
And Tutchin flagrant from the ſcourge below. *Pope.*

EAR'LINESS, *ſ.* Quickneſs of any action with reſpect to ſomething elſe: as, *earlineſs* in the morning, the act of riſing ſoon with reſpect to the ſun; *earlineſs* of growth,

growth, the act of growing up ſoon in compariſon with other things of the ſame kind.—The goodneſs of the crop is great gain, if the goodneſs anſwer the *earlineſs* of coming up. *Bacon.*

EARL'STON, or EARSILTON, a town of Scotland, in Berwickſhire, ſeated on the river Leader, thirty-five miles ſouth-eaſt of Edinburgh. It is the birth-place of the celebrated Thomas the Rhymer, whoſe real name was Thomas Lermont: the ruins of the little tower he poſſeſſed, ſtill remain at the weſt end of the town. A little below Earlſton, on a rocky bank overlooking the Leader, ſtands Cowdenknows, an ancient building, now ſomewhat modernized; and on the adjacent knolls may be ſeen the remains of its *broom*, ſo renowned in Scottiſh lore.

EAR'LY, *adj.* [æꝛ, Saxon, before.] Soon with reſpect to ſomething elſe: as, in the morning, with reſpect to the ſun; in time, with reſpect to creation; in the ſeaſon, in compariſon with other products.—Sickneſs is *early* old age: it teaches us diffidence in our earthly ſtate, and inſpires us with thoughts of a future. *Pope.*

I am a tainted wether of the flock,
Meeteſt for death: the weakeſt kind of fruit
Drops *earlieſt* to the ground, and ſo let me. *Shakeſpeare.*

EAR'LY, *adv.* Soon; betimes.—The princeſs makes her iſſue like herſelf, by inſtilling *early* into their minds religion, virtue, and honour. *Addiſon.*

None in more languages can ſhew
Thoſe arts, which you ſo *early* know. *Waller.*

"EARLY to bed, and EARLY to riſe,
Makes a man healthy, wealthy, and wiſe."

This proverbial diſtich is addreſſed to every claſs of indolent perſons; and eſpecially to thoſe nocturnal revellers, gameſters, and drunkards, who convert the night into day, and finally bring upon them mental imbecility, poverty, and diſeaſe.

"The EARLY bird catches the worm;" or, The cow that's firſt up gets the firſt of the dew. Or, "EARLY ſow, EARLY mow."—Theſe proverbs are ſo many admonitions to riſing early, and well-ſpending the day.

"It EARLY pricks that will be a thorn."—Spoken of the inclinations and tendencies of children which are ſoon to be diſcovered, and conſequently eaſy to be provided againſt, if attended with an earneſt, ſteady, and philanthropic, mind. The Latins ſay: *Protinus apparet, qui arbores frugiferæ futuræ.*

To EARN, *v. a.* [eaꝛnman, Sax.] To gain as the reward or wages of labour; or any performance.—Thoſe that have joined with their honour great perils, are leſs ſubject to envy; for men think that they *earn* their honours hardly. *Bacon.*—The great expence of the poor takes up almoſt all their *earnings*. *Locke.*—To obtain, as a conſequence of action:

To do the act, that might th' addition *earn*,
Not the world's maſs of vanity could make me. *Shakeſp.*

EARN, a river of Scotland, which riſes in Loch Earn, nd joins the Tay, a little below Perth.

EARNE, a lake of Ireland, in the county of Fermanagh, thirty miles in length. It is narrow in the middle; and in this part is an iſland on which ſtands Inniſkilling.

To EARNE, *v. n.* now YEARN; [from ȝýꝛnan, Sax.] To have a great longing; to feel great anxiety. *Spenſer.*

EAR'NEST, *adj.* [eoꝛnȝꝛe, Sax.] Ardent in any affection; warm; zealous; importunate.—He which prayeth in due ſort, is thereby made the more attentive to hear; and he which heareth, the more *earneſt* to pray. *Hooker.*—Intent; fixed; eager:

On that proſpect ſtrange
Their *earneſt* eyes they fix'd; imagining,
For one forbidden tree, a multitude
Now ris'n, to work them further woe or ſhame. *Milton.*

Serious; important. Some ſay in *earneſt*, not in *jeſt*.—They whom *earneſt* lets do often hinder from being partakers of the whole, have yet this the length of divine ſervice, opportunity for acceſs unto ſome reaſonable part thereof. *Hooker.*

EAR'NEST, *ſ.* Serioufneſs; a ſerious event, not a jeſt; reality; not a feigned appearance.—The main buſineſs and *earneſt* of the world is money, dominion, and power. *L'Eſtrange.*

Nor can I think that God, Creator wiſe!
Though threat'ning, will in *earneſt* ſo deſtroy
Us, his prime creatures. *Milton.*

[*Ernitz penge*, Dan. *arres*, Fr.] Pledge; handſel; firſt fruits; token of ſomething of the ſame kind in futurity.—The apoſtles term it the handſel or *earneſt* of that which is to come. *Hooker.*—It may be looked upon as a pledge and *earneſt* of quiet and tranquillity. *Smalridge.*

Which leader ſhall the doubtful vict'ry bleſs,
And give an *earneſt* of the war's ſucceſs. *Waller.*

EAR'NEST, *ſ.* in law, money paid in part of a larger ſum, or part of the goods delivered, on any contract, &c. which being done by way of earneſt, the property of the goods is abſolutely bound by it: and the buyer may recover the goods by action, as well as the vendor may the price of them. And by the ſtatute of frands, 29 Car. II. c. 3. no contract for ſale of goods, to the value of ten pounds or more, to be valid, unleſs ſuch earneſt is made or given.

EAR'NESTLY, *adv.* Warmly; affectionately; zealouſly; importunately; intenſely.—*Earneſtly* invoke the goodneſs and power of an all-merciful and almighty God. *Smalridge.*—Eagerly; deſirouſly:

My ſoul, more *earneſtly* releas'd
Will outſtrip her's; as bullets flown before,
A latter bullet may o'ertake, the powder being more.
Donne.

EAR'NESTNESS, *ſ.* Eagerneſs; warmth; vehemence; impetuoſity:

Marcus is over warm; his fond complaints
Have ſo much *earneſtneſs* and paſſion in them,
I hear him with a ſecret kind of horror,
And tremble at his vehemence. *Addiſon.*

Solemnity; zeal; ſerioufneſs.—There never was a charge maintained with ſuch a ſhew of gravity and *earneſtneſs*, which had a ſlighter foundation to ſupport it. *Atterbury.*—Solitude; care; intenſeneſs.—With overſtraining, and *earneſtneſs* of finiſhing their pieces, they often did them more harm than good. *Dryden.*

EARSH, *ſ.* [from *err*, to plough.] An arable field, from which the corn has been cut and carried, and the ſtubble only remains. See STUBBLE.

Fires oft are good on barren *earſhes* made,
With crackling flames to burn the ſtubble blade. *May.*

EAR'SHOT, *ſ.* Reach of the ear; ſpace within which words may be heard.—Gomer, ſtand you out of *earſhot*: I have ſomething to ſay to your wife in private. *Dryden.*

EARTH, *ſ.* [eoꝛꝺ, Sax.] Soil; terrene matter:

The ſmiling god is ſeen; while water, *earth*,
And air, atteſt his bounty. *Thomſon.*

The terraqueous globe; the world.—This ſolid globe we live upon is called the *earth*; which word, taken in a more limited ſenſe, ſignifies ſuch parts of this globe as are capable, being expoſed to the air, to give rooting and nouriſhment to plants, ſo that they may ſtand and grow in it. *Locke.*

Nought ſo vile that on the *earth* doth live,
But to the *earth* ſome ſpecial good doth give. *Shakeſp.*

Different modification of terrene matter: In this ſenſe it has a plural; as in the different genera of *earths*, viz. boles, clays, marls, others, &c.—*Earths* are opake, inſipid, and, when dried, friable, or conſiſting of parts eaſy to ſeparate, and ſoluble in water; not diſpoſed to burn, flame,

flame, or take fire. *Woodward.*—This world oppoſed to other ſcenes of exiſtence:

What are theſe,
So wither'd, and ſo wild in their attire,
That look not like th' inhabitants o' th' *earth*,
And yet are on't? *Shakeſpeare.*

The inhabitants of the earth.—The whole *earth* was of one language, *Gen.* xi. 1.—Country; diſtinct region:

In ten ſet battles have we driven back
Theſe heathen Saxons, and regain'd our *earth*,
As *earth* recovers from the ebbing tide. *Dryden.*

The act of turning up the ground in tillage. [from *ear*, to plow.]

Such land as ye break up for barley to ſow,
Two *earths*, at the leaſt, ere ye ſow it, beſtow. *Tuſſer.*

To EARTH, *v. a.* To hide in earth.—The fox is *earth-ed*; but I ſhall ſend my two terriers in after him. *Dryden.*—To cover with earth.—*Earth* up with freſh mould the roots of thoſe auriculas which the froſt may have uncovered. *Evelyn.*

To EARTH, *v. a.* To retire under ground:

Hence foxes *earth'd*, and wolves abhorr'd the day,
And hungry churls enſnar'd the nightly prey. *Tickel.*

For the natural hiſtory and habitudes of the different earths, ores, ſtones, and other ſubſtances, of which our globe appears to be compounded, *as far as at preſent known*, ſee the articles CHEMISTRY and MINERALOGY.

For the magnitude, motion, figure, denſity, magnetiſm, ſeaſons, and other phenomena, of the Earth, conſidered as a planet; with the theories of Deſcartes, Burnet, Steno, Woodward, Whiſton, and Buffon, as to its primordial and preſent ſtate; ſee the article ASTRONOMY, vol. ii. p. 361–370.

But the "Theories of the Earth," erected by the above-mentioned able philoſophers, having, in many reſpects, been found defective, later writers have endeavoured to ſatisfy inquiſitive minds on this important ſubject, by propoſing ſeveral new hypotheſes, ſupported by great depth of reſearch, and equal learning and ability. The firſt who ventured on this devious ground, is Dr. James Hutton, who publiſhed his New Theory of the Earth, in the firſt volume of the Philoſophical Tranſactions of the Royal Society of Edinburgh. This theory ſoon attracted the notice of other ingenious men, and became a ſubject of the moſt intereſting inveſtigation. Dr. Hutton's ſyſtem may be compriſed under four general propoſitions: 1ſt. That our preſent continents, rocks, and ſtrata, have been formed by ſubſidence, under the waters of a former ocean, from the decay of a former earth, carried down to the ſea by land-floods, torrents, and tempeſts. 2d. That the ſtrata formed at the bottom of the ocean are brought into fuſion, and conſolidated, by ſubterraneous fire. 3d. That the ſtrata, thus melted and conſolidated under the waters of the ocean, are forced up by ſubterraneous fire, to form new continents, mountains, and iſlands. 4th. That the three foregoing operations of nature, viz. the waſte of the old land, the formation of new under the ocean, and the elevation of the ſtrata thus forming under the waters for future dry land, are a progreſſive work of nature, which always did, and always will, go on forming world after world in perpetual ſucceſſion.

The firſt who has ventured to combat this theory, is the learned and ingenious M. de Luc. This able philoſopher has alſo propoſed a theory of his own; nearly the ſame in principle with that of Dr. Hutton, but extremely different in its mode of operation. Both the theories have been cloſely inveſtigated and compared, in letters from M. de Luc to Dr. Hutton, publiſhed in the Monthly Review, and commencing June 10, 1790. And as this correſpondence develops a conſiderable portion of new and intereſting information in geology, we think it right to preſent our readers with the ſubſtance of it, in M. de Luc's own words, who addreſſes Dr. Hutton as follows: "We ſet out, on both ſides, from this indubitable fact; that our *continents* have been once the *bottom of the ſea*: which is the grand phenomenon to be explained in a *Theory of the Earth*. Yours is compoſed of three fundamental hypotheſes: 1ſt. That no *ſolid ſtratum* of the earth can have been formed, but by its ſubſtance having been firſt *melted*, and then cooled. 2d. That the ſame *heat* by which our *ſtrata* have been *melted*, has raiſed them above the level of the *ſea*. 3d. That new *continents*, ſimilar to ours, are now forming at the bottom of the ocean, of the materials of the preſent ones, as theſe have been formed of the materials of former *continents*; and that the *continents* now forming, will riſe alſo, when ours ſhall be entirely *waſted*.

1ſt HYP. *No ſolid ſtratum of the earth, can have been formed, but by its ſubſtance having been firſt melted, and then cooled.*—The preſent diſquiſition having *ſolids* for its object, I muſt premiſe what I underſtand by *ſolidity*. I define a *ſolid*, a body whoſe conſtituent parts have been brought, by whatſoever cauſe, into ſo cloſe a *contact*, that they remain united by *coheſion*; the cauſe of which is not our object. Two principal cauſes may bring incoherent particles into *cloſe contact*; either *fuſion*, or the *medium* of a *liquid*; but the final effect is the ſame; the particles *adhere* to one another by *coheſion*. You mention both theſe cauſes; but you fix excluſively on the firſt. Now, *ſolids* formed by theſe two different mediate cauſes, muſt have different characters; and from theſe we may firſt determine which of the two cauſes has *conſolidated* our *ſtrata*. The diſtinctive characters of *ſolids* produced by *fuſion* are, that ſuch *ſolids* may be *melted* again by mere *heat*; and that, after cooling, they ſhall be the ſame, or nearly ſo, as before: but of all the *ſolid ſtrata* of our *continents*, *lavas* only are of that nature; conſequently, none of the other *ſtrata* have been *melted*. The ſame concluſion may be drawn from a more remote theory. *Fuſion* is an operation of *fire*, by which a *liquid* is produced of ſubſtances which, before, were not in that ſtate: but the proceſs of *liquefaction* is very different, when ſubſtances have been already *melted*, from what it is when they have not; and from that difference, we may alſo judge your hypotheſis, by premiſing ſome principles. A *liquid* is a ſubſtance compoſed of homogeneous particles, either *ſimple* or *mixed*; which particles are in a certain *combination* with *fire*, from which reſult theſe two characteriſtic properties; that the conſtituent particles of ſuch ſubſtances have but very little *adherence* together; but that, however, they have a *tendency* towards one another at a ſenſible *diſtance*. It is from the firſt of theſe properties, that particles of *liquids* ſubmit ſo readily to the law of *gravitation* in their maſs itſelf, ſo that their ſurface is always horizontal; and from the latter, that the ſmall maſſes of *liquids* tend to aſſume a *ſpherical* form. Now, from theſe properties alſo it is, that a *liquid conſolidates* by a certain degree of cooling; and that the *ſolid* produced has a peculiar character. For, while the ſubſtance was *liquid*, its conſtituent particles, from their *tendency* to one another, were come to the cloſeſt poſſible *contact*; without yet *adhering*, becauſe of their *combination* with *fire*: but when that *combination* ceaſes by a ſufficient degree of cooling, their *adheſion* inſtantly takes place.

Let us now examine, from theſe principles, what muſt be the proceſſes of *fuſion*, in the two claſſes of *ſolids* above diſtinguiſhed. Fragments or powders of ſubſtances which have been already *melted*, are immediately *liquefied* again by a ſufficient degree of *heat*; their conſtituent particles having been brought before to homogeneity and to the faculty of *combining* immediately with *fire*: from which, when they cool, they produce *ſolids* ſimilar to thoſe which have been *melted*: but the caſe is very different with *ſolids* which are known to be produced by other cauſes than *fuſion*; as for inſtance, *mortar*, *concretions* made by ſome *waters*, the *ſolid* parts of animals and *vegetables*, beſides many others controverted between us. *Coheſion*, or its modification called *affinity*, is alſo the immediate cauſe

cauſe of the *conſolidation* of thoſe bodies; but not one of them can be *liquefied* by *fire*; without undergoing great alterations in its conſtituent parts. If ſuch a *ſolid* is compoſed of *heterogeneous* particles, theſe muſt firſt combine together and with other particles, ſo as to become *homogeneous*: they muſt alſo be reduced to ſuch a ſtate, as to combine with *fire* in the manner which produces *liquidity*: and it is known by experience, that theſe *combinations* are produced by more or leſs alterations in the very ingredients of the ſubſtance; either by the loſs of ſome of theſe ingredients, or by the addition of new ones, or by both. From which cauſes, the new *ſolid* afterwards produced by cooling, bears hardly any reſemblance to the *ſolid* melted, and frequently none at all. Now, ſuch is the caſe of all our *ſtrata*, (*volcanic products* excepted;) and this, as I have ſaid before, is an immediate and evident proof, that they have not been *conſolidated* by *fuſion*.

I might confine myſelf to that general demonſtration; but I will examine ſome of the facts you allege for the ſupport of your hypotheſis. You ſay, p. 237, "I ſhall only mention one ſpecimen, which muſt appear more *deciſive of the queſtion* . . . . In this ſpecimen, *petro-ſilex*, *pyrites*, and *cinnabar*, are ſo mixed together and cryſtallized *upon each other* . . . . that it is impoſſible to conceive any one of thoſe bodies to have had its *fluidity* and *concretion* from a cauſe which had not affected the other two." This is, indeed, a *deciſive* fact, but *againſt you*: for, if that aggregation of various ſubſtances had been *melted*, they would not have remained as they are; you may try it. You ſay alſo, p. 232, "It may be aſſerted, that no *ſiliceous* body, having the hardneſs of *flint*, nor any *cryſtallization* of that ſubſtance, has been formed *except* by *fire*." What may be *aſſerted* in that reſpect, is, that no known operation of *fire* has ever produced, either *flint*, or any *cryſtallization* of that ſubſtance. *Flint*, and other hard ſubſtances of that kind, appear to be your great object; therefore I ſhall confine myſelf to them. You ſay, that the actual form in which *flinty maſſes* are found, demonſtrates that they have been *introduced* among the *ſtrata* in a *fluid* ſtate, by *injection* from *ſome other place*:" and you "refer thoſe who would enquire *more minutely* into the ſubject, to examine the *chalk countries* of France and England." If you have examined thoſe countries with as much attention as I have done, we may ſpeak from recollection. Suppoſe then that we have before us ſome of the high *chalk cliffs* along the Thames, or on the ſea coaſt. We ſee there a number of *ſtrata*, as diſtinct and regular as the rows of cut ſtones in buildings. Each of thoſe *ſtrata*, from the loweſt to the higheſt, is interſperſed, in its maſſes, with *flints* of all ſizes. Thoſe, now diſtinct bodies, are not in the *chalk*, as *knots* in the wood, round which the fibres are bent; or as *nodes* in *ſtalactites*, which alſo have cauſed inflections in the coatings of the dominant ſubſtance; they lie in the *chalk*, as would equal and ſimilar pieces of the *chalk* itſelf, without any alteration or diſturbance in the *chalk* round them. Now, ſir, was each of thoſe *ſtrata*, from the loweſt to the uppermoſt, *injected* while it was forming? If ſo, the *melted flint* ought to have come from the water above; but this is impoſſible. Or did the *injection* continue from below? But why were not ſuch *injections* ſtopped in the lower *ſtrata*, inſtead of being ſo equally diſſeminated in them all? Where did the *chalk* retire that was diſplaced by theſe new maſſes? Where are the traces of their paſſage through the *chalk*? What was the *power* that *ſhot* thoſe maſſes through ſuch a reſiſting *medium*, in which, as in all others, the reſiſtance would have been as the ſquares of the velocities; Why was that *power* intermittent? Theſe are queſtions, to which I cannot find any anſwer for you. After this external inſpection of *flints* diſſeminated in *chalk ſtrata*, let us come to ſome of their particulars. In breaking many of them, we find them hollow, and filled with unaltered *chalk*: many round pieces have only a *flint-ſhell*, and the inſide is *chalk*. How can it be conceived, that a *melted matter* has been thrown up in *bubbles* through the *chalk*, and filled with it? Great quantities of *marine bodies* are found in thoſe *ſtrata*, ſome of which (the *echini* of various ſpecies) are like *egg-ſhells*, both in ſhape and fragility, and they have only one or two very ſmall apertures. Theſe *ſhells* are moſtly filled with *chalk*: but a great many, which, by their external appearance and their ſituation in the *chalk*, are abſolutely ſimilar to the others, are filled with *flint*. How could you conceive, that *injections* of *melted flint* made through the *ſtrata* have met exactly, not only thoſe *ſhells*, but their ſmall aperture, in whatever ſituation it happened to be in the *chalk*? And how could the *chalk* that was in before, come out by the ſame ſmall hole through which the *melted flint* was introduced? I cannot doubt, that if you had examined, as I have done, theſe and a great many other ſtriking facts, you would have alſo thought, as I do, that *flint* is only a particular modification of the *chalk* itſelf. The manner, indeed, is unknown; but we know of no particular proceſs that can produce *flint*; and every circumſtance belonging to its maſſes in the *chalk*, leads to that general opinion alone.

You quote, alſo, as a proof of your hypotheſis, *foſſil wood*, found in looſe *ſtrata*, impregnated with hard ſubſtances, as *ſpar*, *pyrites*, *flint*, and *agate*; and the reſult of your obſervations on that *foſſil* is, p. 234, "that however little of the *wood* is left unpenetrated, the diviſion is always diſtinct between the *injected* part and that which is not penetrated by the *fluid flint*:" but, again, how can you conceive, that ſuch *denſe* and *hot* fluid would be *injected* into a cloſe ſubſtance compoſed of *combuſtible fibres*? I have myſelf found in many ſorts of *ſtrata*; petrified pieces of *wood* of all the ſorts you deſcribe, and of many others; and they contradict your hypotheſis by every one of their various appearances, a few of which I ſhall mention. In *ſtrata* of looſe *ſand*, I have found pieces of *wood*, ſo hard, as to ſtrike fire with ſteel, though impregnated only with fine concreted *ſand*; and the ſame *ſtrata* contain alſo *concretions* of mere *ſand*, in various ſhapes, very ſimilar to thoſe of *flints*. In *clayey* ſtrata I have found pieces of *wood*, hardened by a penetration of *clay*, that was afterwards *concreted*: they are generally involved by a *concretion* of the ſame ſubſtance; and ſimilar *concretions* are found in the ſame *ſtrata*, either round other extraneous bodies, or in homogeneous maſſes, either ſolid, or cracked, and filled with *ſpar*. In *ſtrata*, where proceſſes of *agatization* have taken place, I have found pieces of *wood* penetrated with *agate*; and in one of theſe pieces the *agatization* has been ſo gradual, that ſome of the fibres may be ſcraped with the nail, and are ſtill *combuſtible*, though between other fibres fixed and hardened by imperceptible *agate*. I did not find any ſeparate maſſes of *agate* in thoſe ſtrata, as ſeparate maſſes of *flint* are found in the *chalk* ones; but all the extraneous bodies were either impregnated or filled with that ſubſtance. Many *ſea-ſhells* of the ſcrew kind are thus circumſtanced: ſome are involved by a concretion of the ſurrounding ſubſtance, ſome are looſe in it. If theſe *ſhells* are put into an acid, they are diſſolved, and a *nucleus* only remains, which ſhews all the ſhades of *agatization*. In the wideſt revolutions of the *ſhell*, where the ſubſtance of the *ſtratum* had been firſt admitted, this has remained opaque; but it is hardened, and has a gloſſy ſurface. Farther in, the *agate* is ſtill mixed with the ſubſtance of the *ſtratum*; but it begins to have ſome tranſparency; and in the deepeſt and narroweſt revolutions, the *agate* is almoſt as tranſparent as glaſs. Now, if a maſs of *melted agate* had been *injected* in thoſe *ſhells*, the appearance would have been abſolutely reverſed; the *opaque* part would have been in the bottom of the *ſhells*, where the ſand would have been forced; and the pure *agate* would be in the outward revolutions.

You mention, p. 233, the *pudding-ſtones of England*, which, you ſay, you *have not ſeen in their natural ſituation*: but, ſir, this is only a particular phenomenon belonging to a numerous claſs, conſiſting of *concretions* of large and diſtinct materials mixed with ſand, formed in looſe *ſtrata*

of

of the ſame ſort. You look upon ſuch *concretions* as being inexplicable by any other cauſe than *fire*. "If it is, (you ſay, p. 230,) by means of *heat* and *fuſion* that the looſe and porous ſtructure of *ſtrata* ſhall be ſuppoſed to have been *conſolidated*, then every difficulty . . . is at once removed. The looſe and *diſcontinuous* body of a *ſtratum* may be *cloſed* by means of *ſoftneſs* and *compreſſion*." I have found a great variety of thoſe groups *in their natural ſituation*, and among theſe the *pudding-ſtones* you mention; and I will deſcribe their general characters. The groups properly called *pudding-ſtone* by lapidaries, are found in looſe gravelly *ſtrata* of *pebbles*, ſuch as compoſe them; and they only differ from the reſt of the *ſtratum*, by the *ſand* being *concreted* in that particular maſs. Similar *concretions*, but not worth the attention of lapidaries, are found in the *ſtrata* of the common flinty *gravel*; and neither in theſe, nor in the former, is there any ſign of *compreſſion* upon *ſoft* materials: the *gravel* of which they are formed has its natural ſhape. The general cauſe of ſuch diſtinct groups in looſe *ſtrata*, is the *conſolidation* of the *ſand* between larger materials; which *ſand*, from the beginning of the *ſtratum*, filled up the interſtices between thoſe materials. I have ſeen, in various countries, hills formed of looſe *ſand*, in which were *ſtrata* almoſt entirely compoſed of *ſea ſhells*, mixed with *ſand*; and in theſe *ſtrata* I have found *pudding-ſtones* formed of thoſe *ſhells* inſtead of *gravel*: the *ſand* between them was concreted. In other *ſand-ſtrata*, where *concretions* have been only produced between or round ſcattered *ſhells*, I have found many ſuch groups, in which the *ſhells* ſtill retained their native colour. Laſtly, I have ſeen, in *ſtrata* of *gravel* mixed with *ſhells*, *pudding-ſtone* containing theſe two ſorts of bodies; and the *ſhells* alſo had their native colours. All theſe facts are ſo contrary to ſuppoſitions of *heat*, *fuſion*, and *ſoftneſs*, that I am ſure you would never have formed your hypotheſis, had you had more opportunities of ſtudying, in *their natural poſition*, the ſpecimens you have in your cabinet. The *ſea ſhells*, mentioned in many of the above examples, lead me to a more general objection againſt your hypotheſis. It would be ſufficient to examine thoſe bodies, to be convinced, that the *concretions* in which they are found did not undergo a *melting-heat*; but, moreover, how could you conceive, that the *animals* themſelves, of which theſe are the *relicts*, could have lived upon theſe very *ſtrata*, which you ſuppoſe to have been ſucceſſively *conſolidated* by *fuſion*? Here ends every appearance of poſſibility: and I might have confined myſelf to this ſingle objection, had I not thought it more convenient, to follow all the arguments you have adduced in favour of your own hypotheſis.

Since the ſtrata of our *continents* have not been *conſolidated* by *fire*, it muſt be by ſome proceſs of *water*; for you agree that their *conſolidation* muſt have been the effect of one of thoſe two cauſes: but you object againſt the laſt, and I muſt now examine your objections. We have ſeen that it is ſufficient for the *conſolidation of looſe* materials, that any vehicle can help minute particles to inſert themſelves between larger ones, ſo as to multiply the points of cloſe *contact* in the maſs; and *water* is fit for that purpoſe. Againſt this you allege, p. 227, firſt, the difficulty of finding *conſolidating* matters; and that alſo, of explaining, "whence came the matter with which the numberleſs *cavities* in thoſe maſſes were to be filled." I ſhall anſwer to theſe difficulties by a fact. If we take proper *lime* and *ſand*, we produce *mortar*: if we mix it with *ſtones*, we form a *wall*: if this be built in a place that ſhall be afterwards covered with *water*, it will in time *conſolidate*, not only as well as in the air, but better. Now, ſir, if your firſt objection, that of finding *conſolidating matters*, relates to *lime-ſtone*, *ſand-ſtone*, or other homogeneous *ſolid ſtrata*, I anſwer, that thoſe *matters* were originally in the *ſtrata* themſelves, as they are in *mortar*; and if you ſpeak of *ſtrata* compoſed of diſtinct large materials, with other ſubſtances between them, as *ſtrata* of *granite*, *pudding-ſtone*, or of ſome broken hard bodies now conſolidated together, theſe *ſtrata* have been *conſolidated* as walls, becauſe of the intervals between the large materials being filled with other ſubſtances which could *conſolidate*. Here, ſir, there is a circumſtance which is again deciſive between your theory and mine. In yours, where *fuſion* is to be the *conſolidating* cauſe, it is impoſſible to conceive, that *ſtrata* of *lime-ſtone* could be found upon *looſe marle*; or *ſand ſtone* and *petro-ſilex*, upon *looſe ſand*; which, however, is common: for, how could the uppermoſt *ſtrata* be *melted*, while thoſe under them remained unaltered? but that fact is eaſily explained in my theory; for, as improper *mortar* would not *conſolidate* in *water*, ſo all our *ſtrata* which did not contain proper particles for their *conſolidation* in the bottom of the ſea, remain *looſe*, either wholly, or in part.

You ſay again, p. 227, "Without ſome power by which *water* . . . . ſhould be ſeparated . . . . it is inconceivable how thoſe maſſes (our *ſtrata*) ſhould be abſolutely *conſolidated* without a particle of *fluid water* in their compoſition." You are miſtaken, ſir; the moſt part of our *ſtrata* are ſtill capable of imbibing *water*, in the ſame manner as they contained it when they were *conſolidated*; as does *mortar*, either *conſolidated* in water or in the air: and we have in the *ſtalactites*, and in *concretions* made in *water*, inſtances of more compact bodies *conſolidated* in that manner. But another of your objections will bring us to a diſquiſition of greater importance: it is at p. 228, where you ſay, "If *water* has been the *menſtruum* by which the *conſolidating matter* was introduced into the interſtices of *ſtrata*, maſſes of thoſe bodies could only be found *conſolidated* with ſuch ſubſtances as *water* is capable of diſſolving." This argument is again contradicted by *mortar* and *plaſter*; which, though *conſolidated* by the medium of *water*, are not *ſoluble* in it: but I ſhall now take a larger field, and maintain, not only the *precipitation* of *conſolidating* ſubſtances, but that of the whole of our *ſtrata* themſelves; and, firſt, of what *water* do you mean to ſpeak: is it *diſtilled water*, *rain-water*, or any particular *ſpring-water*? Here you have already ſome ſorts of *waters*, different in their faculty of *diſſolving*: but, in general, what are all our *menſtrua*, if not *water* impregnated with ſuch ſubſtances as make it capable of *diſſolving* certain other ſubſtances? and how ſhort is our knowledge of the power of nature, in reſpect of the compoſition of *menſtrua*, by previous ſolutions in that primary *liquid*, which is common to every *menſtruum*?

To prove to you the neceſſity of having recourſe to *precipitation* for the explanation of our *ſtrata*, I ſhall begin by pointing out the chaſm you have left in your theory, by too ſuperficial an examination of our continents. They are entirely formed of *ſtrata*: conſequently that ſort of compoſition muſt have a common general origin; and to diſcover this, our attention muſt be firſt fixed upon the lowermoſt of theſe *ſtrata*. However, you ſay, p. 256, "The nature of *granite* is too intricate a ſubject to be conſidered where we have only to prove the *fuſion* of ſubſtances from the *evident marks* which are to be obſerved in a body." This is not applicable to *granite*, which ſurely bears no *mark* of *fuſion*: and, in the mean time, it is the opinion of the moſt informed naturaliſts, that *granite*, or ſome other ſuch hard rock, forms the lowermoſt *ſtrata* of our continents. Perhaps that claſs of ſtrata has the more embarraſſed you, becauſe of a very important circumſtance, viz. that thoſe lowermoſt *ſtrata* contain no *relicts* of *marine animals*: but immediately above the *ſtrata* of *granite*, there is an immenſe maſs of other *ſtrata*, alſo without *marine bodies*: theſe are formed of *grey rock*, intermixed with the ſhivering *ſtrata* of *ſchiſtus*. What then became of the *animals* of a former *ſea*, during the accumulation of thoſe ſubſtances in their future abode? Whence came the materials of thoſe two *primary* ſets of diſtinct *ſtrata*, ſo generally ſpread at the bottom of the ancient ocean? Why did their, ſo different, ſubſtances, come at diſtinct periods? Where was the fire kindled, that *conſolidated* them, before the exiſtence of the *ſtrata* accumulated

lated over them? Immediately after thoſe two *primary* ſets of *ſtrata*, we find, all over our continents, *ſtrata* formed of *calcareous* ſubſtances. With theſe you do not appear embarraſſed: you think it ſo certain that they were formed from the *relicts* of *ſea animals*, that you lay this down as a fact not neceſſary to be proved: but, ſir, are thoſe pretended *animal relicts* the accumulated product of that ſucceſſion of changes of *ſea* into *land*, and *land* into *ſea*, in which conſiſts the peculiarity of your hypotheſis? or, have all theſe ſubſtances been produced in that *ſea* which has immediately preceded the preſent? I ſhall anſwer, 1ſt. That we ſee no pure *calcareous* ſubſtance migrating from our *continents* toward the *ſea*, to form there *calcareous ſtrata* ſimilar to ours; and that, conſequently, ſuch a ſuppoſition would be gratuitous. 2d. That the general idea, of a ſeparate migration from the land of different unmixed materials, keeping again ſeparate in the *ſea*, though accumulating upon one another in diſtinct *ſtrata*, is abſolutely chimerical. It would at firſt appear leſs improbable, that the whole of our *calcareous ſtrata* had been produced in the former *ſea*: however, this alſo is contrary to all phenomena of that claſs. 1ſt. Why are thoſe pretended *relicts* of *ſea animals* depoſited in ſo many diſtinct *ſtrata*, inſtead of forming only one maſs? 2d. Why do we find as great accumulations of *marine bodies*, in *ſtrata not calcareous*, as in the *calcareous* ones? 3d. How were the *calcareous ſtrata* accumulated all over the bottom of the former *ſea*, unmixed with any other ſubſtance: while the *land* is ſuppoſed to have furniſhed, *at the ſame time*, the materials of the other ſorts of *ſtrata* accumulated *over* thoſe? Theſe remarks are only general ideas, which I offer to your meditation; and I am ſure, that when you come to examine attentively ſome of the parts of our *continents* which exhibit ſucceſſive and diſtinct claſſes of *ſtrata*, you will, yourſelf, be glad to find, in the following pages, a twilight ſpread on that grand phenomenon, by the theory of *diſſolution* and *precipitation*, which at firſt appeared to you ſo abſurd.

It is a very common fact, that *water* may depoſite *concrete* ſubſtances, which afterward it cannot *diſſolve*. This, principally, is the effect either of the *emiſſion* of ſome *elaſtic fluid*, whoſe ingredients, previouſly *diſſolved* by *water*, had enabled it to *diſſolve* the ſubſtances now precipitated; or of *water*, at the time of that *precipitation*, diſſolving ſome other ſubſtance. Thoſe are operations performed in many ways, ſpontaneouſly upon our continents, and artificial in our laboratories: and by analogy to thoſe known operations, I ſhall undertake to ſhew, that the whole of our *ſtrata* has been produced by *precipitation*. We clearly perceive in the *ſucceſſion* of our *ſtrata* a variety of diſtinct operations, nearly the ſame, in every reſpect, all over our continents; which, in the firſt place, muſt have been performed during PERIODS diſtinct from each other, not only in point of time, but by eſſential differences in the productive cauſes; and which alſo muſt have begun at a diſtinct EPOCHA of the exiſtence of our globe. Theſe are undoubtedly in the number of the moſt important circumſtances to be explained in a *Theory of the Earth*; and, in the mean time, they point out *precipitation*, not merely as a vague cauſe, but as the cauſe which affords the cleareſt idea of a beginning, and is the moſt ſuſceptible of modifications adequate to that variety of diſtinct effects. We are ſtill, no doubt, too ignorant in natural hiſtory and chemiſtry, to form a fixed and preciſe theory of thoſe operations; but we can trace their out-lines; and this I ſhall attempt. In this ſketch of the hiſtory of the *earth*, prior to its preſent ſtate, I fix upon a very remote, but diſtinct, EPOCHA, from which I ſhall come down to the complete formation of our *continents*. At that time, *light* did not exiſt: but, that ſubſtance excepted, our globe contained all the ingredients from which were to reſult its preſent ſtate, and that of its *atmoſphere*. In the number of thoſe ingredients, were the conſtituent particles of *water*, and another ſubſtance, which, with *light*, forms *fire*. No *liquid* exiſted in that ſtate of the *earth*, becauſe *fire*, which is a neceſſary part of their compoſition, did not exiſt. This is a moſt material point, not only in the hiſtory of the *earth*, but in natural philoſophy; and, from the general principles of that ſcience, together with indubitable facts, I have ſhewn, (in my work, *Idées ſur la Meteorologie*,) that *light* is one of the conſtituent parts of *fire*, as certainly, as this is a conſtituent part of *water*, of *aqueous vapour*, of *aëriform fluids*, and of numberleſs other *elaſtic* and *non-elaſtic* ſubſtances. To theſe propoſitions I here refer; and, from that determined ſtate, in which our globe was once, I propoſe to trace the operations which have produced our *continents*.

FIRST PERIOD.—A great event changed that primordial ſtate of the *earth*, which, elſe, had exiſted everlaſtingly; this was the addition of *light* to the confuſed maſs of its ingredients; and the following were the immediate conſequences of that addition: 1ſt. From *light*, united to one of the other ſubſtances, *fire* was compoſed, and the various effects of *heat* began. 2d. The moſt immediate effect of the exiſtence of *fire*, was its union with the conſtituent particles of *water*: from which that univerſal *liquid* was produced. 3d. From fire alſo, and from ſeparate *light*, the production of all the *atmoſpherical fluids* took place in determined circumſtances. 4th. *Water* diſſolved ſucceſſively a variety of ſubſtances; being unable to perform ſome of thoſe *diſſolutions* by antecedent ones. 5th. A number of other ſubſtances, ſome of a difficult ſolution, ſome inſoluble in that firſt ſtate of the liquid, ſubſided in it, and promiſcuouſly formed the *unliquefied* part of our globe. 6th. When *ſoftneſs* had been thus produced in the maſs of our globe, it aſſumed, by gravity and by its rotatory motion, the form that it now wears.

SECOND PERIOD.—An *original* LIQUID being thus compoſed, it began to *diſſolve* ſome of the ſubſtances which, at firſt, had ſubſided; and that *diſſolution*, together with the emiſſion of various *elaſtic fluids*, occaſioned, in the greateſt part of the LIQUID, the ſimultaneous *precipitations* of two ſorts of cryſtallized ſubſtances, of *mica* and of other *powders*, which, altogether, compoſe *granite*. In other parts of the LIQUID, different ſubſtances, partaking of the nature of the former, were promiſcuouſly *precipitated*; and, laſtly, in ſome parts, a pure *quartzeous powder*. That firſt general *precipitation*, and all the following ones of other kinds, were intermittent; becauſe of the ſlowneſs of the communication of the *precipitating* ſubſtances from the bottom to higher parts of the LIQUID, and of the ſlowneſs alſo of the emiſſion of *elaſtic fluids* from its ſurface downward. To thoſe intermiſſions were owing diſtinct *ſtrata*, formed in the courſe of each diſtinct *precipitation*. A mixture of proper particles, both in ſize and in form, *precipitated* together in a liquid, is an adequate cauſe to produce the multitude of points of *cloſe contact*, neceſſary to *conſolidate* a maſs by *cohęſion*: and that circumſtance having exiſted in a high degree in thoſe firſt *ſtrata*, they formed a very hard and thick *cruſt* at the bottom of the LIQUID all over the globe. The ſame cauſe, but with different combinations, produced various degrees of *ſolidity* in moſt parts of the ſubſequent *ſtrata*. During that PERIOD, the LIQUID emitted a great abundance of *aqueous vapour* and of other *elaſtic fluids*, which formed a firſt *atmoſphere* round the globe.

THIRD PERIOD.—The formation of *granite* and of other *quartzeous ſtrata*, was ſucceeded in the LIQUID, by very different *precipitations*. To this PERIOD belongs, eſpecially, the *grey rock* intermixed with the ſhivering *ſtrata* called *ſchiſtus*, which, all over our continents, appears as having formed immenſe *ſtrata* over the *granite*. At ſome part of this PERIOD, a great effect was produced, which, by its repetitions in the following PERIODS, has been the immediate cauſe of all the revolutions undergone by our *ſtrata*; and the following was its firſt cauſe. After the *ſolid cruſt* had been produced on our globe, the looſe ſubſtances on which it was laid, having continued to ſhrink in many parts, by gravity, and by a more intimate combination

bination between themſelves, vaſt cavities were formed under that *cruſt*. The firſt great event depending on that cauſe, fixes the end of this PERIOD: this was the ſinking at once of a great part of the *cruſt*, and the accumulation of the LIQUID over that ſunken part. Thus *dry lands* of various ſizes were produced, on which *vegetation* began.

FOURTH PERIOD.—It is only from that firſt revolution in the bottom of the LIQUID, that we may ſeparately conſider our *continents* as being then the *bed of the ſea*. That great alteration in the combinations of cauſes, both in the now broken bottom of the LIQUID, and in the LIQUID itſelf, together with an increaſe of *light*, prepared new events. The *bed of the ſea*, though formed of ſunken *ſtrata*, was not yet ſo broken, nor thoſe *ſtrata* ſo diſlocated, as they became afterward, from a continued *retreat* of the looſe ſubſtances under them: but they were, in many parts, covered with fragments of their ſubſtances, which, mixed afterward with various powders, either gathered or precipitated, were conſolidated in diſtinct *ſtrata*. To this *period* I aſcribe the beginning of the *phoſphoric* decompoſition by which our ſun emits *light*, and from which our globe then began to receive a conſtant ſupply of that ſubſtance.

FIFTH PERIOD.—Many great events belong to this part of the exiſtence of our globe; the firſt of which is, that the *ſea* began to be peopled with *animals*. They had not exiſted before; for we find none of their *relicts* in the former *ſtrata*, and their firſt appearance is in ſome *ſtrata* of *ſchiſtus*, which were ſtill forming: but a little after, probably by a new and conſtant ſupply of *light*, the LIQUID was diſpoſed to the diſtinct *precipitation* of *calcareous* ſubſtances, and all the former *precipitations* were ſtopped. Immenſe *calcareous ſtrata*, of various ſorts, were then formed all over the bottom of the LIQUID, by which the *primary ſtrata* were covered. In ſome of theſe *ſecondary ſtrata*, either in the ſame ſets, or in different parts of the *ſea*, a great quantity of *relicts* of *ſea animals* were buried; but in many other *ſtrata* of the ſame kind, even in the ſame ſets, there were few or none depoſited. The ſame difference, reſpecting the *exuviæ* of *ſea animals*, happened in ſome of the following *ſtrata*: ſome have none; and ſome, in which no *calcareous* ſubſtance was depoſited, excepting thoſe *exuviæ* themſelves, contain a prodigious quantity of them. Among the *ſea animals*, whoſe *relicts* are depoſited in thoſe *calcareous ſtrata*, were many ſpecies which diſappeared when that kind of *precipitation* was at an end. During that diſtinct *precipitation* a new ſort of revolution began in the bottom of the *ſea*, by *volcanic eruptions*: and many *volcanic cones* were ſurrounded, as *lavas* covered by *calcareous ſtrata*. Towards the end of this PERIOD, other great revolutions of the firſt claſs took place, by partial *falls* of the bottom of the ſea, in its whole extent, owing to the continued retreat of the looſe materials under the ſolid *ſtrata*. In thoſe *falls*, ſome of the deeply broken *ſtrata* being turned up, in falling more on one ſide than on the other, and ſome parts of them being prevented from falling, by the reſiſtance of *concreted* ſubſtances under them, vaſt *ridges* of different forms were produced on the ſurface of our future *continents*. To this only it is owing, that the lowermoſt *ſtrata* of our *land* happen to be under our inſpection: we ſee them clearly turned up in the center of our great ridges of mountains; and, directed by that immediate information, we diſcern them in ſmaller ridges, and in their fragments ſcattered over many parts of the uppermoſt *ſtrata*. In thoſe revolutions, alſo, many *iſlands* which had remained up in the third PERIOD, and on which *vegetation* had produced great accumulations of *peat*, ſunk for the firſt time, and were afterward covered with other kinds of *ſtrata*. At that time, however, the bed of the *ſea* was the only theatre of revolutions; a great maſs of *land* remained, which had not yielded to the *retreat* of the looſe ſubſtances under it.

SIXTH PERIOD.—Another great alteration happened now in the *ſea*. Not only the *precipitation* which had produced *ſolid calcareous ſtrata* ended in moſt parts of the LIQUID; but this was rendered capable, perhaps by the *volcanic eruptions* continuing with violence, of *diſſolving* many *calcareous ſtrata* of the *chalk* kind, of which remains only the *flinty gravel* found in ſo many parts of our continents. The origin of that *gravel* is manifeſted by the ſame *marine bodies* which exiſt in our *chalk ſtrata*, and ſometimes by *chalk* itſelf being found in its maſſes. Many ſorts of *ſtrata* belong to this PERIOD; the firſt of which proceeded from a *precipitation* of *ſand*, which, in many parts of the ſea, was *conſolidated* in *ſtrata* over thoſe of *lime-ſtone*. After this, and ſome other *precipitations*, new revolutions happened in the bed of the *ſea*, by which the *ſand* and *calcareous* ſtrata were broken and diſlocated; as were the particular ſets which contain our *coals*. As all theſe revolutions had for their common cauſe the ſinking of new parts of the bottom of the *ſea*, the level of the *ſea* itſelf ſunk alſo more and more; and then the upper parts of the high *ridges*, which had remained between fallen parts, appeared as *iſlands* over that level, and began to be covered with *vegetation*. In the latter part of this PERIOD, many new ſorts of *ſtrata* were formed over the ruins of the former: theſe are ſtrata of *clay*, *marle*, *ſand with gravel*, and ſtrata of various ſorts of pure *ſand*. The moſt parts of thoſe *ſtrata* were ſuch as could not *conſolidate*, except partially. The *ſea animals*, which, notwithſtanding the above revolutions, continued to propagate in many parts of the *ſea*, became nearer and nearer the ſpecies which inhabit the preſent *ſea*, and their *relicts* were depoſited in great abundance in many of the new *ſtrata*: ſome are not very ancient, for we find them ſtill with their native *colours*, which have vaniſhed in the more ancient ones: however, among the more recent, there are ſome whoſe ſpecies now exiſt only in very remote parts of our *ſea*. Theſe remains of the lateſt inhabitants of the ancient *ſea* are often found mixed with remains of *animals* and *vegetables* proceeding from a *continent*, which then ſtill exiſted: or rather, this fact proves the exiſtence of that *continent*, and that it was then peopled with *animals*. We are now come near another revolution, of which I am not to ſpeak in this place, having here only to trace the formation of our *continents* under the *ſea*. The revolutions which produced their characteriſtic form were moſtly at an end, by the looſe ſubſtances under them being ſettled; conſequently they were nearly the ſame as we ſee them now. The *continent*, on which the *animals* lived, whoſe *exuviæ* were carried to ſome parts of the *ſea*, ſtill exiſted; being, by its ſolid compoſition, ſupported over the *cavities* formed by the *retreat* of the looſe ſubſtances under it: however, in that ſtate, it was expoſed to the ſame ſort of revolution which had happened over the reſt of the globe.

I confine myſelf, ſir, within thoſe narrow limits, in reſpect of the operations and revolutions that happened on our globe, prior to the retreat of the *ſea* from our *continents*: but, in that mere ſketch, I have pointed out a ſucceſſion of cauſes, whoſe characteriſtic effects are diſtinctly marked on the ſurface of thoſe *continents*: and this I think ſufficient to ſhew, that the theory of *precipitation* is the only one that can bear to be examined comparatively with the preſent ſtate of our *ſtrata*. The only argument which you have oppoſed to that theory is, that *ſubſtances precipitated in a liquid, ought to be ſtill ſoluble by that liquid*: but a moment's reflection would have made you diſcover, that, on the contrary, no ſubſtance can be *precipitated* in a *liquid*, while that *liquid* ſtill retains the faculty of *diſſolving* it; and, in general, that the very modifications which produce the *precipitation* of ſubſtances in a *liquid* are the cauſe of its incapacity of diſſolving them again. As for the admiſſion of an *original* LIQUID, ſuch as I have explained it, if it gives a clear, though not a preciſe, idea, of the great phenomena obſerved on the ſurface of our

globe, of the intricate compound of the *liquid* called *sea-water*, and of the no less intricate assemblage of *elastic fluids* which now forms our *atmosphere*, I think you will not oppose to it, our incapacity of producing such a *liquid*. I have said before, that we are too little advanced in general, precise, and well-directed, observations, to determine exactly those phenomena: it will be then, particularly, to establish, from a number of new observations, the characteristic facts, from which I have drawn these out-lines. I come now to your second hypothesis, in the examination of which, new proof will occur of what I have hitherto stated.

2d. HYP. *The same heat that has melted our solid strata has been capable of raising them.*—According to this hypothesis, when our *strata* had been produced by a pretended *fusion*, they were *raised* by the same *heat* that had *melted* them. On this I must quote your own words: "There has been, you say, p. 263, an extreme degree of *heat* below the *strata* formed at the bottom of the sea; and this is *precisely* the *action of a power* required for the *elevation* of those *heated bodies* into a higher place." In explanation of this, I find only these few words, which are in the same paragraph: "The power of *heat* for *expanding* bodies, is, so far as we know, *unlimited*." Being deprived of more explanation from you, I must suppose, what only can give the idea of an adequate *power* of that kind; and this would be, the sudden and copious production of some *elastic fluid*: but, sir, if you had taken notice of what I have said, respecting that idea, in my Letters on the *Theory of the Earth*, you would not have renewed that ancient hypothesis. When that supposed operation took place, the *strata* which were to form our *continents*, were either in their first state of *fusion*, or *consolidated* by cooling. In the first case, the expanding fluid would have raised an immense *bubble*, the middle of which would have soon burst, by the soft matter falling down its sides; or if the *strata* had been before *consolidated*, they would have been broken to pieces: and in both cases, the *elastic fluid* having made its escape, the raised materials would have sunk again. To prove that our continents have been *raised* by the expansion of some substance below them, you say, p. 271, "One thing is demonstrable, from the inspection of the *veins* and their contents; this is the *successive irruptions* of those *fluid substances*, breaking the solid bodies which they met, and *floating* these fragments of the broken bodies in the *vein*." This is unintelligible to me: for you here suppose a very dense *liquid*, since it is to *float* fragments of *stones*; but such a substance cannot afford the smallest idea of an *expansion* such as you want it: however, let us go on. "It is very common, you say, to see three *successive series* of those operations; and all these may be perceived in a small fragment of stone, which a *man of science* may examine *in his closet* often *better* than *descending the mines* . . ." But first, if an *expanded matter* had broken through our *strata*, would it have only filled up the fissures? would it not have rushed out in torrents? However, no exuberance of the substances of *veins* is found any where. On the other hand, you give afterwards *lavas* as a proof of those *irruptions of melted substances*: we ought then to find it in *veins*; and none of them contain *lava*. Thus, the phenomenon of our *veins*, which you thought so favourable to your hypothesis, is absolutely against it. You do not say what is that *small fragment of stone* which is to inform a *man of science*; but I have *descended* into various *mines*, and there I have seen a variety of quite different substances laid over one another, either regularly or promiscuously. Many sorts of *metallic ores* form their distinct layers, between other mineral substances; and *veins* entirely different from each other are found, at but a little distance, in the same ridges of mountains. These, and many other circumstances, which you would have seen *better* in the *mines*, than in a *small fragment of stone*, would have led you to think, that if a *liquid substance* had been forced, from some furnace, through our *strata*, and had filled up the fissures, it would have been an homogeneous substance, as *lavas* are, and not such a variety of distinct substances.

In order to determine the *power* exerted in your supposed operation, you say, p. 271, "Let us consider what *power* could be required to force up, from the most unfathomable depth of the ocean, to the *Andes* or the *Alps*, a *column of fluid metal or stones*: this *power* cannot be much less than that required to elevate the *highest land upon the globe*." As you allude afterwards to the *columns* of *lava* forced up to the top of high *volcanos*, I will apply to them your argument, for shortness sake; and I shall suppose, that the principle on which you depend is, that a *liquid column*, whatever be its diameter, presses upon its base, in proportion to its *height*: but, sir, if the *vaults*, against which the *liquid column* presses upwards, were to give way, the column would instantly subside; and in the case you want to explain, the *vaults* against which the *power* was to exert itself were our whole *continents*; which were to be *raised*, and so to give way. I do not think that you have given a sufficient degree of attention to that pretended analogy. You quote an example of such an operation; and, as the case is real, the above argument will thereby be exemplified. "It must be evident, you say, p. 275, that in the case of the *new-island* near *Santorini*, had the *expansive power* been *retained*, instead of being *discharged*, much more *land* might have been *raised* above the level of the ocean." My proposition is, that no *land* can be raised in that manner, because the *expansive power* must be *discharged*: and this is an instance of it; for no *land* was *raised*. I have examined that event, with that of a *new hill* formed near *Naples*: in both, the *discharge* of the *power* was the first and constant symptom observed; and the blast itself was the cause of the new exuberances formed on the surface of the ground: not by raising a *land*, by which must be understood *whole strata*, but by heaping up melted and broken materials. These, in short, were only two *volcanic cones*, similar to all those which, in the sea, form *islands* and *mountains* on our continents.

The common *mole-hills* give us a clear and precise idea of the mechanic operations by which such *heaps* are formed upon the solid *ground*; those operations being of the same general kind, from the little disregarded excrescence made by the *mole*, up to the *Etna*, and to the *volcanic cones* of the *Andes*. A first *opening* is made at the surface of the ground, by the *power* which is to perform the whole mechanic operation. The ground afterwards is undermined, and the *power* throws up the *loose materials*, which accumulate round the opening. In the formation of a *mole-hill*, the whole operation is mechanic; the animal is, in the mean time, the *miner* and the *heaper*. In the formation of *volcanic cones*, there are also chemical operations, by which, first, a great *heat* is produced, that melts certain mineral substances, which I have some reasons for supposing to lie under all the *strata*: at the same time, *elastic fluids*, especially *steam*, are produced; and these form the mechanic *power*. The first effect of that *power* is, to burst the *strata* above. If, then, the *melted matter* obstructs the passage to those constantly forming *elastic fluids*, they force it up through the *opening*, mixed with masses of the broken *strata*: whence the accumulation of those materials, on the outside, in the uniform shape of a *cone*. The constant rushing out of the *elastic fluids*, keeps a channel open in the axis of the *cone*, through which, from time to time, are forced up *lavas*, either compact, or frothy; these are the *pumice stones*. At other times, when the *liquid matter* is not sufficient to fill up the channel, the *blast* bursts through it, and drives along, even at a great height above the *crater*, showers of red-hot masses of that *liquid*; these are the *volcanic cinders*. When those *showers* are thrown up from a great depth, part of the *melted matter* consolidates against the sides of the *channel* in its cooler

parts,

parts, by which at laſt it is obſtructed. Then a threatening quiet takes place, during which the *melted matter* and the *elaſtic fluids* are accumulated; and at laſt theſe burſt open the *cone* in ſome weak part, whence a *lava* flows, followed ſometimes by ſhowers of *cinders*, and broken pieces of the *ſtrata*, from which a new *cone* is formed on the ſide of the main one. Such are the operations by which *volcanic* iſlands and mountains are formed: we ſee thoſe operations in the few *volcanoes* which are ſtill in action; but they are very inconſiderable, comparatively to ſimilar operations, which, having taken place in the bottom of the *ancient ſea*, have formed there the *volcanic* mountains now found every where upon our continents, many of which are partly buried under *ſtrata* of *lime* and *ſand* ſtones. Some of the *cones* produced at that time have been immenſe, as we may judge from the ſkirts of their baſes, exiſting now under the form of circular ridges of hills: the *cones* themſelves have ſunk into caverns over which they were heaped; and the circular ridges of hills, ſeemingly formed of a ſeries of *cones*, are only the ſections of *lavas*, which had flowed from and around the immenſe ſunken *cone*. Many of thoſe *circular ridges* I have called *volcanic crowns*, (*couronnes volcaniques*;) and it ſeems probable that the ſame events have happened on the ſurface of the *moon*.

Now, ſir, if you read the deſcriptions given by contemporary authors, of the riſing of the *Iſolà-nuovo*, near *Santorini*, in the year 1707, and of the formation of the *Monte-nuovo*, in ſight of the inhabitants of *Naples*, in 1538, you will find, that thoſe events anſwer perfectly to the theory I have ſtated above. There was no *land* raiſed, but only *broken materials* thrown up. In the *new iſland*, thoſe materials came out from many *openings*; in the *new hill* there was only one *opening*, through which came out ſuch a quantity of broken and melted materials, as to form, in a ſhort time, a *cone* of three miles in circumference, and of a proportionable height. Theſe examples, conſequently, inſtead of ſupporting your hypotheſis, are evident inſtances in favour of the arguments by which I have ſhewn its impoſſibility. You yourſelf complete the proofs againſt that hypotheſis, in the cloſe of that article, where you ſay, p. 285, "How that *land* is preſerved in its *elevated ſituation*, is a ſubject on which we have *not even the means of forming a conjecture*:" but, ſir, the abſolute impoſſibility of ſuch *pieces of land* as our *continents* remaining in that *elevated ſituation*, after having been *heaved up*, and thereby *broken to pieces*, is preciſely what I oppoſe againſt that hypotheſis; and your acknowledging that we have not *even the means of forming a conjecture* for its explanation, is giving it up entirely.

Since our *continents*, though now *dry*, have evidently been covered by the *ſea*, and ſince, as I have ſhewn, they cannot have been *raiſed* from its bottom, the *ſea* muſt have ſunk, and retired to that part of the globe where it now is. You admit that *dilemma*; but having adopted the firſt of thoſe operations, you object againſt the laſt; and this is one of your arguments, p. 264: "If the preſent *land* has been diſcovered by the *ſubſiding* of the waters, there has not been a *former land* from whence the *materials* had been produced for the conſtruction of the preſent, when at the bottom of the *ſea*; for there is no veſtige remaining of that *land*." I do not underſtand the argument. We both admit a *former land*, from an evident ſymptom, which is, the *relics* of *land* animals and vegetables found in our *ſtrata*. We both alſo acknowledge, that there is *no veſtige remaining of that land*, it being now covered by the ocean. As for the neceſſity of a *former land*, to provide *materials* for the preſent, it is what I am far from admitting, as you have ſeen above. In this reſpect, you add in the ſame place: "Neither could the natural productions of the *ſea* have been accumulated in the *ſhape* we now find them on the ſurface of the earth; for how ſhould the *Alps* and *Andes* have been formed within the *ſea*, from the natural production of the water? Conſequently this is a ſuppoſition inconſiſtent with *every natural appearance*." I have explained before, how thoſe *ridges* have been *formed*: but what, in that reſpect, is contrary to *every natural appearance*, is, that in any way, our *mountains* can have been formed *in the ſhape in which we now find them*. The higheſt parts of the *Alps*, as well as the loweſt hills, are formed of *ſtrata*; but in theſe firſt huge maſſes, and in the parallel ridges that follow them, the moſt parts of the *ſtrata* are *broken* and *turned up*. This you may have ſeen clearly defined in M. DE SAUSSURE's *Voyages dans les Alpes*. The ſame ſituation of the *ſtrata* is obſerved in many parts of every ridge of mountains, and even in hills; and it is evident that they are now the *higheſt* parts of the ground, only becauſe the other parts have *ſunk* round them.

You ſay again, p. 265, "The ſinking the body of the *former land* into the *ſolid* globe, ſo as to ſwallow up the greateſt part of the ocean after it, if not a natural impoſſibility, would be at leaſt a *ſuperfluous exertion* of the *power of nature*. Such an operation would diſcover as little *wiſdom* in the *end elected*, as in the *means* appropriated to that *end*." Certainly it would be an odd *attempt* of any *power*, to ſink the *body of the former land* into the *ſolid globe*; and I do not know who has thought of it. That *land* had *cavities* under it, as I have explained above; and it required very little *exertion of power* to ſink it into them; and here, your objection of an unwiſe *exertion of power*, which does not affect my theory, is again entirely againſt you; according to your theory, the revolution by which our *land*, formerly under the *ſea*, is now above its level, is only one, in a ſeries of alternate revolutions, ſome already paſt, ſome to come, in which the ſame parts of the globe have been ſometimes *ſea*, at other times *land*. The *firſt land* that *roſe* from the bottom of the water, ſtood already upon a firſt *cavity*. The *materials* of that *land* went into the *ſea*, to form there a *ſecond land*; which roſe, and driving the *ſea* over the *firſt land*, remained *dry* in that manner. Upon the *firſt land*, then become again the *bottom of the ſea*, new *materials*, coming from the *ſecond land*, were accumulated; and, at a proper time, a *third land* roſe, either the *firſt land* newly ſtocked, or only the *ſtrata* formed upon it. In the firſt caſe, the *cavity* under the *firſt land* was double the ſize of what it was before, and conſequently that *land* had been again *ſtretched* in proportion to the *cavity* under it: in the latter caſe, a new *vault*, of the ſize of a continent, was to ſwell over the firſt, and ſo to leave a ſecond *cavity*. I cannot go any farther; I am overwhelmed by the weight of thoſe *broken materials*, forming, however, a ſucceſſion of *vaults* over *vaults*, in an indefinite ſeries; and I am ſure, that when you come to conſider theſe conſequences of your theory, you will be perſuaded to abandon it.

I now come to your opinion, "that our *continents* are *wearing away*." This is a very material object of enquiry, both in its nature, and by its connections with the whole of your *Theory*. It is important by its nature, becauſe every queſtion relating to it is to be determined by immediate facts; which renders it ſuſceptible of an abſolute deciſion: it is ſo by its connection with the whole of your *Theory*; for, if it is demonſtrated that our continents are not *decaying*, other *continents* cannot have been *deſtroyed* by the cauſes you aſcribe to the pretended *decay* of ours; nor conſequently could theſe have been formed from the *materials* of decayed continents. The whole, then, of your Theory will depend on this queſtion, to be decided by immediate facts: *Are our continents in a ſtate of decay*; *ſo that it might be foreſeen, that, in time, they will be deſtroyed, and their materials returned into the ſea?*

The following is the manner in which you introduce this new ſubject: "Our *land*, you ſay, p. 296, has two *extremities*; *the tops of the mountains* on one hand, and the *ſea-ſhores* on the other: it is the intermediate ſpace between theſe two, that forms the habitation of plants and animals. While there is a *ſea-ſhore*, and a *higher ground*, there is that which is required in the ſyſtem of the world: take that away, and there would remain an aqueous globe,

in

in which the world would periſh." On this there is no queſtion. "But in the *natural operations* of the world, the *land* is *periſhing continually*; and this is that which now we want to underſtand." In this, no doubt, conſiſts the general queſtion. "Upon the one *extremity* of our *land*, there is no increaſe, or there is no acceſſion of any mineral ſubſtance. That place is the *mountain-top*, on which nothing is obſerved but *continual decay*." This is much too generally expreſſed: for there are many *tops* of mountains which do not *decay*, but, on the contrary, receive ſome *increaſe* by the accumulation of *vegetable earth*. However, to avoid particular queſtions, I grant, that, upon the whole, the *mountain-tops* may be conſidered as being in a ſtate of *decay*.

"The *fragments* of the *mountain* are *removed* in a gradual ſucceſſion, *from the higheſt ſituation to the loweſt*. Being *arrived* at the *ſhore*, and having *entered* the *dominion of the waves*, in which they find perpetual agitation, theſe hard *fragments*, which had eluded the reſolving powers natural to the ſurface of the earth, are incapable of reſiſting the powers here employed for the *deſtruction of the land*. By the *attrition of one hard body upon another*, moving ſtones and rocky ſhores are mutually impaired. And that *ſolid maſs*, which of itſelf had potential ſtability againſt the violence of the waves, affords the inſtruments of its own *deſtruction*; and thus gives occaſion to its actual *inſtability*." This I do not grant in any reſpect. As to the manner of treating this ſubject, it is determined by one of your own remarks. "In the *deſtruction* of the preſent *earth*, you ſay, p. 297, we have a *proceſs* that is performed *within the limits of our own obſervation*: therefore, in knowing the *meaſure* of this *operation*, we ſhall find the means of calculating what has paſſed on a former occaſion, the *deſtruction of former continents*." Therefore I ſhall neither uſe, nor admit, any argument, which is not founded on *immediate obſervation*.

You aſſert in theſe few words, the *deſtruction* of our *continents*, in ſetting out from the *mountain-top*. "The *fragments* of the *mountain* are *removed* in a gradual ſucceſſion, *from the higheſt ſtation to the loweſt*." Here, ſurely, the *proceſs* is *within the limits of our obſervation*. But inſtead of adducing preſent and obſervable facts, you have recourſe to ancient ſuppoſed ones. You mention the *materials* of which our *continents* are compoſed; and, taking for granted that thoſe *materials* proceed from former *continents*, you make that mere hypotheſis the foundation of your proofs of the preſent *deſtruction* of ours. This will appear from the following examination: "*Gravel*, you ſay firſt, p. 289, forms a part of the *materials* which *compoſe our ſolid land*. But *gravel* is no other than a collection of the *fragments* of ſolid ſtones worn round, or having their regular form deſtroyed by agitation in water, and the attrition upon each other, or upon ſimilar hard bodies. *Conſequently*, in finding maſſes of *gravel* in the *compoſition* of our land, we *muſt conclude* that there had exiſted a *former land*, on which there had been tranſacted certain *operations of wind and water*, ſimilar to thoſe which are *natural to the globe at preſent*, and *by which* new *gravel* is *conſtantly prepared*." Then, inverſely, if I demonſtrate, by actual *obſervation*, that the *operations of wind and water* upon our *continents* do not prepare any *gravel* for *future* ones; I ſhall have proved that the whole of your *Theory* is without foundation.

"*Sand* (you ſay alſo) is the material *which enters, perhaps, in greateſt quantity, the compoſition of our land*. But *ſand* is *no other* than *ſmall fragments* of hard bodies, worn or rounded, more or leſs, by attrition. *Conſequently*, the *ſame natural hiſtory of the earth* which is *inveſtigated* from the maſſes of *gravel*, is alſo *applicable* to thoſe maſſes of *ſand* which we find forming ſo large a portion of our land *throughout all the earth*." You agree here to a fact, which is very important in more than one reſpect, viz. the immenſe quantity of *ſand* throughout all the ſurface of the earth. As for your concluſion, you will agree alſo, that if no *gravel* goes to the *ſea* from our *continents*, the *ſand* cannot proceed there from its *attrition*. But, previouſly, that definition of *ſand*, which you here intend as a foundation for your argument, is in itſelf a mere hypotheſis. In your Theory, you ſometimes accumulate *materials* on the bottom of the *ſea*, there to form *ſtrata*; then you ſpeak of raiſed *ſtrata*, whoſe *materials* return to the *ſea*. But before introducing thoſe alternate operations, it was incumbent on you to explain the *origin* of thoſe *materials*. For, you undertake to explain the general fact of the *ſtratification* of our *continents*; a leading one in the former hiſtory of the earth: and in that undertaking it anſwers to nothing, to ſuppoſe, on whatever foundation, that new *ſtrata* are formed of antecedent *ſtrata*; as it would be nothing towards explaining the *origin* of *vegetation*, to ſhew how a *plant* proceeds from another *plant*. You were then to explain, whence came the *materials* of which the *firſt* of all *ſtrata* were formed, before you could ſay with any foundation, that *ſand is no other than ſmall fragments* of former hard *ſtrata*: for it may be, and I think it is, a ſubſtance which has formed *ſtrata* by *precipitation* in a *liquid*. You ſee, then, that you uſe controvertible arguments: while, the *proceſs* being within the *limits of our obſervations*, you ought to have proved, that both *gravel* and *ſand* are carried from our *continents* to the *ſea*: which, on the contrary, I ſhall prove not to be caſe.

You come next to *clay*; and, as this ſubſtance bears a greater appearance of having been floated in water, it ſeems at firſt more probable that our *ſtrata* of *clay* might have proceeded from the *decay* of former *continents*. I could ſhew you, however, even by following directly the operations from which you ſuppoſe our *clay* to have been formed, that its phenomena do not anſwer to that deſcription. But ſuch a diſquiſition would be here uſeleſs, ſince, what we have now to find out, and that by *actual fact*, is, whether or not *our continents are wearing away*.

You ſpeak, laſtly, of *calcareous ſubſtances*; and, continuing to follow your method of proving the exiſtence of *preſent operations* by ſuppoſed *paſt ones*, you ſay, firſt, p. 288, "We have already obſerved, that all the *ſtrata* of the earth are compoſed either from *calcareous relicts of ſea animals*, or from the collection of ſuch *materials* as we find *upon our ſhores*:" and, after having ſo taken for granted, that our *calcareous ſtrata* are the *relicts of ſea animals*, you enter into a long ſpeculation on *vegetation and animal life*, to prove that our continents *muſt* wear away, to feed the preſent *ſea animals*. But I have proved above, that our *calcareous ſtrata* cannot be ſuppoſed to be the *relicts of ſea animals*: and, by proving to you now, that our *continents* do not *decay*, I ſhall anſwer, in the moſt incontrovertible manner, to the reſt of your ſpeculation. In that demonſtration I ſhall follow a plan that you have laid yourſelf. Before you entered into theſe ſpeculative diſquiſitions, you had uſed an argument, *à priori*, from which you firſt concluded, that it was neceſſary that our *continents* ſhould be deſtroyed. There you trace operations which ought to have been proved; and I ſhall follow the ſame order, to prove that thoſe operations do not exiſt: "A ſolid body of land, you ſay, p. 214, could not have anſwered the purpoſe of a habitable world; for a *ſoil* is neceſſary to the growth of plants: and a *ſoil* (1ſt. *Hyp.*) is *nothing but the materials collected from the deſtruction of the ſolid land*. Therefore (2d. *Hyp.*) the ſurface of this land, inhabited by man, and *covered with plants* and animals, *is made by nature to decay*, in diſſolving from the hard and compact ſtate in which *it is found below the ſoil*: and this *ſoil* (3d. *Hyp.*) is *neceſſarily waſhed away*, by the continual circulation of the water running from the ſummits of the mountains towards the general receptacle of that fluid. (4th. *Hyp.*) The *heights of our land* are thus *levelled with the ſhores*: our fertile *plains* are formed from the *ruins of the mountains*; and thoſe *travelling materials* are ſtill *purſued* by the *moving water*, and *propelled* along the inclined ſurface of the earth. (5th. *Hyp.*) Theſe *moveable materials* delivered into the ſea, cannot for a

long continuance, reſt upon the ſhore; for, by the agitation of the *winds*, the *tides*, and the *currents*, every *moveable* thing is *carried* farther and farther *along the ſhelving bottom of the ſea, toward the unfathomable regions of the ocean.*" I ſhall follow the ſame order in proving, from facts, the contrary of every one of theſe *Hypotheſes*.

1ſt. HYP. *A ſoil is nothing but the materials collected from the deſtruction of ſolid ſtrata.*—You have yourſelf contradicted that aſſertion, in acknowledging "that *ſand* is the *material* which enters, perhaps, in greateſt quantity the compoſition of our land . . . . throughout all the earth." For it does not appear that you look upon that *ſand* as proceeding *from the deſtruction of the ſolid ſtrata below it*; or in caſe you did, I am going to prove that it is not ſo. 1ſt. That *ſoil* is found in *ſtrata* of various ſorts, laid over one another; they may be alternately mixed or unmixed with *gravel*, more or leſs loamy, and ſometimes of pure *clay*: which is abſolutely contrary to the idea that it is a *ſoil* formed there, from the decompoſition of *hard ſubſtances*. 2d. That *ſoil* is ſometimes ſo thick, that no *hard ſubſtance* is found in ſinking deep wells into it. This alſo is contrary to the idea of a decompoſition of *hard ſubſtances*, ſuch as are *below*; for, in the few inſtances (comparatively to the whole) where a *ſoil* proceeds really from ſuch a deſtruction, the *ſolid ſtrata* are found at a little depth. 3d. When *ſolid ſtrata* are found under that almoſt general *ſoil*, their nature bears ſeldom any reſemblance to it; which, however, ought to be the caſe, if it proceeded from their decompoſition. 4th. There are ſome inſtances of *ſandy ſoils* proceeding from the *decompoſition of the ſame ſand-ſtone* which is found below them; and then there is no difference between the *ſoil* and the *ſtone*, except in *hardneſs*; but in many more caſes, apparently ſimilar, notwithſtanding a great reſemblance between the *ſand* above, and the *ſand-ſtone* below, there are evident proofs that the firſt is not a decompoſition of the laſt. For inſtance: *ſand* lying over *ſand-ſtone* very like it, contains often a *flinty gravel*, which is not found in the *ſtone*, nor in any ſolid *ſtrata* in the whole country. Whatever then be the origin of the *ſand* that we find laid in *ſtrata* almoſt all over the ſurface of our *continents*, there cannot be any doubt that it came out of the ſea with them, *looſe* as it is: and conſequently there was no need of a *deſtruction of ſolid ſtrata*, to produce a firſt *ſoil* upon them.

2d. HYP. *The ſurface of our continents has been made by nature to decay, for the growth of plants.*—You are anxious, ſir, to produce a *ſoil* fit for *vegetation*, though there was a *ſoil* ready upon our *continents*; and you never mention how *vegetation* began upon the *ſoil* you think to have been produced afterwards. According to your Theory, *hard* and *hot* ſtrata roſe from the bottom of the *ſea*, when the *continents* which exiſted before were waſted. But by a neceſſary conſequence of that operation, the *ſea* was to be repelled upon the decayed continents. You think that they were formed in ſucceſſion: but whenever a ſet of *continents* roſe from the *unfathomable bottom* of the *ſea*, it could not but drive the water upon thoſe that exiſted. Then the *plants* and their *ſeeds* were to be ſubmerged; and if any of theſe laſt had come by chance to the ſhore, they muſt have been unfit for vegetation, before the ſcorching *heat* of the new continents could be diſſipated, and a *ſoil* produced by the decay of thoſe *hard ſtrata*. After a ſatisfactory explanation of the manner in which our continents were abandoned by the ſea, one of the moſt important points in a *theory of the earth*, is to give a clear and diſtinct account of the beginning of *vegetation* upon them: I find none in yours, but you have it in mine. I have explained how the *tops of our mountains* were become, in the former *ſea*, *iſlands* or *peninſulas*, which had been covered with *vegetation* and ſtocked with animals. Thence, when they were become the *high grounds* of our land, proceeded the *ſeeds* by which *vegetables* were produced upon the *ſoil*, ready to receive them. The *ſeeds* of moſſes, ferns, gramina, heath, and many other ſmall *plants*, were carried every where by winds; and thoſe were the vegetables that firſt covered the *original ſoil* all over the continents. Many *trees* and other vegetables have *winged ſeeds*; by which form, though heavier, they were alſo carried by winds: from them proceeded the firſt *foreſts*, and a variety of dominant vegetables, according to the *ſoil*. Birds and other vehicles propagated other ſorts of plants. From that theory, we have upon the new continents a *ſoil* covered with *vegetation*; while the hypotheſis of *our land having been made by nature to decay for the growth of plants*, explains nothing in that reſpect.

3d. HYP. *A* SOIL *is neceſſarily waſhed away.*—This is completely contradicted by a general fact. An immenſe part of our continents, ſtill in the hands of nature, is left to its ſpontaneous products. I have ſeen vaſt extents of thoſe grounds, and received informations of many more of Europe and Aſia; and the following is their general ſtate: In every part where the winds have not diſturbed *vegetation*, or moiſture forwarded it to *peat*, thoſe grounds are covered with a ſtratum of *vegetable earth*, produced from the remains of decayed *vegetables*. That *ſtratum* is as diſtinct from the *original ſoil*, as *oil-paint* from cloth, wood, or metal, over which it is laid: it is compoſed upon every *ſoil*, of a black powdery ſubſtance, mixed with roots, under which are found *ſands* of all ſorts, either pure, or mixed with gravel, loam, and even hard rock very little impaired. This is an evident proof that the *ſoil* is not *waſhed away*; for, if it had been the caſe, in reſpect of thoſe grounds, the *vegetable earth* had not gathered over them.

Perhaps you thought only of *culture*, and ſo accuſed *man* of the deſtruction of his own *dwelling*: but I can vindicate him, both by the nature of the proceſs, and by the fact. In reſpect of the proceſs, it is one of my objects to ſhew the care taken by the huſbandman, to collect in ditches what comes out of his fields by rain, and to lay over it as *manure*, what he does not eat of his crop, with the product of the *unmoved* ſurface of his graſs fields, and of the neighbouring uncultivated grounds. This extends to all ſorts of cultivated lands; but here I ſpeak only of the plains: and as a proof of the efficacy of thoſe proceſſes, I may quote alſo a general fact. All the *uncultivated* lands I have obſerved, are more or leſs intermixed with *cultivated* ones, and ſome from a time immemorial; and I have never found (without ſome particular reaſon) the level of the laſt, lower than that of the firſt; on the contrary, I have found it often higher. Conſequently, the *original ſoil* of the plains and of rounded hills, has not been, and is not to be, waſhed away.

4th. HYP. *The heights of our land are levelled with the ſhore, by the continual circulation of water, running from the ſummits of mountains towards the ſea.*—The examination of this hypotheſis will take in again the whole of your ſpeculations; for it will lead us to the *ſea*, in purſuit of the *rivers*, loaded with the *depredations* of all the *moving waters* upon our land. But as precipitation only can have been the cauſe of ſome natural philoſophers miſtaking the nature of the operations which take place on the ſurface of our globe, we muſt follow them ſtep by ſtep. At the beginning of our *continents*, they had a quantity of *ſteep grounds*; and *ſtreams* began to flow in every part of their ſurface. But this is too large a field to be traced in all its particulars; therefore I ſhall proceed at once to the *tops* of the *Alps*, and thence follow the courſe of *natural cauſes* down to the *ſea*. That part of the inveſtigation will ſupply the whole; for what I ſhall eſtabliſh upon that great ſcale, will be applicable to the ſame proceſſes on ſmaller ones. I ſhall not, however, here ſtop at thoſe high parts of the central ridge of the *Alps*, where ice covers the ruins of tumbling rocks; it being ſufficient for our preſent purpoſe to obſerve, that no *fragment* of thoſe rocks can come out of their high region, but by coming to mix with thoſe of the lower ones, of which I ſhall follow the courſe. Our preſent

ſent object will be only thoſe parts of the *Alps* where a ſufficient *vegetation* can reach, and which incloſe completely that part which I ſet aſide for the preſent. It is certain that every *ſteep rock* is falling down faſter or ſlower; and theſe are the *fragments* which you think are *propelled along the inclined ſurface of the earth*, to be *delivered into the ſea* by the *moving water*: let us then follow their courſe.

It is evident, that the *fragments* of tumbling rocks muſt firſt accumulate under them, and riſe there in a ſlope, which I ſhall call *talus*; a word uſed in fortification, for that ſort of ſloping grounds which have the natural declivity of looſe materials rolling over one another. *Taluſes* of that ſort are found now on all the ſides of every ridge of the *Alps*; and they may be divided into three claſſes, in reſpect of their forwardneſs. The firſt claſs is under *rocks*, ſtill very high, and decaying very faſt. Theſe *taluſes* are almoſt *barren*; the conſtant fall of new rubbiſh prevents *vegetation* from covering them: they are known to increaſe both in extent and in height, and by increaſing in this laſt dimenſion, they tend to cover the ſteep ſurface of their *rocks*. The ſecond claſs is under rocks which, either originally were only ſteep at their upper part, or were much diſpoſed to crumble down. Theſe *taluſes*, though ſtill barren towards the top, are, more or leſs, covered with *vegetation* in their lower parts; for here the acceſſion of new materials is leſs frequent, the larger fragments only roll down, and by their acquired velocity, they extend the baſe of the *talus*. There the ſhade produced between the large materials, preſerves more moiſture; *moſs* begins to cover them, and it becomes the receptacle of the ſeeds of other plants, whoſe decay forms a firſt ſtock of *vegetable earth* between the ſtones. Then ligneous plants alſo begin to grow; and, when *vegetation* is ſo eſtabliſhed, it fights its way up, covering and binding ſucceſſively the new falling materials. Laſtly, a third claſs of *taluſes* is found under *rocks*, whoſe decay is nearly, or entirely, at an end. Here *vegetation* has got up to the remaining veſtiges of the *rocks*; which, if no longer decaying, are themſelves covered with *moſs*. There are frequently many rows of thoſe *taluſes* at different heights on the ſame ſides of high mountains: in that caſe the upper ones undergo the fate of the *rocks* over which they are forming. Sometimes the operation ends in a ſucceſſion of *ſlopes* and *terraces*; and, in ſome other caſes, the whole ſide of the mountain is reduced to one ſingle *ſlope*. Various ſorts of *vegetations* cover thoſe *taluſes*: under ſhivering *rocks* they are generally covered with graſs and a few ſhrubs: if their materials, though ſmall, are not in flakes, they are moſtly covered with ſhrubs; and, where the materials are larger, trees are the dominant products of the ſoil. In the immenſe *taluſes* of the *Alps*, there are frequently three diſtinct zones, determined by their elevation, and alſo by the ſize of the materials; the lowermoſt are foreſts, the middle ones are thickets, and the uppermoſt are paſtures. That operation is, either finiſhed or going on, within and all round ſteep mountains; and, when it is completed, both in the large valleys and in the external parts, it produces an everlaſting ſecurity againſt further demolitions by *wind* and *rain*. For the whole of that ground is covered by *vegetation*, and ſtocked with *vegetable earth*; and this ought to be torn off, before any of the *fragments* under it could be moved: while, on the contrary, the quantity of that *earth* is conſtantly increaſing by the decay of *plants*, whoſe roots, in the mean time, bind the materials more and more. Theſe *taluſes*, to which every ſteep *mountain* has been, or tends to be, reduced, cannot have then any aggreſſors but *men* and *ſtreams*; and I will examine the operations of both.

The inhabitants of the *mountains*, both within and round them, make great uſe of the lower parts of thoſe *taluſes*, when they are compoſed of an arable ſoil; and this is inevitably brought down by culture. If the huſbandman has a ſufficient ſpace at the bottom of the ſlope, he does not trouble himſelf with that effect of his work: for the parts of the ſlope which he does not cultivate, as being too high, follow by degrees the parts that ſubſide by culture: and the only conſequence of the operation is, that the whole *talus* tends to acquire a ſmaller degree of declivity. But if, either by other proprietors, or for want of room in the bottom, the cultivator is confined to a certain ſpace, then begins his care for the preſervation of the ſoil: he ſtops the ſmaller materials by ditches, and the larger by walls. In vineyards, where the culture has the greateſt tendency to level the ſlope, the vine-dreſſer extends further his care: his yearly work in winter is to bring up on his back the ſoil that he has brought down by digging downwards. Through theſe precautions, prompted to each individual by ſelf-intereſt, thoſe bulwarks of *mountains* are as ſafe in the hands of men as we have ſeen them in the hands of nature.

Streams will at firſt appear more powerful agents for the deſtruction of mountains; but let us follow their operations, and begin from the high valleys, where ſudden *torrents* are formed, at every heavy rain, and great thawing of the ſnow. Theſe violent *ſtreams* daſh againſt every *talus*, which, in extending itſelf, has reached their bed. As long as a *torrent* can bend its courſe round ſuch projections, it is only repelled; but by their increaſe there comes a moment when, falling upon them with great violence, it undermines them, and produces at once a great ſliding down of the ſurface of the *talus*, even though ſometimes already covered with trees. Theſe momentary dams force the water to riſe; but its increaſing weight at laſt breaks them; and the impetuoſity with which it falls, favoured by the uſually great declivity of thoſe narrow valleys, gives it the power of driving along the moſt part of thoſe materials which had been accumulated gradually within its reach. Here, ſir, you might ſay with reaſon, "the *travelling materials* are purſued by the *moving water*, and propelled along the inclined ſurface of the ground:" but they only *travel* for a ſhort time: in every hollow place, or in any part where the *torrent* can ſpread, it loſes the power of driving them; thereby are filled up all the deep parts of its bed, and all the ſinuoſities of the valley through which it runs; and if, when every part of that valley is levelled in its breadth, and reduced to an equal declivity, the *taluſes* are not yet retired to a proper diſtance and ſettled there, the new accumulated materials are propelled by the *torrent* down to ſome large valley, where at laſt they are ſtopped; for there the *torrent* can ſpread without bounds. At the beginning of thoſe operations, *caſcades* were formed in many of thoſe outlets from narrow valleys into large ones; but now, in moſt parts, the materials brought down by the *torrents*, which have been accumulated there in the form of very obtuſe *ſemi-cones*, reach the entrance of the *defiles*, and the *torrents* flow over them. Not one of the *fragments* of the high parts of the *mountains* comes out of them but through ſuch a paſſage; conſequently we have, in thoſe *ſemi-cones*, the whole of the rubbiſh that does not remain in the upper parts; and we ſhall not loſe ſight of it, nor even of the *duſt*, which is carried away at firſt by the *torrents*.

Theſe ſecondary accumulations of *fragments*, proceeding from the high regions of great mountains, are very conſpicuous in their large valleys; and they are now of the three claſſes already deſcribed in reſpect of the primary *taluſes*. In the parts where the *torrents* continue to produce great havoc above, the *ſemi-cones* are ſtill barren; a continual recruit of new materials, in times of great floods, prevents *vegetation*. When the great demolitions above are become rare, *vegetation* begins to take poſſeſſion of the parts which the *torrent*, by dividing itſelf in many branches upon the ſlope, has abandoned. Laſtly, in many places, where every great revolution in the upper valleys is at an end, the *torrent*, confined in various furrows that it has formed, leaves full ſcope to *vegetation*, upon a ſoil which yields to all ſorts of culture. There hamlets and villages are built, near the leſs turbulent,

lent, and now embanked, rills of the ſame *torrent* which formerly would have appeared threatening the whole mountain with deſtruction.

Our *fragments*, ſo gathered in the lower vallies, are not all yet at their laſt ſtage, but I muſt leave them for a moment, in order to examine the effects of *vegetation*. I had already deſcribed thoſe effects; and I muſt ſuppoſe that you had not given attention to them, when you aſſerted that the *heights of our land* were to be *levelled with the ſhore*; therefore, to ſhew you that the preſerving power of *vegetation* is a fact, not only general, but ſtriking to every attentive obſerver, I will tranſlate here a paſſage of one of the moſt intereſting works upon mountains, *(Obſervations ſur les Pyrenées,)* publiſhed lately by M. RAMOND DE CHAR CONNIERE, who had before given ſome obſervations on the *Alps*, in a tranſlation of Mr. Coxe's inſtructive *Letters on Switzerland*. "In tracing up (he ſays) the ſucceſſive cauſes of the fertility of the *valley of Campan*, one of the high valleys of the *Pyrenées*, it is to the creſt of *Tourmalet*, between the pointed rocks of the valley of *Baſton*, and the blunted rocks of the *Eſcalette*, that I ſhall tranſport the obſerver. I ſhall ſhew him, on one ſide, the *Gave*, ſtill rolling the fragments of the tumbling hills; while on the other, the *Adour* now ſpares even a blade of graſs. We ſhall follow this lively but beneficent ſtream, we ſhall view his meanders traced by the turf and by rocks covered with moſs: we ſhall behold him at *Trames-aigues*, falling in a magnificent caſcade, between rocks covered with flowers. The firs will ſoon embelliſh with their vigorous and picturesque tufts, his bold, but inoffenſive, falls: for now he has forgotten his ancient fury, and vegetation approaches with confidence. The mountains are tumbled; he has levelled their fragments: the declivities are ſoftened; nothing now irritates him; every thing favours his deſtination: and to the obſerver, who never beheld a torrent thus at peace with nature, the apparent tumult of his waters forms a ſurpriſing contraſt with the tranquillity of his banks.

"It is from the lowering of ſteep rocks and the levelling of ragged declivities, that the valley of *Campan* is now one of the moſt delicious receſſes of paſtoral life. It was before a deep furrow, between the foot of the *Pic-de-Midi*, and the calcareous rocks which lean againſt it. There the firſt torrents were impetuous in proportion to the ſteepneſs of the declivity, and boiſterous from the aſperity of the forms ſketched by the ancient ocean. But the tops of the lofty ſummits are come to fill up the bottom of thoſe precipices; the running waters have inceſſantly tended to level the ſoil; the accumulated rubbiſh has been ſpread: a reſt has ſucceeded to long convulſions, and vegetation has covered theſe heaps of ruins. The valley of *Campan* is then an anticipated picture of the future ſtate of the whole earth; it inſtances that ſtate of calm announced and determined by M. de Luc. Such will be all the valleys of the Alps and Pyrenées, of Caucaſus, Atlas, and the Andes; when the powers which tend to preſerve ſhall be in equilibrium with thoſe which tend to deſtroy; when the ſummits ſhall ceaſe to deſcend towards the foundations, and the foundations to riſe towards the ſummits; when the declivities ſhall have acquired that degree of inclination which prevents any farther rolling down of materials; when active vegetation, ſo ready to take poſſeſſion of every ſurface as is for a ſhort time at reſt, after having often been repulſed by the laſt agitations of theſe expiring giants, ſhall ſit in peace upon their mouldered limbs." This, ſir, is a true picture of numberleſs valleys in the high ridges of mountains: and if ſudden falls of ſteep rocks continue ſtill for a time to diſturb their peace, they only protract thoſe neceſſary operations, which will ſecure *eminences* upon our ſettled *plains*, as long as the known *natural cauſes* ſhall remain ſuch as they are.

Let us now return to the low and large valleys of the Alps, in which we have gathered all the *fragments* that have either fallen immediately from their ſides, or deſcended from the upper parts by the impulſe of the *torrents*. Every accumulation of that rubbiſh which remains at a ſufficient diſtance from the bed of the gathered waters in the valley, is perfectly ſecured by *vegetation*; a certain *criterion* of *reſt*, and a *ſafeguard* againſt *wind* and *rain*. But this is not yet the caſe with all thoſe accumulations; ſome have advanced up to the banks of the *river*, which, in great floods, undermine them. There new falls happen, and we have again *travelling materials*; for the *river* riſes againſt that rubbiſh; but again it is only to level it: it remains in every part of the valley where the *river* can ſpread, and the large *fragments* are there buried in the *duſt* that had been produced at their firſt falling from the rocks. This laſt tumultuous operation in *mountains* protracts the ſettling of their whole maſs; for this will not be completed till every *talus* of the ſides of the low valleys, and every *ſemi-cone* formed there by *torrents*, ſhall be *ſettled* at a proper diſtance from the *river*; and with this circumſtance are, more or leſs, connected all the operations in the upper parts of the *mountains*. Such a *river* will continue to attack ſome part of its banks, as long as the above-mentioned cauſes ſhall bring materials along them; and the baſes of the *taluſes* being ſo impaired, it gives occaſion to new ſliding down of materials. But when all thoſe operations ſhall be completed, and the ſmoothing work of thoſe rivers finiſhed, they will flow as harmleſsly as the *Adour* in the valley of *Campan*.

So far we are ſure not to have loſt ſight of one of the fragments that, ſince the origin of our *continents*, are fallen from any of the rocks in the *Alps*; they were all to paſs through ſome of the large *valleys* before they could come out of their boundaries; and what I am now going to prove is, that they have only raiſed and levelled the bottom of every *valley*, without one of them being, either come, or to come, out of thoſe boundaries. We could not chooſe any field of obſervation larger than this; ſince the greateſt *rivers* of Europe proceed from the *Alps*. When the various original branches of thoſe *rivers* began to flow in the hollow parts of that vaſt ridge of *mountains*, they found numberleſs cavities, which they firſt filled with water, and where they depoſited the rubbiſh they drove before them in every part where they were confined: and a great number of thoſe cavities are ſtill *lakes*, ſome of which are large enough to appear in the maps. Now, before one ſingle *fragment* of the *Alps* could come out of their boundaries, theſe *lakes* ought to be filled with rubbiſh; and they are not. This is a complete demonſtration for paſt events; and the following will anſwer for thoſe to come.

The largeſt *lakes* receive immediately the waters of the wideſt *valleys*, in which unite the ſmall branches of the *rivers*. There alſo ought to unite all the *fragments*, before they could proceed any farther: but thoſe *fragments* do not even reach there; they all remain in the *valleys*, and *duſt* only is depoſited in thoſe *lakes*, except by ſome *torrents* falling immediately from the mountains round them. It is a curious object in time of flood, to ſee, from ſome high ground, the *turbid* water of the *river*, firſt forcing its way through the *limpid* water of the *lake*, and by degrees becoming *limpid* itſelf, by depoſiting the *minute materials* which it carries ſo far, but *no farther*. Conſequently, ſince, even at this period when the *mountains* are not yet ſettled, nothing but ſuch inconſiderable *materials* arrive in thoſe *lakes*, no *gravel* will ever come out of the *Alps*.

When, however, theſe very *rivers*, which glide out of the *lakes* as *limpid* as the *rain* fallen on the mountains, are obſerved flowing in the *plains*, we often ſee *gravel* in their bed. This fact, which cannot contradict the former, leads us to enquire into the origin of the *gravel* ſo generally found in the bed of almoſt every river; and the following are the general facts relating to that intereſting phenomenon: 1ſt. The *gravel* of a *river* flowing in a *plain*, is conſtantly the ſame that is found in the adjacent land,

land. 2d. A *river* may have much *gravel* in its bed, though the land near it has very little: but the bed of ſuch *river* is much below the ſurface of the land, and the *gravel* it contains is no more than might be contained in the maſs of the land that has been dug away. 3d. The *gravel* of many *rivers* bears no reſemblance to any of the *hard ſtrata* that it has pervaded in its courſe: it is ſometimes a *gravel* of *flint*, though there are no *chalk ſtrata* on its banks; it is frequently of *primordiary ſtones*, even in large *blocks*, though there are no *mountains* nor *ſtrata* of thoſe *ſtones* even to a great diſtance: but the ſame *gravels* and *blocks* are in the adjacent land. 4th. The bed of ſome *rivers* is *gravelly* in ſome parts, and without *gravel* in other parts, alternately; and this again is found in the grounds correſponding to theſe different parts of the *river*. The conſequences of theſe facts are as obvious in themſelves, as great in the *theory of the earth*. 1ſt. It is evident, that the *gravel* depoſited in the bed of *rivers* flowing in the *plains* was before in that part of the ground which they have furrowed in forming their channels. 2d. Since thoſe *rivers* have no other *gravel* but what proceeds from the *plains* themſelves, it is evident alſo, that the *plains* cannot have been *formed from the ruins of mountains*; for thoſe *ruins* ought to have been ſpread over them by theſe very *rivers* which, on the contrary, rob them in cutting their channels. 3d. Conſequently all the *gravel* of the *plains* is come out of the *ſea*, as well as every other of their *ſtrata*, when our *continents* were left dry. 4th. But no *gravel* goes to the *ſea* from our *continents*; ſince *rivers*, which have *gravel* in ſome parts of their bed, do not even move it along with their whole courſe. This laſt conſequence, which relates to the main object of all our preſent enquiries, will be more and more aſcertained, by the following conſiderations and facts.

When water has a free paſſage along or above ſome obſtacles, without bending much its courſe or riſing ſenſibly, a part of it remains ſtagnant between thoſe obſtacles, and the reſt glides over it as it would upon a ſolid and ſmooth body. This is the reaſon why, in following the courſe of *moving water* from the tops of the mountains, we have ſeen it driving materials before it, when it was obliged to riſe; and leaving them on its bottom wherever it could ſpread: it is alſo the reaſon why, when a *river* which flows in a plain, happens to drive *ſand* and *gravel* from ſome narrow path, theſe ſubſide in wider parts, and the *gravel* is buried in the *ſand*. The reſiſtance found by water, in a well-ſettled bed, from its flowing over a nearly horizontal plane, is ſufficient to determine its principal current in the parts above; and the growth of aquatic plants upon the bed of ſuch *rivers* is a clear proof that they do not even drive the *ſand* which lies on that bottom. But there are few *rivers* which do not ſtill drive ſome *ſand* in ſome parts of their courſe; and this proceeds from their having cut deeply ſome parts of the ground, when they firſt formed their beds. There the *rivers* cannot ſpread: in floods they attack thoſe ſteep banks; and, at every fall of new materials, either by theſe attacks, or by the waters filtrating in the ground, they riſe againſt them, and drive them along, till they find a ſpace to ſpread, where all thoſe materials ſink and remain. But in time thoſe *ſteep banks* will give way, the *rivers* will find ſpace to ſpread along their whole courſe, their ſmoothed banks will be covered with *vegetation*, and in their very floods they will, as the *Adour, even ſpare a blade of graſs!*

Let us now go to the ſea, to meet there the *rivers* loaded with the *whole* of the depredations made upon our continents by every *moving water*. "We never ſee, you ſay, p. 295, a *river* in a flood, but we muſt acknowledge the carrying away of *part* of our *land*." This is true; but we are now enabled to eſtimate that part, and to determine how far it may favour your *theory of the earth*. If a *river*, at its coming into the *ſea*, does not meet on the *coaſt* with a *gravelly* and *ſandy* ground, the only *materials* that it brings out of our continent, as the total reſult of all the cauſes which act upon the grounds whence its waters proceed, are nothing but mere *duſt*, as may be certified by the inhabitants of the coaſts near the mouth of every *river*. No *gravel*, nor even *ſand*, is gathered there, but what proceeds from the coaſt itſelf; and we have ſeen the reaſons of that fact, in following the *moving waters* from the *higheſt* to the *loweſt* grounds. *Duſt* then is the only ſort of *material* that our *continents* could furniſh to future ones, from the *waters moving* on their ſurface; and that proviſion, inconſiderable as it is even now, is temporary: it proceeds only from the beds of the *rivers* not being yet wide enough in every part, nor their *banks* ſo ſmoothed, as to prevent their ſtill hurting the ground in ſome parts of their courſe. But thoſe very demolitions are the work of *rivers* for ſettling their *bed*; which operation ſhall be completed without a ſenſible loſs of the maſs of our continents; and a time will come, when the loſs of ſome *duſt*, that they may continue to undergo in great floods, will be more than compenſated, by the acquiſition they conſtantly receive all over their ſurface, from the increaſe of *vegetable earth*, a product in which *water* and *air* enter as ingredients. From that collection of facts, which are *within the limits of our inſpection*, it is evident, that no materials can be expected from our *continents* for new ones, by the *natural cauſes* acting over their ſurface. What remains then to examine is, the immediate effect of the *ſea* in that reſpect; a part of which, in your opinion, is contained in the laſt of the hypotheſes which I have enumerated before.

5th. HYP. *The moveable materials delivered into the ſea are there by the agitation of the water, carried farther and farther along the ſhelving bottom of the ſea, towards the unfathomable regions of the ocean.*—The propoſition I am going to eſtabliſh in that reſpect, from theory and from facts, is, that upon every *ſhelving ſhore*, where the declivity is ſmall, the *agitation of the water*, inſtead of carrying materials *from the coaſt towards the bottom of the ſea*, carries them, on the contrary, *from the bottom of the ſea towards the coaſt*; and that there is a degree of *declivity* in which there is no tendency to alteration. You mention three ſorts of *agitations* of the ſea; the *tides*, the *current*, and the *waves*: the firſt of which, however, will, I think, appear to you incapable of any immediate effect, if you conſider how ſlow the water riſes and falls upon open ſhelving ſhores: in the firſt of theſe motions it brings along ſome *ſea-weeds* floating in the water, and it leaves them moſtly on the ſhore. I think it then ſufficient to examine the operations of the *currents* (another effect of the *tides*) and of the *waves*.

Currents never reach ſuch *ſhores* with any perceivable degree of action, except againſt *capes*, which they only tend to round: and when thoſe projections have acquired a ſufficient degree of obliquity, the *currents* move nearly in a parallel direction with the *coaſt*, at ſome diſtance from the ſhore, having no other effect than that of tending conſtantly to ſmooth it. The whole action of the *ſea* upon the *coaſts* is then concentrated in the *waves*: it is almoſt only by their means that the *tides* and *currents* have ſome influence in that action; and this is, becauſe, when the water is higher, the *waves* reach farther upon the ſhore. Let us then conſider the effect of that cauſe. If the wind blows *from* the coaſt, the *ſea* is not agitated near it; there are hardly any *waves*: and if it blows *againſt* the coaſt, the impulſe of the *waves* being in that direction, tends to roll the materials *from the bottom towards the ſhore*; by which *ſhoals* are firſt produced, and the *ſtrand* extends by degrees. This is known upon every *ſhelving* ſhore; and I will give you ſome inſtances of that operation. It is by the *ſea-ſand* carried up in that manner, that the formerly main branch of the *Rhine*, which paſſed through *Holland*, has been ſtopped. It is by the ſame operation that the acceſs of moſt part of the ſea-ports, along the coaſt of the North Sea, and of many others, would be ſtopped, if *roads* were not kept open by great labour. In the ſame manner are the *ſediments* of the *rivers* accumulated

accumulated *againſt* ſuch ſhores: and when theſe *ſediments* do not come to bind the light *ſand* of the *ſea*, beſides its accumulation againſt the ſhore, it is raiſed by the winds at ſome diſtance, and forms thereby ſucceſſive rows of *ſand-hills*, ſometimes very high. Theſe are natural and certain effects of the *waves* upon every *ſhore*, either originally *ſhelving*, or reduced to that form by the operations I ſhall deſcribe hereafter: and its *maximum* takes place, when there is ſuch a *declivity*, as to produce an *equilibrium* between a greater impulſe of the advancing *waves*, but along an aſcending plane, and the ſmaller impulſe of the retreating waves, but on a deſcending plane. When that *equilibrium* is produced, nothing more can happen, nor in fact happens, upon any *coaſt*, but ſmall alternatives of partial increaſes and decreaſes, according to variable circumſtances.

I come now to the remarkable reſult of your enquiries on the *deſtruction* of our *continents*. "Every *revolution of the globe*, you ſay, p. 298, wears away *ſome part of ſome rock upon ſome coaſt*; but the quantity of that *decreaſe*, in *meaſured time*, is not a *meaſurable thing*; . . . the age of man does no more in that eſtimate, than a ſingle year . . . . But man is not confined to what he ſees; he has the experience of former men. Let us then go to the Romans and the Greeks in ſearch of a *meaſure* of our *coaſts*, which may be compared with the preſent ſtate of things." After that enquiry, you acknowledge, p. 301, "that this *decreaſe* of the *coaſts* in general *has not been obſerved*; and that it is as generally thought that *the land is gaining upon the ſea*, as that *the ſea is gaining upon the land*." However, you conclude in this manner: "To ſum up the argument, *we are certain that all the coaſts* of the preſent *continents* are *waſted* by the *ſea*, and conſtantly *wearing away* upon the whole." This is a very poſitive deciſion againſt acknowledged facts; and it would require very ſtrong arguments to ſupport it: however, you adduce none but thoſe which I have quoted above, to which I ſhall anſwer, in continuing to deſcribe the operations of the *ſea* upon the *coaſts*.

When our *continents* firſt appeared above the level of the *ſea*, their *coaſts* were not all of that *ſhelving* form on which I have proved that the *ſea* has no deſtructive power? ſome were *abrupt*, and there began an apparent deſtruction. The *cliffs*, compoſed of looſe materials, fell down apace, the *currents* drove along the ſhore a great part of the light materials, but the *gravel*, and the coarſe *ſand*, ſunk and remained under the *cliffs*. In that manner have been formed thoſe *ſtrands* and *beaches* which we find now along every ſteep *coaſt*, and over many of which we ſee already the inoffenſive ſurge of the *ſea*, dying away, in rolling ſome *gravel* backwards and forwards, or ſmoothing the *ſand*. This is the *attrition of one hard body upon another*, which, p. 296, you ſuppoſe to *give occaſion to the inſtability of our continents*. But the *duſt* produced thereby does not vaniſh: in falling between the large materials, it concurs with the *ſand* of the *cliffs* to give them *ſtability*; for, in that manner, a ſolid bottom is produced, that riſes by degrees, and on which the new *gravel* only continues to be rolled by the *waves*.

I have had many opportunities of ſtudying thoſe *ſtrands* and *beaches* along various ſteep coaſts: very few of theſe are ſtill attacked by the *ſea* itſelf; they are moſtly impaired by the *land-water* filtrating in them, which, in looſening the materials, brings down ſometimes large maſſes of them within the reach of the *waves*. Then the *agitation* of the *ſea* carries away again the minute materials, but leaves the large ones upon the *beach*, which thereby riſes more and more. I have ſeen thoſe growing *outwarks* of our *land* in all their degrees. In ſome parts, where the quantity of large materials is but ſmall in the land, the ſea ſtill over-runs the beach every tide: in other parts, it only riſes over it in ſpring-tides with high winds; and in many parts, the *cliffs* are already retired at a diſtance, and reduced in a ſoft ſlope covered with *vegetation*. There ends all deſtructive power of the *ſea*: for it reaches no more ſuch *coaſts*, being ſeparated from them by the *ſtrand*. Thoſe *coaſts*, then, are in the caſe of continental grounds, which are preſerved when covered by *vegetation*; and the *ſtrand* itſelf has acquired that degree of *declivity*, which renders it unimpairable by the *waves*. Now, ſir, by the obſervable gradation of thoſe effects of known cauſes, we are irreſiſtibly led to conclude, that, in time, our *land* will, in the ſame manner, be every where abſolutely *inattackable* by the *ſea*.

In your ſpeculative ſyſtem of *decay* of our *continents*, you had not conſidered any of thoſe objects; for you ſpeak only of the *wearing away of ſome part of ſome rock upon ſome coaſt*, by *every revolution of the globe*. In this reſpect, not having found any certain diminution of any known rocks, from the times of the Greeks and Romans, you think, with reaſon, that this proceeds only from the want of an exact meaſurement of theſe rocks in ancient times: but this remark does not imply that theſe rocks will *conſtantly* wear away; and I am going to prove to you that they will not. If a *rocky* coaſt is of ſuch a nature as not to be eaſily deſtructible by the weather, it is covered with *ſea-weeds* to the reach of the waves, and above with *moſs*: a clear proof that ſuch a *coaſt* is not *wearing away*. But if the rocks come to fall in large maſſes, or in general, when any of them decay, the fragments are accumulated in the water under them, and the preſerving *beach* is formed. Then the remaining rocks themſelves differ no more, for preſervation, from thoſe of our mountains.

Let us now ſum up all the operations which are going forward along our *coaſts*; and firſt, thoſe by which our continents acquire more extent. The land *increaſes*, 1ſt. In the places where the original declivity of the *ſhore* was ſuch, that the motion of the waves, in bringing *ſand* from the bottom of the *ſea*, has extended the *ſtrand*. 2d. Near the mouth of *rivers*, where the motion of the waves has alſo accumulated their *ſediments* along the coaſts. 3d. Near every part where looſe *cliffs* have been, or are ſtill, falling; where every creek has received, by the *currents*, all the minute materials ſo fallen; becauſe the currents loſe their rapidity in thoſe receſſes. Thoſe are the well-known and very great *acquiſitions* of our *continents*; which have no other compenſation by real *loſſes*, but from the retreat of *ſteep coaſts*; ſo ſmall in itſelf that it can hardly be recorded any where elſe, but on each ſpot, and which is to have an end. There is another ſort of *loſs* of our *continents*, which has been much inſiſted upon by thoſe authors who have thought, like you, that the *ſea* threatened the *land*; but that loſs is not real. The *new grounds* along the coaſts are in general very fertile; and ſome have been early incloſed: but when that has been done before the ground has acquired a ſufficient ſolidity, it has ſunk by drying. Storms, then, in a high ſea, have broken the dikes, and the waves have daſhed away the ſoil; which thereby has been tranſported to other parts of the coaſt. This has been the caſe in a manner very dreadful and fatal for thouſands of inhabitants of the coaſts of the North Sea, but very inconſiderable, comparatively with the whole of the acquiſitions of thoſe coaſts.

From the oppoſite operations it is, that, in conſulting only hiſtorians, you have concluded, "that it is as generally thought that the *land is gaining upon the ſea*, as that *the ſea is gaining upon the land*." But if theſe oppoſite deciſions are meant to expreſs *continuance*, they are both without foundation; for each of thoſe effects has, in its nature, a *maximum* which I have explained; and when it ſhall be produced, every *coaſt*, upon the whole, will be *at reſt*. I might ſtop here, in the examination of your *Theory of the Earth*; for, if our *continents* cannot be *deſtroyed* by the known cauſes acting upon them, they cannot have been *formed* of the *materials* of other *continents* deſtroyed in that manner. However, as it would be difficult to demonſtrate, that the *duſt* that probably will continue, in ſome meaſure, to go out of our *continents*, ſhall be compenſated by the increaſe of the *vegetable earth*; it might remain in your mind, that our *land*, though thereby gaining in extent, may *in time* be *levelled with the ſhore*. But I

ſhall render that diſquiſition uſeleſs to our preſent purpoſe. If the *natural operations* which, according to your opinion, are to deſtroy our *continents*, go on ſo ſlowly that there is no trace upon the ſurface of the earth, nor any record in the memory of man, by which we may judge *when* thoſe operations *began*, their *beginning* muſt be very *remote*; and you think it ſo. But I will ſhew you, that we have both theſe ſorts of documents, by which it is demonſtrated that our *continents* are not *old*; which demonſtration will render it uſeleſs, in reſpect of your theory, to determine how long theſe *continents* will laſt.

This brings me to a different kind of ſurvey of our *continents*, which I ſhall introduce by your own expreſſions. "We are inveſtigating," you ſay, p. 297, the *age* of the *preſent land*, from the *beginning* of that body which was *in the bottom of the ſea*." Having thus announced the object of your inveſtigation, we were to expect a concluſion relating to *time paſt*; but in the cloſe of your inquiry, we find its object entirely different; the concluſion relates to *future time*: "It is in vain, you ſay, p. 293, to meaſure a quantity which eſcapes our notice, and which hiſtory cannot aſcertain: we might juſt as well attempt to meaſure the diſtance of the ſtars without a parallax, as to calculate the *deſtruction* of the *ſolid land* without a *meaſure correſponding to the whole*." Permit me to repreſent to you, that with the view of inveſtigating the *age* of the preſent *land*, an inquiry reſpecting the *time* in which its *deſtruction* ſhall be completed, was far from your purpoſe. It is not ſurpriſing that you find no means of calculation in this reſpect, ſince the operation *that* you ſuppoſe going on, does not exiſt; our *continents* are certainly not *deſtroying*: but you might have acquired, by various means, a diſtinct idea of their *age*; for we ſee on them many ſorts of *effects*, which, from the nature of their *cauſes*, muſt have had their origin at the *beginning of that body which*, before, *was in the bottom of the ſea*; and diſtinct *parts* of thoſe *effects*, produced in *known times*, are *comparable* to the *whole*. This new inquiry will relate to ſome of the ſame diſtinctive parts of the ſurface of our continents, as were the objects of the former; *continued changes* tending to a *maximum*, are their characteriſtics. I have already proved that tendency, as relating to *future time*; and now I ſhall examine the ſame *changes*, in their correſpondence with *time paſt*.

In returning, for the preſent purpoſe, to the tops of our *mountains*, I ſhall begin a ſtep higher than in the former diſquiſition. I had then only to collect, without any poſſibility of loſs, all the *fragments* ſeparated from thoſe high grounds by natural cauſes: therefore I paſſed over the central ridges of their great chains; it being ſufficient to take notice of thoſe *fragments*, by meeting them in certain paſſages, where they muſt firſt gather, before they fall into the beds of the main ſtreams; the only conveyance for them out of the mountains: but we ſhall have a number of intereſting objects to ſtudy in thoſe high regions, where the characters of *decay* ſeem ſo ſtrongly impreſſed, that to thoſe who arrive there uninformed, they muſt appear as the tomb-ſtones of our continents. However, from thoſe towering monuments of devaſtation, to the ſteep hillock riſing over a ſmooth plain, there is no difference, either in the general cauſes of their deſtruction, or in the inference that may be drawn from them, to determine the *age* of our continents: all thoſe grounds came out of the *ſea* in a much more rugged ſtate than that in which they now appear; which ſtate has been the original cauſe of their *decay*; and whatever be their height, if they are ſtill *abrupt*, the operation which tends to ſmooth them is not finiſhed.

It is unneceſſary to enlarge on the proof, that all the *ſteep* high grounds of our *continents* came out of the *ſea* in the ſame decaying ſtate in which they now are. Abrupt ſides of mountains, ſometimes many thouſand feet high, exhibit the *ſections* of numberleſs *ſtrata*, the moſt part of which are conſiderably out of the horizontal poſition in which they muſt have been formed. Conſequently, thoſe *ſections*, and *à-fortiori* thoſe of leſs magnitude, but having the ſame characters, muſt have been the effect of ſome cauſe which had the power of overturning the whole maſs of the *ſtrata* themſelves. So far we cannot but agree; for your theory on the formation of our *continents* is founded, as well as mine, on cauſes which muſt have produced ſuch a diſorder; and in reſpect of the *continents* once dry, we agree alſo, that no other cauſes of alteration can be admitted, than thoſe which are ſtill in action. This then ought to be ſufficient to eſtabliſh, that the great *chaſms* of our *continents* exiſted at their origin; but as many other queſtions depend on that primary one, I muſt treat it more particularly.

The huge ruins of high mountains incloſe, in the moſt chaotic manner, immenſe ſpaces, now vacant, though they muſt have been filled, formerly, with the continuation of the ſame *ſtrata*, the remains of which now ſurround them. This is a very ſtrong feature of our *continents*, which muſt ſtrike every beholder capable of feeling aſtoniſhment at the wonders of nature; and he will aſk himſelf, "What is become of the immenſe bulk of materials which are miſſing in thoſe vacancies?" This then is the firſt and preciſe object which muſt excite the attention of the curious, with reſpect to geologic ſyſtems; but at the ſame time it muſt create a juſt diffidence of every ſyſtem which does not give a clear and ſatisfactory account of ſuch ſtriking monuments of revolution. It is not even neceſſary to travel in mountains, in order to receive the impreſſion of thoſe wonderful objects: *landſcape* painters and engravers have ſpread their pictures in every claſs of dwellings, from the ſumptuous palace to the humble cottage; ſteep mountains, threatening rocks, deep-winding valleys, waterfalls, tumultuous torrents, foaming between tumbled maſſes of impending caves, are the objects which they commonly intermix with ſofter ſcenes, for picturesque effect; and far from ever exceeding nature in that ruinous appearance of ſome parts of our *land*, they muſt ever remain much below the ſtupendous ſcenes which they attempt to repreſent.

If it were not for the vague idea of ſome geologiſts, that the *running waters*, working, ages after ages, on the ſurface of our *continents*, have ploughed down their deepeſt *valleys*, and have formed the *hills*, either by ſcooping the ſoil round them, or by raiſing heaps of rubbiſh, every attentive man would conſider thoſe objects with a curious eye; and finding on every *ſteep ground* evident marks of a *continued decay*, it would naturally occur to his mind, that ſuch an operation muſt have had a *beginning*, not impoſſible to be determined; and that its diſcovery might lead to ſome great event in the hiſtory of our globe. I ſhall then firſt remove that cauſe of incurioſity, by proving, that the *land-waters*, thoſe which have run over the ſurface of our *continents* ever ſince they exiſted, have had no ſhare whatever in the production of the ruinous appearance of ſo many of their parts, except along the immediate channel of ſome ſtreams: for if that queſtion is once determined beyond the power of diſpute, the phenomena which I have deſcribed, will re-aſſume the power that they ought to have had long ſince on thoſe who think nature worth obſerving: and that attention will anſwer a greater purpoſe than is commonly thought; which I will explain when all the previous queſtions have been thoroughly examined.

The *icy valleys* of the *Alps* are now known to moſt curious travellers; it is become the faſhion to viſit them: let then *faſhion* be, in this inſtance, uſeful to mankind, by aſcertaining ſome facts, the light of which, being ſpread over all the phenomena of the ſame kind, will render them equally great in their conſequences. To the viſitors of the *Alps* then, I appeal, for the exactneſs of what I am going to deſcribe; and from ſome of them I expect, that by their example, they will excite curioſity and attention to numberleſs objects, not ſo ſtupendous, but equally important in the hiſtory of the earth. Lofty and abrupt ranges of pyramidal rocks are the wonderful

borders of the *icy valleys* of the *Alps*; and every part of them is in continual decay. If *decay* and *propulsion of materials* by *running waters* had been the causes of the vast excavations manifested by the *sections* of the *strata* all around, every channel of the *waters* thence proceeding would be levelled with rubbish: for, the necessary effect of running waters propelling broken materials, is to fill up with them every hollow place, till all the grounds which they pervade, being reduced to a regular slope, they wander promiscuously over those spread materials. Let us then consult attentively the phenomena on that first leading question.

There is hardly any *water* that *runs* in those immense high *valleys* of the *Alps*: the waters that come down their steep sides, from rain or thaw of snow, pass immediately under the accumulated *ice* which fills them; where, constantly stopped in the points of bearing of the ice upon the ground, they *filtrate* more than they *run*. This is a first view of the object, which, in the very theatre of the greatest *past* devastations, excludes completely the idea that they have been produced by *running waters*; and the other following facts will only illustrate that peremptory exclusion. 1st, A part of the *waters* that come out of those valleys, falls in *cascades*, from the edges of steep rocks, over lower grounds: if *waters*, thus issuing from under the *ice*, had contributed to produce the vacancies now existing between the upper ridges, the rubbish carried off, accumulating up to those rocks, would have long ago prevented *cascades*, as it has happened in many parts of those mountains, where rubbish is really carried down. 2dly, In the lower outlets of the *icy valleys*, the *water* comes out of the *ice* in the same manner as some celebrated streams, *Arethusa*, *Vaucluse*, and others, come out at once from under some rock or hillock; that *water* has no open channel, till it has cleared the *ice*, and being first filtered through its crevices, it never brings out any other materials than coarse sand: surely, the immense quantity of materials missing in the upper parts, cannot have been carried away through such channels. 3dly, When those *waters*, being united in the first lower valleys, begin to form torrents, they often meet with narrow cuts, where they still undergo repeated falls between broken rocks; and these are the only passages through which any *water* can have come out of the same extent of high grounds, ever since the existence of our *continents*: now, if the materials missing in the upper valleys had been carried away by *waters*, that immense quantity of rubbish would have either stopped or widened those passages, and reduced the whole length of the channel to an equal declivity. Lastly, if it were objected, that the rubbish has been carried down by degrees to wider places, we should then come to a decisive proof of the contrary, from a fact already stated: many hollow places, now *lakes*, are pervaded by some of those accumulated *waters* ever since they ran; there the whole quantity of the rubbish which they have propelled, has remained, and it amounts to nothing, compared with the vacancies above.

I have begun this particular survey of our *continents*, by distinct and well-known parts of the great scene of ruin and devastation exhibited in the *Alps*; not on account of their great *vacancies* between *eminences* composed of broken and mouldering *strata*, which is a common phenomenon on the surface of our continents; but because of the peremptory proofs which we have in those parts, that *running waters* have had no share in the ruinous state of our *mountains*; and that consequently their *chasms* existed, *from the beginning of the present land, which was before in the bottom of the sea*; and now I shall give a similar demonstration, in respect of *abrupt eminences*. None of the deeply dissected tops of the immense ridge of the *Alps*, can be affected by any *water*, except that of immediate rain or thaw of snow, which, trickling down the rising grounds in a thousand rills, never unites on them in any stream capable of disturbing large or weighty materials; and consequently, the operations of the various causes designed by the collective word *weather*, may be observed there unmixed with any sensible effect arising from the impulse of *running waters*. Now, sir, those immense obelisks, which no *continental* cause can have produced, are as shattered as any part of the valleys where torrents are raging; and the only alteration produced on them by the *weather*, an alteration which still continues at a great rate, is that of softening their abrupt surfaces, without any sensible loss of their materials, which accumulate round the steep grounds whence they fall.

When a long-continued inattention to certain objects of nature, has rendered man insensible to them, he commonly remains so, till some object of the same class, but of a great magnitude, rouses his attention. Our soft *vales*, their rich meadows, their *rising grounds* covered with verdure up to picturesque *rocks*, have been in all ages attracting spots for men; there were the first settlements, and there still the traveller slackens his pace: but we do not expect to receive any important instruction from those objects, and, not being consulted, they remain silent. If the decaying ornaments of the bordering hills, those *rocks* boldly projecting with endangered trees over them, excite some degree of astonishment, it is soon dissipated by the vague idea, that *time past* has no bounds; and if some attention is given to *causes*, without which, *time* effects nothing, the innoxious *stream*, meandering in the *vale*, is charged with devastations, from which the *vale* itself is supposed to have proceeded: nothing, in that cursory manner of studying nature, stops the spirit of system; the space is wide open before the presumed thief; and his accomplice, as receiver of the boundless succession of thefts, is no less than the *ocean*: but in the great ridges of mountains, there are immense *excavations*, bordered also by ruin-like *eminences*; and we are absolutely sure, that the *materials* missing in those *valleys*, have not been carried into the *ocean*. Here imagination is stopped, and the astonishment of reason begins. I shall now suppose, that some attentive men, roused by that first fact, and conceiving great doubts on what has been maintained by some geologists on the operations of *running waters*, is resolved to observe for himself.

Our observer comes first into one of those *vales*, so numerous on our continents, where *rapid slopes*, covered with verdure and surmounted by *abrupt rocks*, are the winding borders of a space, the bottom of which is *levelled* and pervaded by a clear *stream*. Nothing in that quiet scene raises the idea of devastation; but our observer knows, that the now pacific water, sometimes swells, becomes *turbid*, overflows the meadows, and that, in some of its floods, it has produced great havock in the neighbouring grounds; and as this is the cause referred to by some geologists, he will not form any judgment on its effects, till he has some opportunity to see it at work. This may happen in autumn, when all the surrounding grounds having been soaked by a long continuance of heavy rain, the flood is greater than usual: rapid and turbid torrents rush out from all sides; the clear river is changed into a muddy pool, which covers the bottom of the *vale*; and trees carried down by the stream, are signs of a violent attack on some parts of the neighbouring grounds. Those unwelcome changes of scene may have lodged in many minds a prejudice which they might remove: nobody is fond of going in quest of knowledge, during such an inauspicious state of the elements: but our observer is resolute; and notwithstanding the inclemency of the weather, and the badness of the roads, he approaches the scene, where the wet and weakened grounds are attacked by the raging waters. In going up the main inundation he meets with muddy torrents, rushing from recesses of the *vale*; and there being stopped, he climbs by the sides of those *waters*, in order to examine their operations, and to find a passage higher up. There he first observes, that those swoln *rills* are only made *turbid*, because their channels are still too narrow for the quantity of water gathered in them: for, the sides of the sort of trough in which those

thoſe channels conſiſt, are *ſlopes*, formed of looſe materials fallen from the abrupt incumbent rocks; and the unuſual bulk of the rapid water which now paſſes in that trough, cauſes the baſe of thoſe ſlopes to be attacked, and ſome of their materials to be carried away. There alſo he obſerves, that all the *trees* now ſtanding on the upper parts of thoſe *ſlopes*, muſt tumble down ſucceſſively: for the looſe grounds on which they have grown are undermined; and the ſteep ſections of thoſe grounds, though out of the reach of the torrents, are gradually demoliſhed by the weather; thereby forming new *ſlopes* under thoſe which are now decaying. It is eſpecially from thoſe attacks of the *water* on looſe grounds, that it is made *turbid*; but at the ſame time he obſerves, that all the gravel, ſo torn, ſubſides as ſoon as the water comes to wider and leſs inclined parts of the channel, and that mere duſt is carried down into the main flood. Laſtly, in ſome widened parts of thoſe channels, he obſerves, that the new *ſlopes* formed under the ruinous ones, are, even in that extraordinary weather, out of the reach of the torrents; and he may judge, that, when every other part of the bottom of thoſe troughs ſhall be made wide enough to contain the ſame quantity of water in a fixed bed, the *ſlopes*, covered again with verdure, will remain unimpaired. Theſe ſide torrents are the feeders of the main flood below, and the ſame operations take place along the courſe of every one of them, up to the remoteſt *rill*, which is then alſo become a *torrent*.

Our obſerver has now entered on a diſtinct *field*; or what I ſhall call a diſtinct *ſyſtem of grounds*; in which he is ſure, that, ever ſince the origin of our continents, all the *rain-water* that has not immediately ſunk into the ſoil, muſt have followed the ſame courſe which it now purſues. He knows every part of that ſet of grounds where the *rain-water*, by gently following oppoſite declivities, divides itſelf between that *ſyſtem* and the next grounds which feed other *Rivers*, without any power of altering their original boundaries; and thence he traces in his mind, the firſt gathered *rills*, the forms of their various channels, the places of their meeting, many ſpots where they fall abruptly, and many where they abate their courſe. Comparing, then, what he has now obſerved of the effects of a heavy and laſting *rain* in that *area*, with its effects on other high grounds of equal extent, but whoſe declivities are regular and ſmooth, he is ſtruck with the idea, that the firſt ſmall *rills* produced by the firſt *rain* which fell on his *ſyſtem*, could not have gathered, ſo as to form thoſe diſtinct *ſtreams* which he has obſerved, if that *area* had not *previouſly* been interſected by deep *furrows* tending to a *lower place*: for, *rain-water*, the ſource of all our *continental waters*, has not the power of driving heavy materials, till it has acquired bulk and velocity; and being once ſettled in a channel, it cannot have any materials to drive along, except what may fall in its way. Now, the firſt of thoſe circumſtances muſt ariſe from *previouſly* wide and deep interſection of the ground, which alſo muſt have a great declivity; and the laſt can only proceed from originally abrupt and decaying ſides of thoſe excavations. Thence the preſent regular ſtate of ſo many high grounds, which, though *looſe*, are not interſected by *chaſms* on any of their declivities: their ſurface was originally *even*, and the firſt ſmall *rills* of the *rain-water*, remaining conſtantly ſeparate on that ſurface, have never acquired the power of digging *dales* and *vales* bordered with *ſteep* ſides. Such is the firſt general conſequence derived by our obſerver, both from his preſent remarks, and from all the facts which they recall to his mind; and on that previous point he concludes finally, that attributing the *deep channels* which interſect his *ſyſtem of grounds*, to the *waters* which are now ſeen pervading it, would be, taking for the *effect* of *ſtreams*, the very *cauſe* of almoſt every diſtinct *ſtream* on our *continents* from their beginning; namely, *original hollow tracks*.

A firſt ſettled point in ſuch inquiries is a firſt ſtep that may lead farther. Our obſerver now intends to examine, what has been the *real* effect of *running-waters*, for altering the *original form* of his *ſyſtem*; and in that inquiry he firſt compares the *ſides* of the *vale* with its *lower ground*. The inundation which he has obſerved, notwithſtanding its exceſs, did not reach the *ſlopes* of looſe materials, formed on the *ſides* of that *vale*, under the vertical *ſections* of the upper grounds; conſequently, the *ſtreams* cannot have had any ſhare in the *form* of thoſe *ſides*; they were originally ſteep and crumbling, and their rubbiſh has ſucceſſively formed thoſe *ſlopes* now covered with verdure: but ſince thoſe *ſides* were originally *abrupt*, it is not in the nature of things that they could then incloſe an *horizontal* ground: ſuch a *chaſm* was to have an irregular bottom, and muſt have extended below the preſent level; conſequently, that *horizontal ground*, extending from hill to hill in the bottom of the *vale*, muſt conſiſt of looſe materials carried down by the *ſide-torrents*. When our obſerver forms that conjecture, the *ſtream* is confined in its uſual bed, and much reduced by long dry weather: from that circumſtance, a deep ſection of the ground is left uncovered on the banks of the *ſtream*, and there his conjecture is confirmed; for the upper part of that ground is mere ſand, and the *fragments* of the *ſtony ſtrata* which compoſe the neighbouring hills, are ſeen in the loweſt parts of the ſection.

That *ſucceſſion* in the *ſediments* compoſing the horizontal ground of the *vale*, points out to our obſerver a ſort of *chronometer*; by comparing that ſucceſſive work of the *ſtreams*, with the ſtate of the *ſlopes* and *ſteep grounds*, in the channels of the *ſide torrents*: which channels, hereafter, I ſhall call *dales*. In a new ſurvey of thoſe, now quiet paſſages of mere *rills* or *rivulets*, he finds firſt, that many of them are ſurmounted, like a *vale* itſelf, by abrupt ſections of the upper grounds; and a greater proximity of their ſides permitting an immediate compariſon between them, he obſerves, in many places, that their *ſtrata* have no correſpondence, either in *direction*, *ſituation*, or *height*: which is a new proof that all theſe *chaſms* have been the effects of *convulſions*, antecedent to the preſent ſtate of our continents. He alſo remarks characteriſtic differences between moſt part of the *dales* and the *vale*; from which differences muſt have reſulted thoſe which are obſerved in the effects of *running-waters*. The *vale* was a wide and deep *chaſm*; the *dales* were narrow *crevices*, branching from that main one. The rubbiſh, which, from the beginning, has fallen from the abrupt ſides of the *vale*, has never been carried off by any external cauſe; the bottom of that wide *chaſm* became firſt a ſort of lake, along which the accumulated rubbiſh remained undiſturbed: but in the narrower and rapid *dales*, the firſt *fragments* falling from the ſteep ſides, met together in the bottom of the trough; and the *torrents*, whenever they were formed by heavy rains, drove them down to the *vale*; where they were ſpread by the united waters. None of thoſe fragments could remain in the rapid parts of the troughs, except what filled their hollow parts, and levelled ſome wide ſpaces; but every fragment carried farther, remained in the *vale*, where the water, from the extent of the ſpace, could not have any ſenſible degree of rapidity. All the hollow parts of the bottom of the *vale* were then to be filled and levelled, before any *fragment* could proceed farther: that operation, begun with *fragments*, has been finiſhed with *ſand*; ſince *ſand* only is found at ſome depth in the *horizontal ground*: conſequently, nothing but *ſand* can ever have been carried out of that *vale*, by the *waters* paſſing through it.

The preſent ſtate of the *dales* affords inſtances of the ſame phenomenon, and points out its cauſe. In going up ſome of thoſe paſſages, our obſerver finds, at ſucceſſively higher levels, ſome *horizontal grounds*, whoſe *ſections* on the banks of the contracted *rivulet*, exhibit the ſame order of materials that is obſerved in the *horizontal* ſoil of the *vale*: no large *fragments* are perceived in thoſe *ſections*, but in the loweſt parts; and conſequently, none

of

of thoſe proceeding from higher grounds, have paſſed farther. Theſe grounds lie in wide parts of the *dales*, which parts originally were hollow; and there alſo, as in the *vale*, the *ſlopes*, produced by the decay of the ſides, deſcend without interruption, from the upper abrupt parts (if any remain) down to the *horizontal ſoil*: thoſe *ſlopes* were formed originally round ſmall *lakes*, in which the ſpread *water* had no power to diſturb them; and thoſe *lakes* have been filled, firſt with *fragments*, and then with *ſand*; the whole proceeding from above: but in greater declivities and narrower paſſages, many of the *ſlopes* are divided in their height by abrupt ſections; the higheſt and moſt ancient parts being in decay, and new *ſlopes* having been formed under them. This is found in very deep parts of the *chaſm*, which receive a great abundance of water in times of flood, and are much wider overhead than in the bottom. In ſuch parts of the *dales*, the firſt *ſlopes* produced by their decaying ſides could only be preſerved ſo long as they did not obſtruct the courſe of the water: for when they came to meet, from ſide to ſide, they were ſoon deſtroyed, and their materials were carried away by the ſtream. Such demolitions were frequent, as long as the trough remained too narrow to contain a moderate quantity of water: but thereby the decay of the ſides was more rapid, as they remained uncovered with *ſlopes*; and the paſſage widened: but when, by thoſe repeated demolitions of the *ſlopes*, they were retired to ſuch a diſtance, as to be out of the reach of common floods, they roſe againſt the decaying rocks, and vegetation binding their ſurface, it was no longer ſuſceptible of ſliding down. However, thoſe firſt ſettled *ſlopes* were not yet ſafe; in extraordinary floods they were attacked at the bottom, and afterwards, while they were increaſing in height, from the continued decay of the rocks above, their abrupt ſections mouldered by the weather: thence *ſlopes* under *ſlopes*, the loweſt of which were from time to time attacked by great *torrents*, till they were removed out of their reach.

Such are the general claſſes of *ſucceſſive* operations, which our obſerver clearly traces on the ſides of his *dales*; and their varieties in different parts, may generally be aſſigned to determinable differences in the *original ſtate* of thoſe parts. Some *rocks*, for inſtance, peeping here and there out of the ſloping grounds, betray the original ruinous ſtate of thoſe ſides, and ſhew evidently that the *chaſm* has been the effect of a convulſion: immenſe pieces of rock were, at firſt, either projecting out of the broken ſides, or heaped againſt them; and now they are almoſt buried in a quantity of rubbiſh, which is, or will be in time, bound together by *vegetation*. In every part where thoſe ſloping grounds have already their baſe out of the reach of torrents, they are covered with verdure: the *rain*, which they can only receive from the air, ſinks into their porous ſoil; and being collected in millions of internal channels, it only helps to feed the ſprings. The moiſt part of thoſe grounds, though from a long time covered with *vegetation*, ſtill receives rubbiſh from the ſteep upper parts; but moſs, herbaceous plants, and ſhrubs, bind ſucceſſively thoſe layers of new ſoil into a tenacious cruſt, unimpairable by the weather. This is the cauſe why ſo few large fragments of the ſtill decaying parts of the *dales* are now carried down to the general receptacle: the fragments which, in their firſt fall, attain the bed of the torrents, or thoſe which are ſtill torn by theſe from their banks, if propelled as far down as the *vale*, ſubſide there, forming promontory-like accumulations over the general level. Nothing then, but *ſand*, is now, in the greateſt flood, floated by any of the *ſide-torrents*, when they meet together in the *vale*; and the whole quantity of that *ſand*, which cannot remain ſuſpended in water that moves ſlowly, as does that of the *vale*, is depoſited on the overflowed grounds.

Our obſerver has now accompliſhed the different purpoſes for which he had undertaken that exact ſurvey of a certain extent of grounds, which, from the *origin* of our *continents*, muſt have been drained by the ſame ſet of *channels*. The firſt of thoſe purpoſes was to diſcover, from the preſent ſtate of thoſe grounds, and the cauſe acting on them, the ſtate in which they were *when they came out of the ſea*; and he has found that they were to be interſected by great *chaſms*, the ſides of which were abrupt, and ſuſceptible of decay by the natural cauſes acting on our *continents*. His ſecond purpoſe was, to aſcertain the real effects of *running waters* in that *area*, and to diſtinguiſh them from thoſe which may collectively be aſſigned to the *weather*; and in this reſpect he has found, 1ſt. That a great impetuoſity is neceſſary for *ſtreams* to carry along any materials heavier than *ſand*. 2dly. That a great declivity is required to produce that impetuoſity. 3dly. That thoſe *waters* being the reſult of collected *rain*, become only impetuous by being aſſembled in *ſettled* channels. 4thly. That before thoſe *ſtreams*, once ſettled, can propel any looſe *materials*, theſe muſt fall in their way, by cauſes foreign to their own impulſe. 5thly. That looſe *materials* can only come into the beds of *ſtreams*, by falling from *ſteep grounds* lying along them. 6thly. That when, either at firſt or in time, the falling fragments of *ſteep grounds* find a ſuitable ſpace for accumulation, they form *ſlopes*, which riſe againſt the abrupt ſurfaces, and at laſt ſtop their decay. 7thly. That if, for want of a proper ſpace, thoſe *ſlopes* are at firſt demoliſhed by *ſtreams*, they themſelves, with the decaying grounds, retire thus by degrees to greater diſtances, till, placed at laſt out of the reach of their aggreſſors, they are covered by *vegetation*. Laſtly, That it is only during that ſettling of the *ſides* of their *channels*, that impetuous *ſtreams* have looſe materials to drive along; that thoſe materials, propelled in great declivities, ſubſide in every hollow place, or are ſpread in wide ſpaces which have leſs declivity; and that the *ſections* of thoſe *ſediments* exhibit at preſent the ſucceſſive work of *running waters* in time paſt.

The third and fundamental purpoſe of our obſerver, in analyſing thoſe operations, was to diſcover whether it were poſſible, by their help, to go back, with ſome degree of certainty, to the *time* when they *began*, and conſequently to the *origin* of our *continents*; and he is now ſatisfied that this view may be attained by a general *formula*, whoſe conditions, as pointed out by his *ſyſtem of grounds*, are the following: 1ſt. A certain *original ſtate* of things, to be traced up from the known *cauſes* which could *alter* it. 2dly. A meaſurable quantity of *alteration*, already produced by thoſe *cauſes*. 3dly. Continued *alterations* produced by the ſame *cauſes*, the quantity of which, in the life of a man, may be meaſurable. Laſtly, (as a check over thoſe points, when it is in the nature of the object,) a certain quantity of *alteration*, ſtill to be performed in ſome parts, to reduce them to the ſame *unalterable* ſtate already produced in other parts. This he conceives to be an incontrovertible manner of inquiring into the *age* of our *continents*: and though he finds it ſtill difficult to determine, with a certain degree of accuracy, thoſe quantities which are to ſerve as *co-efficients* in his *formula*; yet he conceives clearly, from the ſtate of things in that reſpect, as exhibited in every part of his *ſyſtem of grounds*, that what has vaguely been alleged for aſſigning a very great antiquity to our *land*, is void of any ſort of foundation.

The only certain way of finding general laws in a claſs of phenomena, is to begin by fixing on a well-determined phenomenon of the claſs, and then analyſing it accurately. This our obſerver has done; and thereby he finds himſelf warranted to conclude, that all the diſtinct *congeries of channels*, interſecting every *ſyſtem of grounds*, of whatever extent, whoſe *waters* proceed at laſt to the *ſea* in one *ſtream*, were, like that of his *ſyſtem*, original ſeries of *chaſms*, or of other ſorts of *hollow tracks*; and that, in the ſame circumſtances, the ſame operations which he has obſerved, muſt have taken place in thoſe *ſyſtems*: for a great *river* is only a congeries of leſs ones, ſimilar to that which came out of his *vale*; and the private *ſyſtems of grounds* whence theſe ſmall *rivers* proceed, are to the

grounds pervaded by the great *river*, as the *dales* are to the *vale* in the *ſyſtem* which he has ſurveyed. Conſequently, all thoſe *ſtreams* have fixed channels, determined by the *original form* of the ſurface of our *continents*; and, ſince *natural cauſes* act always in the ſame manner, by the ſame circumſtances, he cannot doubt that clear *data* for the calculation of the *age* of our *continents*, are to be found along many of thoſe *ſtreams*.

In the courſe of his ſurvey, our obſerver has taken notice of another claſs of phenomena, which appears to him clearly expreſſive of the little *age* of our *continents*. He has found, in the upper parts of his *ſyſtem*, ſcattered eminences, conſiſting of ſteep decaying *rocks*, which, from their ſituation, muſt have conſtantly been out of the reach of every poſſible *ſtream*, ever ſince their origin as *dry land*; along which he has found undiſturbed *ſlopes*, formed of fallen materials, and riſing againſt their abrupt and ſtill decaying ſides. That obſervation recalls to his mind many elevated *plains*, which alſo, ever ſince they have exiſted, muſt have been above the level of every *ſtream*; and on which, however, riſe inſulated *hills* or *hillocks*, compoſed of *ſtony ſtrata*, which, dipping one ſide into the ground, preſent their abrupt *ſections* on the oppoſite ſide. That claſs of phenomena ſtrikes him as a very important one: for thoſe *eminences* muſt have exiſted in a ſtate of *decay* from the *origin* of our *continents*; and the rubbiſh accumulated under their ſteep ſurfaces ſometimes bears no reſemblance to the ſurrounding ſoil. There then *progreſſes of effects* may be obſerved, unmixed with foreign cauſes of any importance; and the above general *formula*, for finding *time paſt* by *laſting operations*, may be applied to thoſe grounds with more accuracy than along *ſtreams*. The ſpirit of ſtrict analyſis being thus raiſed in our obſerver, he conceives laſtly this general idea, that all the *cauſes* which have acted on the ſurface of our *continents*, ever ſince they have exiſted, being known, and the nature of their *effects* being alſo determined, thoſe *effects* muſt be eaſily diſtinguiſhed from what exiſted before they took place; and that conſequently, a number of ſuch *effects*, (not only of different natures, as proceeding from different *cauſes*, but even without any connection with each other, excepting that of *time*,) might afford diſtinct *chronometers*, which, by their reunion, would lead to a *natural chronology*, overlooked till now, from a precipitate deciſion that it was not to be found.

I have now, ſir, under the aſſumed character of *an obſerver*, given you a ſketch of my own hiſtory, in a courſe of conſtant obſervation for above forty years. I conceived, very early, the importance of an exact determination of the *changes* which have happened to our *continents*, from the time of their exiſtence as *dry land*; and very ſoon alſo I perceived, that curſory obſervations could not afford any certain reſults in that reſpect. I then began to fix my attention on thoſe parts of the mountains, or other high grounds, which, from their elevation above every poſſible (either paſt or preſent) *ſtream*, could not have been affected, at any time, but by the direct action of *rain* or *ſnow*, and by their immediate conſequences. There, however, frequently finding the ſame great excavations, which, in lower grounds, are vaguely attributed to *running waters*, the fallacy of this laſt idea ſtruck me; and I firſt concluded, that thoſe *excavations* exiſted from the *origin* of our *continents*. There alſo I could ſtudy, without any poſſible miſtake, the effects of all the immediate cauſes which have acted on the *abrupt parts* of the ſurface of our *continents*, ever ſince they have exiſted; namely, the tendency of thoſe parts to moulder down by the effects of the *weather*; the progreſs of that *decay*; its tendency to an *end*, when the rubbiſh is undiſturbed; the cauſes that can diſturb it; and the *maximum* of their effects. That preliminary ſtudy enabled me, afterward, to diſtinguiſh, in other places, the real effects of *running waters*, from the effects of other cauſes, which are only rendered effectual by certain original ſtates of the grounds, eaſily traced back; and from that ſingle diſcrimination of cauſes, light ſucceeded to the obſcurity in which the phenomena of the ſurface of the *earth* had been involved by ſome geologiſts: for then, rendered attentive to *origins* and *progreſſes* of *natural operations* on our *dry land*, I found many different claſſes of them, which fix its origin at a time not very remote.

The importance of the final reſult of thoſe obſervations has made me deſirous to facilitate them to others, by ſketching a plan of reſearches, and pointing out the objects which are to be examined. That ſtudy is, in a great degree, almoſt within the reach of every man; for there is hardly any country which does not afford ſome of the claſſes of phenomena, which may lead to the *age* of our *continents*; and I have known from experience, what intereſt ſuch a fixed and endleſs object of obſervation can ſpread on the ſuppoſed loſt hours of *travelling* or *airing*. After a little practice in that kind of obſervation, the effects of the principal cauſes which have acted on every part of our *land*, may eaſily be diſtinguiſhed: the effects produced by each of thoſe cauſes, in former times, have left clear monuments: their preſent operations are ſeen; and the whole together affords various *meaſures of time*, which I ſhall next explain.

The following are the principles of inveſtigation which may enable us to diſcover the *time* when our *continents* began to exiſt.—1ſt, To find out ſuch *effects* as could only begin at that time, but muſt neceſſarily have begun then.—2d, To determine the mode of action of the *cauſes* which produce thoſe *effects*.—3d, To examine, whether the *whole* of the *operations* thus determined, may be known; by endeavouring to diſcover what was the ſtate of things in thoſe parts of our *continents* at their *origin*.—4th, To compare the *parts* of thoſe *effects* which have been performed within the memory of men, with the *whole* of what has been produced.—5th, To direct the ſame inquiry to various claſſes of *effects* having thoſe determined characters, in order to find out whether the ſeparate deductions drawn from them, coincide in reſpect of the *time* when their various *cauſes* began to act on our new-born *continents*.

Whatſoever be the claſs of *geological phenomena* which we examine with that view, the principles of enquiry are the ſame. It is evident, for inſtance, that all the *waters* which unite in one main *ſtream*, arriving laſtly at the *ſea*, proceed from a *ſet of grounds*, whoſe declivities tend towards that common receptacle: and that no material alteration can have happened to that *ſet* from the *beginning*; ſince, for the production of any change in that reſpect, the original *high boundaries* of the various *ſyſtems* of *grounds*, thus diſtinguiſhed, ought firſt to have been deſtroyed; while thoſe high lands are the very parts of our *continents* where the action of *running waters* is at its *minimum*, and conſequently incapable of producing any eſſential alteration in thoſe boundaries. That incontrovertible propoſition puts a ſtop to all wandering conjectures: each of the various *ſyſtems* of *grounds* whence a main *ſtream* proceeds, is the ſame that it was at the *origin* of our *continents*: and by ſetting out from that firſt reſult of theory and obſervation, I have clearly determined two diſtinct cauſes of alteration in the *original ſtate* of thoſe *ſyſtems*; one proceeding from the *decay* of their *ſteep parts*; the other from the action of *running waters*. The *effects* of thoſe two only cauſes of deſtruction, are as diſtinct as the cauſes themſelves; their *accumulation*, from the *time* when they *began*, is very conſpicuous; and their *progreſs* in a given *time*, is traced by *monuments*. From thoſe very intelligible phenomena, I have already demonſtrated that our *continents* have undergone but very ſmall and well-determined alterations; and in my preſent enquiry into their *age*, I ſhall begin by the ſame phenomena, in which we ſhall find various kinds of *chronometers*.

Let us return to the higheſt *boundaries* between ſeparate *ſyſtems* of *running waters* on our hemiſphere; namely, the *tops* of the *Alps*. There we find immenſe *ruins* of *ſtrata*, the moſt part of which, being turned up, form the towering ſummits of thoſe mountains. The chaotic ſtate of

thoſe

thoſe high grounds muſt have exiſted at the time when all the known cauſes acting on our *continents* began their action: for, not only the power of *ſtreams* is there at its *minimum*, but thoſe high valleys are filled up with *ice*, which prevents the propulſion of any large materials by *waters*: and as for the *duſt* and ſmall *gravel*, which ſometimes come out from under that *ice*, they have been ſtopped in hollow places, not yet filled with them; and their very diſtinct maſs cannot account for any ſenſible part of the *cavities* obſerved above. However, the broken *ſtrata* which ſurround thoſe *cavities* are conſtantly mouldering down: but the falling materials accumulate under them in the form of *ſlopes*, which ſhew ſenſibly the quantity of that *effect* from its *beginning*, coeval with our *continents*. Conſequently, the degree of *rapidity* in the decay of thoſe ſummits, may give us a firſt idea of the *time* when all the *continental* cauſes began to act. On that particular, I ſhall only uſe the expreſſions of a celebrated obſerver of the *Alps*, M. De Sauſſure. Among other material obſervations which he has publiſhed from a fortnight's ſtay, in July 1788, on the *Col-du-géant*, a ſummit of thoſe mountains elevated 1880 fathoms above the level of the ſea, is the following: "The water proceeding from the thawing of ſnow, filtrates conſtantly in the crevices of the inclined *ſtrata* of thoſe ſummits, and being expanded by froſt, it ſplits them aſunder. It is well known by all who frequent thoſe mountains, *that their rocks are conſtantly crumbling down*; but on the *Col-du-géant*, that phenomenon is impreſſed on the mind in a very forcible manner, by the frequency of the *reports* of cruſhing maſſes of rocks: I ſhall not exaggerate in ſaying, that we did not paſs one hour, without hearing ſuch *reports* as equalled the roaring of thunder, produced by the falls of rocks from the ſides of the *Mont-blanc*, of the *Aiguille-marbrée*; and of the very *eminence* on which we had fixed our ſtation." This is not a *ſlow progreſs*; and when compared with the *whole* that has been performed, it cannot carry us far back in tracing its *beginning*.

That fact is the greateſt of its kind exhibited on our hemiſphere; but the circumſtances and cauſes on which it depends, being common to a multitude of *grounds*, the ſame effects may be obſerved over the whole ſurface of the land. The vague operations attributed to *running waters*, veiled that important field of enquiry into the *age* of our *continents*: but attention only, with the moſt common knowledge of the laws of *hydraulics*, will now direct every obſerver, in finding out, within his rambles or in his travels, many *ſteep grounds*, which muſt have been ſuch from the origin of our *continents*. For that purpoſe it is ſufficient to examine, whether any cauſe, belonging to the preſent ſtate of things, can have either raiſed the ſteep eminences obſerved, or ſunk the ground before them. Thoſe objects, of great importance to geology, will be found, not in a few ſpots, but in millions; not in mountains only, but in hills and hillocks: they will be diſtinguiſhed along *ſtreams*; as the fancied effects of theſe are now exploded; by which means two particular *progreſſes* will be there obſervable, the ſmoothing of originally *abrupt chaſms*, and the ſettling of the *channel* of the *ſtream*. In that way of inveſtigation, founded on real principles, *vegetation* in particular, as aſcending over the *ſlopes* of *rubbiſh* under the *decaying grounds*, will afford, in almoſt every country, one of thoſe *chronometers*. Vegetation tends inceſſantly to take poſſeſſion of thoſe *ſlopes*, and it is only protracted by the falling rubbiſh. Many *ſlopes* are already fixed; the *ſteep grounds* from which they have proceeded, were, either leſs high, or more diſpoſed to crumble down, than others: but in numberleſs ſpots that operation is ſtill going on; and by comparing the *whole* that has been produced, as ſhewn by the maſs of the *ſlope*, with determined points in the *progreſs*, and examining in that reſpect, the ſteps upwards of *vegetation*, this general concluſion will be obtained every where, *that our continents are not very old*.

If the laws aſſigned to ſome great operation of nature be real, they generally are confirmed by various claſſes of phenomena, which have the ſame remote cauſe; and here we have many confirmations of that ſort. The *ſand* and ſmall *gravel* carried off from the great mountains, has been (as I have explained,) ſtopped in various receptacles, where, if it has not yet filled them up, it lies ſtill without any ſenſible loſs. Thoſe ſpaces, as they now are obſerved, have a general level, conſiſting partly of *water*, and partly of gathered *ſediments* of the *river*: which laſt are as diſtinct as the *water* itſelf, from the ſurrounding original boundaries of their common receptacle. The known *lakes* are the moſt conſpicuous inſtances of that kind; we find, in all of them, *new grounds* formed round the mouth of every *ſtream* diſcharged there. The *ſediments* depoſited by *rivers*, at their meeting that almoſt ſtagnant water, being conſtantly accumulated againſt the ſhore by the waves, are thereby raiſed ſome feet above the common level of the *lake*, and the moſt ancient parts are ſeldom overflowed. Theſe *new grounds* being very fertile, are inhabited, as ſoon as, by the help of ſome embankments, there is ſafety in ſettling upon them. Thus, traditions and records indicate the *progreſs* of thoſe acquiſitions of *lands*; and if, in conſulting thoſe hour-glaſs-like *chronometers*, we did not conſider that it has required more or leſs time for the firſt *ſediments* to riſe to the level of the water, the *calculated time* ſince thoſe *rivers* began to deſcend from the *mountains* would fall ſhort of what we know, from clear documents of hiſtory, on the *age* of our *continents*.

The whole of the operations performed by *rivers* along their courſe, affords the ſame reſult in various modes; but here I muſt confine myſelf to ſuch general outlines as may lead to particular obſervations. It is evidently againſt the laws of *hydraulics* to ſuppoſe, that a *ſtream* which, at its beginning, found a ſucceſſion of natural *troughs* in the interſected declivity of the grounds, has ſince changed its main courſe: but its inflections may have been altered; and as this is a proceſs which required *time*, it becomes alſo a *chronometer*. When a *river*, in following ſome original *troughs*, met with high grounds which ſtopped its paſſage, it was forced to change its courſe; but at the ſame time it attacked the obſtacle which repulſed it, and there began an operation which could only end when the *ſtream*, having acquired a proper ſweep, ſhould ceaſe to act againſt a ſteep bank. I ſhall not ſpeak of rocky channels, as no material alterations have been produced in their original forms: looſe grounds only can ſhew us the work of *ſtreams*; and in theſe it is very diſtinguiſhable, becauſe they have really cut ſome parts of their beds through them. When the *rivers* were firſt ſtopped againſt ſuch grounds, by undermining them, they formed a peculiar ſort of *cliffs*, very diſtinct from the *ſteep grounds* which had been produced by the convulſions of the *ſtrata* before the birth of our *continents*; for, in the firſt, there is always a horizontal ſoil oppoſite to them on the other ſide of the *river*, proceeding from the heavy materials fallen from the *cliffs* which have been accumulated on the parts abandoned by that river. Theſe *cliffs* then, being produced by *demolition*, gradually retreated; and the materials which continued to fall from them, accumulating at their foot, began to embank the *ſtream*. Such of the *cliffs* as thereby ceaſed to be attacked, continuing however to moulder down, were reduced into *ſlopes*, ſoon covered by *vegetation*; and ſo *ended* the deſtructive power of the *river* in ſuch parts, by its *bed* being there *ſettled*. Theſe are the evident operations performed by *rivers* in their originally ſhort *turnings*; which effects have been either favoured or retarded by particular circumſtances, eaſily diſcovered on almoſt every ſpot. If that operation is completed the *cliffs* firſt formed, are ſeen at ſome diſtance, either cultivated or covered with verdure; and *horizontal grounds* are found on the oppoſite ſide of the *river*; and if the *cliffs* are ſtill attacked, the inhabitant of the ſpot can generally aſcertain what demolition has been performed in known times. In this laſt caſe, conſi-

dering the parts where the attacks muſt have begun, and the extent of the *horizontal grounds* oppoſite to the *cliffs*, the private hiſtory of thoſe ſpots, which, in point of *chronology*, is the ſame as that of the *continent* itſelf, is eaſily diſcovered. I have frequently obſerved phenomena of that kind; and I am convinced, that every body who will dedicate ſome time to that ſtudy, will wonder why it has been ſo often repeated by geologiſts that our *continents* are *very old*.

In this ſketch of the temporary deſtructive operations of the *rivers*, we find, at the ſame time, the origin of the *ſediments* which have formed, and are ſtill forming, *new grounds* along their beds, and the reaſon why that *progreſs*, which evidently has been at firſt very rapid, tends now to ceſſation. No *large materials* can be *floated*; and as for their being *impelled*, this cannot happen except in narrow ſteep channels. But the *ſand* is *floated* at firſt, and it only ſubſides when the *water*, having a ſufficient ſpace for ſpreading itſelf, loſes its rapidity: there its accumulation forms *new grounds* along the *river*, which maintains its courſe through them; but that operation alſo is diminiſhing every where, as the demolitions above become leſs and leſs. This again may be obſerved in ſome parts of almoſt every *river*, with circumſtances indicate the *beginning* and the *rate* of the *progreſs*; but I ſhall confine myſelf to one example. The *Rhine* and the *Mozelle*, in coming out of narrow valleys, meet together in an open ſpace where the town of *Coblentz* is ſituated. I happened, in the year 1778, to be there at a time when a great excavation had been made on one of the banks of the *Rhine*, a little above the confluence of the two *rivers*, for the building of a palace. The late M. La Roche, chancellor of the elector of Trieſt, a learned and obliging man, ſuperintended theſe works, which I viſited in his company; and on the ſpot he informed me of ſome circumſtances that had been obſerved before I came there. The whole of the facts concerning that place are worthy to be recorded, as they are now covered by the thick and long-laſting veil of a magnificent palace. In the lower part of that excavation, I ſaw large rounded ſtones, ſuch as muſt remain in every part of the bed of a *river* when it ceaſes to be boiſterous. Over thoſe ſtones, forced out of the valleys by the ſtill raging *rivers*, have been laid irregular *ſtrata* of ſmaller and ſmaller *gravel*, intermixed with *ſand*; and the uppermoſt *ſtrata*, to a thickneſs of about eight feet, are mere *ſand*. The *Romans*, in their conqueſt of Germany, encamped along that part of the *Rhine*, where they have left various kinds of monuments: the ſpot here mentioned was one of their *burial* places; for which purpoſe they had ſunk *wells* in the *new ground*, as it then exiſted. Many of thoſe *wells*, containing *urns*, various other *ſepulchral attributes*, and ſome *legion-ſtones*, were diſcovered in making the above excavation; and I ſaw ſtill on its ſides, the ſections of two of them, the contents of which, taken out when they were firſt opened, were ſhewn to me by M. La Roche. Theſe ſections, which I could exactly obſerve, were in the ſmall *gravel* mixed with *ſand*, and had been filled up to its level; and all the other *wells* had been found in the ſame ſituation: conſequently, it is from that time that the accumulation of eight feet of *ſand* has happened; and now the *river* never riſes to the level of that *ſand*, but in the moſt extraordinary floods. Here then we have, not only a clear *ſucceſſion* of effects, ſhewn by that of the *ſtrata*; but ſuch a *ſucceſſion*, as anſwers perfectly to the nature of the operations by which the *beds* of *rivers* have been fixed as they are at preſent; and an *hiſtorical monument* is found in ſuch a ſtage of that *progreſs*, as precludes abſolutely the ſuppoſition that our *continents* are *very old*.

I ſhall now proceed, with the ſame *river*, to the *ſea-ſhore*, there to meet another *Roman monument*, which contradicts many other geological hypotheſes. Some geologiſts in particular, with a view of ſupporting the opinion that our *continents* are gradually demoliſhed by the *rivers*, have alleged a fact, little known in its nature, that of the *Rhine* having been prevented, by an accumulation of *ſediment*, from continuing to reach the *ſea*. Many important phenomena are connected with that fact, for the determination of which I muſt now reſume, with more particulars, the operations going on along the *ſea-coaſt*, which I only ſlightly ſketched before. In the courſe of that expoſition will be ſeen, what is the real fact in reſpect to the diſcharge of the *Rhine* into the *ſea*, and that it is totally foreign to the above-ſuppoſed cauſe.

Speculative geologiſts have ſuppoſed various kinds of imaginary operations, as performed on our *coaſts*; and they have attributed alſo imaginary effects to real cauſes. There are only three general *operations* really going on around our *continents*; and they are ſuch as exclude every idea of a *ſlow* change of the *level* of the *ſea*, and of any ſort of production of new *continents* while others are deſtroying: each of thoſe *operations* having a very decided character, which implies particularly, that it is tending to an end. The firſt of them, ſtill performed by the *ſea* on ſome parts of our *coaſts*, has been conſidered by ſome geologiſts, as a cauſe of deſtruction of the *continents* themſelves, either on every coaſt, or in ſome particular direction, according to various ſyſtems. That operation however is nothing more than the demoliſhing and ſmoothing of what remains within the reach of the ſea, of *abrupt ſections* of the *land*. For the ſupport of thoſe ideas, inſtead of argument, pompous and terrifying deſcriptions of ſtorms have been uſed; but they vaniſh at the appearance of theory alone, as the raging waves (their acting cauſe) die away on the ſhelving ſhores. The *ſea* has no deſtructive power over *coaſts* which do not impede its motions; it could not therefore produce *cliffs* where there were none originally: it has only attacked the parts of the *coaſts*, which, at the revolution which changed its beds, remained ſteep by the rupture of *ſtrata*; and the effect of that operation has been, and is ſtill in ſome parts, the reduction of thoſe *cliffs* into *inclined planes*, on which, when brought to a proper declivity, the operation is at an end. This I have before ſufficiently explained.

The ſecond *operation* performed along our *coaſts* is the gathering of the *ſediments* carried there by the *rivers*: which effect has been conſidered as a ſign of the deſtruction of our *continents* by the *waters* running on their ſurface. I have refuted that idea in its principle; and, from what I have proved in that reſpect, it is evident, that the *rivers* will carry leſs and leſs *ſediments* into the *ſea*, as their channels ſhall be nearer to a complete ſettlement. The laſt *operation*, which ſtill continues on many of our *coaſts*, is the waves and tides bringing up materials from the bottom of the *ſea* againſt the *ſhore*; which has been conſidered by ſome geologiſts as the productive cauſe of our *continents* by *ſlow* progreſs, either all around them, or on one ſide, while the oppoſite ſide is ſuppoſed to be deſtroying. But I have proved that this *operation*, by its nature, is alſo temporary: it takes place only on ſhallow and moveable bottoms, and it muſt ceaſe when the *ſea*, by thus extending the *ſtrand*, becomes deeper near it. Theſe three deſcribed operations, I repeat, are the only general ones known to be performed on our *coaſts*; and it is very evident that they cannot have had, at any time, any influence on the *exiſtence* of our *continents*; they being only cauſes of ſome *alterations* of their *boundaries*: the firſt of them, the only one that could diminiſh their extent, has operated very little, and in but few parts of our *coaſts*; while, in other parts, theſe have made very conſiderable *acquiſitions* by the two laſt cauſes: and as theſe *additions* to our *land* have been produced *by degrees*, I ſhall now explain how they afford us a new kind of *chronometer*.

Many parts of the bottom of the *ſea*, probably the greateſt part, conſiſt of a very fine hard *ſand*, incapable of binding by itſelf, and ſo eaſily moved, that, when brought up and dried on the ſtrand, the wind blows it about; unleſs it mixes, near the ſhore, with the *clayey ſediments* of *rivers*. When that mixture does not happen,

and

and the wind drives the *ſand* along the ſhore, a curious proceſs takes place, which is, that in the parts where the ſea-water does not reach, many plants which prefer *ſand* to other ſoils, as *ſalix arenaria*, *carix arenaria*, ſome *thiſtles*, &c. grow on that *ſand*, and ſtop that which flies about along the ſhore; for it ſubſides between thoſe plants which impede the velocity of the wind. Thereby, on every ſandy *coaſt* of that kind, repeated ridges of *ſand-hills (dunes)* have been formed; and thoſe natural *dikes*, which preſerve the loweſt lands againſt the *ſea*, are, by the ſame operation, conſtantly increaſing in height and breadth. If the coaſt is inhabited, and then ſome partial demolition is produced in the *dunes* by ſome violent whirl-wind, it is ſufficient to plant on the beach ſmall *tufts* of ſtraw, for the wind itſelf to repair the damage, by the flying *ſand* ſubſiding between the *tufts*, and new plants growing in it. But when that ſame *ſand* happens to mix under water with the *ſediments* of ſome *river*, it then binds, and when brought out of the *ſea*, it accumulates, and forms *new land* along the *coaſts*.

In order to exemplify the effects of thoſe two cauſes, which I have obſerved on many parts of the boundaries of our *continent*, I ſhall fix on a well-known part of the *North-ſea coaſt*; that of *Holland*, which is comprehended between the two *new lands* called *Zealand* and *Frieſland*, and lies between two branches of the *Rhine*. That *river*, at ſome diſtance from the *ſea*, divides itſelf into three *branches*, two of which, the *Iſſel* to the north, and the *Waal*, connected with the *Meuſe*, to the ſouth, include that ſpace; in which alſo is comprehended the third *branch*, which, as it tended the moſt directly to the *ſea*, retained the name of *Rhine* when the main *river* received it. Every *new land*, being laid *horizontally*, and compoſed of various recent *ſediments*, is always very diſtinct from the *continental land*, which riſes irregularly above that level, and is of a different nature. The *continental land* of the whole *North-ſea coaſt*, conſiſts of *ſand*, variable in its nature, and variouſly mixed with fragments of *flint* and *quartz*, ſometimes alſo with gravel and blocks of *granite*; and it extends in that manner to a great diſtance from the *ſea*, over hills and plains. The boundaries of that *continental ſoil*, which were the original *coaſts* of that *ſea*, are almoſt as diſtinct now as if the *ſea* ſtill bordered them. In the ſpace which I am now deſcribing, their waving line comes down near the mouth of the *Iſſel* in the *Zuyder-ſee*, it paſſes near *Utrecht* acroſs the channel called *Rhine*, and at *Moerdyk*, a Dutch village on the part of the original *coaſt* where the *Waal* came firſt to the *ſea*, at a little diſtance from the ancient mouth of the *Meuſe*. Such then was evidently the *original* ſtate of that part of the boundaries of our *continents*. It is to that determined part of the new-born *continent*, that *Holland* has been added; and here we have one of the moſt complete examples of both operations by which our *land* has received an increaſe of extent. The bottom of the *North-ſea* conſiſts entirely of the light *ſand* above-mentioned, and the water is very ſhallow at a great diſtance from the *coaſts*; which are the principal cauſes of the great tracts of *new lands* that now border on that ſea. In the ſpace here fixed, a *new land* was ſoon formed in an extent of thirty-five or forty miles forwards; conſiſting firſt of *clayey ſand-banks*, alternately formed of *ſea-ſand* and of the *ſediments* of the *rivers*; which *banks*, by degrees, united with each other, and with the *coaſt*; while, from time to time, ſtreams of *peat* ſlided over them from the ſkirts of the *continental land*; and when, by the action of tides and waves, thoſe *ſediments* had riſen above the moſt ordinary level of the *ſea*, *peat-moors* were formed on ſome parts of their ſurface. That addition to the *continent* might have extended much farther, on account of the ſhallowneſs of the *ſea*, if the quantity of *ſand* there accumulating had not exceeded the power of the *ſediments* of the *rivers* to bind it: but early in the courſe of thoſe operations, a long ridge of *ſand-banks*, which paſſed on the fore-part of the growing *new land*, and extended much farther on a line bending to the north-eaſt, being arrived at the common level of the water, *ſand-hills*, or *dunes*, roſe over them, forming a ſtring of *new iſlands* along that line. Thus the extent of the *new land*, which was afterwards to be pervaded by the prolonged three branches of the *Rhine* and the *Meuſe*, was fixed to the ſpace there incloſed by the *dunes*; where confuſed *ſediments* of *clay* from the *rivers*, of *ſand* mixed with *ſhells* from the *ſea*, and of *peat* from the *continental land*, roſe firſt up to the common ſurface of the water: after which, every inundation adding new *ſediments* over thoſe *marſhes*, their ſoil roſe ſo as to be overflowed only in times when great floods of the *rivers* concurred with great tides of the *ſea*.

That circumſtance, of the *new land* here in view being ſo protected againſt the *ſea* on its fore-part, gave riſe to the celebrated nation of the *Belgi*; as, in order to enjoy quietly the *land* within the *dunes*, which was very fertile, and in a ſituation favourable for the communication between the *ſea* and the continent, it was ſufficient to embank the *rivers* againſt their temporary riſings: which at that time was eaſily executed; and this *new land* is probably the firſt that has been *incloſed* on thoſe *coaſts*: a circumſtance to which I ſhall more particularly attend. The middle branch of the *Rhine*, which retained its name, continuing then to flow down to the *ſea*, was conſequently embanked, and it became the moſt direct communication between the *ſea* and the land. Such was the ſtate of the *Belgic coaſt*, when the *Romans* took poſſeſſion of it; and, conſidering its favourable ſituation for trade, they raiſed a toll on the veſſels at their entrance into the *ſtream* called *Rhine*: for which purpoſe they built there, on the ſea-ſhore, a *toll-houſe*, the *ruins* of which ſtill remain, ſunk in the ſand below the common level of the ſea. Thoſe *ruins* have been ſeen ſometimes at very low water, and round them were found many old *coins* of various northern nations then trading with the *Belgi*, and ſome *legion-ſtones*. Since thoſe times, the ſcene has much changed on that *coaſt*; and to begin by the pretended *obſtruction* of the *Rhine*, (as M. DE BUFFON calls it,) the *ſea-ſand* having continued to accumulate along the *dunes*, and theſe to extend, the mouth of the *branch* called *Rhine* was ſtopped, and the *dunes* united together over it. The communication of that *branch* with the *ſea* being thus cut off, it was turned into an inland channel, by ſtopping the entrance of the water into it from the land; and ſince that time the *river Rhine* diſcharges wholly through its *branches*, the *Iſſel* and the *Waal*.

The above is the main hiſtory of the *new land* now called *Holland*, from its beginning, coeval with the origin of our *continents*, to the time when the middle *branch* of the *Rhine* was ſtopped; and before this laſt epocha, the *Romans* had ſettled on its ſhore: what remains then to be determined in reſpect of *chronology*, is, what may be the length of the *period* anterior to that *hiſtorical event*. A fact will lead us to that determination; and at the ſame time will ſerve to explain ſome other alterations which have happened on the *Belgic coaſt* ſince the epocha of its conqueſt by the *Romans*. The ſoil of that *new land* ſunk conſiderably after it was *incloſed*; which made it neceſſary, at different times, to raiſe the dikes which were alſo ſinking, and to increaſe their breadth. Hence the ſurface of a great part of that rich *peninſula* has long lain below the level of low water in the *rivers*; and the rain-water, which, at the beginning, was diſcharged through *ſluices* at every returning tide, muſt now be all pumped out; and, in ſome parts, from a depth of fifteen feet from the level of the loweſt water in the *rivers*. This will firſt account for ſome events, which being little known by a certain claſs of geologiſts, they conceived that the *ſea*, by its attacks on our *continents*, is conſtantly encroaching on them. The moſt famous of thoſe events are three irruptions of the *ſea* in the *new land* above deſcribed; the firſt of which, in the year 1222, invaded its north ſide, and formed there the gulf *Zuyder-ſee*, on the part where the *Iſſel* had prolonged its courſe through the ac-

cumulated *new ſoil*; and the two others, which, in 1421, and 1446, formed alſo many gulfs, in the ſouth part of the ſame *land*, on the prolonged courſe of the *Waal* and the *Meuſe*: to which irruptions, ſome more recent, that happened from the ſame cauſe in ſome parts of the *Baltic*, eſpecially in the peninſula of *Jutland*, have been added by this ſame claſs of geologiſts. Theſe are, indeed, dreadful events in the hiſtory of mankind: for thouſands of inhabitants periſhed by the entire ſubmerſion of their dwellings, which even ſunk into the ground, that was then reduced again to mud: but in reſpect of the *continent* itſelf, it loſt only a part of the *new lands*, which, having been *too early* incloſed, had already ſunk below the loweſt level of the *ſea*. It is eaſy to conceive, that a high and agitated *ſea*, breaking the *dikes* of ſuch *lands*, fell over them with an impetuoſity capable of reducing their looſe ſoil into mud, and to waſh it away. A great part of the beautiful country of *Holland*, the remains of the *new land* above deſcribed, would be expoſed to the very ſame accident, if, from the opulence and greater knowledge of the inhabitants, there were not a ſtrict watch kept, and great expence beſtowed on every part of its *dikes*; for maintaining them in conſtant repair: for, if the *Zuyder-ſee*, or the main *river*, were to break open thoſe *dikes*, that country would be loſt paſt recovery, up to the *continental land*; which was the caſe in the above irruptions; and there would remain only a ſtring of *ſand-iſlands* bordered with *dunes*, as thoſe are which range before the entrance of the *Zuyder-ſee*, and extend, at a certain diſtance, round *Zealand*.

We know then the real cauſe of thoſe dreadful and irreparable ſubmerſions of ſome *new lands*: thoſe which have undergone that fate; had been *incloſed* at *too ſmall a diſtance of time* from their *formation*, or from the *origin* of our *continents*, when the ſediments of the *ſea* and of the *rivers* began to gather in thoſe places. *New lands*, ſo formed, require a certain length of *time* to ſettle and become firm. While yet unincloſed, though raiſed above the common level of the *ſea*, they ſink alſo for a long time; but as long as they are lowered by that cauſe, they continue to be overflowed by the *ſea* and the *rivers* every time they riſe above a certain level; whereby the *low lands* receive new *ſediments* on their ſurface, till at laſt they become firm. But if a new land is *incloſed*, only becauſe it is but ſeldom overflowed, and without conſidering its *age*, ſinking then, without receiving new ſupplies of *ſediments* on its top, it may be depreſſed below the loweſt level of the *ſea*: which was the caſe of the *new land* between the *Waal* and the *Iſſel*. But ſome *new lands* have not been ſo early *incloſed*, and we have an object of compariſon in that reſpect, from a *new land* next to that firſt, between the *Iſſel* and the *Eems*, which will lead us to an eſtimate of the length of *time* that may prevent ſuch *ſinking*. The *new land* which we have now in view, is a *peninſula* that contains the *low grounds* belonging to the provinces *Frieſland* and *Groninguen*. When the inhabitants of that country undertook to improve their *new lands*, they did not *incloſe* them: their ſettlements were on the edge of the *continental land*, where are now the towns of *Groninguen*, in the province of that name, and of *Leeuwarden* in that of *Frieſland*; whence they began to cultivate the low land, though ſtill expoſed to inundations. By cutting ditches and channels, they obtained materials for raiſing the ground in ſome places, where they built their farm-houſes and ſome villages, which thus were ſecured againſt the floods. I have ſeen thoſe materials; they are a clayey ſea-ſand, mixed with *recent ſhells*. At that time the inhabitants could cultivate no grains but what were ſown in the ſpring, and ſometimes they even loſt their crops; but in the mean time the land was improved, and it roſe yearly; for the water, by riſing and retiring ſlowly, always left new *ſediments*, which were very fertile, and at the ſame time compenſated the *ſinking* of the maſs: and when thoſe *lands* became *firm*, they increaſed ſenſibly in height. This has been the practice on many other parts of thoſe *coaſts*, where the inhabitants were not rich enough to be bad economiſts.

In the ſixteenth century, a great tract of *new lands* in both the above provinces was only expoſed to temporary inundations in winter: and GASPARD ROBLEZ, a Spaniſh governor, undertook to incloſe it with *dikes*. That work was completed in 1570; but as the outward new lands, though ſtill expoſed to frequent inundations, were of a ſufficient *age* for being *firm*, a century more brought an almoſt equal tract of thoſe *lands* to the ſame ſtate as the firſt, which then was alſo *incloſed*. The *progreſs* of that *increaſe* has not yet been checked, becauſe of the range of *new iſlands* formed in the *ſea* at ſome diſtance, which prevents too great an acceſs of *ſea-ſand*; by which means the ſediments of the rivers are ſufficient for binding the *ſand* on the fore-part of the *new lands*. Every generation, by private undertakings of the inhabitants next to the *ſea*, incloſes ſome new parts of thoſe extenſions, and no *ſinking* is obſerved within the *dikes*. The incloſers always leave out of their *dikes* the parts of the new grounds which are ſtill expoſed to frequent inundations: they afford paſture for their cattle during a great part of the year; and every time that they are overflowed, they improve for future generations. Now, had we only that well-known *progreſs* of an *operation*, which *muſt* have *begun* at the *origin* of our *continents*, nothing could contradict that proof that they are not *very old*: and when we compare alſo the ſteadineſs of that *peninſula*, incloſed only in 1570, with the ſinking of the next, the remains of which is *Holland*, there can be no doubt, that the *Belgi* incloſed the laſt at *too ſmall a diſtance* from its *origin*.

I ſhall now reſume that particular demonſtration under a general view. Wherever there is an *increaſe* of *land* by the influence of the *ſea* and *rivers*, it is very eaſy to diſtinguiſh the *original boundaries* of the *continent*, from which the *new land* may be meaſured; and if there is any *monument* or *record*, that determines ſome *ſtage* in its *progreſs*, the *ratio* between the *increaſe* from that *point*, and what had been produced before, is a real *chronometer*. I have made that ſort of obſervation on many parts of our *coaſts*, and I have always found the ſame general reſult. All thoſe *patched* works have begun at the ſame time; and their differences, in extent and rapidity of progreſs, proceed from a combination of the depth of the *ſea* near the *coaſt*, with the nature of its bottom, the ſituation of the *coaſt*, and the quantity of *ſediments* of the *rivers*. The outward aſpect of thoſe *new lands* is ſufficient for diſcerning them, but their compoſition ſerves alſo to diſtinguiſh them in depth, by boring through them. This has been the caſe by the want of *freſh water* for their inhabitants: they ſink *wells* through the *patched land*, and, when they attain the *original ſoil*, they often find in it *ſprings* which filtrate in the prolonged *ſtrata* of the next *continental ground*.

So far, ſir, I have only followed your own directions: I have examined various *progreſſes* going on by *natural cauſes*, namely, the actions of *gravity* and of *water*, from the *tops of the mountains*, to the *ſea-ſhore*; and in that ſurvey I have ſhewn you various *modula* for the calculation of *the time elapſed ſince the origin of our continents*. But theſe *proceſſes* are only ſome particular claſſes in the variety of different *effects* which were to begin at the ſame *time*, from known *natural cauſes*, when ſuch a revolution took place as formed a *dry land* from what was before the *bottom of the ſea*. At that *time*, every effect obſerved on our *continents*, except their general ſhape, and the nature of their *materials*, began to take place, and has continued ever ſince: conſequently, if, by following the ſame principles of inveſtigation, applied to different *proceſſes* depending on diſtinct *cauſes*, we find, in reſpect of the *time* when they *began*, the ſame general reſult as from the former; that agreement will produce a degree of certainty in our inveſtigation, much beyond what would have appeared to you ſatisfactory, from only one claſs of unequivocal phenomena.

Since our *mountains*, which have been *under* the *ſea*, are

NOW

now *above* it, a change muſt have happened in their comparative *level*. Therefore, if any phenomenon can lead us to eſtimate how long it is ſince that change of *level* took place, it will be a new means of diſcovering the *age* of our *continents*. The *level* of the *ſea*, whatever be its abſolute *height*, is the loweſt, and *(cæteris paribus)* the *warmeſt* part of the *atmoſphere*; it was ſo before the *revolution*, and it remained the ſame after it. But in reſpect of our *mountains*, a great change happened: ſuppoſing that their *tops* were already *iſlands* in the former *ſea*, or that they were ſtill under it, at that *epocha*, either by the *ſea* ſubſiding, or by their riſing, they were placed in a *colder* region of the *atmoſphere*; and conſequently, every effect proceeding from that diſtinct new circumſtance, *began* at that *time*: a *temperature* often near the *freezing point* on the tops of high *mountains*, (of the *Alps*, for inſtance,) produced frequent falls of *ſnow*, the thawing of which happening to be leſs than its production, the yearly exceſs of this, transformed partly into a ſpongy *ice*, began to clog their upper valleys, and to cover the inclined ſurfaces that could retain it. When thoſe accumulations had much increaſed, the weight of the *ice* made it ſlide down; which was effected by the *ice* thawing on its ſides, which diſengaged it from the rocks, and by its breaking acroſs the ſlopes, from its tendency downwards. In that manner, the accumulated *ice* entered various channels, through which it ſlided down in the form of *lavas*; and when it had attained a *warmer* region, it there thawed, rapidly, every ſummer. That ſtate of the accumulations of *ice* in the *Alps*, which brought them on the whole to a regular *progreſs* of *increaſe*, was produced after a certain time; and as it ſtill continues, it becomes a new *chronometer*, abſolutely independent of thoſe that we have conſidered before. The faſter thawing of the *ice*, when it has attained the lower valleys, depending in many reſpects on local and accidental circumſtances, does not afford a juſt idea of the *progreſs* of the *ice* in thoſe mountains: on the whole, it would there appear at a ſtand, the *lavas* of *ice*, called *glaciers*, ſometimes advancing, at other times retreating: but that *progreſs* is very obſervable in the upper parts; for each generation tranſmits to the following, ſome account, either of the formation of new laſting heaps of *ice*, or of the extenſion of old ones, ſo as to fill up paſſages which till then had remained open; and many ſuch ſigns of continued *increaſe*, are even within the memory of individuals. Therefore, it is impoſſible to ſuppoſe, that our *continents* are very old; for, if that were the caſe, the upper region of thoſe mountains, in every part that could retain *ice*, would be at this time incruſted with it.

From the revolution which produced our *continents*, another alteration happened on the ſurface of our globe relating to *temperature*, the *cauſe* of which is not here my object, except, in this reſpect, that it is quite different from the former; as for the *effect*, it is an *accumulation* of *ice* in the *polar regions*, which is ſtill going on. We have alſo ſome meaſure of a *rate* of *progreſs* in this effect; on which I ſhall only quote the following paſſage, in a paper written by Dr. BLAGDEN, *Phil. Tranſ.* vol. lxxiv. p. 231. "Since our northern navigations, the coaſt of *Weſt Greenland*, and its ſurrounding *ſeas*, have *gradually* become more and more *inacceſſible* on account of *ice*." Here then, *obſervation* embraces alſo a *proportional part* of the *whole* effect, from which we may conclude, that, with ſo rapid a *progreſs*, if our *continents* were *very old*, all thoſe *coaſts* would be *inacceſſible*. It might be ſaid, from BUFFON'S hypotheſis, that our globe is cooling; which would account for undetermined progreſſes of ice: but that inconſiſtent naturaliſt has acknowledged, that the very reverſe is the reſult of a compariſon between recorded ſymptoms of *temperature* in ancient times, and what we obſerve now. Beſides, that objection is precluded by various ſubordinate phenomena of the growing *ice*, ſome of which have been pointed out by M. DE SAUSSURE, who, from a long and attentive ſtudy of the *Alps*, has formed the ſame concluſion that I have in reſpect to the *age* of our *continents*.

I have ſaid, that no large fragment of rock can be removed, by the impulſe of *water*, from the upper valleys of the *Alps*; ſince thoſe valleys themſelves, and every channel from them to lower valleys, are filled with *ice*: but ſome of thoſe fragments, and very large ones, are tranſported on the *ice* itſelf. Thoſe *blocks* fall on the *ice* from the ſteep ſides of the adjacent mountains; and if, by their acquired velocity, they roll over its ſurface, ſo as to attain ſome part of its ſluggiſh *ſtream*, they follow it down to the next low valley, and are there depoſited on thoſe ſpots where the *ice* entirely thaws under them. There is always ſome ſuch *block* on its long journey down; and it is eſpecially from obſervations on their *march*, that the ſlow motion, downwards, of the whole maſs of *ice*, has been diſcovered, and in ſome degree determined. M. DE SAUSSURE explains that proceſs, and then adds: "From theſe *blocks*, accumulated at the end of the *Glacier-des-bois*, (valley of *Chamouny*,) reſults an important remark. Conſidering that they are depoſited on that ſpot as the *ice* thaws which brings them down, it is ſurpriſing that they are not in *greater number*. That fact, *concordant with many others which I ſhall ſucceſſively mention*, leads us to think with M. DE LUC, that the preſent ſtate of our *continents* is not *ſo ancient* as ſome philoſophers have conceived it." See *Voyages aux Alpes*, ſect. 625.

You may judge now, ſir, that it was not ſo difficult as you thought, to find ſome means of enquiring into the *age* of our *continents*: it required only to reflect on the various effects that were to *begin* at their origin; and then to fix on ſome ſuch an effect, the *progreſs* of which might be obſerved, and to apply to that obſervation: I have deſcribed ſome of thoſe effects, and their reſult; but almoſt every phenomenon continuing, progreſſively, on the ſurface of our *continents*, might, from ſome connection with *time*, and ſome ſign of *beginning*, afford materials for the ſame enquiry; I was therefore obliged to confine myſelf to ſome general claſſes of objects, and I ſhall only add one more. I muſt obſerve firſt, that ſince it is already evident that our *continents* are not of an unbounded *antiquity*, none of the theories which ſuppoſe their production to have reſulted from ſome *ſlow* progreſs, can be ſupported for an inſtant; as thereby the imaginary cauſes to which thoſe progreſſes are attributed, are brought too near us, for remaining hidden under the veil of *time paſt*. Therefore, I ſet aſide thoſe theories, which have no foundation whatever; and I take for granted with you, that the *ſea* has changed its *bed* by the ſudden action of ſome powerful cauſe: which propoſition, as one of the moſt important in geology, I ſhall alſo directly prove in the courſe of the following examination.

When *vegetation* was generally ſpread over the ſurface of our *continents*, the decay of *plants* began to form a *layer* of a particular *earth*, nearly the ſame over every kind of original ſoil, and always perfectly diſtinct from it: it is a blackiſh *duſt*, bound by the roots of vegetables which continue to grow over it. I paſs by the *foreſts*, as there the work of *vegetation* is too obſcure; I ſhall then mention only, that it appears, in that reſpect, that ſome *foreſts* were firſt produced on grounds where they could not continue. Some decaying *foreſts* of *oaks* are recorded in *Germany*, and even in ſome parts there remain ſcattered ſtunted *oaks*, on grounds where it has in vain been attempted to renew them; but I ſhall confine myſelf to open countries. *Heath* has been the predominant *plant* over *ſandy* grounds in hills and plains, and common *graſs* on the flat ſummit of mountains, and on *rocky* and *clayey* ſoils at a ſmaller elevation. Many and very extenſive parts of our *continents* are ſtill totally undiſturbed: I have viſited ſome of them in various parts of Europe; and a great part of Aſia is ſtill in that ſtate. In the countries of that nature which I have viſited, and on grounds that, ever ſince they exiſted, remained in the hands of Nature, the whole of the *vegetable layer* is found under the ſpontaneous

turf;

turf: it varies according to local circumſtances; but not according to the *elevation*; for, *cæteris paribus*, I have found it ſenſibly of the ſame thickneſs on the loweſt and higheſt grounds; a direct proof, that thoſe diverſely *elevated* parts of our *continents* were not ſucceſſively, but at once, abandoned by the *ſea*. In the places where no particular cauſe has either diſturbed or forwarded *vegetation*, that *vegetable layer* is about eighteen inches thick. This then is the whole product of that particular *operation*, begun at the origin of our *continents*.

There are many ways by which we can find a *modulum* for concluding, from the above phenomenon, the *age* of our *continents*; but I ſhall confine myſelf to one, as *hiſtorical monuments* are the means of obtaining it. In the undiſturbed *heaths* of Germany, and eſpecially upon barren hills of great extent, are found numbers of *tumuli*, or burial-places of the firſt and ſtill rambling inhabitants of the country: I have had the opportunity of ſearching ſome of them; they are heaps of earth and ſtones, covering *urns*, in which are found remains of bones and aſhes. In the places where a great many of thoſe *tumuli* are on the ſame ſpot, there is often ſomething like an *altar*, formed of two upright ſtones with one acroſs on the top; and in ſearching round thoſe places, ſome inſtruments have been found made of *flint* and in the form of knives. Thoſe heaps of *moved* ſoil are now covered with *vegetation*; and the *vegetable layer* under the *turf* differs ſo little in thickneſs from that of the neighbouring *undiſturbed* grounds, that if we did not conſider that a certain length of time was requiſite before *vegetation* could be generally ſpread, we ſhould be led to refer the *origin* of our *continents* to a very little diſtance beyond the epocha when thoſe *tumuli* were heaped.

It has been agitated among philoſophers, whether or not the *hiſtory* of *arts* and *ſciences* can throw any light on the degree of the *antiquity* of *mankind*. I have no doubt in reſpect of the affirmative; if we only diſtinguiſh what human underſtanding can diſcover by following the conſequences of ſome *axioms*, (as in geometry and mechanics,) and what may be concluded from conſpicuous and well-obſerved *phenomena* (as in aſtronomy); from what cannot be attained by long obſervations and experiments, tranſmitted from one generation to another, paſſing through many errors afterwards corrected (as in natural philoſophy and natural hiſtory). But this would lead me too far; therefore I ſhall confine myſelf to one object, that of the *progreſs* of *agriculture*: and as I have ſtated many facts of that claſs in my *Letters on the Hiſtory of the Earth and of Man*, I ſhall now only mention the general reſults of my obſervations in that reſpect. I muſt here diſtinguiſh two ſtates of *culture* as now obſerved upon our *continent*; one of which relates to their completely inhabited parts, where the origin and progreſs of ſettlements are ſo much effaced, that it would be very difficult, if not impoſſible, to trace them by immediate obſervation: the other of countries in which the inhabitants are very few in compariſon to the extent of the *land*, but where they are increaſing in number, in proportion as *culture* is gaining over grounds never cultivated before: which laſt caſe is that of the greateſt part of Aſia, and of much of the north-eaſt of Europe: here the *progreſs* of *culture* and *ſettlements* is very diſtinct, and the following are the general facts obſervable in that reſpect.

In all thoſe countries there are certain *centres* of *culture*, or more ancient *ſettlements*; which, with ſubordinate *centres* of different degrees round them, are, in the *wilderneſs*, like the ſyſtems of *celeſtial bodies* in *ſpace*. The main *centre* of *culture* and *ſettlement* firſt exiſted, and from that have ſprung *colonies*, which have been new *centres* afterwards themſelves ſurrounded by ſubordinate *ſettlements*. Hence the origin of diſtinct *nations*, or of the firſt empires, with their ſubdiviſions, into provinces, diſtricts, commons, and private ſets of families; which ſubdiviſions have been aided by the main *centre*, or at leaſt have enjoyed through it the protecting power of the whole *ſyſtem*. The ſmalleſt ſubdiviſions, like the ſmall branches of trees, are thoſe which, by inceſſant endeavours to extend *culture*, contribute the moſt to aggrandize the *empire*, and to increaſe the ſtrength of the other branches and of the ſtem itſelf.

All the accounts which are given of the progreſs of *culture* in *Aſia*, correſpond in that reſpect with what I have obſerved in the *wilderneſſes* of the north-eaſt of *Europe*. I may give that name to countries, which, when only known from maps or political hiſtories, may appear wholly cultivated and intirely inhabited; while in fact they are, what I have deſcribed before, ſets of *centres* of *culture* in the *wild heath*. The original *ſettlements* were moſtly along main *ſtreams*, and in the parts of their courſe were a great extent of *ſediments*, firſt gathered, had been abandoned by the *rivers*, when they were ſettled in deeper channels. Thoſe rich ſoils, producing abundant and laſting paſture, ſtopped ſome rambling ſhepherds, who fixed there, by firſt contriving ſome ſort of huts, and planting round them the fruit-trees and particular plants, which, growing ſpontaneouſly in other places, had been a part of their food. A more ſedentary life increaſed their families; they found a ſatisfaction, before unknown to them, in their ſocial intercourſe; and the firſt endeavours of thoſe ſettlers towards *culture*, were produced by their deſire of remaining together. That wiſh, naturally excited by the enjoyment of mutual ſervices, was increaſed by the neceſſity of guarding againſt invaders the effects of their labour, which had produced a greater and a more permanent fertility: therefore, in proportion as they multiplied, they augmented the number of habitations on the ſame ſpot; till at laſt, as they alſo occupied more land, they found it inconvenient to carry on *culture* at too great a diſtance. Then they began to form *colonies* beyond their convenient ſphere of activity; aſſiſting them in their firſt ſettlement, and remaining bound to them by the reciprocal ties of friendſhip, mutual benefit, gratitude, and common ſecurity.

The extent of the grounds whoſe natural fertility had produced thoſe nurſeries of men being limited, they at laſt were obliged to ſend *colonies* to greater diſtances: they then looked round for rivulets, dales, borders of foreſts, and other deſirable ſpots, with favourable means of communication between the multiplying new ſettlers; and, at laſt, when thoſe reſources were alſo exhauſted, their increaſed power and induſtry prompted them to extend culture over the leſs fertile grounds between them, and at greater diſtances. One of the practices of higheſt antiquity in thoſe difficult ſettlements was, that of firſt chooſing the moſt convenient ſpot at ſome diſtance, often very great; and after having cut a ditch round the determined place, and raiſed its internal ſide with the materials taken from it, to enrich the incloſed land by the *vegetable layer* belonging to the neighbouring grounds, as far as they conveniently could get it. Thoſe ſtript ſpots are ſoon covered with a new vegetation, and the cattle, grazing on them, keep down the young heath; by which means they ſometimes become tolerable paſture: the more remote parts remain wild, and they ſerve only for rambling flocks of ſheep, and for great quantities of bees, which feed on the bloom of the heath. For all thoſe undertakings, the new *ſettlers* were firſt aſſiſted by their families, and afterward by the *government* and by the ſtock of diſcovered means: then the ſucceſsful *colonies* helped their own families round them. By thoſe means, the increaſing difficulties on leſs favourable lands were compenſated by the increaſing power of the protecting *centres*, and by the *progreſs* of the *arts* of *agriculture*.

Thoſe endeavours have never ceaſed from the earlieſt times; they go on, in thoſe numerous parts of our *continents* where the cultivated grounds are ſtill like *iſlands* in *wilderneſſes*; and the *progreſs* from each original *centre of culture* may be traced back, by only obſerving what is going on in its ſkirts, and round each of its firſt diſtant *ſettlements*. None of thoſe *ſyſtems* of *culture* are at reſt, nor can be found to have ſtopped at any time: they are thriving

thriving and extending over the ſtill undiſturbed grounds; and if it were not for the growing *capital towns* and *cities*, which ſwallow up a part of the cultivating tribe; for the ſpirit of novelty ſpringing up, with many vices, in ſuch crowds of men; and for the ſchemes of opulence originating in thoſe centres of luxury and idleneſs, which, in ſo many minds, have changed the original motive of extending *culture*, that of producing food for a growing population, into a view of greater revenue; that *progreſs* would be ſtill more rapid. Nothing can be more intereſting, more inſtructive for the hiſtory of *mankind*, than the ſtudy of countries where thoſe *progreſſes* are ſtill far from approaching near their end. Beſide what their external appearance unfolds to an experienced eye, there are numberleſs characteriſtic circumſtances, to be collected by proper inquiries, from records, monuments, traditions, conformities of methods, of rites, of feaſts, of manners, of errors, of parts, of language; which lead us to refer various *ſettlements* to the common *centres* whence they proceed; and the *names* of a great many places, deſcriptive of certain ſpots, point out by the language from which they are derived, the time when the preſent *towns* or large *villages* were only *mills*, *farms*, *hamlets*, *fords*, *bridges*, &c. at the ſame time that *names* of the ſame ſignifications, but moderniſed, belong to modern ſettlements which are ſtill what their names expreſs.

That preſent ſtate of the north-eaſt part of Europe, as a mean ſtate between a great part of Aſia and America on the one hand, and the ſouth-weſt part of Europe on the other, throws a great light on the ſtate of this laſt country, one of thoſe which I had firſt ſet aſide. Here, by particular circumſtances, the *archipels* (may I be permitted to introduce this word?) of *culture* have moſtly coaleſced: from which cauſe, the diſtinctions between their parts appear to be merely artificial or conventional diviſions. There are indeed ſuch diviſions, produced by wars, and by the ſchemes and jealouſies of commerce, which have introduced a great confuſion between the original *groupes* of men, even in ſome parts of the countries where the natural connections may eaſily be traced; but at the ſame time, from analogy with the growing countries, we may as ſurely conclude the *origin* of countries of full growth; as by analogy with the improving *marſhes* on the outſide of long incloſed *new lands*, the *origin* of theſe, though in full culture, is clearly underſtood. Conſequently, the *progreſſes* of *culture*, and of the *art* of *agriculture*; to which now I may add that of *commerce*, as a conſequence of the growth of *nations*; agree with the general reſult of the *progreſſes* of ſpontaneous effects over the ſame *grounds*; and the whole leads to this irreſiſtible and great conſequence, that the *origin* of our *continents* is at too ſmall a diſtance from our times, for the *revolution* which produced them to be blotted out of the *memory of men*.

Thoſe real inquiries into the *hiſtory* of our *continents*, when more generally attended to, will be the *tomb-ſtone* of every *theory of the earth*, the *agents* of which, and their agency, muſt be hidden under the veil of *unbounded antiquity*, for fancy to take the appearance of genius, and aſſertion that of knowledge. What ſtudy had thoſe philoſophers made of the real facts, who firſt decided, ſeemingly from natural hiſtory and the hiſtory of mankind, (and thus were believed,) that our *continents* were of an *antiquity* loſt in the night of *time paſt?*

In oppoſition to ſuch determined *data* of real *chronology* as have been afforded by the *continents* themſelves, what are the dreams of ſome nominal antiquarians, whoſe imagination, fond of the *remote*, (and the more remote, the greater their fondneſs!) inclines them to adopt the fables of ſome Aſiatic ſects, contradicted by their own monuments when attentively examined, as Mr. BRYANT, and other learned men, have proved, and denied by ſome of their own countrymen! Shall we receive, on an object of ſuch moment as the *age* of our *continents* and that of the preſent *race of men*, the obſcure aſſertions of ignorance, pride, or deſign, in ſome ſets of men; when it is in our power to conſult the unbiaſſed and ſtubborn *phenomena of the earth!*"

We do not find that any of the poſitions ſet up by M. de Luc, either in refutation of the Huttonian theory, or in ſupport of his own, have been controverted by any ſubſequent writer. Mr. Williams, who publiſhed a Theory of the Earth in 1791, does not appear to have ſeen that propoſed by M. de Luc; but he offers many objections to that of Dr. Hutton; his remarks on which are as follow: "I acknowledge the truth of almoſt all Dr. Hutton has advanced about the weathering, decompoſition, and waſte of the ſuperficies of many of our rocks and ſtrata, and of our mountains and cavernous ſhores: and that the ſpoils of the mountains are carried down by land-floods to the valleys and to the borders of the ocean. So far we go together; but here we muſt part, as I poſitively deny that any ſtrata are formed under the waters of the ocean. It is evident to a demonſtration, that the ſea purges itſelf, by the tides, of all the earthy matter carried down by the floods, which earthy matter is thrown back upon the ſhores, in the bays and creeks, and at the mouths of great rivers, where, by degrees, it enlarges the bounds of the dry land in exact proportion to the quantity carried down by the floods. It is alſo clearly demonſtrated, that the earthy matter waſhed off the face of our mountains and rocks has no manner of tendency to the real waſte and deſtruction of the preſent earth; ſo far from it, that, on the contrary, the habitable parts of the earth are gradually, but really and effectually, renovated, enlarged, and improved, thereby. Many lakes, marſhes, and frightful gulfs, among the mountains and in the plains, have been filled up in the courſe of the rivers of the world, which are now rich, beautiful, and habitable, countries; many millions of acres of new land have been made in the valleys and plains, at the mouths of the rivers in the bays, creeks, and ſhores, of the ocean; and many and extenſive portions of this new land are now the fat valleys by the rivers, which are the ſcenes of population, wealth, and ſocial happineſs. It is upon this deſcription of land that the higheſt number of the great commercial cities of the world are ſeated, ſuch, as, for inſtance, London, Amſterdam, Alexandria, and many of the cities of China, &c. Whoever will take the trouble to peruſe my eſſays, will be convinced that the Deltas, Belgias, and Carſes, and other deſcriptions of new land, formed and forming in all parts of the world, fully and perfectly correſpond with the quantity of matter waſhed off the mountains and rocks; and all this is a real, a great, a ſubſtantial, and a durable, improvement of the preſent earth. Man cannot live upon the ſummits, nor high up the ſides of lofty mountains; but the froſts and thaws, and other changes of the air and weather, decompoſe part of the ſuperficies of the mountains, which is carried down by the floods to the valleys and to the margin of the ſea, where new land is gradually increaſed, which enlarges the bounds of the earth in convenient ſituations for increaſed population, &c. This uſe which benevolent Providence makes of the ſediment of rivers in the ordinary courſe of things, is not a fanciful hypotheſis, but a real and viſible fact, which may be viewed, examined, and thoroughly inveſtigated, by the man of leiſure and abilities; and I am perſuaded, that if Dr. Hutton will read my papers upon this ſubject, he will be convinced of the errors of his hypotheſis. I have made it evident to a demonſtration, that if, for argument's ſake, we allow the particles of matter carried down by the rivers to be ſpread out over the bounds of the ocean, and to ſubſide in it, we ſhould, in that event, have no coal, no lime-ſtone, free-ſtone, nor any other uſeful foſſil body. We ſhould have no ſuch thing as ſtrata nor bed, nor diviſion of any kind whatſoever, but all would be one uniform ſolid maſs of ſediment compounded of all things. If we can ſuppoſe any order of diſtinction in a ſediment, it muſt agree with the laws of gravitation; of courſe the heavieſt

heavieſt particles would ſubſide, and take poſſeſſion of the loweſt place, from which they would not be diſlodged by the lighteſt. But we need not deſcend to particulars: ſtratification muſt be performed by a ſhallow ſpread and flow of water; but we cannot allow of ſtratification, nor of any diſtinction of ſtrata of different qualities under the bed of the waters of the ocean, without a miracle.

"To have recourſe to the agency of fire, in order to conſolidate a ſtratum, is, in the firſt place, *unneceſſary*, ſince we daily ſee induration going on without it. We ſee various foſſil bodies of various qualities and degrees of hardneſs formed and forming before our eyes, which are as well conſolidated and cemented as if they had been fuſed by fire. In ſome places we ſee caverns of various degrees of extent and magnitude, ſome of which are almoſt, and others altogether, filled up by a ſmall flow of water, depoſiting particles of ſtony matter; and the bodies ſo formed are afterwards conſolidated, in the courſe of no very long time, to degrees of ſtrength and induration equal to any of our rocks and ſtrata. Mines recently worked are in many places ſo quickly choaked up by the formation of various concretions, that we are often obliged to demoliſh them, to prevent their ſtopping up the paſſage altogether. It is plain, therefore, that the matters depoſited by water, either contain in themſelves the principle of induration, or receive it from the atmoſphere; which laſt appears the moſt likely; and as the conſolidation and preſent ſtate of the rocks and ſtrata in the earth were producible, by powers which we ſtill ſee to exiſt in nature *without* fuſion, ſo it is but reaſonable to infer that they could not poſſibly have been produced *by* it. A fire that could bring the bed of the ocean into fuſion, muſt have heated the waters to ſuch a degree, that the whole race of animals in them muſt have become extinct. Fuſion would produce an immenſe maſs of glaſs or ſlag, which might crack indeed in cooling, but could never form regular horizontal ſtrata of ſuch diſſimilar matters as thoſe of which the ſtrata of the earth are compoſed. How could coals ſubſiſt in the intenſe heat which vitrified their concomitant ſtrata? The ſame may be ſaid of the argillaceous ſtrata which, in all countries, are found in a *ſoft* ſtate, immediately above and below very *hard* ſtrata of ſtone; for if fire had hardened the one, it muſt have hardened the other alſo. Moſt of the operations and effects of ſubterraneous fire, that we have any knowledge of, are outrageouſly violent and deſtructive, and only produce diſorder and ruin. If the bed of the ocean was really to be forced up by ſubterraneous fire to the height of our mountains, we might expect to find as great confuſion and diſorder, and marks of the ruins of the world, among Dr. Hutton's mountains as among Dr. Burnett's; but I have ſhewn, that the ſtrata of our real mountains are as regular as any of the plains. In truth, I have not ſeen ſuch regularity of the ſtrata any where elſe as among the highland mountains of Lochabar, which are the higheſt in Britain. Dr. Hutton lays great ſtreſs upon the phenomena of mineral veins;—but, in truth, every appearance of mineral veins, and of their contents, point to water with a diſtinct and legible index, as the chief agent in their formation. On the ſuppoſition of ſuch a theory being true, all theſe veins ſhould be wide above, and narrow below, which is not found true in experience, very many of them being exceeding ſtraight and narrow for many fathoms next the ſurface, which are very wide farther down; and every ſubſtance found in theſe veins ſhould be the hardeſt in all the bowels of the earth, becauſe the force and violence of the ſubterraneous fire would have a much freer paſſage through theſe open fiſſures than through ſolid unbroken ſtrata of ſeveral thouſand miles of thickneſs; but this, in fact, is not the caſe, the inſide of many of our mineral veins being exceedingly ſoft and argillaceous. Again, upon the ſuppoſition of the contents of our mineral veins being formed by metallic ſtreams, forced up from below by fire, our mineral ores ſhould be all pure and unmixed with earthy or ſtony matter, which is not ſo; and no metallic or mineral ore would be found out of the cavities of mineral veins; but neither is this the caſe."

Our limits will not permit us to follow the author farther in his remarks, nor to give more than a general outline of his theory. All his deſcriptions are full and accurate; but he falls into the defect of many geologiſts, that of ſuppoſing the whole ſurface of the earth to be like the ſpots which he has obſerved; and he does not appear to have ſufficiently partaken of the ſtock of knowledge daily increaſing by continual obſervations in all countries. It ſeems alſo extraordinary that a work, which contains ſo many uſeful and accurate obſervations, and ſo many well-drawn concluſions againſt theories which obtained credit in the world, ſhould alſo preſent to us a theory which has no real ſupport: the former imaginary theories of the earth reſting only on ſuperficial appearances, a competent knowledge of ſome claſs of characteriſtic facts would ſuffice to overturn them; and that knowledge Mr. Williams perfectly poſſeſſes. To ſubſtitute, however, a well-founded theory for thoſe fanciful ſyſtems, required a very extenſive knowledge of principles and general facts; which do not appear to have been objects of this author's particular attention. He has peremptorily refuted all thoſe theories that *ſuppoſe* only certain agencies, becauſe they *require* them, and which, either intentionally, or by conſequence, contradicted the Moſaic account of the events that took place at the creation of our globe: from which diſquiſitions this general conſequence reſults, that nothing has yet been ſtated, which really weakens the foundations of our faith in that hiſtory. Mr. Williams evidently ſhews, that if our continents were not, both internally and externally, compoſed as they are, they would be unfit for the ſupport of the vegetable and animal creation; which is a ſtrong ſupport of *final cauſes*: but when he undertakes to explain how that admirable arrangement has been produced, and in what manner the operations agree with what has been tranſmitted to us by the Moſaic revelation, which attempt required a full knowledge of the extenſive field of phenomena already explored, he falls ſhort of his mark.

Suppoſing, as many others have done, and as appears to be undeniable, that the ſuperficial parts of the earth were originally mixed with water into a fluid or chaotic ſtate, Mr. W. endeavours to prove, that all the regular ſtrata were formed by the flow of the tides ſucceſſively ſpreading out the depoſited matters on a large horizontal plane; and that the granites, and other ſtones, which he does not conſider as ſtratified, ſubſided when the water was in ſome degree of reſt, as at the height of the tides, or where local obſtructions occaſioned ſtagnation. He thinks that, when the whole ſurface was in a fluid ſtate, the tides would neceſſarily riſe to a prodigious height, ſeveral miles higher than the tops of any of our mountains; that the mountains of granite, which are uniform throughout, muſt have ſubſided in one tide; that the tides would be higheſt, and have their *reſting places*, on the two oppoſite parts of the globe, which are now the two continents; and that the direction of the tides, on different parts of the globe, would be ſuch as we now find that of the ſtrata to be. He ſuppoſes the interior body of the earth to have been formed in the ſame manner, prior to the ſuperficial parts; that, from various cauſes, it was full of inequalities; that it would contain much water, both in the compoſition of the not yet conſolidated ſtrata, and in ſeparate cavities; that when the ſuperficial ſtrata were laid between tides, and the ocean began to retreat into its preſent bed, the weight of theſe ſuperincumbent ſtrata would force out the water impriſoned below them; that theſe ſtrata themſelves, as yet ſoft and flexible, would, in many caſes, be bent and broken; that cracks would be occaſioned alſo by their contraction in drying, which cracks would be increaſed by

by the inclination of the ſtrata different ways, and be wideſt at the top; and that, as the whole ſolid matter would diminiſh in bulk as it became dry, high tides would ſtill overflow it, and pour extraneous ſtony matter into the fiſſures. On theſe principles, he explains all the declivities, ruptures, interruptions, and irregularities, of the ſtrata, which we now behold.

From a minute examination of the larger grains and fragments found in the compoſition of our rocks, viz. the talc and mica, quartz, feltſpat and ſhirl, whoſe texture is evidently of the very fine ſtratified or tabulated kind, Mr. Williams concludes that all theſe bodies, and thoſe, in general, which are of a ſimilar ſtructure and not cryſtallized, were once in a diſtinct ſtrata, though not now to be found in that ſtate. On this circumſtance he inſiſts, as one of the many evidences of the univerſal deluge; the effects of which, local and general, he conſiders at great length, adding ſome obſervations reſpecting its efficient cauſes, and the differences of the preſent from the antediluvian ſtate of the earth. By the high tides and violent agitation of the diluvian waters, the primitive ſtrata, which had never before felt any rain, were looſened and torn aſunder, and ground down by attrition againſt one another; and all the ſuperficial parts of the earth were reduced again into a chaos. When the waters began to abate, the larger ſtony particles and fragments would ſubſide firſt, and form the compound rocks and beds of ſand; and the finer and lighter ſediment would be ſpread into ſtrata by the tides, as already mentioned; the difference from the primitive operation ſeeming to conſiſt only in this, that the waters now carried vegetable and animal bodies, and fragments of ſtones and metals already conſolidated. In this enquiry, the ſtrata of coals are particularly examined, and attributed chiefly to diluvian wood; in ſome inſtances, to peat moſſes. In reſpect to theſe laſt, as they now exiſt, he proves that they are univerſally of poſtdiluvian formation, ſome of them very recent, all from vegetables, moſtly from heath.

With regard to the *reſting-places* imagined by this author in his theory of the tides, we cannot conceive any reaſon whatever, why, in the liquid globe, with the two oppoſite ſwellings of the water going inceſſantly round it, there ſhould be two oppoſite fixed points of *reſt* of thoſe ſwellings, where, by a *calm*, the material of our continents ſhould have ſubſided in both hemiſpheres. Admitting, however, for a moment, that this has been the caſe: as ſoon as the materials of thoſe ſuppoſed growing maſſes had arrived at ſuch a level as to divide the liquid into the Pacific and Atlantic oceans, even by mere ſhoals of the ſame extent as thoſe continents, the imaginary *great tides*, ſuch as he ſuppoſed to riſe eight miles above the common level, would have been ſtopped, and the motion of the ſea have been reduced to what it is now: for, ſuppoſing that all the *maſs* of both continents, down to the level of the ſhore, were now ſubtracted, not the ſmalleſt change would happen in the tides: therefore, that *maſs* cannot have been accumulated by tides.

The next writer on this intereſting ſubject, is the late celebrated Dr. Franklin, in his Conjectures concerning the Formation of the Earth, &c. publiſhed in the Tranſactions of the American Philoſophical Society for 1793. The doctor ſuppoſes the central maſs of the earth to be a fluid, probably air, in a ſtate ſo extremely condenſed as to float the heavieſt ſubſtances; and that the waves raiſed and propagated on this internal ocean, by ſubterraneous fires or the ſudden converſion of water into ſteam, ſhake the incumbent ſhell, produce earthquakes, and occaſion thoſe diſtant rumbling ſounds which announce their approach. He thinks that the remains of animals and plants now peculiar to the torrid zone, found in the moſt northern climates, afford a proof that the earth has changed its poles; which hypotheſis, in his opinion, accounts the moſt readily for the deluge, and for the various changes which have happened on the face of our globe. The doctor ſeems to confound the poles of the earth's axis with thoſe of the terreſtrial magnet; for he conjectures that the approximation of ſome large comet might, by its ſuperior magnetic power, have deranged the poles of our globe, and thereby have produced thoſe ſtriking revolutions on the ſurface. Dr. Franklin farther ſuppoſes that the iron ore in our globe is the gradual production of time; that it derived its magnetiſm from ſome external cauſe, and that the magnetic power is perhaps diffuſed through the univerſal ſyſtem. It is enough to mention theſe *conjectures*, for the notice of thoſe who engage in ſuch ſpeculations. That the matter of the earth is not homogeneous, but increaſes in denſity towards the center, is inferred by M. de la Place, from a compariſon of the obſervations made in different places to determine a degree of the meridian. Whether this nucleus be fluid, it is more difficult to decide. It cannot be air in its elaſtic form; ſince, under the enormous compreſſion, the particles would be ſo approximated as moſt probably to aſſume a new conſtitution.

In 1796, a new Theory of the Earth was publiſhed in Paris, by J. C. Delametherie; who alſo endeavours to refute that of Dr. Hutton. The ſentiments eſpouſed by this writer are nearly the following: The exterior cruſt of the globe, according to him, was formed in the boſom of the waters; from which it emerged in a ſtate not very different from its preſent appearance. The cruſt, after its formation, underwent petty alterations, from a variety of local cauſes. The waters ſurpaſſed the higheſt mountains: that is, they were at leaſt three thouſand *toiſes* above their preſent level. All mountains, all valleys, and all plains, were formed by cryſtallization amid the waters. The materials that compoſe them were truly diſſolved:—but how have they been diſſolved? every one of theſe ſubſtances requires much *water of ſolution*. The ſmall quantity of exiſting water would be abſolutely inadequate; ſince, if it were ſpread over the whole ſurface of the globe, it would only make a ſtratum of ſeven or eight hundred feet in thickneſs—a new proof that moſt of the waters of the primitive ſeas has diſappeared. If there may have exiſted an exterior ſtratum of water of three thouſand *toiſes*, or eighteen thouſand feet, and there remains now but ſeven hundred feet, or about one twenty-fifth part, what is become of the twenty-four parts that have diſappeared? The ſolution of this great queſtion is attended with many difficulties. The different changes of the axis of the globe, which have been ſuppoſed in order to account for this phenomenon, are contrary to the known laws of ſtatics, and to the aſtronomical theories at preſent prevailing. There remain but two hypotheſis. Either the waters have paſſed totally or in part to other ſpheres; or they have been buried in interior caverns of the earth.

M. Delametherie does not conſider the paſſage of the waters to other ſpheres as impoſſible. The cold of the ſuperior regions of the atmoſphere would not prevent it: evaporation takes place in the moſt intenſe cold; nor would the ſmall denſity of theſe upper regions be an obſtacle; for evaporation takes place even in the vacuum of the air-pump. Moreover, the ſolar atmoſphere, which envelopes the terreſtrial, would favour ſuch evaporation. Nevertheleſs, this cauſe ought not, according to analogy, to produce any great diminution of waters on the ſurface of the globe. It remains, then, that they muſt have taken refuge in its interior:—but how did this happen? In all ſyſtems, internal cavities are ſuppoſed. Their exiſtence is not hypothetical. It reſts on facts. They muſt be under all volcanoes. From the great extent to which earthquakes are felt, there are evidently fiſſures and caverns, that reach to immenſe diſtances. They muſt paſs under the ſea; and the water of the ſea finds its way into them. There are inſtances of this water having penetrated into the interior of volcanoes. They will therefore precipitate themſelves into the deep abyſſes, and be buried there. Now, this author thinks that theſe cavities are large enough to abſorb the maſs of water that has diſappeared

peared from the ſurface of the earth.—As to the formation of theſe cavities, he obſerves that it was effected at the time of the cryſtallization of the globe. They were filled at firſt with elaſtic fluids, which were gradually diſſipated by different cauſes. Afterward, the waters took their place. Some caverns have been formed by ſubterraneous fires:—but the moſt powerful cauſe has been the refrigeration of the globe. The author thinks (vol. v. p. 332) that, though the ſurface of the globe has been brought to its preſent ſtate by the action of water, it may, at the firſt moment of its formation, have undergone a very great degree of heat, as happens to a comet paſſing near the ſun. The aqueous cryſtallization of ſtrata has been before ſtrongly maintained: but we do not feel inclined to receive it as a ſolution of the various contortions of ſtrata, and of the curious poſition of the ſteeps, &c. The whole theory of this writer appears unſatisfactory. Inſtead of a comprehenſive plan, derived from an accurate ſurvey of nature, he has formed a Moſaic work, compoſed of pieces picked from different theoriſts. Had he obſerved for himſelf, he would not have believed the cauſes of confuſion, in the ſtrata of the earth, to have been ſo confined in their operation. He muſt alſo have perceived that their irregularity is not for the moſt part original, nor derived from cryſtallization, but the work of agents that have broken and diſturbed what was once continuous and uniform.

The lateſt work on geology with which we are acquainted, was publiſhed in 1797, by P. Howard, Eſq. intitled "Thoughts on the Structure of the Globe." A principal object of this work is, to refute thoſe theories which endeavour to place the origin of our globe anterior to the time ſtated by Moſes; or, as having been brought into exiſtence in any manner different from that expreſſed in the holy ſcriptures; or, that ſhall apply the preſent appearance of the earth's ſurface, to any other cauſe than that of a general deluge. The writings of Buffon are thought by Mr. Howard to furniſh many proofs of the above-mentioned nature. "The manifeſt object of his theory, ſays Mr. H. is to exclude the agency of a divine architect, by proving the poſſibility of the actual exiſtence of the univerſe from natural cauſes; but ſolid matter is of itſelf inert: whence, then, aroſe its activity? From heat or fire. Whence that fire? From the preſſure of attraction. Whence that attraction? No anſwer has been nor can be given, without recurring to the will of a Supreme Being. The hypotheſis of the igneous formation of the globe is replete with the moſt ſerious difficulties. That all terreſtrial bodies are vitrifiable by heat is an aſſumption contradicted by experiment: but, admitting the fact, is the being vitrifiable a proof of having been vitrified? After all, M. de Buffon is compelled to have recourſe to water to re-model the ſurface of the earth, and to produce thoſe varieties which could never have been effected by fuſion. But none of thoſe difficulties attend the account furniſhed to us by the ſcriptures. The philoſopher will find in the narration of Moſes, that the firſt elements of all material ſubſtances are there repreſented in one confuſed maſs, called the *abyſs*, without motion or animation; and that the preſent order of things was gradually and at diſtinct intervals drawn from it. In the commencement of each of theſe periods, diſtinct commands are given by the Creator, and diſtinct effects are produced before its cloſe. May he not conſider theſe commands as diſtinct laws impreſſed on nature, by whoſe operation theſe effects were generated and completed within the appointed time? In that idea he will apply to each command ſome one or more of thoſe well-known laws, and compare the effects which ſuch might have produced with the effects ſaid to be produced by that command; and in like manner progreſſively, until by their ſucceſſive application and re-union all material bodies are brought into that arrangement and order we now ſee exiſting. Theſe primary laws may be reduced to general and elective attraction; repulſion and re-action; gravity ſpecific or general; centripetal and centrifugal forces, nearly but not entirely balancing each other, ſo as to form ſpheroids inſtead of perfect globes, and to deſcribe ellipſes inſtead of circles; gravitation central and univerſal. If the progreſſive formation which Moſes deſcribes could be produced by the ſucceſſive application of theſe known means, in ſome one order which may be imagined and deviſed, the greateſt poſſible weight will certainly be given to his account of the creation; and the real ſecret of nature, as far as human underſtanding can dive, will be nearly diſcovered. Thoſe, therefore, who overlooking the marks of deſign univerſally exhibited in the works of creation, and in the adaptation of means to their reſpective ends, exclude the operation of a ſupreme intelligent architect, muſt feel it incumbent on them to demonſtrate, at leaſt to their own ſatisfaction, the poſſibility of this fair form of things exiſting as we behold it, by the ſole operation of the properties inherent to material ſubſtances.

The earth, ſays Mr. H. was originally conſtructed with its poles perpendicular to the equator, the centre of gravity in its centre, and the year conſiſted of 360 days. Leſs prominent inequalities, and a more equal diſtribution of land and ſea on its ſurface, occaſioned a more ſalubrious and equal temperature of the atmoſphere, atteſted by the longevity of its firſt inhabitants. The termination of this golden age might have been affected by the proximity of a comet, condenſing the vapours of the atmoſphere, and attracting the ſubterraneous waters; which, burſting open the vaults of the exterior ſurface, precipitated indiſcriminate portions of the primitive earth into their profound cavities. The more perfect conſolidation of the globe, in the ſouthern hemiſphere, changed the centre of gravity, which produced a proportionate deviation from the exact tract of the equator. It is, however, poſſible that the ocean did not at once ſink to its preſent level: the poſterior acceſſion of waters from hitherto inland ſeas may have cruſhed down other inferior vaults, and finally ſettled its loweſt degradation. As the lands thus became more elevated above the bed of the ocean, the cold became more intenſe; the viciſſitudes of climate were more ſeverely felt; and the life of man experienced a proportionate abbreviation. Thus we find that the age of the poſt-diluvian patriarchs was protracted to the age of 450 years, till the laſt great changes were effected, when the life of man was diminiſhed to its preſent extent.

Having cloſed his analyſis and refutation of Buffon's celebrated theory, Mr. Howard proceeds to conſider thoſe of other writers; and concludes that the real proceſs of nature ſince the deluge, is to level heights and to raiſe the ſubjacent valleys; from which imperceptible but conſtant operation, aided by the increaſing cultivation and population of the north, a milder temperature of the atmoſphere may eventually be predicted. He then ſuggeſts the following obſervations, equally ſolid and ingenious, as a complete refutation of the precipitate concluſions deduced from the phenomena attendant on volcanic eruptions: "Sir William Hamilton, Mr. Ferber, and Mr. Brydone, the two former of whom have particularly applied themſelves to the ſtudy of volcanos, without giving general ſyſtems, have affirmed that the certain indications furniſhed by theſe phenomena announce, beyond all poſſibility of doubt, not one but many revolutions in this globe, during an infinity of ages; inſomuch that the poor abbé Recupero trembles for the credit of the Old Teſtament. Seams of vegetable earth repeated at ſeveral depths, frequently found under and over diſtinct and ſucceſſive beds of hard lava, and the whole exteriorly covered with vegetable earth, compoſed of the mouldered ſcoria of lava, whilſt in other places lavas are found as intact as when firſt iſſuing from the mountain, appear to theſe gentlemen certain and undeniable proofs of the incalculable antiquity of volcanos, and conſequently of the earth itſelf. Theſe philoſophers do not recollect,

recollect that Herculaneum, the date of whose destruction is well known, is covered by nearly seventy feet of lava, interspersed with seven distinct seams of friable earth, the whole covered with good soil. Yet all this has been the undoubted produce of less than 1800 years!"

It appears to Mr. Howard, that M. de Saussure, in conceding the infinitely removed origin of what he terms the carcass of the globe, has not adverted to the heterogeneous assemblages which much have been produced by the deluge; and which, to a mind acquainted with the celerity of chemical processes, must prove the possibility of every alteration attested by natural phenomena having happened within the period assigned by the sacred writers. That the omnipotent Creator must, according to this author's hypothesis, have produced the visible material universe by means of the same general laws, which are now employed to preserve it, is a mere *petitio principii*; the affirmative is incapable of proof, and if it *were* demonstrated, leads to no important conclusion. The Mosaic account of the creation implies *a distinct revelation*. Mr. Howard must have forgotten that authentic tradition could not extend to events antecedent to the existence of mankind. We may justly conclude, that men are too short-sighted to claim *wisdom* as an argument *à priori*, to establish what *are* to be the *laws of nature*, and what have been the events that have happened in the world: the only thing that our *wisdom* can pretend to reach, is to judge, *what are those laws*, and what must have been the *acting causes* to have produced certain *effects*.—See the works above alluded to; and Monthly Review, New Series, vol. 2, 3, 5, 6, 15, 24, 25.

The merits of the Huttonian Theory of the Earth have in part been recently debated between Sir James Hall, Bart. and the ingenious Mr. Kirwan. In the third and fifth volumes of the Edinburgh Transactions, Sir James Hall attempted, by several experiments, to invalidate some of the positions laid down by Mr. Kirwan, in his explanation of this Theory. In reply to these, Mr. Kirwan has published a paper in the eighth volume of Transactions of the Royal Irish Academy for 1802, with the view of examining the force of the reasoning employed by sir James, as well as of determining the consequences fairly deducible from his experiments. Some difficulties had been started against the opinion that granite was ever in a state of fusion, from the feltspar contained in it being, though the most fusible of the two substances, found in this stone with its crystals regularly defined, while the quartz formed a confused and irregular mass, moulded on the crystals of feltspar; and sir James replied to them by arguments which Mr. Kirwan here endeavours to refute. As the principal circumstances, however, on which sir James rests his opinions respecting the subject of granite, depend on some experiments on whin, we shall explain them. Whin, it may be observed, comprehends in Scotland, grunstein, basalt, trap, wacken, and porphyry; stones in which (except the last) none of the component ingredients are found regularly crystallized. Grunstein, a compound of feltspar and hornblende, intimately mixed with each other, but imperfectly and confusedly crystallized in minute grains, was the subject of the experiments here related. "This substance, (says Mr. Kirwan,) sir James vitrified by a strong heat and subsequent rapid cooling. A fragment of the glass thus produced being introduced under a narrow muffle and heated to 21°, in one minute became so soft as to yield readily to the pressure of an iron rod, but after a second minute it became quite hard, though the temperature had been stationary; the substance thus hardened underwent a thorough change, it lost its vitreous character, its fracture was like that of *porcelain*, and it was fusible only in a heat of 31°. In another experiment he found this change to take place even before the glass was in perfect fusion; for while both ends of a fragment of this glass were supported on rests of clay, it was found not to sink down between them until the heat was raised to 30°. In another experiment he found the consolidation which he calls crystallization, to take place even while the heat was gradually increased, and the substance still so viscid as to retain the original shape of the fragments. In another experiment, where the glass was slowly cooled, its texture was found completely to resemble that of whinstone, the *fracture* was *rough*, *stony*, and *crystalline*, with a number of shining facettes interspersed through the mass, and a few crystals in the cavities produced by air-bubbles."

In order to shew that these experiments are deceitful in the conclusions to which they lead, Mr. Kirwan compares the discriminating characters of natural whin with those of the artificial: "1. The *natural* whins, particularly amygdaloids (vulgarly called *toadstones*), frequently contain calcareous spar and zeolyte, now as the former contains fixed air, and the latter a large proportion of water, I hardly think sir James, who professes not to agree with Dr. Hutton in all points, will allow these to have been vitrified or fused. 2. The *natural* whins, according to Dr. Kennedy's statement, lose five per cent. of water and other volatile matter when heated to redness. It is not said whether the artificial lose any part of their weight by such treatment, but it is plain they would not, since even the lavas of Catania and Piedmont, though of ancient date, lost none, as Dr. Kennedy expressly notices, and have thus afforded an excellent criterion for distinguishing the long contested origination of these substances. 3. As sir James has neglected giving a *complete* account of the external characters of the natural whins, which were the subject of his experiments, as also of regenerated or artificial whins derived from them, and as I have not myself seen them, it is difficult for me to compare them with each other, and would indeed be impossible if some account of them had not been given by Mr. Pictet in his valuable Journal Britannique, copied into the 5th vol. of the New Rozier's Journal, p. 313. It is the result of the examination both of the natural and artificial whins by the Society of Natural History at Geneva.

"As to the natural grunstein, they remark that it betrays not the least mark of an igneous origin, but that the whins which sir James produced from it had every distinctive character of a *lava*, and even of a *porous lava*. The basalt (or rather trapp) on which the castle of Edinburgh stands, is of a compact structure; the artificial produced from it, sir James tells us, so greatly resembles it both in colour and texture that it would be difficult or perhaps impossible to distinguish them, *but for a few minute air-bubbles, distinguishable in the artificial*. Neptunists will, however, consider this as a leading character of distinction. The mineralogists of Geneva add, that the colour of the artificial is deeper, and its hardness greater, than that of the natural. If the specific gravity and other characters of both were given, it is probable that other differences might be perceived. It is only in these characters that any difference can be expected, as the internal composition must be the same in both.

"Of the remaining artificial whins I can give no account, their external characters having been omitted; I cannot, however, pass over the general inferences that sir James deduces from his experiments, namely, 'that the arguments against the subterraneous fusion of whinstone, derived from its stony character, seem now to be fully refuted;' for, not to repeat what has been already said, that many of them contain substances whose existence is incompatible with that hypothesis, I must farther add, that the upright state in which many of them exist, for instance, the basaltic pillars of Staffa, and of the Giants Causeway, and of many other countries, the basis they rest on, sometimes granite, sometimes gneis, sometimes coal or lime-stone, and the total absence of all signs of the operation of fire, forbid us to entertain any doubt of their production in the moist way. Nay, the college of Dublin now possesses fragments of basaltic pillars in

which marine ſhells are imbedded; if ſuch evidence can be reſiſted, it is in vain to ſeek for greater."

In the eſſay which the preſent paper is intended to illuſtrate, the author conſidered it as an eſtabliſhed fact, that the emerſion of ſome portion of land from the primæval ocean occurred previouſly to the creation of fiſhes. The circumſtance on which he reſted for the proof of this fact, and which accorded with the Moſaic account of the ſubject, was, that "no petrifactions were found imbedded and incorporated in maſſes of ſtone in ſuch countries as were elevated 8500 or 9000 feet above the actual level of the ſea; for inſtance, in the great Tartarian platform and the elevated regions of Siberia, though in all inferior regions of the ſame extent ſuch petrifactions were abundantly found, at leaſt in limeſtones; but even in theſe none were found in thoſe elevated tracts, as was proved by the teſtimonies of all the philoſophic travellers who have traverſed and examined them. To repel this proof of the Moſaic account, it has been replied by the laborious, learned, and eloquent, writer of the *Hiſtoire du Monde primitif*, and others, that the keen air exiſting in theſe elevated regions had long ago decompoſed and conſumed the ſhells that might have been there depoſited; but as the ſtones ſtill remain, it is evident that the ſhells incorporated in their interior muſt alſo have remained, if any ſuch were ever contained in them."

It is, however, aſſerted by Don Ulloa, in his *Mémoires Philoſophiques*, and by *Gentil*, in the Mem. Par. 1771, that ſhells have been found in the Cordelieres at the height of 13,869 Engliſh feet above the level of the ſea. That the height was ſo great as is here ſtated, the author attempts to diſprove, by the evidence of other writers; as well as from the probable inaccuracy of the barometers by which the former gentlemen made their calculation:—but, let the height be what it may, Mr. Kirwan adds, "It is certain that theſe ſhells were depoſited there after the emerſion of land from the primitive ocean, and conſequently by a ſubſequent deluge; for Don Ulloa expreſsly tells us, that in the ſame rocks in which theſe ſhells are found, *petrified wood* is alſo found, Mem. Philoſophiques, p. 372. This wood muſt have grown on dry land, and muſt have been floated when the ſhells were depoſited, ſince both are found in the ſame rocks. It muſt have been brought thither by a deluge, as no wood can at preſent grow there, as Don Ulloa alſo atteſts. The ſhells are for the moſt part bivalves, which geologiſts allow to form petrifactions of the moſt modern date."

It is a fact in geology, eſtabliſhed by numerous obſervations, that, in mountains which extend from north to ſouth, the weſtern flank is the ſteepeſt, and the eaſtern the gentleſt; and that, where they run eaſt and weſt, the ſouthern declivity is the ſteepeſt, and the northern the moſt gentle. In this paper, the author brings forward the principal facts in ſupport of that deduction; and he conſiders it as clearly proved "that mountains are not mere fortuitous eruptions, unconnected with tranſactions on the ſurface of the earth:" ſince it has been uniformly found by Forſter that "the north and north-weſt ſides are gently covered, and connected with ſecondary ſtrata, in which organic remains abound," while the ſouth and ſouth-weſt ſides are almoſt invariably ſteep. In order to account for this nearly univerſal allotment of unequal declivities to oppoſite points, and for the greateſt being directed to the weſt and ſouth, and the gentleſt to the eaſt and north, Mr. Kirwan ſuppoſes, 1ſt. That all mountains were formed while covered with water. 2d. That the earth was univerſally covered with water at two different eras, that of the creation, and that of the Noachian deluge. 3d. That in the firſt era we muſt diſtinguiſh two different periods, that which preceded the appearance of dry land, and that which ſucceeded the creation of fiſh, but before the ſea had been reduced nearly to its preſent level; during the former, the primæval mountains were formed, and during the laſt, moſt of the ſecondary mountains and ſtrata were formed. 4th. That all mountains extend either from eaſt to weſt, or from north to ſouth, or in ſome intermediate direction between theſe cardinal points; which need not be particularly mentioned here, as the ſame ſpecies of reaſoning muſt be applied to them, as to thoſe to whoſe aſpect they approach moſt. Theſe preliminary circumſtances being noticed, we are next to obſerve, that during the firſt era, this vaſt maſs of water moved in two general directions, at right angles with each other, the one from eaſt to weſt, which needs not to be proved, being the courſe of tides which ſtill continue, but were in that ocean neceſſarily ſtronger and higher than at preſent; the other from north to ſouth, the water tending to thoſe vaſt abyſſes then formed in the vicinity of the ſouth pole. Before either motion could be propagated, a conſiderable time muſt have elapſed.

Now the primæval mountains formed at the commencement of the firſt era, and before this double direction of the waters took place, muſt have oppoſed a conſiderable obſtacle to the motion of that fluid in the ſenſe that croſſed that of the direction of theſe mountains. Thus the mountains that ſtretch from north to ſouth, muſt have oppoſed the motion of the waters from eaſt to weſt: this oppoſition, diminiſhing the motion of that fluid, diſpoſed it to ſuffer the earthy particles with which in thoſe early periods it muſt have been impregnated to cryſtallize, or be depoſited on theſe eaſtern flanks, and particularly on thoſe of the higheſt mountains, for over the lower it could eaſily paſs; theſe depoſitions, being inceſſantly repeated at heights gradually diminiſhing as the level of the waters gradually lowered, muſt have rendered the eaſtern declivities or deſcents, gentle, gradual, and moderate, while the weſtern ſides receiving no ſuch acceſſions from depoſitions muſt have remained ſteep and craggy. Again, the primæval mountains that run from eaſt to weſt, by oppoſing a ſimilar reſiſtance to the courſe of the waters from north to ſouth, muſt have occaſioned ſimilar depoſitions on the northern ſides of theſe mountains againſt which theſe waters impinged, and thus ſmoothed them. Where mountains interſect each other in an oblique direction, the north-eaſt ſide of one range being contiguous to the ſouth-weſt flanks of another range, there the afflux of adventitious particles on the north-eaſt ſide of the one, muſt have frequently extended to the ſouth-weſt ſide of the other, particularly if that afflux were ſtrong and copious.

It has of late been very much the vogue, particularly among the French writers, to endeavour to carry up the antiquity of the earth far beyond that which our received chronology attributes to it. This fancy has been greatly ſtimulated by ſome ancient monuments and inſcriptions diſcovered by the French during their late expedition in Egypt; particularly different figures of the zodiac, in one of which the ſolſtice is indicated in Virgo; and another found in the great temple of Dendara, repreſents the ſun in Leo, approaching Cancer. According to ſuch conſtructions of the zodiac, ſay theſe philoſophers, we muſt go back from the preſent period 15,000 years; and even then we ſhall only arrive at the time in which the figures of the zodiac were contrived: but the world may have undergone many previous revolutions.

With all the ſemblance of ſagacity and truth which accompanies this mode of argument, nothing can be more unphiloſophical than the inference. Is it not an admitted fact, that one of the firſt efforts of aſtronomers, after their ſcience had attained a certain degree of perfection, was to draw from it ſuch modes of arrangement and calculation as might be uſeful in adjuſting the *current* time; and that the period from which they *ſuppoſed* their account to ſet out was in a great meaſure *arbitrary*, depending on the multiplication of cycles into each other, counting backward from any poſition of the heavenly bodies in the then current age, to the period in which theſe bodies (according to their tables) muſt have ſtood in a poſition fitting the purpoſe they had in view? In proof of this, does

not

not the evidence adduced in different papers in the Aſiatic Reſearches amount almoſt to a demonſtration that, excepting a period which accords very well with the Scripture accounts, the whole Bramin chronology of *myriads* of years is merely a clumſy aſtronomical fiction, which at firſt was not even intended to deceive? We may alſo ſtate another well-known fact, that it was long a favourite opinion with aſtrologers, that all the planets muſt have been in conjunction in the firſt ſcruple of the ſign Aries when the world began; becauſe then, according to their notion, was the proper time to begin a year. Others might have contended for a different arrangement, i. e. a differently conſtructed zodiac; but whichever had the greateſt number of ſuffrages at any period, can never prove any thing as to the fact in queſtion. But, not to dwell on a ſubject ſo unfounded, or on the early propenſity of different nations to *forge* for themſelves an high antiquity, is it not known to every one that the Julian period had an arbitrary commencement? If the hiſtory of this fact had been loſt, and correſponding zodiacs had been found, would it have been correct to have inferred that they were made 6500 years ago?—See the article CHRONOLOGY.

EARTH-BAG, *ſ.* in fortification, a bag filled with earth, a ſand-bag to keep off the ſhot of the enemy.

EARTH-BOARD, *ſ.* The board of the plough that ſhakes off the earth.—The plough reckoned the moſt proper for ſtiff black clays, is one that is long, large, and broad, with a deep head and a ſquare *earth-board*, ſo as to turn up a great furrow. *Mortimer.*

EARTH-BORN, *adj.* Born of the earth; terrigenous:

The God for ever great, for ever king,
Who ſlew the *earth-born* race, and meaſures right
To heav'n's great habitants! *Prior.*

Meanly born.—*Earth-born* Lycon ſhall aſcend the throne. *Smith.*

EARTH-BOUND, *adj.* Faſtened by the preſſure of the earth:

Who can impreſs the foreſt, bid the tree
Unfix his *earth-bound* root? *Shakeſpeare.*

EARTH-FLAX, *ſ.* A kind of fibrous foſſil. See AMIANTHUS, vol. i. p. 474.—Of Engliſh talc, the coarſer ſort is called plaiſter, or parget; the finer *earth-flax*, or ſalamander's hair. *Woodward.*

EARTH-NUT. See ARACHIS and BUNIUM.

EARTH-PEA. See LATHYRUS.

EARTH-SHAKING, *adj.* Having power to ſhake the earth, or to raiſe earthquakes:

Now ſcarce withdrawn the fierce *earth-ſhaking* pow'r,
Jove's daughter Pallas watch'd the fav'ring hour;
Back to their caves ſhe bade the winds to fly,
And huſh'd the bluſt'ring brethren of the ſky. *Pope.*

EARTH-WORM, *ſ.* The common worm bred under ground. For its natural hiſtory, ſee the article LUMBRICUS.—Upon a ſhower, after a drought, *earth-worms* and land-ſnails innumerable come out of their lurking places. *Ray.*—A mean ſordid wretch:

Thy vain contempt, dull *earth-worm* ceaſe;
I won't for refuge fly. *Norris.*

EAR'THEN, *adj.* Made of earth; made of clay.—The moſt brittle water-carriage was uſed among the Egyptians, who, as Strabo ſaith, would ſail ſometimes in boats made of *earthen* ware. *Arbuthnot.*

EAR'THINESS, or EARTHLINESS, *ſ.* The quality of containing earth; groſſneſs.

EARTH'ING, *part. adj.* Covering with earth, driving to the earth, as a fox or badger in hunting.

EARTH'LING, *ſ.* An inhabitant of the earth; a mortal; a poor frail creature.—To *earthlings*, the foot-ſtool of God, that ſtage which he raiſed for a ſmall time, ſeemeth magnificent. *Drummond.*

EAR'THLY, *adj.* Not heavenly; vile; mean; ſordid:

When faith and love, which parted from thee never,
Had ripen'd thy juſt ſoul to dwell with God,
Meekly thou didſt reſign this *earthly* load
Of death, call'd life. *Milton.*

Belonging only to our preſent ſtate; not ſpiritual.—It muſt be our ſolemn buſineſs and endeavour, at fit ſeaſons, to turn the ſtream of our thoughts from *earthly* towards divine objects. *Atterbury.*—Corporeal; not mental:

Sudden he view'd, in ſpite of all her art,
An *earthly* lover lurking at her heart. *Pope.*

Any thing in the world; a female hyperbole:

Oh! if to dance all night, and dreſs all day,
Charm'd the ſmall-pox, or chas'd old age away,
Who would not ſcorn what houſewife's cares produce?
Or who would learn one *earthly* thing of uſe? *Pope.*

EARTH'QUAKE, *ſ.* A tremulous motion or convulſion of the earth, generally attended with noiſes under ground; often deſtroying towns and cities, ſubverting rocks, altering the courſe of rivers, and producing the moſt terrible devaſtations. Many fanciful and ſuperſtitious notions have in various ages been ſuggeſted as ſupernatural cauſes of earthquakes; but the late advances made in chemical knowledge contribute greatly to diſpel this miſt of ignorance, and to point out to the geologiſt and philoſopher a more rational theory of this ſtupendous effort of nature. But before we enter upon an explanation of this theory, it will be proper to enumerate the awful effects of ſome of the moſt dreadful earthquakes recorded in hiſtory, as well as to notice the phenomena of thoſe of the lateſt date.

In 1692, an earthquake happened in the iſland of Jamaica, attended with the moſt terrible circumſtances. In two minutes, it deſtroyed the town of Port Royal, at that time the capital of the iſland; and ſunk the houſes in a gulf forty fathoms deep. It was attended with a rumbling noiſe like that of diſtant thunder: the ſtreets roſe like the waves of the ſea; firſt lifting up the houſes, and then immediately throwing them down into deep pits. The wells diſcharged their waters with violent agitation. The ſea burſt over its bounds, and deluged all that ſtood in its way. The fiſſures of the earth were in ſome places ſo great, that one of the ſtreets appeared twice as broad as formerly. In many places it opened and cloſed again; and continued this agitation for ſome time. In ſome of them, the people were ſwallowed up at once; in others, the earth caught them by the middle, and cruſhed them to death; while others, more fortunate, were ſwallowed up in one chaſm, and thrown out alive by another. Other chaſms were large enough to ſwallow up whole ſtreets; and others, ſtill more formidable, ſpouted up immenſe quantities of water, drowning ſuch as the earthquake had ſpared. Yet, ſo great a ſufferer as Port Royal was, more houſes were left ſtanding therein than on the whole iſland beſides. Scarce a planting-houſe, or ſugar-houſe, was left above ground in all Jamaica; and, in lieu of them, appeared great pools of water; which, when dried up, left nothing but ſand, without any mark that either tree or plant had ever grown thereon. Moſt of the rivers were ſtopped in their courſe by the falling of the mountains; till, ſwelling up, they made themſelves new channels: and, it is ſhocking to relate, that the earthquake is ſaid to have ſwept away above 3000 perſons.

Another terrible account is that given by Kircher, of the earthquake which happened in Calabria in 1638. "On the 24th of March (ſays Kircher), we launched, in a ſmall boat, from the harbour of Meſſina in Sicily, and arrived the ſame day at the promontory of Pelorus. Our deſtination was for the city of Euphemia in Calabria; but on account of the weather, we were obliged to continue three days at Pelorus. At length, wearied with the delay, we reſolved to proſecute our voyage; and although the ſea ſeemed more than uſually agitated, yet we ventured

tured forward. The gulph of Charybdis, which we approached, ſeemed whirled round in ſuch a manner as to form a vaſt hollow, verging to a point in the center. Proceeding onward, and turning my eyes to mount Etna, I ſaw it caſt forth large volumes of ſmoke, which covered the iſland, and blotted out even the ſhores from my view. This, together with the dreadful noiſe, and the ſulphureous ſtench, which was ſtrongly perceived, filled me with apprehenſions that ſome more dreadful calamity was impending. The ſea itſelf ſeemed to wear a very unuſual appearance; thoſe who have ſeen a lake in a violent ſhower of rain all covered over with bubbles, will have ſome idea of its agitations. My ſurpriſe was ſtill increaſed by the calmneſs and ſerenity of the weather; not a breeze, not a cloud, which might be ſuppoſed to put all nature thus into motion. I therefore warned my companion, that an earthquake was approaching; and, after ſome time, making for the ſhore with all poſſible diligence, we landed at Tropæa. But we had ſcarce arrived at the jeſuits college in that city, when our ears were ſtunned with an horrid ſound, reſembling that of an infinite number of chariots driven fiercely forward, the wheels rattling and the thongs cracking. Soon after this, a moſt dreadful earthquake enſued; ſo that the whole träck upon which we ſtood ſeemed to vibrate, as if we were in the ſcale of a balance that continued waving. This motion, however, ſoon grew more violent; and being no longer able to keep my legs, I was thrown proſtrate upon the ground. Leaving this ſeat of deſolation, we proſecuted our voyage along the coaſt; and the next day came to Rochetta, where we landed, although the earth ſtill continued in violent agitations. But we were ſcarcely arrived at our inn, when we were once more obliged to return to our boat; and in about half an hour we ſaw the greateſt part of the town daſhed to the ground, burying its inhabitants beneath its ruins. Proceeding onward in our veſſel, we again landed at Lopizium, a caſtle midway between Tropæa and Euphemia, the city to which we were bound. Here, wherever I turned my eyes, nothing but ſcenes of ruin and horror appeared; towns and caſtles were levelled to the ground; Stromboli, though ſixty miles diſtant, belched forth flames with ſuch uncommon violence as to be diſtinctly heard. But my attention was quickly turned to more contiguous danger. The place on which we ſtood now began to ſhake; ſo that, being unable to ſtand, we caught hold of whatever ſhrub grew next us, and ſupported ourſelves in that manner. After ſome time, the concuſſion ceaſing, we again ſtood up, in order to proſecute our voyage to Euphemia, then within ſight. But while we were preparing for this purpoſe, I turned my eyes towards the city; but could ſee only a frightful dark cloud, that ſeemed to reſt upon the place. This the more ſurpriſed us, as the weather was ſo very ſerene. We waited, therefore, till the cloud was paſſed away: then turning to look for the city, it was totally ſunk; and nothing but a diſmal and putrid lake was to be ſeen where it ſtood."

In 1693 an earthquake happened in Sicily, which may juſtly be accounted one of the moſt terrible of which we have any account. It ſhook the whole iſland: and not only that, but Naples and Malta partook of the ſhock. It was impoſſible for any body to keep on their legs; and even thoſe that lay on the ground were toſſed from ſide to ſide as on a rolling billow. Fifty-four cities and towns, beſide an incredible number of villages, were either deſtroyed or greatly damaged. We ſhall only inſtance the fate of Catania, once the reſidence of ſeveral monarchs, and an univerſity. Father Antony Serrovita, being on his way thither, and at the diſtance of a few miles, obſerved a black cloud like night hovering over the city; and there aroſe from the volcano of Montgibello great ſpires of flame, which ſpread all around. The ſea all at once began to roar, as in a violent tempeſt; accompanied with a noiſe as great as if all the artillery in the world had been diſcharged at one ſignal. His horſes ſtopped ſhort, as if petrified; ſo that they were forced to alight. They were no ſooner off, but they were lifted from the ground above two palms; when caſting his eyes towards Catania, he with amazement ſaw nothing but a thick cloud of duſt in the air. This was the ſcene of their calamity; for of the magnificent Catania, there was not the leaſt footſtep to be ſeen. S. Bonajutus aſſures us, that of 18,900 inhabitants, 18,000 periſhed therein!

The next great earthquake was felt on the 1ſt of November 1755. At Liſbon, the capital of Portugal, its effects were moſt ſevere. In 1750, there had been a ſenſible trembling of the earth felt in this city: for four years afterwards, there had been an exceſſive drought; inſomuch that ſome ſprings, formerly very plentiful of water, were dried and totally loſt. The predominant winds were north and north-eaſt, accompanied with various, though very ſmall, tremors of the earth. The year 1755 proved very wet and rainy; the ſummer cooler than uſual; and for forty days before the earthquake, the weather was clear, but not remarkably ſo. The laſt day of October, the ſun was obſcured, with a remarkable gloomineſs in the atmoſphere. The firſt of November, early in the morning, a thick fog aroſe, which was ſoon diſſipated by the heat of the ſun; no wind was ſtirring; the ſea was calm; and the weather as warm as in June or July in this country. At thirty-five minutes after nine, without the leaſt warning, except a rumbling noiſe, a moſt dreadful earthquake ſhook, by quick vibrations, the foundations of all the city, ſo that many buildings inſtantly fell. Then, with ſcarcely a perceptible pauſe, the nature of the motion was changed, and the houſes were toſſed from ſide to ſide, with a motion like that of a waggon violently driven over rough ſtones. This ſecond ſhock laid almoſt the whole city in ruins, with prodigious ſlaughter of the people. The earthquake laſted in all about ſix minutes. At the moment of its beginning, ſome perſons on the river, near a mile from the city, heard their boat make a noiſe as if it had run aground, though they were then in deep water; and at the ſame time they ſaw the houſes falling on both ſides of the river. The bed of the Tagus was in many places raiſed to its ſurface. Ships were driven from their anchors. A large new quay ſunk to an unfathomable depth, with ſeveral hundreds of people who were upon it; nor was one of the dead bodies ever found. The bar of the harbour was at firſt ſeen dry from ſhore to ſhore: but ſuddenly the ſea came rolling in like a mountain; and about Belem Caſtle the water roſe fifty feet almoſt in an inſtant. About noon there was another ſhock; when the walls of ſeveral houſes that yet remained were ſeen to open from top to bottom more than a quarter of a yard, and afterwards cloſed again ſo exactly that ſcarcely any mark of the injury was left.

At Colares, about twenty miles from Liſbon, and two miles from the ſea, on the firſt of November, the day broke with a ſerene ſky, the wind continuing at eaſt; but about nine o'clock the ſun began to grow dim; and about half an hour after was heard a rumbling noiſe like that of chariots, which increaſed to ſuch a degree that it became equal to the exploſions of the largeſt cannon. Immediately a ſhock of an earthquake was felt, which was quickly ſucceeded by a ſecond and third; and at the ſame time ſeveral light flames of fire iſſued from the mountains, reſembling the kindling of charcoal. In theſe three ſhocks, the walls of the buildings moved from eaſt to weſt.

At Oporto, the earthquake began about forty minutes paſt nine. The ſky was very ſerene; when a hollow noiſe like that of thunder, or the rattling of coaches at a diſtance, was heard, and almoſt at the ſame inſtant the earth began to ſhake. In the ſpace of a minute or two, the river roſe and fell five or ſix feet, and continued to do ſo for four hours. It ran up at firſt with ſo much violence, that it broke a ſhip's hawſer. In ſome parts the river opened, and ſeemed to diſcharge vaſt quantities of air; and the agitation in the ſea was ſo great about a league

league beyond the bar, that air was ſuppoſed to have been diſcharged there alſo. St. Ube's, a ſea-port about twenty miles ſouth of Liſbon, was entirely ſwallowed up. Huge pieces of rock were detached at the ſame time from the promontory at the weſt end of the town, which conſiſts of a chain of mountains.

The ſame earthquake was felt all over Spain, except in Catalonia, Arragon, and Valencia. At Ayamonte, (near where the Guadiana falls into the bay of Cadiz,) a little before ten o'clock on the firſt of November, the earthquake was felt; having been immediately preceded by a hollow ruſhing noiſe. Here the ſhocks continued for fourteen or fifteen minutes, damaged almoſt all the buildings, throwing down ſome, and leaving others irreparably ſhattered. In little more than half an hour after, the ſea and river, with all the canals, overflowed their banks, laying under water all the coaſts of the iſlands adjacent to the city and its neighbourhood. On the adjacent ſhore, every thing was irrecoverably loſt; for all that was overflowed ſunk, and the beach became a ſea, without the leaſt reſemblance of what it was before.

At Cadiz, ſoon after nine in the morning, the earthquake began, and laſted about five minutes. The water of the ciſterns under ground waſhed backwards and forwards, ſo that a great froth aroſe. At ten minutes after eleven, a wave was ſeen coming from the ſea, at eight miles diſtance, at leaſt ſixty feet higher than uſual. It daſhed againſt the weſt part of the town, which is very rocky. Though theſe rocks broke a good deal of its force, it at laſt came upon the city walls, beat in the breaſt-work, and carried pieces of the building of eight or ten ton weight to the diſtance of forty or fifty yards. When the wave was gone, ſome parts that are deep at low water, were left quite dry; for the water returned with the ſame violence with which it came. At half an hour after eleven came a ſecond wave, and after that four other remarkable ones; the firſt at ten minutes before twelve; the ſecond, half an hour before one; the third, ten minutes after one; and the fourth, ten minutes before two. Similar waves, but ſmaller, and gradually leſſening, continued with uncertain intervals till the evening.

At Gibraltar, this earthquake was not felt till after ten. It began with a tremulous motion of the earth, which laſted about half a minute. Then followed a violent ſhock; after that, a trembling of the earth for five or ſix ſeconds; then another ſhock, not ſo violent as the firſt, which went off gradually as it began. The whole laſted about two minutes. Some of the guns on the battery were ſeen to riſe, others to ſink, the earth having an undulating motion. Moſt people were ſeized with giddineſs and ſickneſs, and ſome fell down; others were ſtupified; and many that were walking or riding felt no motion in the earth, but were ſick. The ſea roſe ſix feet every fifteen minutes; and then fell ſo low that boats and all the ſmall craft near the ſhore were left aground, as were alſo numbers of ſmall fiſh. The flux and reflux laſted till next morning, having decreaſed gradually from two in the afternoon.

At Madrid the earthquake came on at the ſame time as at Gibraltar, and laſted about ſix minutes. At firſt every body thought they were ſeized with a ſwimming in their heads; and afterwards, that the houſes were falling. It was not felt in coaches, nor by thoſe who walked on foot, except very ſlightly; and no accident happened, except that two lads were killed by the fall of a ſtone croſs from the porch of a church. Malaga alſo felt a violent ſhock; the bells rang in the ſteeples; the water of a well overflowed, and as ſuddenly retired. At Seville ſeveral houſes were ſhaken down; the famous tower of the cathedral called *La Giralda* opened in the four ſides; and the waters were ſo violently agitated, that all the veſſels in the river were driven aſhore.

In Africa, the ſame earthquake was felt almoſt as ſeverely as it had been in Europe. Great part of the town of Algiers was deſtroyed. At Arzilla, in the kingdom of Fez, about ten in the morning, the ſea ſuddenly roſe with ſuch impetuoſity, that it lifted up a veſſel in the bay, and dropped it with ſuch force on the land, that it was broken to pieces; and a boat was found two muſket-ſhot within land from the ſea. At Fez and Mequinez, great numbers of houſes fell down, and a multitude of the people were buried in the ruins. At Morocco, by the falling down of a great number of houſes, many people loſt their lives: and about eight leagues from the city the earth opened and ſwallowed up a village with all the inhabitants, who were known by the name of the *Sons of Beſumba*, to the number of from eight to ten thouſand perſons. At Salle, near a third part of the houſes were overthrown; the waters ruſhed into the city with great rapidity, and left behind them great quantities of fiſh. At Tangier, the earthquake began at ten in the morning, and laſted ten or twelve minutes. The ſea came up to the walls (a thing never heard of before); and went down immediately with the ſame rapidity with which it aroſe, leaving a great quantity of fiſh behind. Theſe commotions were repeated eighteen times, and laſted till ſix in the evening.

In the city of Funchal, in the iſland of Madeira, a ſhock of this earthquake was firſt perceived at thirty-eight minutes paſt nine in the morning. It was preceded by a rumbling noiſe, like that of empty carriages paſſing haſtily over a ſtone pavement. The obſerver felt the floor immediately to move with a tremulous motion, vibrating very quickly. The ſhock continued more than a minute; during which ſpace, the vibrations, though continual, were weakened and increaſed in force twice very ſenſibly. The increaſe after the firſt remiſſion of the ſhock was the moſt intenſe. The noiſe in the air accompanied the ſhock during the whole of its continuance, and laſted ſome ſeconds after the motion of the earth had ceaſed; dying away like a peal of diſtant thunder rolling through the air. At three quarters paſt eleven, the ſea, which was quite calm, retired ſuddenly ſome paces; then riſing with a great ſwell without the leaſt noiſe, and as ſuddenly advancing, overflowed the ſhore, and entered the city. It roſe fifteen feet perpendicular above the high-water mark, although the tide, which flows there ſeven feet, was then at half ebb. The water immediately receded; and after having fluctuated four or five times between high and low water mark, it ſubſided, and the ſea remained calm as before. In the northern part of the iſland the inundation was more violent, the ſea there retiring above one thouſand paces at firſt, and ſuddenly returning, overflowed the ſhore, forcing open doors, breaking down the walls of ſeveral magazines and ſtorehouſes, leaving great quantities of fiſh aſhore and in the ſtreets of the village of Machico.

Theſe were the principal phenomena with which this remarkable earthquake was attended in thoſe places where it was violent. The effects of it, however, reached to an immenſe diſtance; and were perceived chiefly by the agitations of the waters, or ſome ſlight motion of the earth. The utmoſt boundaries of this earthquake to the ſouth are unknown; the barbarity of the African nations rendering it impoſſible to procure any intelligence from them, except where the effects were dreadful. On the north, however, we are aſſured, that it reached as far as Norway and Sweden. In many places alſo of Germany its effects were very perceptible. Throughout the duchy of Holſtein, the waters were violently agitated, particularly thoſe of the Elbe and Trave. In Brandenburg, the water of a lake called *Libſee*, ebbed and flowed ſix times in half an hour, with a dreadful noiſe, the weather being then perfectly calm. The ſame agitation was obſerved in the waters of the lakes called *Muplgatz* and *Netze*; but at this laſt place they alſo emitted an intolerable ſtench. In Holland, the agitations were more remarkable. At Alphen on the Rhine, between Leyden and Woerden, in the afternoon of the firſt of November, the waters were agitated to ſuch a violent degree, that buoys were broken from their chains, large veſſels ſnapped their cables, ſmaller ones were thrown out of the water upon the

land, and others lying on land were ſet afloat. At Amſterdam, about eleven in the forenoon, the air being perfectly calm, the waters were ſuddenly agitated in their canals, ſo that ſeveral boats broke looſe; chandeliers were obſerved to vibrate in the churches; but no motion of the earth, or concuſſion of any building, was obſerved. At Haerlem, in the forenoon, for near four minutes together, not only the water in the rivers, canals, &c. but alſo all kinds of fluids in ſmaller quantities, as in coolers, tubs, backs, &c. were ſurpriſingly agitated, and daſhed over the ſides, though no motion was perceptible in the veſſels themſelves. In theſe ſmall quantities alſo the fluid apparently aſcended prior to its turbulent motion; and in many places, even the rivers and canals roſe twelve inches perpendicular. At Leyden, between half an hour after ten and eleven in the forenoon, the waters roſe ſuddenly in ſome of the canals, and made ſeveral very ſenſible undulations, ſo that the boats were ſtrongly agitated.

Round the iſland of Corſica, the ſea was violently agitated, and moſt of the rivers of the iſland overflowed their banks. In the city of Milan in Italy, and throughout that diſtrict, ſhocks were felt. At Turin in Savoy, there was felt a very violent ſhock. In Switzerland, many rivers turned ſuddenly muddy without rain. The lake of Neufchatel ſwelled to the height of near two feet above its natural level for the ſpace of a few hours. An agitation was alſo perceived in the waters of the lake of Zurich. At the iſland of Antigua, there was ſuch a ſea without the bar as had not been known in the memory of man; and after it, all the water at the wharfs, which uſed to be ſix feet deep, was not two inches. At Barbadoes, about two in the afternoon, the ſea ebbed and flowed in a ſurpriſing manner. It ran over the wharfs and ſtreets into the houſes, and continued thus ebbing and flowing till ten at night.

The agitation of the waters was perceived in many places of Great Britain and Ireland. At Barlborough in Derbyſhire, between eleven and twelve in the forenoon, in a boat-houſe on the weſt ſide of a large body of water called *Pibley Dam*, ſuppoſed to cover at leaſt thirty acres of land, was heard a ſurpriſing noiſe; a large ſwell of water came in a current from the ſouth, and roſe two feet on the dam-head at the north end of the water. It then ſubſided; but returned again immediately, though with leſs violence. The water was thus agitated for three quarters of an hour; but the current grew every time weaker and weaker, till at laſt it entirely ceaſed. At Buſbridge in Surrey, at half an hour after ten in the morning, the weather being remarkably ſtill, without the leaſt wind, in a canal near ſeven hundred feet long and fifty-eight feet broad, with a ſmall ſpring conſtantly running through it, a very unuſual noiſe was heard at the eaſt end, and the water there obſerved to be in great agitation. It raiſed itſelf in a heap or ridge in the middle; and this heap extended lengthwiſe about thirty yards, riſing between two or three feet above the uſual level. After this, the ridge vibrated towards the north ſide of the canal, with great force, and flowed above eight feet over the graſs walk on that ſide. On its return back into the canal, it again ridged in the middle, and then heeled with yet greater force to the ſouth ſide, and flowed over its graſs walk. During this latter motion, the bottom on the north ſide was left dry for ſeveral feet. This appearance laſted near a quarter of an hour, after which the water became ſmooth and quiet as before. During the whole time, the ſand at the bottom was thrown up and mixed with the water; and there was a continual noiſe like that of water turning a mill. At Cobham in Surrey, between ten and eleven o'clock, a perſon was watering a horſe at a pond fed by ſprings. Whilſt the animal was drinking, the water ſuddenly ran away from him, and moved towards the ſouth with ſuch ſwiftneſs that the bottom of the pond was left bare. It returned again with ſuch impetuoſity that the man leaped backwards to ſecure himſelf from its ſudden approach. The ducks were alarmed at the firſt agitation, and inſtantly flew all out of the pond. At Dunſtall in Suffolk, the water of a pond roſe gradually for ſeveral minutes in the form of a pyramid, and fell down like a water-ſpout. Other ponds in the neighbourhood had a ſmooth flux and reflux from one end to the other.

Near the city of Durham, about half an hour after ten, a gardener was alarmed by a ſudden ruſhing noiſe from a pond, as if the head of the pond had been broken down; when caſting his eye on the water, he ſaw it gradually riſe up, without any fluctuating motion, till it reached a grate which ſtood ſome inches higher than the common water level. After this it ſubſided, and then ſwelled again; thus continuing to riſe and fall during the ſpace of ſix or ſeven minutes, making four or five returns in the ſpace of one minute. The pond was about forty yards long and ten broad. At Earſy Court, Berks, about eleven o'clock, as a gardener was ſtanding by a fiſh-pond, he felt a violent trembling of the earth, which laſted about a minute. Immediately after, he obſerved a motion of the water from the ſouth to the north end of the pond, leaving the bottom at the ſouth end altogether dry for about ſix feet. It then returned, and flowed at the ſouth end, riſing three feet up the ſlope bank; and immediately after returned to the north bank, riſing there alſo about three feet. In the time between the flux and reflux, the water ſwelled up in the middle of the pond, collected in a ridge about twenty inches higher than the level on each ſide, and boiled like a pot. This agitation from ſouth to north laſted about four minutes. At Eaton-bridge, Kent, in a pond about an acre in ſize, a dead calm, and no wind ſtirring, ſome perſons heard a noiſe, and imagining ſomething had been tumbling in, ran to ſee what was the matter. On their arrival at the pond, to their ſurpriſe they ſaw the water open in the middle, ſo that they could ſee a poſt a good way down, almoſt to the bottom. The water in the mean time daſhed up over a bank two feet high, and perpendicular to the pond. This was repeated ſeveral times with a great noiſe.

At Eyam-bridge, Derbyſhire, in the Peak, the overſeer of the lead-mines ſitting in his writing-room about eleven o'clock, felt a ſudden ſhock, which very ſenſibly raiſed him up in his chair, and cauſed ſeveral pieces of plaſter to drop from the ſides of the room. The roof was ſo violently ſhaken, that he imagined the engine ſhaft had been falling in. Upon this he immediately ran to ſee what was the matter, but found every thing in perfect ſafety. At this time two miners were employed in carting the ore and other materials to be raiſed up at the ſhafts. The drift in which they were working was about 120 yards deep, and the ſpace from one end to the other fifty yards or upwards. The miner at the end of the drift had juſt loaded his cart, and was drawing it along; but he was ſuddenly ſurpriſed by a ſhock, which ſo terrified him, that he immediately quitted his employment, and ran to the weſt end of the drift to his partner, who was no leſs terrified than himſelf. They durſt not attempt to climb the ſhaft, leſt that ſhould be running in upon them; but while they were conſulting what means they ſhould take for their ſafety, they were ſurpriſed by a ſecond ſhock, more violent than the firſt; which frightened them ſo much that they both ran precipitately to the other end of the drift. They then went down to another miner who worked about twelve yards below them. He told them that the violence of the ſecond ſhock had been ſo great, that it cauſed the rocks to grind upon one another. His account was interrupted by a third ſhock, which, after an interval of four or five minutes, was ſucceeded by a fourth; and, about the ſame ſpace of time after, by a fifth; none of which were ſo violent as the ſecond. They heard, after every ſhock, a loud rumbling in the bowels of the earth, which continued about half a minute, gradually decreaſing, or ſeeming to remove to a greater diſtance. At Shirburn caſtle, Oxfordſhire, at a little after ten in the morning, a very ſtrange motion was obſerved

obſerved in the water of a moat which encompaſſes the houſe. There was a pretty thick fog, not a breath of air, and the ſurface of the water all over the moat as ſmooth as a looking-glaſs, except at one corner, where it flowed into the ſhore, and retired again ſucceſſively, in a ſurpriſing manner. The flux and reflux, when ſeen by lord viſcount Parker, were quite regular. Every flood began gently; its velocity increaſed by degrees, when at laſt it ruſhed in with great impetuoſity, till it had attained its full height. At White Rock in Glamorganſhire, about two hours ebb of the tide, and near three quarters after ſix in the evening, a vaſt quantity of water ruſhed up with a prodigious noiſe; floated two large veſſels, the leaſt of them above two hundred tons; broke their moorings, drove them acroſs the river, and had like to have overſet them. The whole riſe and fall of this extraordinary body of water did not laſt above ten minutes, nor was it felt in any other part of the river, ſo that it ſeemed to have guſhed out of the earth at that place.

At Loch Lomond in Scotland, about half an hour after nine in the morning, all of a ſudden, without the leaſt guſt of wind, the water roſe againſt its banks with great rapidity, but immediately ſubſided, till it was as low in appearance as in the greateſt ſummer-drought. A large ſtone lying at ſome diſtance from ſhore, but in ſuch ſhallow water that it could eaſily be ſeen, was forced out of its place in the lake upon dry land, leaving a deep furrow in the ground all along the way in which it had moved.

At Kinſale, in Ireland, between two and three in the afternoon, the weather being very calm, and the tide near full, a large body of water ſuddenly poured into the harbour with ſuch rapidity that it broke the cables of two ſloops, each moored with two anchors, and of ſeveral boats lying between Sicily and the town. But juſt at the time that a great deal of miſchief was apprehended by all the veſſels running foul of each other, an eddy whirled them round ſeveral times, and then hurried them back again with the ſame rapidity as before. This was ſeveral times repeated; and while the current ruſhed up at one ſide of the harbour, it poured down with equal violence at the other. A veſſel that lay all this time in the pool did not ſeem to be any ways affected by it; nor was the violence of the currents much perceived in the deeper parts of the harbour, but raged with moſt violence on the flats. The bottom of the harbour, which is muddy, was much altered; the mud being waſhed from ſome places, and depoſited in others. The waters did not riſe gradually at firſt; but, with a hollow and horrid noiſe, ruſhed in like a deluge, riſing ſix or ſeven feet in a minute, and as ſuddenly ſubſiding. From different accounts it appeared, that the water was affected in a ſimilar manner all along the coaſt to the weſtward of Kinſale.

In France, ſhocks were perceived in ſeveral places; as at Bayonne, Bourdeaux, and Lyons. Commotions of the waters alſo were obſerved at Angouleſme, Bleville, Havre de Grace, &c. but not attended with the remarkable circumſtances above mentioned.

Such were the moſt ſtriking phenomena with which the earthquake of November 1, 1755, was attended on the ſurface of the earth. Thoſe which happened below ground cannot be known but by the changes obſerved in ſprings, &c. which were in many places very remarkable. At Colares, on the afternoon of the 31ſt of October, the water of a fountain was greatly decreaſed: on the morning of the firſt of November it ran very muddy; and, after the earthquake, returned to its uſual ſtate both as to quantity and clearneſs. On the hills, numbers of rocks were ſplit; and there were ſeveral rents in the ground, but none conſiderable. In ſome places where formerly there had been no water, ſprings burſt forth, which continued to run. Some of the largeſt mountains in Portugal were impetuouſly ſhaken as it were from their foundation; moſt of them opened at their ſummits, ſplit and rent in a wonderful manner, and huge maſſes of them were thrown down into the ſubjacent valleys. From the rock called *Pedra de Alvidar*, near the hill Fojo, a kind of parapet was broken off, which was thrown up from its foundation in the ſea. At Varge, on the river Macaas, at the time of the earthquake, many ſprings of water burſt forth, ſome ſpouted to the height of 18 or 20 feet, throwing up ſand of various colours, which remained on the ground. A mountainous point, ſeven or eight leagues from St. Ube's, cleft aſunder, and threw off ſeveral vaſt maſſes of rock. In Barbary, a large hill was rent in two; the two halves fell different ways, and buried two villages. In another place, a mountain burſt open, and a ſtream iſſued from it tinged with red. At Tangier, all the fountains were dried up, ſo that there was no water to be had till night. A very remarkable change was obſerved on the medicinal waters of Toplitz, a village in Bohemia, famous for its baths. Theſe waters were firſt diſcovered in the year 762; from which time the principal ſpring of them had conſtantly thrown out hot water in the ſame quantity, and of the ſame quality. On the morning of the earthquake, between eleven and twelve in the forenoon, the principal ſpring caſt forth ſuch a quantity of water, that in the ſpace of half an hour all the baths ran over. About half an hour before this great increaſe of the water, the ſpring flowed turbid and muddy; then having ſtopped entirely for a minute, it broke forth again with prodigious violence, driving before it a conſiderable quantity of reddiſh ochre. After this it became clear, and flowed as pure as before. At Angouleſme in France, a ſubterraneous noiſe, like thunder, was heard; and preſently after the earth opened, and diſcharged a torrent of water mixed with red ſand. Moſt of the ſprings in the neighbourhood ſunk in ſuch a manner, that for ſome time they were thought to be quite dry. In England, no conſiderable alteration was obſerved in the earth, except that near the lead mine above-mentioned, in Derbyſhire, a cleft was obſerved about a foot deep, ſix inches wide, and 150 yards in length.

At ſea, the ſhocks of this earthquake were felt moſt violently. Off St. Lucar, the captain of the Nancy frigate felt his ſhip ſo violently ſhaken, that he thought ſhe had ſtruck the ground; but, on heaving the lead, found he was in a great depth of water. Captain Clark, from Denia, in lat. 36. 24. N. between nine and ten in the morning, had his ſhip ſhaken and ſtrained as if ſhe had ſtruck upon a rock, ſo that the ſeams of the deck opened, and the compaſs was overturned in the binacle. The maſter of a veſſel bound to the American iſlands, being in lat. 25. N. lon. 40. and writing in his cabin, heard a violent noiſe, as he imagined, in the ſteerage; and while he was aſking what the matter was, the ſhip was put into a ſtrange agitation, and ſeemed as if ſhe had been ſuddenly jerked up and ſuſpended by a rope faſtened to the maſt-head. He immediately ſtarted up with great aſtoniſhment; and looking out at the cabin-window, ſaw land, as he took it to be, at the diſtance of about a mile. But, coming upon the deck, the land was no more to be ſeen, but he perceived a violent current croſs the ſhip's way to the leeward. In about a minute, this current returned with great impetuoſity, and at a league's diſtance he ſaw three craggy-pointed rocks throwing up water of various colours reſembling fire. This phenomenon, in about two minutes, ended in a black cloud, which aſcended very heavily. After it had riſen above the horizon, no rocks were to be ſeen; though the cloud, ſtill aſcending, was long viſible, the weather being extremely clear.—Between nine and ten in the morning, another ſhip, forty leagues weſt of St. Vincent, was ſo ſtrongly agitated, that the anchors, which were laſhed, bounced up, and the men were thrown a foot and an half perpendicularly up from the deck. Immediately after this, the ſhip ſunk in the water as low as the main chains. The lead ſhowed a great depth of water, and the line was tinged of a yellow colour and ſmelt of ſulphur. The ſhock laſted about ten minutes, but they felt ſmaller ones for the ſpace of twenty-four hours.

This

This very deſtructive earthquake is ſuppoſed to have extended over a tract of at leaſt four millions of ſquare miles. The earthquakes which happened in 1783, and which ruined a great part of Italy and Sicily, tho' much more confined in extent, ſeem to have been not at all inferior in violence.

From the moſt authentic accounts collected by his Sicilian majeſty's ſecretary of ſtate, it was learned, that the part of Calabria which had been moſt affected by this heavy calamity, is that comprehended between the 38th and 39th degree of latitude: that the greateſt force of the earthquake ſeemed to have exerted itſelf from the foot of thoſe mountains of the Appennines called the Monte Dijo, Monte Sacro, and Monte Caulene, extending weſtward to the Tyrrhene ſea: that the towns and villages neareſt theſe mountains, ſituated either on the hills or the plain, were totally ruined by the ſhock of the 5th of February about noon; that as the towns and villages were at a greater diſtance from this centre, the damage they received was leſs conſiderable; but that even theſe more diſtant towns had been greatly damaged by the ſubſequent ſhocks of the earthquakes, and effectually by thoſe of the 7th, 26th, and 28th of February, and that of the 1ſt of March; that from the firſt ſhock of the 5th of February, the earth had been in a continual tremor; and that the ſhocks were more ſenſibly felt at times in ſome parts of the afflicted provinces than at others; that the motion of the earth had been either whirling like a vortex, horizontal, or by pulſations, or by beatings from the bottom upwards. This variety of motions increaſed the apprehenſions of the diſtreſſed inhabitants, who expected every moment that the earth would open under their feet, and ſwallow them up. On the weſtern ſide of the mountains above-mentioned, many openings and cracks had been made; ſome hills had been much lowered, and others entirely ſwallowed up; deep chaſms had been opened, by which many roads were rendered impaſſable; huge mountains were ſplit aſunder, and parts of them driven to a conſiderable diſtance; deep valleys were filled up by the concourſe of the mountains which formed them before; the courſe of the rivers were altered; many ſprings of water dried up, and new ones formed in their place. A ſingular phenomenon was ſaid to have been obſerved at Laureana in Calabria Ultra; viz. that two whole tenements, with large plantations of olive and mulberry trees, ſituated in a valley perfectly level, had been detached by the earthquake, and tranſplanted, with the trees ſtill remaining in their places, to the diſtance of about a mile from their firſt ſituations; and that from the ſpot on which they formerly ſtood, hot water had ſprung up to a conſiderable height, mixed with ſand of a ferruginous nature: that near this place alſo ſome countrymen and ſhepherds had been ſwallowed up, with their teams of oxen, and their flocks of goats and ſheep. The number of lives loſt was eſtimated at 32,367.

The fate of the inhabitants of Scilla was extremely affecting. On the firſt ſhock, February 5, they had fled along with their prince to the ſea-ſhore, where they hoped for ſafety; but, in the night-time, a furious wave (ſaid to have been boiling hot, and by which many people were alleged to have been ſcalded) overflowed the land for three miles, ſweeping off in its return 2473 of the inhabitants, among whom was the prince himſelf, who were at that time either on the ſtrand or in boats near the ſhore. But the moſt ſingular of all the phenomena enumerated in theſe accounts was, that a hill, about 500 palms in height, and 1300 in circumference at its baſis, jumped to the diſtance of about four miles from the place where it formerly ſtood. At the ſame time the hill on which the town of Oppido ſtood, which extended about three miles, parted in two; and as its ſituation was between two rivers, both of theſe were of courſe ſtopped up; two great lakes were formed, and by their continual increaſe threatened to infect the air by their noxious exhalations.

Sir William Hamilton, who, early in the ſame year, made a tour of curioſity through that country, landed on the 6th of May at the town of Pizzo, in Calabria Ultra. Here he was aſſured that the volcano of Stromboli, which is oppoſite, and in view of the town, though diſtant about fifty miles, had ſmoked leſs, and thrown up a ſmaller quantity of inflamed matter during the earthquakes than it had done for ſome years before; and that ſlight ſhocks ſtill continued to be felt. Sir William had ſoon a convincing proof that this laſt information was true; for, ſleeping that night in his boat, (called a *Malteſe ſperonara*) he was awakened with a ſmart ſhock, which ſeemed to lift up the bottom of the boat, but was not attended with any ſubterraneous noiſe.

From Pizzo he paſſed through a moſt beautiful country to Monteleone. Here ſir William had an opportunity of ſeeing many people who had been thrown down by the violence of the ſhocks. Several peaſants told him, that the motion of the earth was ſo violent, that the heads of the largeſt trees almoſt touched the ground from ſide to ſide; that during a ſhock, the horſes and oxen extended their legs wide aſunder, that they might not be thrown down; and that they gave evident ſigns of being ſenſible of the approach of each ſhock.—From Monteleone, Sir William deſcended into the plain, having paſſed through many towns and villages which had been more or leſs damaged, according to their vicinity to the plain. The town of Mileto, ſtanding in a bottom, was totally ruined, not a houſe being left ſtanding. At ſome diſtance he ſaw Soriano, and the noble Dominican convent, a heap of ruins. Paſſing through the deſolated town of St. Pietro, in his way to Roſarno, he had a diſtant view of Sicily and the ſummit of Mount Etna, which then ſent forth a conſiderable ſmoke. Juſt before his arrival at Roſarno he paſſed over the river Meſſano or Metauro, on a ſtrong timber-bridge, 700 palms long, built by the duke of Monteleone. From the cracks made in the banks, and in the bed of the river, by the earthquake, it was quite ſeparated in one part; and the level on which the piers were placed having been variouſly altered, the bridge had taken an undulated form, ſo that the rail on each ſide was curiouſly ſcolloped; but the ſeparated parts having been joined again, it was then paſſable. The town of Roſarno, with the duke of Monteleone's palace there, was entirely deſtroyed; but the walls remained about ſix feet high, and were at that time fitting up as barracks. The only building that remained unhurt was the town gaol, in which were three notorious villains, who would probably have loſt their lives if they had been at liberty.

From Roſarno ſir William proceeded to Laureana, where he was conducted to the place above deſcribed, where the two tenements were ſaid to have exchanged ſituations. In this neighbourhood were ſeveral cracks, none of them above a foot wide; but during the earthquake they had opened very wide, and ſwallowed up an ox, with near 100 goats. Paſſing through the ſame beautiful country to the town of Poliſtene, ſir William did not perceive a ſingle houſe ſtanding. "I travelled (ſays he) four days in the plain, in the midſt of ſuch miſery as cannot be deſcribed. The force of the earthquake there was ſo great, that all the inhabitants of the towns were buried, alive or dead, in the ruins of their houſes in an inſtant. The town of Poliſtene was large, but ill ſituated, between two rivers that were ſubject to overflow. Two thouſand one hundred, out of 6000, loſt their lives here on the fatal 5th of February." At Caſal Nuova, the princeſs Gerace Grimaldi, with 4000 of her ſubjects, periſhed on the ſame day by the exploſion; for ſuch it appears to have been. Some who had been dug alive out of the ruins, ſaid that they had felt their houſes fairly lifted up, without having the leaſt previous notice. An

inhabitant of Caſal Nuova was at that moment on a hill overlooking the plain; when, feeling the ſhock, and turning round, inſtead of the town he ſaw only a thick cloud of white duſt like ſmoke, the natural effect of the cruſhing of the buildings and the mortar flying off.

The town of Caſal Nuova was ſo effectually deſtroyed by this dreadful ſhock, that neither veſtige of houſe or ſtreet remained, but all lay in one confuſed heap of ruins. Caſtillace and Milicuſco, which ſir William next viſited, were both in the ſame ſituation. Terra Nuova, ſituated in the ſame plain, ſtood between two rivers, which, with the torrents from the mountains, had in the courſe of ages, cut deep and wide chaſms in the ſoft ſandy clay ſoil of which it is compoſed. At Terra Nuova, the ravine or chaſm is not leſs than 500 feet deep, and three quarters of a mile broad. Here the accounts of the earthquake were confuſed, by not having the ſituation of the place and nature of the ſoil explained. It was ſaid, that a town had been thrown a mile from the place on which it ſtood, without mentioning a word of the ravine; that woods and corn-fields had been removed in the ſame manner, "when in truth (ſays our author) it was but upon a large ſcale, what we ſee every day upon a ſmaller; when pieces of the ſides of hollow ways, having been undermined by rain waters, are detached by their own weight. Here, from the great depth of the ravine, and the violent motion of the earth, two huge portions of the latter, on which a great part of the town ſtood, which conſiſted of ſome hundred houſes, had been detached into the ravine, and nearly acroſs it, at about the diſtance of half a mile from the place where they formerly ſtood; and what is very extraordinary, many of the inhabitants who had taken this ſingular leap in their houſes, were nevertheleſs dug out alive, and ſome unhurt." Our author's guide there, who was both a prieſt and phyſician, having been buried in the ruins of his houſe by the firſt ſhock, was blown out of it and delivered by the ſecond, which immediately followed the firſt; and there were many well atteſted inſtances of the ſame thing having happened in different parts of Calabria. At Terra Nuova, however, only 400 out of 1600 inhabitants were left alive.

In other parts of the plain, ſituated near the ravine, and near the town of Terra Nuova, our author ſaw many acres of land, with trees and corn-fields, that had been detached into the ravine, frequently without having been overturned; ſo that the crops were growing as well as if they had been planted there. Other ſuch pieces were lying in the bottom in an inclined ſituation; and others again that had been quite overturned. In one place, two of theſe immenſe pieces of land having been detached, oppoſite to one another, had filled the valley, and ſtopped the courſe of the river, the waters of which were forming a great lake; "and this (ſays ſir William) is the true ſtate of what the accounts mention of mountains that had walked, and joined together, ſtopped the courſe of a river, and formed a lake." At the moment of the earthquake the river diſappeared; but, returning ſoon after, it overflowed the bottom of the ravine about three feet in depth; ſo that the poor people who had been thrown with their houſes into the ravine from the top of it, and had eſcaped with broken bones, were now in danger of being drowned. The whole town of Mollochi di Sotto was likewiſe detached into the ravine, and a vineyard of many acres lay near it in the bottom in perfect order, but in an inclined ſituation. There was a foot-path through this vineyard which had a ſingular effect in its then impracticable ſituation. Some water-mills which were on the river, being jammed between two ſuch detached pieces as above-deſcribed, were lifted up by them, and were then to be ſeen on an elevated ſituation many feet above the level of the river. In ſeveral parts of the plain, the ſoil, with timber-trees and crops of corn, conſiſting of many acres, had ſunk eight and ten feet below the level of the plain, and riſen as many in other places. To explain this, it is neceſſary to remark, that the ſoil of the plain is a clay mixed with ſand, which is eaſily moulded into any ſhape. In the plain, near the ſpots where the above-mentioned pieces had been detached into the ravine, there were ſeveral parallel cracks; ſo that, had the violence of the earthquake continued, theſe pieces would alſo probably have followed. It was conſtantly obſerved, that near every ravine or hollow way, the parts of the plain adjoining were full of large parallel cracks. The earth rocking from ſide to ſide, and being ſupported only on one ſide, accounts very well for this circumſtance.

From Terra Nuova, ſir William continued his journey to Oppido. This city ſtands on a mountain of a ferruginous ſort of gritty ſtone, unlike the clay ſoil of its neighbourhood: and is ſurrounded by two rivers in a ravine deeper and broader than that at Terra Nuova. Here, a countryman, who was ploughing his field with a pair of oxen, was tranſported with his field and team clear from one ſide of the ravine to the other, and neither he nor his oxen were hurt.—"Having walked over the ruins of Oppido (ſays our author), I deſcended into the ravine, and examined carefully the whole of it. Here I ſaw indeed the wonderful force of the earthquake, which has produced exactly the ſame effects as thoſe deſcribed in the ravine at Terra Nuova, but on a ſcale infinitely greater. The enormous maſſes of the plain, detached from each ſide of the ravine, lie ſometimes in confuſed heaps, forming real mountains, and having ſtopped the courſe of two rivers (one of which is very conſiderable) great lakes were already formed. Sometimes I met with a detached piece of the ſurface of the plain of many acres in extent, with the large oaks and olive-trees, with corn or lupins under them, growing as well and in as good order at the bottom of the ravine as their companions from whence they were ſeparated do on their native ſoil, at leaſt 500 feet higher, and at the diſtance of about three quarters of a mile. I met with whole vineyards in the ſame order in the bottom, that had likewiſe taken the ſame journey. As the banks of the ravine from whence theſe pieces came are now bare and perpendicular, I perceived that the upper ſoil was a reddiſh earth, and the under one a ſandy white clay, very compact, and like a ſoft ſtone. The impulſe theſe huge maſſes received, either from the violent motion of the earth alone, or that aſſiſted with the additional one of the volcanic exhalations ſet at liberty, ſeems to have acted with greater force on the lower and more compact ſtratum than on the upper cultivated cruſt: for I conſtantly obſerved, where theſe cultivated lands lay, the under ſtratum of compact clay had been driven ſome hundred yards farther, and lay in confuſed blocks; and, as I obſerved, many of theſe blocks were in a cubical form. The under ſoil, having had a greater impulſe, and leaving the upper in its flight, naturally accounts for the order in which the trees, vineyards, and vegetation, fell, and remain at preſent in the bottom of the ravine."

From Oppido ſir William proceeded to the towns of Seminara and Palmi. The former, being ſituated higher up, had ſuffered leſs than Palmi, which ſtood nearer the ſea. Fourteen hundred lives were loſt at this place, and ſome ſingular circumſtances occurred. The town being a great market for oil, there were upwards of 4000 barrels of that liquid in it at the time of its deſtruction; ſo that by the breaking of theſe barrels and jars, a rivulet of oil ran from the ruins for many hours into the ſea. Here our author was informed by the perſon who conducted him, that he had been buried in the ruins of his houſe by the firſt ſhock; and that after the ſecond, which followed immediately, he found himſelf ſitting aſtride a beam at leaſt fifteen feet high in the air. After ſir William's departure from Palmi, in going through one of the narrow paſſes among the mountains of Bagnara and Solano, he felt a very ſmart ſhock of an earthquake, attended with a loud exploſion like that of ſpringing a mine; but fortunately it did not detach any rocks or trees from the high mountains which hung over their heads. In this coun-

try he was aſſured by ſeveral fiſhermen, that during the earthquake on the 5th of February, at night, the ſea was hot, and that they ſaw fire iſſue from the earth in many parts. This laſt circumſtance was frequently repeated in different parts of the plain, ſo that there ſeems to remain no doubt of its authenticity. The idea of ſir William Hamilton is, that "the exhalations which iſſued during the violent commotions of the earth were full of electrical fire; juſt as the ſmoke of volcanoes conſtantly is during violent eruptions: for I ſaw no mark (ſays he) in any part of my journey, of any volcanic matter having iſſued from the fiſſures of the earth; and I am convinced that the whole has been done by vapours and exhalations only. The firſt ſhock felt at this place, as I was aſſured, was lateral, and then vorticoſe, and exceedingly violent; but what they call violent here muſt have been nothing in compariſon of what was felt in the plain of Caſa Nuova, Poliſtene, Palmi, Terra Nuova, Oppido, &c. where all agreed that the violence of the fatal ſhock of February was inſtantaneous, without warning, and from the bottom upwards."

At Reggio the ſhock had been much leſs violent than in the places hitherto viſited by our author; and "though there was not a houſe in it inhabited or habitable, yet (ſays he) after having been ſeveral days in the plain, where every building is levelled with the ground, a houſe with a roof, or a church with a ſteeple, was to me a new and refreſhing object." He was here informed, that all animals are in a greater or leſs degree much more ſenſible of an approaching ſhock of an earthquake than any human being; but that dogs and geeſe, above all, ſeem to be the ſooneſt and moſt ſenſibly alarmed. The ſhock which damaged Reggio came on gently, ſo that the people had time to make their eſcape, and only 126 were killed; but in the plain this ſhock was as inſtantaneous as it was violent and deſtructive.

On the 14th of May, ſir William Hamilton having taken leave of Reggio, ſet ſail for Meſſina, where he found that the ſhock had been far inferior to what he had ſeen the effects of in other places. Notwithſtanding this comparative mildneſs, however, the miſchief had been very terrible. All the beautiful front of the palazzate, which extended in very lofty uniform buildings, in the ſhape of a creſcent, had been in ſome parts totally ruined, in others leſs; and there were cracks in the earth of the quay, a part of which had ſunk above a foot below the level of the ſea. The howlings of the dogs in the ſtreets of Meſſina, a little before the earthquake, were ſo loud and terrific, that orders were ſent to kill them; and it is ſaid, that during the earthquake, fire had been ſeen to iſſue from the cracks of the quay; but our author is perſuaded that this, as in other caſes, was only a vapour charged with electrical fire, or a kind of inflammable air. Here alſo he was informed, that the ſhock of the 5th of February had been from the bottom upwards; but the ſubſequent ones generally horizontal or vorticoſe. A remarkable circumſtance was obſerved at Meſſina, and through the whole coaſt of Calabria, which had been moſt affected by the earthquake, viz. that a ſmall fiſh called *cicirelli*, reſembling the Engliſh white bait, but larger, and which uſually lie at the bottom of the ſea buried in the ſand, had, ever after the commencement of the earthquakes to the time this account was written, continued to be taken near the ſurface, and that in ſuch abundance as to be common food for the pooreſt ſort of people: whereas before the earthquakes this fiſh was rare, and reckoned among the greateſt delicacies. Fiſh of all kinds alſo were taken in greater abundance on theſe coaſts after the commencement of the earthquakes than before; which ſir William ſuppoſes to have been occaſioned either by the volcanic matter having heated the bottom of the ſea, or that the continual tremor of the earth had forced them out of their retreats. At Meſſina our author was likewiſe informed, that on the 5th of February, and for three days following, the ſea, about a quarter of a mile from the citadel, roſe and boiled in an extraordinary manner, and with a moſt alarming noiſe; the water in other parts of the ſtrait being perfectly calm.

Theſe earthquakes were not perfectly ſettled even in 1784, when ſir William Hamilton wrote the account of the ſtate of Veſuvius, &c. to the royal ſociety of London. In a poſtſcript to that letter he adds the following confirmation of his conjecture, that the volcanic matter, which he ſuppoſed to have occaſioned the earthquakes, had vented itſelf at the bottom of the ſea betwixt Calabria and Sicily: "The pilot of one of his Sicilian majeſty's ſciabecques having, ſome time after the earthquakes, caſt anchor off the point of Palizzi, where he had often anchored in twenty-five fathom water, found no bottom till he came to ſixty-five; and, having ſounded for two miles out at ſea towards the point of Spartivento in Calabria, he ſtill found the ſame conſiderable alteration in the depth. The inhabitants of Palizzi likewiſe declare, that, during the great earthquake on the 5th of February 1783, the ſea had boiled and frothed up tremendouſly off their point."

From the time of this dreadful viſitation in Calabria, we hear no more of earthquakes, until Dr. Gray, F. R. S. publiſhed an account of one which was felt in various parts of England, on the 18th of November, 1795. Happily for this country, however, the circumſtances attending that phenomenon of nature ſo much dreaded in other parts of the world, are here ſo little ſtriking or alarming, that very cloſe enquiry is neceſſary to trace the minute footſteps of ſuch an event. In the ſame proportion, too, we ſhould conceive that its importance as a ſubject for philoſophical obſervation is leſſened; and, indeed, few narrations appear more tedious and unintereſting, than the ſuperſtitious and vague accounts, with which the public have too often been impoſed upon with reſpect to earthquakes in Great Britain. Dr. Grey, ſufficiently aware of this fact, concludes with becoming diffidence as to his obſervations on the *mixed cauſes* of this phenomenon, and with a hope that our iſland will continue to "contribute but a ſmall ſhare of thoſe materials which are requiſite to form a complete theory of earthquakes."

The next account we have of an earthquake in Great Britain, was felt at Edinburgh, on Monday the 7th of September, 1801, at ſix in the morning. It extended through Fife, along the north bank of the Forth, from Kirkaldy by Aberdown, Dunfermline, Kincardine, and Alloa; likewiſe northwards by Kinroſs, to ſome diſtance in a north-weſt direction to Callander, and various parts of Perthſhire. At Stirling and Glaſgow the ſhock was alſo very diſtinctly felt, at nearly the ſame time as in the other places mentioned. The appearances were nearly alike in all. At Edinburgh it continued two or three ſeconds; was preceded by a rumbling, ruſhing, hollow, noiſe from the ground; and had a tremendous, undulating, motion, ſomething reſembling the motion of the waves of the ſea. Beds, tables, chairs, &c. in ſome houſes were obſerved to ſhake, reſembling the rocking of a cradle. Some perſons who felt it had a very diſagreeable ſenſation, attended with a head-ach. The morning was gloomy, warm, and calm; the barometer high, and the thermometer about fifty. The preceding day, Sunday, there was a good deal of rain. A parrot in a gentleman's houſe in the ſouth ſide of the town, ſcreeched ſeveral times during the ſhock, in the ſame manner as theſe birds do in the Weſt Indies during an earthquake: and in one houſe the bells were ſet a ringing.

It ſeems that this ſhock was pretty general. At Dumfermline, its duration, it is ſuppoſed, was only two ſeconds. People who were in high ſtories, and conſequently had the beſt opportunities of obſervation, thought they felt two ſmall ſhocks, and in their ſituations, things that were hanging on the walls were evidently moved from their places, occaſioning ſome noiſe. Many people were awakened from their ſleep by the motion which they felt in their beds, which they generally deſcribe by the rocking of a cradle, or as if a perſon had lifted up one ſide of the bed from the floor, to which a tremulous motion

ſucceeded

ſucceeded for a ſhort ſpace. At Grangemouth, and over all that neighbourhood, two ſevere ſhocks were felt, one at four, the other at ſix, in the morning. At Crieff it reſembled the ſudden fall of a houſe, attended with a rumbling noiſe, which continued about the ſpace of ſix ſeconds. It appeared to go from weſt to eaſt. One perſon ſtates that the roof over his head cracked, and appeared as if it would burſt. The rattling of the diſhes on the ſhelves, and the looſe partitions, helped to increaſe the fears of the people, who ran to the doors. In Stirlingſhire it was felt in the ſame manner. There was not a breath of wind, and the ſky, though ſomewhat cloudy, was altogether calm. Soon after the morning became very bright and warm; nor was there any miſt on Benlomond, Benledy, or any of the neighbouring mountains. The gable end of a barn, a few miles to the weſtward of Edinburgh, where ſome ſhearers were ſleeping, fell in, and the unfortunate tenants were completely buried in the rubbiſh. When the accident was diſcovered, and theſe poor people dug out, two women were found dead, and another very much bruiſed. It was obſerved at Leith, that the tides, for three days, had not ebbed ſo much as uſual at the then age of the moon; ſo much ſo, that the workmen at the New Dock had not been able to accompliſh the work they ordinarily do while the tide is out.

We have ſome recent and awful accounts of the fatal effects of earthquakes in South America, communicated in a letter from Quito, dated February 20, 1797; which ſtates, "that a moſt dreadful cataſtrophe of this kind had been then juſt experienced in the provinces of Taninga, Ambato, Riobamba, Alaoſi, part of Chimbo, and Quito. Not a houſe was left ſtanding: every thing was levelled with the ground. The volcano of Maas made a moſt dreadful eruption, and ſplit in two parts, which ſeparated from each other; while the earthquake ſhook the mountains with ſuch violence, that they were daſhed againſt each other, and threw up ſometimes ſtones with clouds of duſt, and ſometimes ſtreams of burning lava, or water. The mountain Ygualata in falling threw out a ſtream of lava which rolled along with fiery waves, and which in its courſe totally deſtroyed Capalpi, San Andreas, Quaono, Emlyies, Guanando, and ſeveral other places. The mountain Moya almoſt diſſolved into water, and ſwept away Pelile and the celebrated plantation of St. Ildephonſo, where a thouſand perſons periſhed. The mountain Euero fell on the village of the ſame name, without leaving a ſingle witneſs of this melancholy event. The mountain Yatagui fell upon Maſoro, and opened ſuch a dreadful gulf, that every thing, houſes, churches, and inhabitants, all but two perſons, were ſwallowed up by it. This place was converted into a bituminous lake, which emitted a ſulphureous vapour. The ruins are every where ſo great, that all the gold and ſilver of America will hardly be ſufficient to repair the devaſtation. The number of thoſe who loſt their lives cannot be aſcertained; but it muſt have been very conſiderable. The provinces of Riobamba, &c. ſuffered moſt; for in theſe many died of hunger, and even of thirſt, as all the water was corrupted.

Accounts alſo from Bencoolen, Taponooly, and Padang, of the 5th and 7th of March 1797, give the following relation of an earthquake that happened on the weſt coaſt of Sumatra on the 20th of February preceding: The vibratory ſhocks of this earthquake are ſtated to have continued for three minutes, and to have recurred at intervals, during a ſpace of three hours, from its beginning, till the ſhock had completely ceaſed. At Padang, the houſes of the inhabitants were almoſt totally deſtroyed, and the public works much damaged. The ſnow Padang, lying at anchor in the river, was thrown, by the ſudden riſe of the ſea, upwards of three miles in ſhore. The number of lives loſt at Padang exceeded three hundred. Of theſe ſome were cruſhed under the ruins of falling houſes; ſome were literally entombed alive by the earth cloſing upon them, and others were drowned by the ſudden irruption of the waters of the ocean. The effects of this awful convulſion of nature do not appear to have extended to the northward of Taponooly; as at that place little or no damage was ſuſtained. It appears to have come from the ſouthward, and is ſuppoſed to have extended as far as Bencoolen. At Natal, very conſiderable damage was ſuſtained, and ſeveral houſes thrown down, but no lives were loſt.

Another account from Metz ſtates, that at ſix in the morning of the 24th of March 1797, a ſhock of an earthquake had been felt at Sarreguemines, Bliſcatel, and other communes of the department of la Meurthe. No preciſe obſervations were made on its direction. It was ſo violent at Bitche, that it raiſed up part of the arch of the bridge, ſo as to render it dangerous to be paſſed. A fact which ſeems to explain this phenomenon is, that the circumference where it took place contains ſeveral mines of naphtha. One of theſe burns continually, like the *ſolfaterra* at Naples. Some days before, a flaming meteor roſe from the earth, between Fey and Veron, three leagues to the ſouth of Metz. Its diſappearance was followed by a detonation which ſhook the atmoſphere to a conſiderable diſtance around.

To explain the phenomena of earthquakes, various hypotheſes have been ſuggeſted both by ancient and modern philoſophers. Anaxagoras ſuppoſed the cauſe of earthquakes to be ſubterraneous clouds burſting out into lightning, which ſhook the vaults that confined them. Others imagined, that the arches, which had been weakened by continual ſubterraneous fires, at length fell in. Others derived theſe accidents from the rarefied ſteam of waters, heated by contiguous fires; and ſome, among whom was Epicurus, and ſeveral of the Peripatetic ſchool, aſcribed theſe terrible convulſions to the ignition of certain inflammable exhalations. This laſt hypotheſis has been adopted by many of the moſt celebrated writers; as, Gaſſendus, Kircher, Schottus, Varenius, Des Cartes, Du Hamel, Honorius, Fabri, &c. They ſuppoſe that there are many and vaſt cavities under ground which have a communication with one another: ſome of which abound with waters; others with vapours and exhalations, ariſing from inflammable ſubſtances, as nitre, bitumen, ſulphur, &c. Theſe combuſtible exhalations they imagine to be kindled by a ſubterraneous ſpark, or by ſome active flame gliding through a narrow fiſſure from without, or by the fermentation of ſome mixture; and, when this happens, they muſt neceſſarily produce exploſions, tremors, and ruptures at the ſurface, according to the number and diverſity of the cavities, and the quantity and activity of the inflammable matter. This hypotheſis is illuſtrated by a variety of experiments, ſuch as mixtures of iron-filings and brimſtone buried in the earth, gunpowder confined in pits, &c. by all which a ſhaking of the earth will be produced.

Though none of theſe hypotheſes were thought ſufficient for explaining the phenomena of earthquakes in a ſatisfactory manner, one or other of them continued to be adopted by almoſt all philoſophers till the year 1749. In the month of March in that year, an earthquake was felt at London, and ſeveral other places in England. Dr. Stukeley, who had been much engaged in electrical experiments, began to ſuſpect that phenomena of this kind ought to be attributed, not to vapours or fermentations generated in the bowels of the earth, but to electricity. In a paper publiſhed by him on this ſubject, he therefore rejects all the above-mentioned hypotheſes, and finally concludes, that an earthquake is no other than a ſhock of the ſame kind as thoſe which commonly occur in electrical experiments. As to the manner in which the earth and atmoſphere are put into ſuch a ſtate, which prepares them to receive an electrical ſhock, and whence the electric matter comes, the doctor does not pretend to determine; but thinks it as difficult to be accounted for as magnetiſm, gravitation, and other ſimilar ſecrets of nature. The ſame hypotheſis was advanced at nearly the ſame time by ſignor Beccaria, without know-

ing any thing of Dr. Stukeley's diſcoveries. But this learned Italian imagined the electric matter which occaſions earthquakes to be lodged deep in the bowels of the earth, agreeably to his hypotheſis concerning lightning. Dr. Prieſtley alſo, in his Hiſtory of Electricity, contends for the agency of the electrical fluid in the production of earthquakes; and, from the doctrines previouſly advanced by Stukeley and Beccaria, he frames a third hypotheſis of his own.

All theſe, it is true, agree in the main; but, if a particular ſolution of the phenomena is required, perhaps every one of them will be found deficient. Later theoriſts have therefore attributed earthquakes to the ſudden exploſion of inflammable ſubſtances in the bowels of the earth, verified upon the principles of modern chemiſtry, and which feed volcanoes; or from the ſudden formation of elaſtic gas, by the burſting of the waters of the ocean into the fiery chambers of volcanoes. Dr. Mitchell, profeſſor of chemiſtry in Columbia college, New York, has lately written a very ingenious Eſſay on this ſubject, and adduced many ſatisfactory proofs that the earth is extremely cavernous under the ſea, and that ſubterranean communications exiſt between the moſt diſtant craters: a fact which ſeems moſt clearly evinced by the effects of the earthquake above deſcribed in 1755, which deſtroyed Liſbon, and which, from the point of its central exploſion, paſſed under the ſea, and found vent even at the narrow mouths of ſprings in very diſtant countries and iſlands, and even in another continent, and as far as the American iſles.

The theory juſt offered by Mr. Blanchet, of the American philoſophical ſociety, aſcribes the exploſion of volcanos and earthquakes to the expanſion of atmoſpherical air; upon the ſame principle that ſolid bodies are burſt by the froſt, or that trees are ſhivered by lightning. The moſt ſimple principles of natural knowledge, (ſays this writer,) teach us that atmoſpheric air cannot paſs from its permanently aëriform ſtate to that of fluid or ſolid, by any degree of cold with which we are acquainted. Admitting this to be true, there is no longer any ground of ſurpriſe in ſeeing the burſting of bodies which reſiſt the force of freezing water. The air, a fluid of permanent elaſticity, being compreſſed, and forced to give way to the particles of water, which cold, or the attractive power of the atoms of bodies, draws violently together, it follows that the ice, into which the water is converted, muſt break aſunder, in order to afford a paſſage to this aëriform ſubſtance, which cold can neither condenſe nor make ſolid, and muſt rend and ſhiver, with a cracking noiſe, the veſſels no longer able to hold it.

"No perſon ſeems yet to have accounted for the ſhattering of trees by the ſtroke of lightning. A moment's reflection, however, ſuffices to diſcover and explain the cauſe. As it is only by a careful analyſis of facts that we can deduce juſt concluſions, I proceed to examine what happens in the moment of the lightning ſtriking a tree, and it will be ſeen whether this ladder will enable us to reach the cauſe of this phenomenon. Repeated experiments have demonſtrated that caloric, or *the matter of heat*, is the cauſe of the repulſive power of the atoms of bodies; and there is no doubt that the more the atoms of a body are removed from one another, the greater is the capacity of ſuch a body to contain caloric. It is alſo inconteſtably proved, that the bodies which are conſtantly in the ſtate of gas, in the common temperature of the atmoſphere, contain a great quantity of caloric, and in proportion to their ſpecific capacity for holding it. So likewiſe the electric fluid, or what might with more propriety be called the electric gas, muſt contain a prodigious quantity of caloric, ſince this element always exiſts in the ſtate of gas, and the more this gas is accumulated, the more the amount of ſpecific heat muſt alſo be augmented. This being premiſed, whenever the lightning (which is only an accumulation of electric gas, diſcharged from one cloud to paſs to another containing a leſs quantity) happens, in its courſe, to ſtrike a tree, the tree becomes ſo ſuddenly overcharged with caloric, that the air and other conſtituent parts of it, which are diſpoſed rapidly to combine with heat, undergo *expanſion*, and thereby ſhiver the tree, in order to force a paſſage, and to ſet themſelves at liberty. I cannot compare this phenomenon to any thing better than to the diſcharge of a cannon or of a muſket; for every body knows that the diſcharge of a cannon is owing to the ſudden expanſion of the conſtituent parts of the powder by the introduction of caloric. The ſame principle is found to be the immediate cauſe of the eruption of volcanoes, and of earthquakes.

"Whatever may be the agent which kindles and inflames volcanic ſubſtances, whether it be the electric gas which communicates its fire to thoſe moſt inflammable ſubſtances, ſuch as ſulphur, nitre, &c. or whether it be the ſubterranean heat, which, in making its eſcape, ſets fire to thoſe ſubſtances, ſtill it is certain that atmoſpheric air muſt be found in great quantities in the interior of volcanoes. For, ſince the ever-memorable diſcoveries of Lavoiſier, of Fourcroy, of Scheele, and of Ingenhouz, on combuſtion, it is admitted as a demonſtrable truth, that the burning of combuſtible ſubſtances is owing to oxygen; that is to ſay, it is fixed and abſorbed by the body in combuſtion, while the caloric and the light, which are combined with it, eſcape, in order to form the flame, the light, and the heat. In this manner atmoſpheric air is one of the eſſential agents in ſupporting the fire of a volcano. Theſe things being premiſed, as ſoon as a volcano is kindled and ſet on fire, the atmoſpheric air which feeds it, as well as the baſes of ſulphur, of water, &c. which are alſo converted to the ſtate of gaſes by the evolution or accumulation of heat, are expanded, and break out with a violence and impetuoſity not to be reſtrained by the force of oppoſing bodies, and thereby give birth to earthquakes, &c. This theory is remarkably countenanced by the common and uniform ſeries of occurrences which follows the eruption of a volcano. In the firſt place, as ſoon as it is kindled, there appears a thick ſmoke; ſoon after, when the air, &c. become expanded, ſtones of enormous bulk are thrown out to great diſtances into the aërial regions, accompanied with earthquake, and agitation of all the ſurrounding country. As ſoon as the ſuperfluous air is diſcharged and ſet free, there ſucceeds a bright flame, which ſeems to reſtore ſerenity to the abyſs, which again, after a ſhort time, vomits forth a ſhower of fiery and deſtructive matters. In ſhort, all theſe exploſions are produced by the ſudden extrication of ſome matter incapable of confinement, or to the expanſion of air in a reſiſting body."

EAR'THY, *adj.* Conſiſting of earth.—All water, eſpecially that of rain, is ſtored with matter, light in compariſon of the common *earthy* matter. *Woodward.*

Long may'ſt thou live in Richard's ſeat to ſit,
And ſoon lie Richard in an *earthy* pit! *Shakeſpeare.*

Compoſed or partaking of earth; terrene:

To ſurvey his dead and *earthly* image,
What were it but to make my ſorrow greater? *Shakeſp.*

Inhabiting the earth: terreſtrial:

Thoſe *earthy* ſpirits black and envious are;
I'll call up other gods of form more fair. *Dryden.*

Relating to earth:

Mine is the ſhipwreck, in a watry ſign;
And in an *earthy*, the dark dungeon thine. *Dryden.*

Not mental; groſs; not refined:

Teach me, dear creature, how to think and ſpeak;
Lay open to my *earthy* groſs conceit,
Smother'd in errors, feeble, ſhallow, weak,
The folded meaning of your words deceit. *Shakeſpeare.*

EAR'THY TRIPLICITY, in aſtrology, the ſigns Taurus, Virgo, and Capricorn.

EAR'WIG, *ſ.* [eape and pizza, Sax. a grub.] An inſect, imagined to creep into the ear. See FORFICULA.

—*Earwigs*

—*Earwigs* and ſnails ſeldom infect timber. *Mortimer.*—By way of reproach, a whiſperer; a prying informer.

EAR'WITNESS, *ſ.* One who atteſts, or can atteſt, any thing as heard by himſelf.—All preſent were made *earwitneſſes*, even of each particular branch of a common indictment. *Hooker.*—The hiſtories of mankind, written by eye or *earwitneſſes*, are built upon this principle. *Watts.*

EAR'WORT. See HEDYOTIS.

EASE, *ſ.* [*aiſe*, Fr.] Quiet; reſt; undiſturbed tranquillity; not ſolicitude:

The prieſt on ſkins of off'ring takes his *eaſe*,
And nightly viſions in his ſlumber ſees. *Dryden.*

Freedom from pain; a neutral ſtate between pain and pleaſure.—That which we call *eaſe* is only an indolency, or a freedom from pain. *L'Eſtrange.*—Reſt after labour. Intermiſſion of labour.—Give yourſelves *eaſe* from the fatigue of waiting. *Swift.*—Facility; not difficulty:

Following with *eaſe*, if favour'd by thy fate,
Thou art foredoom'd to view the Stygian ſtate. *Dryden.*

Unconſtraint; freedom from harſhneſs, formality, forced behaviour, or conceits:

True *eaſe* in writing comes from art, not chance;
As thoſe move eaſieſt who have learn'd to dance. *Pope.*

At EASE. In a ſtate of undiſturbed leiſure; without pain; without anxiety.—No body is under an obligation to know every thing: knowledge and ſcience in general is the buſineſs of thoſe who are *at eaſe* and leiſure. *Locke.*

To EASE, *v. a.* To free from pain.—Help and *eaſe* children the beſt you can; but by no means bemoan them. *Locke.*—To aſſuage; to mitigate; to alleviate.—Thy father made our yoke grievous, now therefore *eaſe* thou ſomewhat the grievous ſervitude. 2 *Chron.*

Will he for ſacrifice our ſorrows *eaſe?*
And can our tears reverſe his firm decrees? *Prior.*

To relieve from labour, or any thing offends; with *of* before the thing.—I will *eaſe* me *of* my own adverſaries. *Iſaiah*, i. 24.—No body feels pain that he wiſhes not to be *eaſed of*, with a deſire equal to that pain, and inſeparable from it. *Locke.*

EA'SEFUL, *adj.* Quiet; peaceable; fit for reſt:

I ſpy a black, ſuſpicious, threat'ning, cloud,
That will encounter with our glorious ſun,
Ere he attains his *eaſeful* weſtern bed. *Shakeſpeare.*

EA'SEL, *ſ.* [of *eſel*, Teut. an aſs.] The frame on which artiſts place their canvaſs to paint on.

EA'SEL-PIECES, *ſ.* Pieces done on the eaſel, diſtinguiſhed from thoſe that are drawn on walls and ceilings.

EA'SEMENT, *ſ.* Aſſiſtance; ſupport; relief from expences.—He has the advantage of a free lodging, and ſome other *eaſements*. *Swift.*

EA'SEMENT, *ſ.* in law, a ſervice or convenience, which one neighbour hath of another, by charter or preſcription, without profit; as a way through his land, a drain or ſink, &c. A perſon may preſcribe to an eaſement in the freehold of another, as belonging to ſome ancient houſe, or to land: and a way over the land of another, a gate-way, water-courſe, or waſhing-place, on another's ground, may be claimed by preſcription as eaſements. But a multitude of perſons cannot preſcribe; though for an eaſement they may plead cuſtom. *Cro. Jac.* 170. To allege an eaſement by *conſuevit* only, is the beſt way: and things of neceſſity ſhall not be extinguiſhed by unity of poſſeſſion; but a way of eaſe may be thus extinguiſhed. *Lil. Abr.* 496.

EA'SILY, *adv.* Without difficulty.—Sounds move ſwiftly, and at great diſtance; but they require a medium well diſpoſed, and their tranſmiſſion is *eaſily* ſtopped. *Bacon.*

She aſk'd the reaſon of his woe:
She aſk'd, but with an air and mien
That made it *eaſily* foreſeen
She fear'd too much to know. *Prior.*

Without pain; without diſturbance; in tranquillity.—Is it not to bid defiance to all mankind to condemn their univerſal opinions and deſigns, if, inſtead of paſſing your life as well and *eaſily*, you reſolve to paſs it as ill and as miſerable as you can? *Temple.*—Readily; without reluctance:

Not ſoon provok'd, ſhe *eaſily* forgives
And much ſhe ſuffers, as ſhe much believes. *Prior.*

EA'SINESS, *ſ.* Freedom from difficulty.—*Eaſineſs* and difficulty are relative terms, and relate to ſome power; and a thing may be difficult to a weak man, which yet may be eaſy to the ſame perſon, when aſſiſted with a greater ſtrength. *Tillotſon.*

Believe me, friends, loud tumults are not laid
With half the *eaſineſs* that they are rais'd. *Ben Jonſon.*

Flexibility; compliance; readineſs; not oppoſition; not reluctance.—Since the cuſtom of *eaſineſs* to alter and change laws is ſo evil, no doubt but to bear a tolerable ſore is better than to venture on a dangerous remedy. *Hooker.*—The ſafeſt way to ſecure honeſty is to lay the foundation of it early in liberality, and an *eaſineſs* to part with to others whatever they have or like themſelves. *Locke.*—Freedom from conſtraint; not effort; not formality:

Abſtruſe and myſtic thoughts you muſt expreſs
With painful care, but ſeeming *eaſineſs*;
For truth ſhines brighteſt through the plaineſt dreſs. *Roſc.*

Reſt; tranquillity; eaſe; freedom from pain.—I think the reaſon I have aſſigned hath a great intereſt in that reſt and *eaſineſs* we enjoy when aſleep. *Ray.*

EASK, a lake of Ireland, in the county of Donegal: four miles north-eaſt of Donegal.

EAST, *ſ.* [eorꝑ, Sax. *heos*, Erſe.] One of the four cardinal points of the world. The quarter where the ſun riſes: oppoſite to the *weſt*. The regions in the eaſtern parts of the world:

I would not be the villain that thou think'ſt
For the whole ſpace that's in the tyrant's graſp,
And the rich *eaſt* to boot. *Shakeſpeare.*

The gorgeous *eaſt*, with richeſt hand,
Pours on her kings barbaric, pearl and gold. *Milton.*

EAST-BETHLEHEM, a townſhip of the American States, in Waſhington county, Pennſylvania.

EAST-BOURN, a ſmall town in the county of Suſſex, pleaſantly ſituated on the ſea ſhore, and much frequented for ſea-bathing: diſtant from Brighton, twenty miles; ſixteen from Lewes, and ſixty-four from London. A few years ago a Roman bath, and a beautiful teſſelated pavement, were diſcovered here, with evident marks that whatever buildings had been over it had been deſtroyed by fire. Here the proſpects are beautiful, commanding an extenſive view of the wilds of Suſſex, which ſkirt the South Downs; and of the numerous flocks of South-down ſheep which decorate and enrich thoſe alpine paſtures. Here alſo are taken in the proper ſeaſon, July and Auguſt, large flights of wheatears, a moſt delicate bird; decoyed on the downs where they flock by the ſhepherds, who cut the earth out like a Roman T, the hole is covered with the turf, the graſſy ſide downwards, and under it are two horſe-hair nooſes; the birds are ſo timorous, that upon the approach even of a cloud, they run into theſe cavities, and are taken. Two miles diſtant from Eaſt-Bourn is a decoy where a great number of wild-fowl reſort and are taken. Here is a free-ſchool for fifteen boys; and two annual fairs, viz. October 10, and March 12. Near Eaſt-Bourn is Beachy-Head, celebrated in hiſtory for the ſtupendous heights of its cliffs.

EAST-CHESTER, a townſhip of the American States, in Weſt-Cheſter county, New-York, on Long-Iſland Sound, about eight miles ſouth-weſt of Rye, five northerly of Weſt-Cheſter, and ſeventeen north-eaſt of New-York. It contains 740 inhabitants, of whom 106 are electors.

EAST-GREEN'WICH, a poſt town, and the chief townſhip of the American States in Kent county, Rhode-Iſland; ſixteen miles ſouth of Providence, and twenty-two north-north-weſt of Newport, containing, by the cenſus, 1824 inhabitants. The town has a handſome court-houſe; and, although its commerce is greatly reduced, it carries on the fiſheries to advantage, and ſends ſome veſſels to the Weſt-Indies. It is ſituated on the north-weſt part of Narraganſet-bay. Both this town and Warwick are noted for making good cider; and formerly for raiſing tobacco for exportation.

EAST-HAD'DAM, a townſhip of the American States, in Middleſex county, Connecticut, ſituated on the eaſt ſide of Connecticut river, oppoſite to Haddam, of which it was formerly a part. It was ſettled in 1704: fourteen miles ſouth of Middleton, and twenty-one north-weſt of New-London.

EAST-HAM, a townſhip of the American States, in Barnſtable county, Maſſachuſetts, about ten miles long, ſituated on the peninſula of Cape Cod, between Chatham and Wellfleet, 100 miles ſouth-eaſt of Boſton. It contains 1834 inhabitants.

EAST-HAMP'TON, a townſhip of the American States, in Hampſhire county, Maſſachuſetts, ſix miles ſouth of Northampton, and 105 weſt-by-ſouth of Boſton. It contains 457 inhabitants, and is divided from the weſt bank of Connecticut river by the celebrated mountain called *Mount Tom*.

EAST-HAMP'TON, a handſome town of the American States, in Suffolk county, New York, on the ſouth-eaſt coaſt of Long-Iſland, twelve miles eaſt-north-eaſt of South-Hampton, and 105 eaſt of New-York city. The townſhip contains 1497 inhabitants, of whom 214 are electors. Gardner's Iſland is annexed to this town.

EAST-HART'FORD, a town of the American States, in Hartford county, Connecticut, ſituated on the eaſt bank of Connecticut river, oppoſite to Hartford. Here are a number of ſtreams which water the town; alſo iron and glaſs works.

EAST-HA'VEN, a townſhip of the American States, in New-Haven county, Connecticut, on the eaſt ſide of New-Haven harbour. The Scotch Captain, and other ſmall iſles, lie on the ſouth ſhore.

EAST-HA'VEN, a townſhip of the American States, in Eſſex county, Vermont, eleven miles ſouth eaſt of the ſouthern end of Willoughby's Lake, and eighteen north-by-weſt of the upper bar of the Fifteen-mile-falls on Connecticut river.

EAST-INDIA COMPANY. See COMPANY, vol. iv. p. 875.

EAST-IN'DIES, a name commonly applied to all thoſe countries on the continent of Aſia, with which Great-Britain, and the other nations of Europe, have from time to time been connected in commerce. Theſe extenſive regions are diſtinguiſhed by the name of Hindooſtan, or that part of the continent and peninſula of Aſia *within* the river Ganges; and of that part *without* or beyond the Ganges, conſiſting of what is now called the Birman Empire, or kingdoms of Aracan, Ava, and Pegu, the Malayan iſles, Siam, Cambodia, &c. See theſe reſpective titles, and the articles INDIA, and HINDOOSTAN.

EAST-ISLAND, a ſmall iſland in the Atlantic, near the coaſt of Main, in America. Lat. 32. N. lon. 67. 32. W. Greenwich.

EAST-LOOE, a borough town of Cornwall, ſituated on the mouth of the river Lowe, and governed by a mayor and eight burgeſſes, who form a common-council; but the recorder and other officers are choſen by the mayor only. It was firſt incorporated by queen Elizabeth, A D. 1587. The principal trade conſiſts in the herring-fiſhery, exporting of oats, and importing of coals. It has a well-founded charity-ſchool for thirteen poor boys.

EAST-MAIN, that part of New-Britain, or Labrador, in North-America, which lies on the eaſt ſide of James's-bay; as part of New South Wales on the weſt ſide of the ſame bay is called *Weſt-Main*. The Hudſon's-bay factory, called *Eaſt-Main*, is ſituated on the ſouth part of Eaſt-Main, between Rupert and Slade rivers, both of which run weſtward into James's-bay.

EAST-MEATH, a name ſometimes given to the county of Meath, in Ireland, to diſtinguiſh it from Weſt-Meath. See MEATH.

EAST-RIVER, a river of the United States of America, or rather a channel between Long-Iſland and New-York Iſland, and between Long-Iſland and the ſtate of Connecticut, where it is more generally called *Long-Iſland Sound*.

EAST-NESS, or EASTON-NESS, a cape in the German Ocean, on the eaſt coaſt of England, and county of Suffolk, between Southwold and Loweſtoff.

EAST-POINT, the extreme eaſt point of the iſland of St. John, in the Gulf of St. Lawrence.

EAST-POINT, the north-eaſt extremity of New Holland. Lat. 10. 42. S.

EAST-WINDSOR, a townſhip of the American States, in Hartford county, Connecticut; ſeparated from Windſor by Connecticut river, and about ſeven miles north-eaſt of Hartford. The compact part of the town lies on one broad ſtreet, of about two miles in length. In the townſhip are three congregational churches. The lands are fertile, and produce large quantities of good tobacco.

EASTANALLE'E, a town of the American States, ſituated on the north-eaſt head branch of Alabama river, in Georgia.

EAS'TER, a feaſt of the church, held in memory of our Saviour's reſurrection. This feaſt has been annually celebrated ever ſince the time of the apoſtles, and is one of the moſt conſiderable feſtivals in the Chriſtian calendar; being that which regulates and determines the times of all the other moveable feaſts. The rule for the celebration of Eaſter, fixed by the council of Nice, in the year 325, is, that it be held on the Sunday which falls upon or next after the full moon which happens next after the 21ſt of March; that is, the Sunday which falls upon or next after the firſt full moon after the vernal equinox. The reaſon of which decree was, that the Chriſtians might avoid celebrating their Eaſter at the ſame time with the Jewiſh Paſſover, which, according to the inſtitution of Moſes, was held the very day of the full moon.

To find EASTER *according to the New or Gregorian Style, till the year* 1900 *excluſive.*—Look for the golden number of the year in the firſt column of the table, againſt which ſtands the day of the paſchal full moon; then look in the third column for the Sunday letter, next after the day of the full moon, and the day of the month ſtanding againſt that Sunday letter is Eaſter-day. When the full moon happens on a Sunday, then the next Sunday after is Eaſter-day.

For example. For the year 1804, the golden number is 19; againſt which ſtands March the 26th, and the next Sunday letter, which is G, below that, ſtands oppoſite April 1, which is therefore the Eaſter-day for the year 1804.

Though the Gregorian calendar be much preferable to the Julian, it is yet not without its defects. It cannot, for inſtance, keep the equinox fixed on the 21ſt of March, but it will ſometimes fall on the 19th, and ſometimes on the 23d. So that the full moon happening on the 20th of March, might ſometimes be paſchal; yet it is not allowed as ſuch in the Gregorian computation;

Gold. Num.	Paſchal full moon.	Sund. letter
14	March 21	C
3	22	D
	23	E
11	24	F
	25	G
19	26	A
8	27	B
	28	C
16	29	D
5	30	E
	31	F
13	April 1	G
2	2	A
	3	B
10	4	C
	5	D
18	6	E
7	7	F
	8	G
15	9	A
4	10	B
	11	C
12	12	D
1	13	E
	14	F
9	15	G
	16	A
17	17	B
6	18	C

computation; and on the contrary, the full moon of the 22d of March may be allowed for paſchal, which it is not. Scaliger and Calviſius have alſo pointed out other inaccuracies in this calendar. An excellent paper on this ſubject by the earl of Macclesfield, may be ſeen in the Philoſ. Tranſ. vol. 40, p. 417.

EAS'TER-ISLAND, an iſland in the South Pacific Ocean, about thirty miles in circumference; without wood or freſh water as far as is yet known. It is noticed by captain Cook, who deſcribes it as extremely barren, and peopled with meagre ſavages in a ſtate of nature, and quite naked, except their chiefs. They appeared to worſhip the ſun, and proſtrated themſelves before two immenſe ſtones, one of which was flat, and the other erect, about ten feet high, and ſeven fathoms round; with a figure of a man's head carved at the top, and a garland, of moſaic or inlaid work, not ill performed. They called one ſtone Dago, and the other Taurico. Lat. 19. 20. S. lon. 114. 49. W. Greenwich.

EAS'TER-OFFERINGS, *ſ.* Money preſented to the pariſh-prieſt at Eaſter.

EAS'TERLING, *ſ.* A native of ſome country eaſtward to another: in the Engliſh hiſtory, ſpoken of people from the ſhores of the Baltic:

He oft in battle vanquiſhed
Thoſe ſpoilful, rich, and ſwarming, *Eaſterlings*. *Spenſer*.

EAS'TERLING, *adj.* Belonging to the money of the eaſterlings, ſterling.

EAS'TERLY, *adj.* Coming from the parts toward the eaſt.—When the *eaſterly* winds or breezes are kept off by ſome high mountains from the vallies, whereby the air, wanting motion, doth become exceeding unhealthful. *Raleigh*.—Lying towards the eaſt.—Theſe give us a view of the moſt *eaſterly*, ſoutherly, and weſterly, parts of England. *Graunt*.—Looking towards the eaſt.—Water he chuſes clear, light, without taſte or ſmell, drawn from ſprings with an *eaſterly* expoſition. *Arbuthnot*.

EAS'TERN, *adj.* Dwelling or found in the eaſt; oriental.—Like *eaſtern* kings a lazy ſtate they keep. *Pope*.

Eaſtern tyrants from the light of heaven
Seclude their boſom ſlaves. *Thomſon*.

Lying or being towards the eaſt.—The *eaſtern* end of the iſle riſes up in precipices. *Addiſon*.—Going towards the eaſt. Looking towards the eaſt:

The angel caught
Our ling'ring parents, and to th' *eaſtern* gate
Led them direct. *Milton*.

EAS'TON, a poſt town of the American States in Pennſylvania, and capital of Northampton county, pleaſantly ſituated at the mouth of the Lehigh; and on the weſt ſide of Delaware river. It is regularly laid out, and contains a court-houſe, regiſter's office, and an academy: twelve miles north-eaſt of Bethlehem, and ſeventy north of Philadelphia.

EAS'TON, the chief town of the American States, in Talbot county, Maryland, formerly called Talbot Court-houſe, on the eaſt ſide of Cheſapeak bay, near the forks of Treadhaven river, twelve miles from its junction with Choptank river. It has a handſome court-houſe, and market-houſe; and ſeveral ſtores for the ſupply of the adjacent country: five miles ſouth-weſterly of Williamſburg, thirty-ſeven ſouth of Cheſter Town, and 118 ſouth-weſt of Philadelphia.

EAS'TON, a townſhip of the American States, in Waſhington county, New York. In 1790 it contained 2539 inhabitants; and by the ſtate cenſus of 1796, it appears that 347 of its inhabitants are electors.

EAS'TON, a townſhip of the American States, important for its iron manufactures, ſituated in Briſtol county, Maſſachuſetts, near the head of Raynham river; ſix miles north-weſt of Raynham, and twelve weſt of Bridgewater. It contains 1466 inhabitants. The beſt mill-ſaws in the ſtate are made here. The art of making ſteel was introduced here by captain Eliphalet Leonard, in 1786. It is made in quantities; and is cheaper than imported ſteel, and equal in quality for large work, ſuch as plough-ſhares, horſe-ſhoes, &c. which require large quantities of hard ſteel. But for edge tools it is found to be of inferior quality to what is imported. The manufacture of linſeed oil began here in 1792, and from an annual ſtock of three thouſand buſhels of ſeed, there has been annually produced near five thouſand gallons of oil.

EASTONNE'SS, the moſt eaſterly cape on the coaſt of Suffolk, and the north point of Southwold Bay.

EAST'WARD, *adv.* Towards the eaſt.—The moon, which performs its motions ſwifter than the ſun, gets *eaſtward* out of his rays, and appears when the ſun is ſet. *Brown*.

EA'SY, *adj.* Not difficult.—The ſervice of God, in the ſolemn aſſembly of ſaints, is a work, though *eaſy*, yet withal very weighty, and of great reſpect. *Hooker*.—Not cauſing difficulty.—The whole iſland was cut into ſeveral *eaſy* aſcents, and planted with variety of palaces. *Addiſon*.—Quiet; at reſt; not haraſſed; unmoleſted; ſecure; not anxious.—A marriage of love is pleaſant, a marriage of intereſt *eaſy*, and a marriage where both meet happy. *Addiſon*.—A man ſhould direct all his ſtudies and endeavours at making himſelf *eaſy* now, and happy hereafter. *Spectator*.—We plainly feel whether at this inſtant we are *eaſy* or uneaſy, happy or miſerable. *Smalridge*.—Free from pain:

Pleaſure has been the buſ'neſs of my life,
And every change of fortune *eaſy* to me,
Becauſe I ſtill was *eaſy* to myſelf. *Dryden*.

Complying; unreſiſting; credulous:

The kindeſt father I have ever found him,
Eaſy and good, and bounteous to my wiſhes. *Addiſon*.

Ready; not unwilling:

Pity and he are one;
So merciful a king did never live,
Loth to revenge, and *eaſy* to forgive. *Dryden*.

Free from want of more.—They ſhould be allowed each of them ſuch a rent as would make them *eaſy*. *Swift*.—Not conſtrained; not ſtiff:

Praiſe the *eaſy* vigour of a line,
Where Denham's ſtrength and Waller's ſweetneſs join.
Pope.

To EAT, *v. a.* preterite *ate*, or *eat*; part. *eat*, or *eaten*. [etan, Saxon; *itan*, Gothic; *eich*, Erſe.] To devour with the mouth.—Locuſts ſhall *eat* the reſidue of that which is eſcaped from the hail, and ſhall *eat* every tree which groweth. *Exod.* x. 5.—To conſume; to corrode. They entail a ſecret curſe upon their eſtates, which does either inſenſibly waſte and conſume it, or *eat* out the heart and comfort of it. *Tillotſon*.—To ſwallow back; to retract. This is only uſed of a man's word.—They cannot hold, but burſt out thoſe words, which afterwards they are forced to *eat*. *Hakewill*.

Credit were not to be loſt
B' a brave knight errant of the poſt,
That *eats*, perfidiouſly, his word,
And ſwears his ears through a two-inch board. *Hudibras*.

To EAT, *v. n.* To go to meals; to take meals; to feed.—And when the ſcribes and phariſees ſaw him *eat* with publicans and ſinners, they ſaid unto his diſciples, How is it that he *eateth* with publicans and ſinners? *Matt.* ii. 16.—To take food.—He that will not *eat* till he has demonſtration that it will nouriſh him; he that will not ſtir till he infallibly knows the buſineſs he goes about will ſucceed, will have little elſe to do but ſit ſtill and periſh. *Locke*.—To be maintained in food.—The righteous *eateth* to the ſatisfying of his ſoul, but the belly of the wicked ſhall want. *Prov.* xiii. 25.

But, thanks to my indulgent ſtars, I *eat*,
Since I have found the ſecret to be great. *Prior*.

To

To make way by corroſion.—A prince's court *eats* too much into the income of a poor ſtate. *Addiſon on Italy.*

"EAT at pleaſure, drink by meaſure."—The French ſay: *Pain tant qu'il dure*, (bread as long as it laſts,) *vin à meſure*; and ſo likewiſe the Italians: *Pan mentre dura, ma vin à meſura.* The intent of this proverb is to ſhew that exceſs in eating is not ſo prejudicial as in drinking: it doth not deprive a man of his underſtanding, nor ſo nearly aſſimilate him with the beaſts of the field; yet the conſequences of an overloaded ſtomach are often as fatal in the end.

EA'TABLE, *adj.* That may be eaten.

EA'TABLE, *ſ.* Any thing that may be eaten:

If you all ſorts of perſons would engage,
Suit well your *eatables* to ev'ry age. *King's Cookery.*

EA'TER, *ſ.* One that eats any thing.—The Caribees and the Cannibals, almoſt all, are *eaters* of man's fleſh. *Abbot.*—If the taſte of this fruit maketh the *eaters* like gods, why remaineſt thou a beaſt? *Brown.*—A corroſive.

EATH, *adj.* [eaꝺ, Saxon.] Eaſy; not difficult. An old word.—Where eaſe abounds, it's *eath* to do amiſs. *Spenſer.*

What works not beauty, man's relenting mind
Is *eath* to move with plaints and ſhews of woe. *Fairfax.*

EATH, *adv.* Eaſily:

Who hath the world not try'd,
From the right way full *eath* may wander wide. *Hubb. Tale.*

EAT'INGHOUSE, *ſ.* A houſe where proviſions are ſold ready dreſſed.—An hungry traveller ſtept into an *eatinghouſe* for his dinner. *L'Eſtrange.*

EA'TON, a town of the American States, in the northern part of Stafford county, New Hampſhire; three miles north of the great Oſſipee lake, and about fifty-ſix north by weſt of Portſmouth. Incorporated in 1766.

EA'TONTOWN, improperly called *Edentown*, pleaſantly ſituated in New Jerſey, belonging to the American States, about a mile ſouth of Shrewſbury, in the ſame townſhip. It is a place of buſineſs, and thriving.

EAVES, *ſ.* [eȝeȝe, Saxon.] The edges of the roof which overhang the houſe.—The iſicles hang down from the *eaves* of houſes. *Woodward.*

Uſher'd with a ſhower ſtill,
When the guſt has blown his fill,
Ending on the ruſtling leaves,
With minute drops from off the *eaves.* *Milton.*

EAVES-CATCH, or EAVES-LATH, *ſ.* A thick board, with a featheredge to receive the lower courſe of tiles on the roof of a houſe.

To EAVES-DROP, *v. a.* To catch what comes from the eaves; in common phraſe, to liſten under windows.

EAVES-DROPPERS, *ſ.* perſons who liſten under walls or windows, or the eaves of a houſe, to hearken after diſcourſe, and thereupon to frame ſlanderous and miſchievous tales. In the eye of law ſuch perſons are a common nuiſance, and preſentable at the court-leet: or are indictable at the ſeſſions, and puniſhable by fine, and finding ſureties for good behaviour. 4 *Comm.* 169.

EAU DE LUCE. See PHARMACY.

EAUZE, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Condom: a celebrated city in the time of the Romans, after whom it came into the poſſeſſion of the Goths, with the whole province of Gaſcony, and from them it was taken by Clovis. It was deſtroyed by the Normans in their incurſions, in the reign of Louis the Debonnaire: four leagues and a half weſt-ſouth-weſt of Condom. Lat. 43. 52. N. lon. 17. 45. E. Ferro.

EBAL, [Heb. a heap.] A mountain of Paleſtine, ſituated in Samaria, near the plain of Moreh. *Deut.* xi. 29.

EBAU'LER, a town of Arabia Deſerta: 130 miles ſouth of Ana.

EBB, *ſ.* [ebba, eꝺꝺlob, Saxon; *ebbe*, Dutch.] The reflux of the tide towards the ſea: oppoſed to *flow:*

Hither the ſeas at ſtated times reſort,
And ſhove the loaden veſſels into port;
Then with a gentle *ebb* retire again,
And render back their cargo to the main. *Addiſon.*

Decline; decay; waſte.—This tide of man's life, after it once turneth and declineth, ever runneth with a perpetual *ebb* and falling ſtream, but never floweth again. *Raleigh.*

Thus all the treaſure of our flowing years,
Our *ebb* of life for ever takes away. *Roſcommon.*

EBB, in figurative language, is uſed to ſignify the loweſt pitch of fortune or condition in the world; decay; waſte.—You have brought all things to that low *ebb.* *Spenſer.*

"Every flow has its EBB." By this proverb the viciſſitudes of fortune are aptly compared to floods and ebbs (ups and downs), according to the Latin proverb; *Veriæ ſunt fortunæ vices.*

To EBB, *v. n.* To run back towards the ſea: oppoſed to *flow:*

From thence the tide of fortune left their ſhore,
And *ebb'd* much faſter than it *flow'd* before. *Dryden.*

To decline; to decay; to waſte:

But oh, he *ebbs!* the ſmiling waves decay;
For ever lovely ſtream, for ever ſtay! *Halifax.*

EBDO'MARY, *ſ.* [*ebdomadarius*, Lat.] An officer, anciently appointed weekly in cathedral churches, to ſupervise the regular performance of divine ſervice, and preſcribe the particular duties of each perſon attending in the choir, as to reading, ſinging, praying, &c. To which purpoſe the ebdomadary at the beginning of his week drew in form a bill or writing of the reſpective perſons and their ſeveral offices, called *tabula*; whereupon the perſons there entered were ſtiled *intabulati.* This is manifeſted in the Statutes of the Cathedral Church of St. Paul, London, digeſted by Dr. Ralph Baldock, dean of St. Paul's, *anno* 1295, MSS.

EB'DOME, a feſtival in honour of Apollo, at Athens, on the ſeventh day of every lunar month. It was uſual to ſing hymns in honour of the god, and to carry about boughs of laurel.—There was alſo another of the ſame name celebrated by private families the ſeventh day after the birth of every child.

E'BED, [Heb. a ſervant.] A man's name.

EBEDME'LECH, [Heb. the ſervant of the king.] A man's name.

EBEL'LEBEN, a town of Germany, in the circle of Upper Saxony, and county of Schwartzburg: a fief of the elector of Saxony, ſituated on the Elbe: twenty miles north-weſt of Erfurt, and eleven north-eaſt of Muhlhauſen.

E'BELSTOT, or EBELTOFT, a town of Denmark, in Jutland, and dioceſe of Aarhuus: fifteen miles eaſt-north-eaſt of Aarhuus.

E'BENDORF, a town of Germany, in the archduchy of Auſtria: nine miles weſt of Ziſterſdorf.

EBENE'ZER, [Heb. a ſtone of help.] A man's name.

EBENE'ZER, the name of a monument erected by the prophet Samuel, between Mizpeh and Shen, to commemorate a victory gained by the Iſraelites over the Philiſtines, near which alſo the Iſraelites encamped, previous to the battle fought between them and the Philiſtines, in which the Iſraelites were vanquiſhed, and the ark of God taken. 1 *Sam.* iv. 1. v. 1. and vii. 12.

EBENE'ZER, a poſt-town of the American States, and the capital of Effingham county, Georgia, ſeated on the ſouth-weſt bank of Savannah river; five miles from Abercorn, twenty-five north-north-weſt of Savannah, ſeventy-five ſouth-eaſt of Louiſville, and 860 ſouth-weſt of Philadelphia. It was ſettled in 1735, by a number of proteſtants driven out of Saltzburg, in the electorate of Bavaria, by perſecution.

E'BENFELD, a town of Germany, in the duchy of Carniola: three miles ſouth of Stein.

E'BENFURTH, a town of Germany, in the archduchy

of Auſtria, on the Leyta, built by the knights-templars; eighteen miles ſouth of Vienna.

E'BENHAUSEN, a town of Germany, in the circle of Franconia, and biſhopric of Wurzburg: five miles north-north-weſt of Schweinfurt.

E'BENHEIT, a town of Germany, in the circle of Upper Saxony, and margraviate of Meiſſen: two miles north-eaſt of Konigſtein.

E'BENSFELD, a town of Germany, in the duchy of Stiria: ſix miles weſt of Pettau.

E'BENTHAL, a town of Germany, in the duchy of Carinthia: two miles ſouth-ſouth-eaſt of Clagenfurt.

EB'ENUS, *ſ.* [ἔβενος or ἔβελος of the Greeks; *ebenus* or *ebenum* of the Romans; from the Hebrew *heben.*] EBONY; in botany, a genus of the claſs diadelphia, order decandria. The generic characters are—Calyx: perianthium one-leafed, bell-ſhaped, terminated by five filiform teeth, which are villoſe, and nearly equal. Corolla: papilionaceous, length of the calyx; ſtandard roundiſh, ſtraight, entire; rudiments of wings obſcure, creſcent-ſhaped; keel creſcent-ſhaped, gibbous, aſcending at the tip. Stamina: filaments diadelphous, all growing together into a ſheath, with tips diſtinct; antheræ roundiſh. Piſtillum: germ roundiſh, villoſe; ſtyle capillary; ſtigma terminal, acuminate. Pericarpium: legume ovate. Seed: ſingle, rough with hairs.—*Eſſential Character.* Calyx, with teeth, the length of the corolla; wings, ſcarcely any; ſeed, one, rough with hairs.

Species. 1. Ebenus Cretica, or Cretan ebony: leaves ternate, quinate, or pinnate, with two pairs of leaflets; ſpikes terminating. This riſes with a ſhrubby ſtalk three or four feet high, with ſeveral ſide branches; leaves at each joint, hoary, compoſed of five narrow lanceolate leaflets, which join at their tails to the foot-ſtalk, and ſpread out like the fingers of a hand; the branches are terminated by thick ſpikes of large purple flowers: the ſpikes are from two to three inches long, and make a fine appearance; it flowers in June and July, and in very warm ſeaſons will ſometimes perfect ſeeds in England. It grows naturally in Crete, and ſome iſlands of the Archipelago. Lamarck and Juſſieu refer this plant to the genus Anthyllis.

2. Ebenus pinnata, or pinnated ebony: leaves pinnate, with four pairs of leaflets; ſpikes axillary, on very long peduncles. Biennial; native of Barbary and the Levant; flowers in July.

Propagation and Culture. Theſe are propagated by ſeeds, which ſhould be ſown in the autumn, for thoſe which are ſown in the ſpring often fail; they muſt be ſown in pots, and placed under a frame in the winter, where they may be protected from froſt. In the ſpring the plants will come up; they ſhould be kept clean from weeds, and refreſhed now and then with water. When theſe have acquired ſtrength enough to be removed, they ſhould be each planted in a ſeparate ſmall pot filled with light earth, and plunged into a moderate hot-bed juſt to promote their taking new root; then they ſhould be gradually inured to bear the open air, into which they ſhould be removed the latter end of May, placing them in a ſheltered ſituation, where they may remain till autumn, when they muſt be removed into ſhelter; for theſe plants will not live in the open air through the winter, nor ſhould they be too tenderly treated, leſt they draw up weak. During the winter ſeaſon, the plants muſt be ſparingly watered, but in the ſummer they will require to be often refreſhed. The other management is the ſame as for other of the hardier exotic plants, among which they will make a fine variety. See AMERIMNUM and DIOSPYROS.

E'BENZWEIER, a town of Germany, in the archduchy of Auſtria: four miles ſouth of Gmunden.

E'BER, or HEBER, [Heb. a paſſage.] A man's name.

E'BERACH, BURG, or BURG-EBRACH, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg: ſeven miles ſouth-weſt of Bamberg, and thirty-two eaſt of Wurzburg.

E'BERBACH, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: thirteen miles weſt-north-weſt of Mentz.

E'BERBACH, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine, on the Neckar, celebrated for its wine: eleven miles eaſt of Heidelberg.

E'BERBERG, or EBERNBERG, a caſtle of Germany, in the palatinate of the Rhine, beſieged, in 1692, by the landgrave of Heſſe Caſſel, without ſucceſs; and taken by the margrave of Baden, in 1697: five miles ſouth-weſt of Creutznach.

EBERMAN'STADT, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg, on the Wiſent: thirteen miles eaſt-ſouth-eaſt of Bamberg.

E'BERN, a town of Germany, in the circle of Franconia, and biſhopric of Wurzburg: twenty-four miles eaſt of Schweinfurt, and forty north-eaſt of Wurzburg.

E'BERNDORF, a town of Germany, in the duchy of Carinthia: fourteen miles eaſt of Clagenfurt.

E'BERNSTEIN, a town of Germany, in the duchy of Carinthia, on the river Gortſchitz: twelve miles north-north-eaſt of Clagenfurt.

E'BERSBACH, a town of Germany, in the circle of Weſtphalia, and principality of Naſſau Dillenburg: ſix miles north-north-eaſt of Dillenburg.

E'BERSBERG, a town of Germany, in the archduchy of Auſtria: eight miles ſouth-weſt of Ens.

E'BERSDORF, a town of Germany, in the duchy of Stiria: five miles ſouth-ſouth-eaſt of Hardeberg.

E'BERSDORF, a town of Germany, in the circle of Upper Saxony, and territory of Erzgebirg: three miles ſouth-ſouth-weſt of Frakenberg.

E'BERSDORF, or KOTTINS EBERSTORF, a town of Germany, in the archduchy of Auſtria, on the Danube: ſix miles eaſt-ſouth-eaſt of Vienna.

E'BERSHARD, a town and caſtle of Hungary: ſeven miles ſouth-eaſt of Preſburg.

E'BERSPERG, a town of Germany, in the circle of Bavaria: nineteen miles eaſt of Munich.

E'BERSPEUNT, a town of Germany, in the circle of Bavaria: thirty-four miles eaſt-north-eaſt of Munich.

E'BERSTADT, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: four miles ſouth of Darmſtadt.

EBERSTALL'ZELL, a town of Germany, in the archduchy of Auſtria: eight miles ſouth of Wells.

E'BERSTEIN, a county and principality of Germany, in the circle of Suabia, ſituated between the margraviate of Baden and duchy of Wurtemberg. The family was extinct in the year 1660, and by virtue of a treaty made in 1505, paſſed to the houſe of Baden. The town and caſtle of Eberſtein are two miles weſt of Kuppenheim.

E'BERSTHAL, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: two miles ſouth of Krantheim.

EBER'TUS (Theodore), a learned German in the ſeventeenth century, who filled the chair of Hebrew profeſſor at Frankfort-on-the-Oder, and was rector of the univerſity in that place in 1618, and 1627. He acquired conſiderable reputation by the profound learning diſplayed in his writings, and in particular by the intimacy of his acquaintance with the oriental tongues. In 1628, he publiſhed a work intitled *Elogia Juriſconſultorum & Politorum centum illuſtrium, qui ſanctam Hebræam Linguam aliaſque ejus propagines orientales propagarunt, auxerunt, promoverunt,* 8vo. He afterwards publiſhed *Chronologia Sanct. Ling. Doctorum, &c.* preſenting us with a chronological view of the principal doctors and learned men who have cultivated the Hebrew language, from the earlieſt times to the preſent; The Life of Jeſus Chriſt, written in Hebrew; *Poetica Hebraica,* 8vo. 1620; a moral treatiſe intitled *Speculum Morale*; and A Century of Political Obſervations, written in Latin.

EB'HER. See ABHER.

E'BIN, or YBIN, one of the ſmaller Philippine Iſlands, in the Eaſtern Indian Sea.

EBIN'GEN, or EHINGEN, a town of Germany, in the circle of Suabia, and duchy of Wurtemburg: thirty-ſix miles ſouth of Stutgart, and twenty-two ſouth of Tubingen.

E'BION, and E'BIONITES. There is much diſagreement among eccleſiaſtical hiſtorians reſpecting the exiſtence of a perſon named Ebion, in the age that is by many aſſigned to him. According to Epiphanius, Tertullian, Optatus, St. Hilary, St. Jerome, and others, a perſon ſo called lived in the latter end of the firſt or the beginning of the ſecond century, who was a ſtoic philoſopher, and, embracing many of the opinions of Cerinthus, became the leader of a new ſect, who after him were called Ebionites. Irenæus, however, as well as Euſebius and Origen, by their making not the leaſt mention of ſuch a perſon as Ebion, and by the derivation which the two latter give of the name of the ſect, from a term ſignificative of poverty, meanneſs, or vileneſs, leave it at leaſt doubtful whether Ebion be not an imaginary character. But it is not a matter of much moment how the queſtion is decided. The Ebionites, according to the teſtimony of Origen and Epiphanius, held the ſame tenets with the Nazarenes. From all the information that has reached our day, it is not poſſible to aſcertain preciſely what thoſe tenets were. Many of the repreſentations given concerning the Ebionites by the ancient fathers are ſo confuſed and contradictory, that they do not merit ſerious attention. And ſome of the tales which they relate concerning them, are exact copies of the calumnies which were propagated by the Pagans, to diſcredit the characters of the early Chriſtians. One of their leading doctrines appears to have been a belief that Jeſus Chriſt was a mere man, like themſelves, though poſſeſſing ſupernatural powers, which were communicated for the purpoſe of qualifying him for his divine miſſion. They appear alſo to have conſidered the laws of Moſes to be binding on them; but to what extent cannot be affirmed with any certainty. According to ſome writers, they received only the Goſpel of St. Matthew as of divine authority, which they poſſeſſed in the Hebrew or Syro-chaldaic language, and rejected the reſt of the New Teſtament, particularly the Epiſtles of St. Paul. The learned Lardner, however, is of opinion, that there is room for fairly arguing that they received all the four Goſpels; and that ſome of the ſect at leaſt, by the quotations which they adduced from the Acts of the Apoſtles, and ſome of the Epiſtles, have given reaſon for concluding that they did not reject all the Epiſtles attributed to the great apoſtle of the Gentiles. But there is much obſcurity in the relations which remain reſpecting the tenets of this ſect; and little more can be advanced on that head, from the concurrent teſtimony of the moſt ancient and reſpectable eccleſiaſtical writers, than that, to uſe the words of Juſtin Martyr, "they acknowledged Jeſus to be the Chriſt, yet maintained that he was a man, born of man."

EB'MAT, a town of Germany, in the circle of Upper Saxony, and circle of the Vogtland: five miles ſouth of Oelſnitz.

EB'ON, *adj.* Made of ebony:

And from the golden quiver at her ſide
Rattles the *ebon* arrow's feather'd pride. *Prior.*

EB'ONIST, *ſ.* A worker in ebony. *Scott.*

EB'ONY, *ſ.* [*ebenus*, Lat.] A hard, heavy, black, valuable, wood, which admits a fine poliſh. For the various ſpecies, &c. ſee EBENUS.

Oft by the winds extinct the ſignal lies,
Ere night has half roll'd round her *ebon* throne. *Gay.*

EBORA'CUM, anciently a city of the Brigantes in Britain, the reſidence of Septimius Severus, and Conſtantius Chlorus, and where they both died; a Roman colony, and the ſtation of the Legio Sexta Victrix. Now YORK. *Caer-frock*, or *Caer-effroc*, in Britiſh. *Camden.*

EBREICH'STORF, a town of Germany, in the archduchy of Auſtria: eight miles north-north-eaſt of Ebenfurth.

EBREU'IL, or EBREUILLE, a town of France, in the department of the Allier, and chief place of a canton, in the diſtrict of Gannat, on the Soioule, containing about 3000 inhabitants: two leagues weſt of Gannat.

EBRI'ETY, *ſ.* [*ebrietas*, Lat.] Drunkenneſs; intoxication by ſtrong liquors.—Bitter almonds, as an antidote againſt *ebriety*, hath commonly failed. *Brown.*

EBRILLA'DE, *ſ.* [French.] A check of the bridle which a horſeman gives a horſe, by a jerk of one rein, when he refuſes to turn.

EBRIO'SITY, *ſ.* [*ebrioſitas*, Lat.] Habitual drunkenneſs.—That religion which excuſeth Noah in ſurpriſal, will neither acquit *ebrioſity* nor ebriety in their intended perverſion. *Brown.*

E'BRIOUS, *adj.* [from *ebrius*, Lat.] Drunken; given to drunkenneſs. *Not much uſed.*

E'BRO, anciently IBERUS, a river of Spain, which, taking its riſe in Old Caſtile, runs through Biſcay and Arragon, paſſes by Saragoſſa, and, continuing its courſe through Catalonia, diſcharges itſelf with great rapidity into the Mediterranean, about twenty miles below the city of Tortoſa.

EBRO'NAH, the thirtieth encampment of the Iſraelites, in their journey from Egypt to Canaan. *Numb.* xxxiii. 34.

EB'STORF, a town of Germany, in the circle of Lower Saxony, and principality of Lunenburg, celebrated for its honey, of which the inhabitants ſell annually to the amount of ſeveral thouſand crowns: ſeven miles weſt-north-weſt of Ultzen.

EBU'DÆ, or HEBUDES, in ancient geography, iſlands on the weſt of Scotland. Now called the *Weſtern Iſles*, or *Hebrides*, a corruption of *Hebudes*. By Beda called *Mevaniæ*.

To EBUL'LIATE, *v. n.* [*ebullio*, Lat. to bubble.] To bubble out

EBULL'IENCY, *ſ.* A bubbling out; an ebullition. *Not much uſed.*

EBULLI'TION, *ſ.* [*ebullio*, Lat.] The act of boiling up with heat. Any inteſtine motion.—Iron, in aqua-fortis, will fall into *ebullition* with noiſe and emication. *Brown.*—That ſtruggling of effervescence which ariſes from the mingling together any alkalizate and acid liquor; any inteſtine violent motion of the parts of a fluid, occaſioned by the ſtruggling of particles of different properties. *Quincy.*—A violent cold, as well as heat, may be produced by this *ebullition*; for if ſal ammoniac, or any pure volatile alkali, diſſolved in water, be mixed with an acid, an *ebullition*, with a greater degree of cold, will enſue. *Arbuthnot.*

EB'ULUS, *ſ.* in botany. See SAMBUCUS.

E'BUR, *ſ.* [Lat.] Ivory.

EBUR'NEAN, *adj.* [from *ebur*, Lat.] Conſiſting of ivory; made of ivory.

EBU'SUS, in ancient geography, the greater of the two iſlands called *Pityuſæ*, in the Mediterranean, near the eaſt coaſt of Spain, to the ſouth-weſt of Majorca; famous for its paſtures for cattle, and for its figs. Now *Ivica*: 100 miles in compaſs, without any noxious animals.

ECALE'SIA, &c. See HECALESIA.

ECALGRA'IN, a bay or creek of the Engliſh Channel, on the weſt coaſt of France, between Cape Anderville and the Nez de Jobourg.

ECA'NUS, a man's name. 2 *Eſd.* xiv. 24.

ECASTAPHYL'LUM, *ſ.* in botany. See DALBERGIA.

ECATOMBÆ'ON, *ſ.* [εκατομβαιων, Gr.] The firſt month of the Athenian year. It conſiſted of thirty days, and began on the firſt new moon after the ſummer ſolſtice, and conſequently anſwered to the latter part of our June and beginning of July. The Bœotians called it *Hippodromus*, and the Macedonians *Lous*.

EC'BASIS, *ſ.* [Greek.] A figure in rhetoric; a digreſſion.

ECBATA'NA,

ECBATA'NA, anciently the capital of Media, and reſidence of its kings, built by Deioces, king of the Medes, according to Herodotus: Pliny ſays, by Seleucus; but that could not be, becauſe it is mentioned by Demoſthenes. It was ſituated on a gentle declivity, diſtant twelve ſtadia from Mount Orontes, and was in compaſs 150 ſtadia. Here ſtood the royal treaſury and tombs. It had a very ſtrong citadel, encompaſſed with ſeven walls, the outermoſt of which was the loweſt, and each of the reſt progreſſively higher, ſo that they all overtopped each other; and were each of a different colour. The outermoſt was white; the ſecond black; the third purple; the fourth blue; the fifth red, or rather of an orange colour; and the ſummit of the ſixth was covered with ſilver, and that of the ſeventh or innermoſt, with gold. Such is the account given by Herodotus, i. 98. It appears not improbable that theſe walls had a reference to the ſeven planets, though nothing is hinted on that ſubject by the hiſtorian.—From ſcripture hiſtory we learn, that this city was the royal ſeat of Arphaxad, who encompaſſed it with a ſtone wall, and erected its gates; both of which were remarkable for their extraordinary dimenſions. It was taken by Nabuchodonoſor, king of Aſſyria, after a battle in which Arphaxad was ſlain. *Judith*, i. It is ſaid that Alexander the Great found 26,000 talents of gold in the treaſury of this city.—Another *Ecbatana* of Perſia, a town of the Magi. *Pliny*.—A third of Syria.

ECBO'LICS, *ſ.* [from εκβαλλω, Gr. to caſt out.] Medicines which cauſe abortion.

ECBO'LIUM, *ſ.* in botany. See JUSTICIA.

ECBRYSO'MA, *ſ.* [from εκ, and βυεσα, Gr. the ſkin.] With ſurgeons, the protuberance of a bone at the joint, which appears through the ſkin.

EC'CARD, or ECKHARD (John-George), a learned antiquarian, born in 1674, at Duingen, in the diſtrict of Lauenſtein, where his father was chief foreſter. He was ſent to the ſchool of Pforta, where his favourite ſtudy was poetry. He then removed to Leipſic, where he became acquainted with the celebrated Leibnitz. In 1696 he left Leipſic, became a corrector of the preſs, and afterwards ſecretary to field-marſhal count Fleming, who intended to make him major of his regiment; but neither theology, to which he was deſtined by his mother, nor the military profeſſion, were agreeable to his taſte. By the recommendation of Leibnitz, he obtained the profeſſorſhip of hiſtory at Helmſtadt, in 1706; and in 1713 he was appointed a counſellor of the electorate of Hanover, and hiſtoriographer, in conſequence of which he aſſiſted Leibnitz in his *Origines Guelphicæ*, and in 1717 he became his ſucceſſor as librarian at Hanover. After this he travelled at the expence of George I. through great part of Germany, to ſearch the libraries and archives for manuſcripts and materials to enable him to proſecute the compilation of the above-mentioned genealogical work. His *Origines Sabaudicæ*, procured him the favour of the great prince Eugene of Savoy; and his *Origines Familiæ Habſburgo-Auſtriacæ*, that of count von Zinzendorf, through whoſe means the emperor Charles VI. raiſed him to the rank of nobility. He proceeded to Cologne, and on the 2d of February, 1724, he formally abjured the Lutheran religion in the college of the Jeſuits, in that city. The elector of Cologne treated him with great reſpect, and cardinals Paſſionei and Spinola aſſured him of the protection of pope Innocent XII. who promiſed benefices to both his ſons if he would come to reſide at Rome. The elector of Mentz, the elector Palatine, and the princes of Paſſau and Fulda, and the nobility of Milan, all made him moſt advantageous offers, to enable him to complete his *Scriptores rerum Italicarum*; but he entered into the ſervice of the biſhopric of Wurzburgh, where he was entruſted with the care of the library belonging to the court and the univerſity. The dean and chapter committed to his charge the valuable manuſcripts contained in the diplomatic archives of the cathedral, which he arranged and claſſed with great ability. Several propoſals for improving the form of the academic lectures, and eſtabliſhing a profeſſorſhip of the law of nature at Wurzburgh; calling the public attention to the much-neglected natural hiſtory of that diſtrict; the intereſting account of the old imperial palace of Salzburgh, near Neuſtadt, on the Saal; and his *Commentarii de rebus Franciæ Orientalis*, printed with great magnificence at Wurzburgh, in two folio volumes, were the fruits of his meditation and ſtudy, which he often continued throughout the day, and till a late hour at night. It is much to be regretted, however, that he did not live to put the laſt hand to his important work on the hiſtory of Wurzburg. While defining, in the preface, the boundaries of the biſhopric under St. Burckhard, he was ſuddenly ſeized with a mortal diſeaſe, which put a period to his exiſtence in the month of February, 1730. The principal of his works are, 1. *De uſu & præſtantia ſtudii etymologici in hiſtoria*; Helmſt. 1706, 4to. 2. *Hiſtoria ſtudii etymolog. linguæ Germanicæ*; Hanov. 1711, 8vo. 3. *Leges Francorum Salicæ & Ripuariorum*; Francf. & Lipſ. 1720, folio. 4. *Origines familiæ Habſburgico-Auſtriacæ*; Lipſ. 1721, folio. 5. *Hiſtoria genealog. Principum Saxon, &c. &c. Accedunt origines Sabaudicæ ſtemma Deſideratum genuinum; origo domus Br. Luneb. & Czàreæ connexio, &c.* Lipſ. 1722, folio. 6. *Corpus Hiſtoriarum medii ævi*; Lipſ. 1723, vol. ii. folio. 7. An Account of ancient Salzburg, and the Palace Salz, in Franconia; Wurzburg, 1725, 8vo. Leipſic, 1751, 8vo. 8. *Commentarii de rebus Franciæ orientalis & epiſcopatus Wirceburgenſis, &c.* Wirceb. 1729, tom. ii. folio; a work of great learning, and an honourable teſtimony of the author's extenſive knowledge of hiſtory. 9. *De origine Germanorum eorumque vetuſtiſſimis coloniis, migrationibus ac rebus geſtis, libri duo*; Goetting. 1750, 4to. cum fig. 10. *Origines Guelphicæ; Opus præcunte D. God. Guil. Leibnitio, D. Jo. Geo. Eccardi literis conſignatum, poſtea a D. Jo. Dan. Grubero novis probationibus inſtructum, variiſque perneceſſariis animadverſionibus caſtigatum; jam vero in lucem emiſſum a Chriſt. Lud. Scheidio*; Hanov. tom. i. 1750, tom. ii. 1751, tom. iii. 1752, tom. iv. & ult. 1753, folio.

ECCATHAR'TICS, *ſ.* [from καθαιρω, Gr. to purge.] According to Gorræus, *eccathartics* are remedies which, applied to the ſkin, open the pores; but in general they are underſtood to be deobſtruents: ſometimes expectorants are thus called, and ſo are purgatives.

ECCEN'TRIC, or ECCENTRICAL, *adj.* [*eccentricus*, Lat.] Deviating from the center. Not having the ſame center with another circle: ſuch circles were firſt ſuppoſed by the Ptolemaic philoſophy.—Whence is it that planets move all one and the ſame way in orbs concentric, while comets move all manner of ways in orbs very *eccentric? Newton*.

They build, unbuild, contrive,
To ſave appearances: they gird the ſphere
With centric, and *eccentric*, ſcribbl'd o'er,
Cycle and epicycle, orb in orb. *Milton.*

Not terminating in the ſame point; not directed by the ſame principle.—Whatſoever affairs paſs ſuch a man's hands, he crooketh them to his own ends; which muſt needs be often *eccentric* to the ends of his maſter. *Bacon.*—Irregular; anomalous; deviating from ſtated and conſtant methods.—This motion, like others of the times, ſeems *eccentric* and irregular. *King Charles*.

Then from whate'er we can to ſenſe produce,
Common and plain, or wond'rous and abſtruſe,
From nature's conſtant or *eccentric* laws,
The thoughtful ſoul this general inference draws,
That an effect muſt preſuppoſe a cauſe. *Prior.*

ECCENTRI'CITY, *ſ.* Deviation from a center. The ſtate of having a different center from another circle.—In regard of *eccentricity*, and the epicycle wherein it moveth, the motion of the moon is unequal. *Brown.*—By reaſon of the ſun's *eccentricity* to the earth, and obliquity to the equator, he appears to us to move unequally. *Holder.*—

Excurſion from the proper orb.—The duke at his return from his *eccentricity*, for ſo I account favourites abroad, met no good news. *Waller.—Eccentricity* of the earth is the diſtance between the focus and the center of the earth's elliptic orbit.

ECCHELLEN'SIS (Abraham), a learned Maronite, who flouriſhed in the ſeventeenth century, was induced by his countryman, Gabriel Sionita, to viſit Paris, to become his coadjutor in preparing for the preſs the magnificent Polyglot Bible, publiſhed by M. le Jai. It was he who furniſhed the Arabic and Syriac texts of the Book of Ruth, with the Latin verſion. He was afterwards appointed profeſſor of the Syriac and Arabic languages in college-royal at Paris. In 1636, the college *De Propaganda Fide* added him to the number of thoſe who were to be employed in tranſlating the ſcriptures into Arabic, and recalled him for that purpoſe out of France to Rome, where he was engaged on that work in 1652. He was alſo made profeſſor of the oriental languages at Rome; and was choſen by the archduke Ferdinand II. to tranſlate out of the Arabic into Latin the fifth, ſixth, and ſeventh, Books of Apollonius's Conics, in which work he was aſſiſted by John Alphonſo Borelli, a celebrated mathematician. The whole work was printed at Florence, with Archimedes's book *De Aſſumptis*, in 1661, in folio. He died at Rome in the year 1664. Beſides what have been already mentioned, Ecchellenſis was the author of, 1. *Inſtitutio Linguæ Syriacæ*, 12mo. 1628. 2. *Synopſis Philoſophiæ Orientalium*, 4to. 1641. 3. *Verſio Durrhamani de medicis Virtutibus animalium, plantarum, & gummarum*, 8vo. 1647. 4. *Chronicon Orientale Latine red. cum Supplemento Hiſtoriæ Orientalis*, folio, 1651. 5. *Eutychius vindicatus*, againſt Selden and Hottinger, 4to. 1661. 6. Remarks on the Catalogue of Chaldee Writers, compoſed by Hebed-Jeſu, 1653.

ECCHYMO'SIS, *ſ.* [from εκχυω, Gr. to pour out, or from εκ, out of, and χυμος, juice.] An effuſion of humours from their reſpective veſſels, under the integuments; or, as Paulus Ægineta ſays, "When the fleſh is bruiſed by the violent colliſion of any object, and its ſmall veins broken, the blood is gradually diſcharged from them." This blood, when collected under the ſkin, is called an *ecchymoſis*, the ſkin in the mean time remaining entire; ſometimes a tumor is formed by it, which is ſoft and livid, and generally without pain. If the quantity of blood is not conſiderable, it is uſually reſorbed; if much, it ſuppurates: it rarely happens that any further inconvenience follows; though, in caſe of a very bad habit of body, a mortification may be the reſult; and in ſuch a caſe regard muſt be had to the mode of cure.

EC'CLESBOURN, a river of England, which runs into the Derwent in Derbyſhire.

ECCLESFE'CHAN, a town of Scotland, in the county of Dumfries: fifteen miles eaſt from Dumfries.

EC'CLESHALL, a ſmall town in Staffordſhire, 142 meaſured miles from London. It ſtands near the river Sow, is a neat place, noted for pedlars wares, and has a good charity-ſchool. The market-day is Friday: fairs, Midlent-Thurſday, Holy-Thurſday, Auguſt 16, and the firſt Friday in November. Here is a palace of the lord biſhop of Litchfield and Coventry.

ECCLE'SIA, *ſ.* [Gr.] A church, the church, an aſſembly.

ECCLE'SIAN, *ſ.* One who adheres to the church, a churchman.

ECCLESIA'NI, *ſ.* in eccleſiaſtical hiſtory, thoſe who adhered to the church in oppoſition to the civil magiſtrate.

ECCLE'SIARCH, *ſ.* [from εκκλησια, Gr. the church, and αρχος a chief.] The ruler of a church.

ECCLESIAS'TES, *ſ.* [*l'eccleſiaſte*, Fr. *eccleſiaſte*, Ital. *eccleſiaſtes*, Lat. εκκλησιαστης, Gr. *i. e.* the preacher.] A canonical book of the Old Teſtament, the deſign of which is to ſhew the vanity of all ſublunary things. It was compoſed by Solomon; who enumerates the ſeveral objects on which men place their temporal happineſs, and then ſhews the inſufficiency of all worldly enjoyments. The Talmudiſts made king Hezekiah to be the author of it; Grotius aſcribes it to Zorobabel, and others to Iſaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after having experienced all the follies and pleaſures incident to human life.

ECCLESIAS'TIC, or ECCLESIASTICAL, *adj.* [*eccleſiaſticus*, Lat.] Relating to the church; not civil.—Is diſcipline an *eccleſiaſtical* matter or civil? If an *eccleſiaſtical*, it muſt belong to the duty of the miniſters. *Hooker.*—Clergymen, otherwiſe little fond of obſcure terms, yet in their ſermons are liberal of thoſe which they find in *eccleſiaſtical* writers. *Swift.*

ECCLESIAS'TIC, *ſ.* A perſon dedicated to the miniſtries of religion.—The ambition of the *eccleſiaſtics* deſtroyed the purity of the church. *Burnet.*

ECCLESIAS'TICAL COURTS. See COURTS OF LAW, vol. v. p. 300.

ECCLESIAS'TICAL CORPORATIONS, *ſ.* Thoſe where the members that compoſe them are ſpiritual perſons. They were erected for the furtherance of religion, and perpetuating the rights of the church. See CORPORATION, vol. v. p. 222.

ECCLESIAS'TICAL LAW. See CANON-LAW, vol. iii. p. 734.

ECCLESIAS'TICAL STATE. See CLERGY, vol. iv. p. 660.

ECCLESIAS'TICALLY, *adv.* In an eccleſiaſtical manner.

ECCLESIAS'TICUS, *ſ.* An apocryphal book, generally bound up with the ſcriptures; and ſo called, from its being read in the church, *eccleſia*, as a book of piety and inſtruction, but not of infallible authority. The author was a Jew, called *Jeſus the Son of Sirach*. The Greeks called it the *Wiſdom of the Son of Sirach*.

EC'CLESTONE, a town in Lancaſhire; it has a market on Saturday, and is 205 miles from London.

ECCOPE'US, *ſ.* [from εκκοπτω, Gr. to cut off.] An inſtrument for cutting off limbs, uſed by the ancient chirurgeons. It is ſimilar to the modern raſpatory.

ECCOPRO'TICS, *ſ.* [from εκ and κοπρος, Gr. dung.] Mild cathartics. Medicines which operate gently by ſtool.

ECCRINO'LOGY, *ſ.* [from εκκρινω, Gr. to ſecrete, and λογος, a diſcourſe.] The doctrine of the ſecretions of the body.

ECCRY'SIS, *ſ.* [from εκκρεω, Gr. to flow out.] An excretion, expulſion, or removal, of any excrementitious or morbific matter from the body, either by the bowels, or any other convenient paſſages. It is alſo taken for the excreted matter itſelf. It is ſimilar to apocriſis, which alſo, according to Hippocrates, is applied to the contagious effluvia of the air, or to a certain morbid quality, impreſſed upon the air by exhalation, called *miaſma*.

ECDI'CI, *ſ.* [εκδικοι, Gr.] Among the ancients, patrons of cities, who defended their rights, and took care of the public money. Their office reſembled that of the modern ſyndics.

EC'DICUS, *ſ.* [εκδικος, of εκ and δικη, Gr. juſtice; in civil law.] An attorney or proctor of a corporation; a recorder.

ECDO'RICS, *ſ.* [from εκδερω, Gr. to excoriate.] Medicines which excoriate and burn through the ſkin.

ECHALAR', a town of Spain, in Navarre: twenty miles north of Pamplona.

ECHALLE'NS, a town of Swiſſerland, in the canton of Bern, with a bailiwic of the ſame name, belonging to the cantons of Bern and Friburg, conquered by the Swiſs in 1475, and ceded to the two cantons in the year 1484: ſix miles from Lauſanne.

ECHAPE'R, *v. a.* in the manege, a galliciſm uſed in the academies, implying to give a horſe head, or to put on at full ſpeed.

ECH'ARD,

ECH'ARD (James), a French monk of the dominican order, born at Rouen in 1664, and died at Paris in 1724, aged eighty years. He was the author of a work highly eſteemed by his order, on many of whom it beſtows much praiſe, ſometimes, as may be expected, with too much partiality; but which will be found of uſe to biographers and eccleſiaſtical hiſtorians; it is intitled *Scriptores Ordinis Prædicatorum recenſiti, notiſque hiſtoricis & criticis illuſtrati*, 2 vols. folio, 1721.

ECH'ARD (Lawrence), a writer chiefly in hiſtory, the ſon of a clergyman at Barſham, near Beccles in Suffolk, where he was born in 1671. He was educated at Chriſt's college, Cambridge, where he took the degree of maſter of arts, and afterwards entered into holy orders. He was firſt ſettled in Lincolnſhire, where he began to make himſelf known by his writings. He publiſhed, in 1699, the Roman Hiſtory, from the Building of the City to the Settlement of the Empire by Auguſtus, 8vo. which was followed by its continuation from that period to that of Conſtantine. Theſe were afterwards printed together in 3 vols. 8vo. In 1702, he publiſhed a General Eccleſiaſtical Hiſtory, from the Birth of Chriſt to the Eſtabliſhment of Chriſtianity under Conſtantine, folio. This was well received, and came to a ſixth edition, in 2 vols. 8vo. 1722. It was probably the cauſe of his profeſſional promotion to the offices of prebendary of Lincoln, and chaplain to the biſhop of that dioceſe. His next work was a Hiſtory of England, from the Invaſion of Julius Cæſar to the End of James the Firſt's Reign, folio, 1707. This he afterwards carried down to the revolution, in two more volumes, printed in 1718. He obtained conſiderable reputation by this performance, which is written in a clear method and perſpicuous ſtyle, though not without various party miſrepreſentations, for ſome of which he was reprehended in a printed letter from Dr. Edmund Calamy. One of his moſt uſeful works was the Gazeteer's or Newſman's Interpreter, being a geographical index or dictionary of all the principal places on the globe. Of this, many editions have been printed, and the Gazeteers of the preſent time may be regarded as its improved copies. He alſo publiſhed a tranſlation of three comedies of Plautus, and took a ſhare in a tranſlation of Terence; but he obtained little credit for either of theſe performances, which were cenſured for the coarſeneſs of their ſtyle. In his proper profeſſion he compiled a volume of Maxims and Diſcourſes, moral and divine, taken from the works of archbiſhop Tillotſon, 8vo. 1719. Mr. Echard was appointed to the archdeaconry of Stow in 1712. Towards the latter part of life he was preſented by the king to the livings of Rendleſham, Sudborn, and Alford, in Suffolk, to which county he removed. Falling into a bad ſtate of health, he was proceeding to Scarborough for the benefit of the waters, when he died in his carriage, in 1730.

ECHARDSAU', a town of Germany, in the archduchy of Auſtria: twelve miles eaſt of Entzerſdorf.

ECHAR'RI, a town of Spain, in Navarre: ſeventeen miles weſt of Pamplona.

ECHAUBROI'GNES (Les), a town of France, in the department of the Two Sevres, and chief place of a canton, in the diſtrict of Chatillon; four miles north of Chatillon ſur Sevre.

ECHAUFFOU', a town of France, in the department of the Orne, containing about 2000 inhabitants: three leagues weſt of l'Aigle.

ECHBRU'NE, a town of France, in the department of the Lower Charente: twelve miles ſouth of Saintes.

ECHECRA'TES, a Theſſalian, who offered violence to Phœbus the prieſteſs of Apollo's temple of Delphi. From this circumſtance a decree was made by which no woman was admitted to the office of prieſteſs before the age of fifty. *Diodorus.*

ECHEL'LE (L'), a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rocroy: eight miles ſouth of Rocroy.

ECHEL'LES (Les), a town of Savoy, ſituated in a narrow valley, on a ſmall river called the *Guier-vif*, in the road from Grenoble to Chambery: ten miles ſouth-weſt of Chambery.

E'CHELSBEKE, a town of Flanders: five miles north of Bergues.

ECHENAY', a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Joinville: ſeven miles eaſt-north-eaſt of Joinville.

ECHENE'IS, *ſ.* [from ἔχω, Gr. to take, and ναῦς, a veſſel; ſo called, becauſe it was fabuloufly ſaid to ſtick to the keels of veſſels and retard their progreſs.] The SUCKER; in ichthyology, a genus of fiſhes belonging to the order of thoracici; the generic character of which is, a buckler upon the head, formed of ſeveral tranſverſe lines, interſected by a longitudinal one. Theſe lines, ſeen under the magnifier, appear to conſiſt of little tufts of briſtles. When the fiſh rubs its head againſt any rough or porous body, the briſtles faſten, and the fiſh remains ſuſpended. Hence it is that the ſucker is often found ſticking to veſſels, and to the ſhark; but it is a vulgar error that they faſten on the ſhark for nouriſhment; ſtill more abſurd was the fable of the ancients, that this fiſh had power to hinder the ſailing of ſhips, and for which ſuppoſed faculty they gave it the name of *remora*, delay or hindrance. See alſo Pliny, lib. ix. and xxxii. for other abſurd notions concerning this fiſh. The number of tranſverſe lines is from eighteen to twenty-four. The head is broad at the top, and ends in a ſharp ſnout. The jaws are armed with ſmall teeth, and the under one is the longeſt. The mouth is wide; the tongue broad; the gills have a large aperture, and the membrane is ſupported by ſtrong rays. The body is long and thick; the fins ſmall, appearing hardly capable to move ſo large a body. They haunt the Mediterranean Sea and the Ocean; and are of the voracious kind, often meaſuring from two to ſeven feet in length. There are three ſpecies, viz.

1. Echeneis neucrates, the pilot ſucking-fiſh: ſpecific character, the tail rounded. It has nine rays in the membrane of the gills, twenty in the pectoral fin, four in the ventral, thirty-five in the anal, eighteen in the tail, and forty in the dorſal. The body is lengthened; head of a middling ſize; mouth large; the lower jaw tapers to a point, and protrudes conſiderably beyond the upper; both are furniſhed with teeth like a file. The tongue is rough, thin, narrow, and looſe; and there are teeth likewiſe in the palate. Not far from the upper lip, and near the buckler, are four ſmall holes. The eyes are ſmall, with a black pupil in a yellow iris. The cheeks are fleſhy, and of a ſilvery colour. The gills have a wide aperture, and a large membrane, which is viſible, and ſupported by ſtrong rays; the covert is ſmall and ſingle. The buckler contains from twenty-two to twenty-four raiſed lines. The body is without ſcales, but full of foramina; back and tail green, and ſides white below the lateral line. All the fins, except the tail, are yellow at their origin, and violet towards the extremities. The trivial name *naucrates*, ſignifies pilot, and has been given it in conſequence of its accompanying ſhips at ſea. This ſpecies inhabits equally, the hot, cold, and temperate, climates. Olaſen ſaw it at Iceland, Ruyſch near the Moluccas, Haſſelquiſt at Alexandria, Forſkael in Arabia, Marcgrave and Prince Maurice at Brazil, Plumier at the Antilles, and Brown at Jamaica. Commerſon, who obſerved it at the Mauritius, remarks, that on the coaſt of Mozambique it is uſed in catching the ſea-tortoiſe; the fiſhermen avail themſelves of its property of faſtening to any ſubſtance: they fix a ring on the body of a living ſucker, juſt above the tail-fin, and of a ſize not to ſlip off; to this they tie a cord; then, putting the fiſh into a tub of ſalt water, they ſail in their boats towards thoſe places where the tortoiſes lie ſleeping on the water: but their ſleep is ſo ſlight, that the approach of the boat generally awakens them, when they plunge to a

conſiderable depth. As ſoon as the fiſhermen ſee one in motion, they throw the ſucker into the water, retaining one end of the cord. The fiſh, being thus partly free, endeavours to ſwim away, but finding itſelf retained by the cord, it takes as large a circle as poſſible, feeling about for ſomething to faſten on; and thus, by the manœuvres of the boatmen, it generally meets with the tortoiſe they are purſuing, and ſticks itſelf ſo tight on the under ſhell, that the fiſhermen eaſily draw both out together.

2. Echeneis remora, the ſmaller ſucking-fiſh: ſpecific character, tail-fin creſcent-ſhaped. It has nine rays in the membrane of the gills, twenty-two in the pectoral fin, four in the ventral, twenty in the anal and tail, and twenty-one in the dorſal. The body is covered with a viſcous matter, and full of little perforations, whence this matter oozes out; Gronovius ſays there are ſmall ſcales, but Bloch could not diſcover any even with a magnifier. The buckler has a cartilaginous rim, and covers the top of the head, extending a little way down the back, and conſiſting of from ſixteen to nineteen furrows, and as many raiſed lines in two rows; but the number of lines appears not to be conſtant, though Linnæus forms the ſpecific character from them. The eyes are ſmall, pupil black, iris ſilvery. The membrane of the gills is looſe at the lower part. The back is round, and of a dark colour, which becomes inſenſibly white towards the belly. Cepede ſays the colour is uniform all over, and without any ſpots. The fins are of a grey colour edged with brown, with ſoft ramified rays, and covered with a thick membrane. This ſpecies is alſo found both in the Mediterranean and the Ocean. Oſbec obſerved it at the Canaries, Renard at the Moluccas, Cateſby in Carolina, Schæpf at New York, and Sloane at Jamaica. As they have but little fleſh, they are not uſed for food; ſuch as are caught being moſtly kept for the cabinets of the curious. They will follow veſſels, and may be eaſily caught with a hook baited with fleſh. Sometimes they ſtick to the keel of a ſhip, but more frequently to the ſhark, and ſeveral of them are ſometimes found upon one; Cateſby found four or five faſtened to a ſhark, and it was with difficulty he could diſengage them: the ſame author remarks, that this fiſh ſwims freely about the ſhark, which never offers to devour it. Its power of ſuction is ſo ſtrong, that Commerſon declares, that, having preſented his thumb to a living one, it communicated a numbneſs like a paralytic affection, which did not ſubſide for a long time. It does not faſten on fiſh for the purpoſe of feeding upon them, or ſucking their juices, as its name would ſeem to imply, for there is no communication between this part of the head and the throat; but only for reſt, or for a more eaſy conveyance; and, perhaps, for ſome remains of food or little worms which may ſtick about the ſhark, which is the fiſh it is moſt uſually attached to. They faſten themſelves to ſhips bottoms, and to rocks, &c. in ſtormy weather. When they ſwim alone, it is moſt commonly on their back, contrary to other fiſhes; the reaſon may be, that the weight of their helmet makes them incline to the poſition of carrying it downwards. This ſpecies is ſeldom more than a foot and a half or two feet long. As this and the preceding are often confounded together, and have been regarded as one ſpecies, we have given figures of both, on the annexed engraving.

3. Echeneis lineata, the lineated ſucker: ſpecific character, tail wedge-ſhaped, and head with ten ſtreaks. The dorſal fin has thirty-five rays, the pectoral eighteen, ventral five, anal thirty-three, tail fourteen. It inhabits the Pacific ocean: is about five inches long; body ſubulate, ſmooth, dark brown, dotted with minute darker ſpots, and ornamented with two whitiſh longitudinal lines on each ſide, which begin at the eyes and end in the tail. Lower jaw longer than the upper; teeth minute in both. This was firſt deſcribed by Archibald Menzies, in the firſt volume of the Tranſactions of the Linnæan Society.

E'CHEVIN, *ſ.* [Fr.] A magiſtrate elected by the inhabitants of ſome cities and towns, to take care of their common concerns, and regulate their police.

ECHILLEU'SE, a town of France, in the department of the Loiret: ſeven miles eaſt of Pithiviers.

E'CHINATE, or ECHINATED, *adj.* [from *echinus*, Lat.] Briſtled like an hedge-hog; ſet with prickles.—An *echinated* pyrites in ſhape approaches the *echinated* cryſtalline balls. *Woodward.*—In botany it is applied to all ſuch plants, or parts of plants, as are beſet with ſpines or prickles.

ECHINI'TES, *ſ.* [from εχινος, Gr. a hedge-hog.] A petrifaction of the echinus or ſea-urchin, called by Dr. Hill *centronia*.

ECHINOMELOCAC'TUS. See CACTUS.

ECHINO'PHORA, *ſ.* [from εχινος, Gr. a hedge-hog, and φερω, to bear; on account of the pricklineſs of its fruit.] Prickly parſnip: in botany, a genus of the claſs pentandria, order digynia, natural order umbellatæ, or umbelliferæ. The generic characters are—Calyx: umbel univerſal, with very many rays; the intermediate one ſhorter; partial, with very many ſeſſile flowers, the central one ſeſſile, receiving the germs between the pedicels; involucre univerſal, with ſome ſharp rays; partial turbinate, one-leafed, ſix-cleft, acute, unequal; perianthium proper, five-toothed, permanent, very ſmall. Corolla: univerſal difform, rayed, floſcules male, abortive; the central one of the umbel female; proper five-petalled; petals unequal, patulous. Stamina: filaments five, ſimple; antheræ roundiſh. Piſtillum: germ oblong, inferior, clothed with an involucel; ſtyles two, ſimple; ſtigmas ſimple. Pericarpium: none, in place of which is a hardened mucronate involucre. Seed: ſingle, ovate-oblong.—*Eſſential Character.* Lateral flowers male; central hermaphrodite; ſeed one, immerſed in an involucel.

Species. 1. Echinophora ſpinoſa, or prickly ſea-parſnip: leaflets ſubulate-ſpiny, quite entire. Root perennial, creeping; ſtalks branching, five or ſix inches high, with ſhort thick leaves, terminating in two or three ſharp thorns, and oppoſite, in pairs; flowers in an umbel, on a naked peduncle, which ariſes from the ſide of the ſtalk; corolla white. It flowers in June. Native of the ſea-coaſt of Europe, eſpecially in the Mediterranean Sea. It was found by Mr. Ray on the ſea-coaſt of Lancaſhire, and by Mr. Blackſtone between Feverſham and Sea Salter. In the former in theſe places it has lately been ſearched for without ſucceſs.

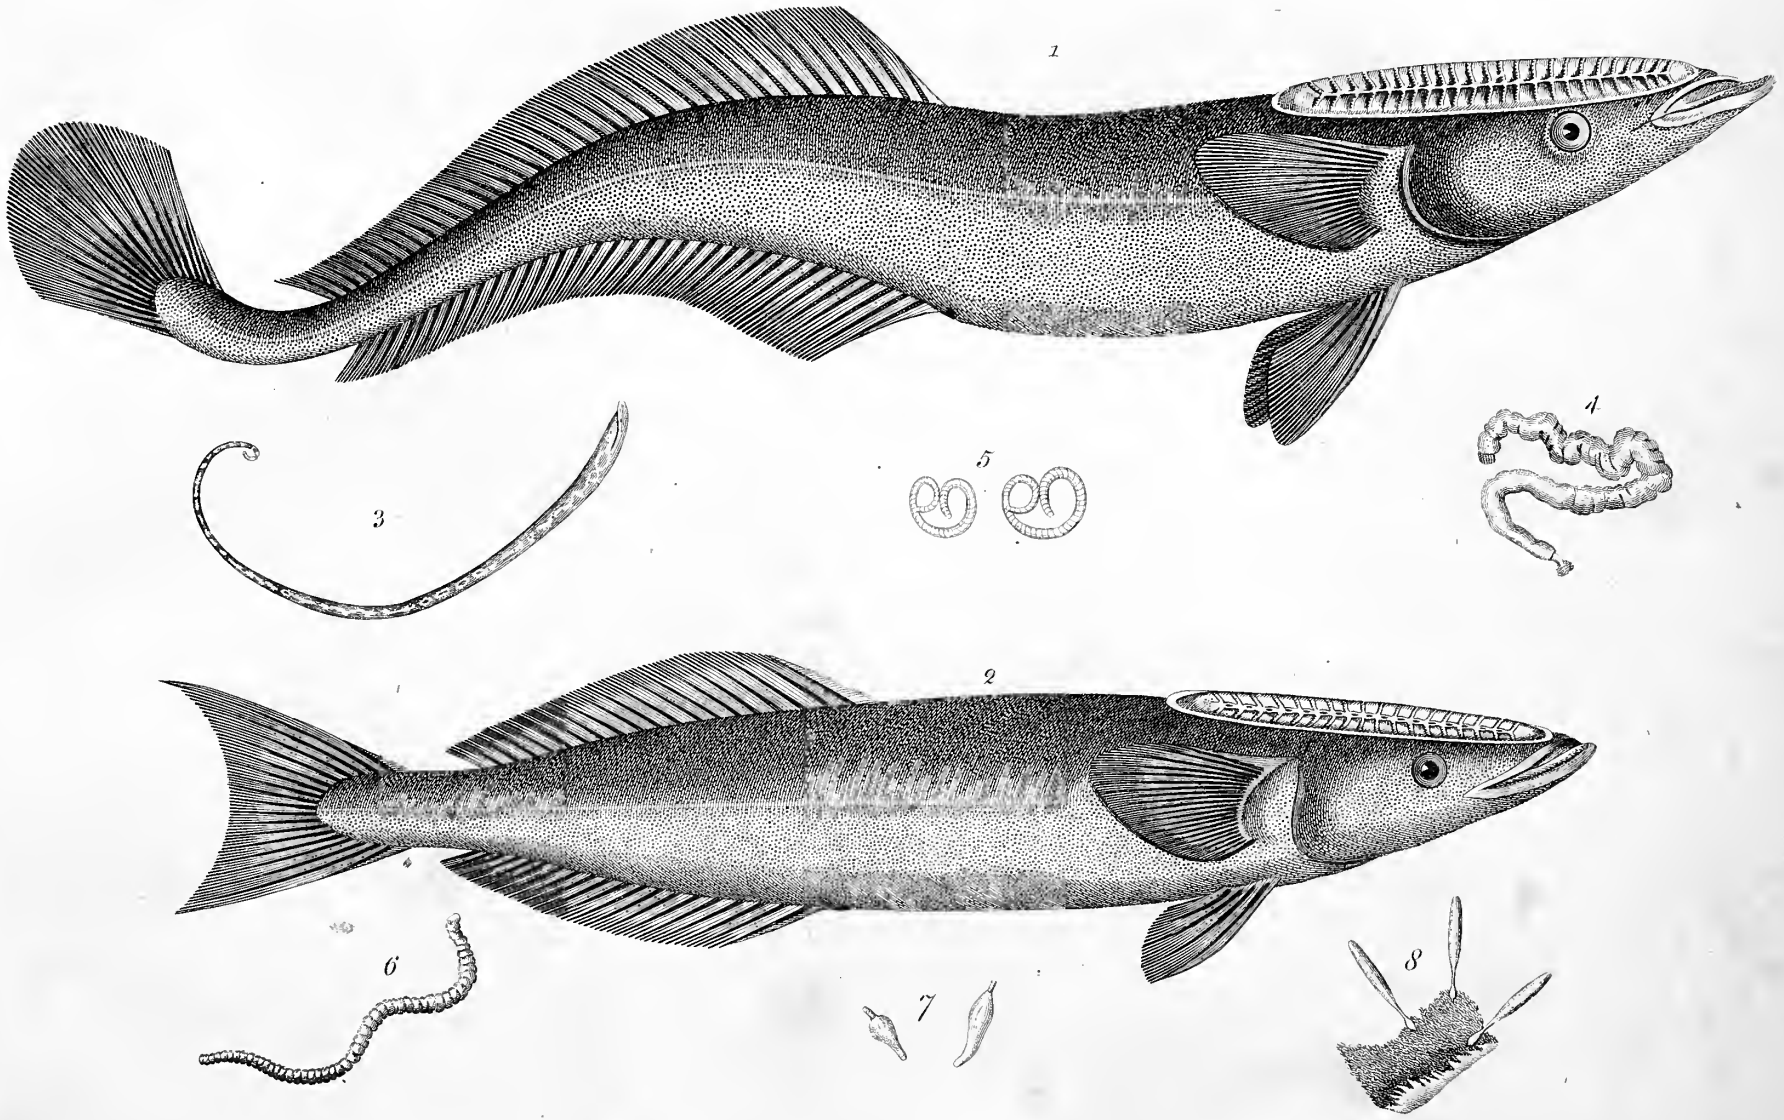
2. Echinophora tenuifolia, or fine-leaved ſea-parſnip; leaflets gaſhed, unarmed. Stalk near a foot and a half high; whence come out two oppoſite ſide-branches at every joint. At the lower part of it are leaves finely divided, like thoſe of the carrot. The flowers grow in ſmall umbels at the extremities of the branches, having a ſhort prickly involucre. It flowers in July. Native of the ſea-coaſt of Apulia. They were both cultivated by Mr. Miller before 1759.

Propagation and Culture. Theſe plants, not producing ſeeds here, are increaſed by their creeping roots. Tranſplant them the beginning of March, a little before they ſhoot. Place them in a warm ſituation, and a dry ſoil; or elſe cover them in winter to prevent the froſt from deſtroying them. See CAUCALIS, DAUCUS, OSBECKIA, and ELEPHANTOPUS.

ECHINOPHTHAL'MIA, *ſ.* [from εχινος, Gr. a hedge-hog, and οφθαλμια, an inflammation of the eye.] An inflammation of the eye-lids, where the hairs briſtle out like the ſpines of a hedge-hog.

E'CHINOPS, *ſ.* [from εχινος, Gr. a hedge-hog, and οψις, appearance; on account of the roughneſs of theſe plants.] The GLOBE-THISTLE; in botany, a genus of the claſs ſyngeneſia, order polygamia ſegregata, natural order compoſitæ capitatæ, (cinarocephalæ, *Juſſ.*) The generic characters are—Calyx: common many-leaved; with ſcales ſubulate, totally reflected, containing many flowers; perianthium partial one-flowered, oblong, imbricate, cornered; leaflets

ECHENEIS AND ECHINORYNCHUS



M. E. Bloch dd.

1. The Sucking Fish. 2 The Remora. 3 Echinorynchus Phoca. 4 Alluconis. 5 Candidus. 6 Lineolatus. 7 Salmonis. 8 Attenuatus.

London. Published as the Act directs. June 12. 1803. by J. Wilkes.

leaflets ſubulate, looſe above, upright, permanent. Corolla: one-petalled, length of the calyx, tubular; border five-cleft, reflex, ſpreading. Stamina: filaments five, capillary, very ſhort; antheræ cylindric, tubular, five-toothed. Piſtillum: germ oblong; ſtyle filiform, length of the corolla; ſtigma double, ſomewhat depreſſed, rolled back. Pericarpium, none; calyx unchanged, larger. Seeds ſingle, ovate-oblong, narrower at the baſe, with obtuſe tip; down obſcure. Receptacle: common-globoſe, briſtly.—*Eſſential Character.* Calyx, one-flowered; corolla, tubular, hermaphrodite; receptacle, briſtly; down obſcure.

Species. 1. Echinops ſphærocephalus, or great globe-thiſtle: heads globular, leaves ſinuate, pubeſcent. Root perennial; ſtalks many, four or five feet high; leaves long and jagged, divided into many ſegments, the jags ending in ſpines. There are ſeveral globular heads of flowers on each ſtalk; florets commonly blue, ſometimes white. Theſe come out in July, and the ſeeds ripen in Auguſt. Native of France, Spain, Italy, Auſtria, Carniola, and Germany. Cultivated in 1596 by Gerarde.

2. Echinops ſpinoſus, or thorny-headed globe-thiſtle: heads interſperſed with long ſpines. Native of Egypt and Arabia. Perennial.

3. Echinops ritro, or ſmall globe-thiſtle; head globular; leaves pinnatifid, ſmooth above. This has a perennial creeping root, ſending up ſtalks two feet high, and branching. Each branch is terminated by a globular head of flowers, ſmaller than thoſe of the firſt, and of a deeper blue, but ſometimes white: they come out in July. The roots are bitter, diuretic, and nouriſhing: quadrupeds, eſpecially the horſe and goat, eat the heads. Native of France, Italy, and Siberia.

4. Echinops ſtrigoſus, or annual globe-thiſtle: heads in bundles; lateral calyxes barren; leaves ſtrigoſe above. It is an annual plant; native of Spain and Portugal. Cultivated in 1731 by Miller.

5. Echinops Græcus, or Grecian echinops: ſtem one-headed; leaves ſpiny; all pinnatifid and villoſe; root perennial, creeping; ſtalks a foot high; leaves ſhorter and much finer divided than the preceding ſorts; hoary, and armed on every ſide with ſharp thorns; ſtalks terminated by one globular head of flowers, blue or white, appearing in June. Native of Greece, whence Tournefort ſent the ſeeds to the royal garden at Paris.

Propagation and Culture. Theſe plants are eaſily propagated by ſeeds, which, if permitted to ſcatter, the plants will come up in plenty, and a few of them may be tranſplanted to the places where they are deſigned to remain to flower; they require no other culture but to keep them clean from weeds; the ſecond year they will flower and produce ſeeds, and the roots will continue two or three years after. They will grow almoſt in any ſoil or ſituation. See CARTHAMUS and ROLANDRA.

ECHINORYN'CHUS, in helmintology, a genus of worms, belonging to the order of inteſtina; the characters of which are theſe: body round: proboſcis cylindrical retractile, and crowned with hooked prickles. Theſe are found fixed very firmly to the viſcera of various animals, generally the inteſtines; and often remain on the ſame ſpot during the whole life of the animal: they are moſtly gregarious, and are eaſily diſtinguiſhed from the tænia by their round inarticulate body. They are divided into four claſſes, viz. I. Infeſting the Mammalia.—Of theſe there are four ſpecies: 1. The Phocæ: body pale: inteſtine milk-white and ſpiral, found in great numbers in the inteſtines of the harp and rough ſeal, and often nearly devours them: from three inches and a half to eight inches long. This is ſhewn in the engraving at fig. 3. 2. Tubifer: body glabrous and tapering behind into a fine hair: found in the ſtomach of the harp ſeal: about an inch long. 3. Gigas: clear white; proboſcis ſheathed, with numerous rows of hooked prickles: found in the inteſtines of ſwine, eſpecially thoſe which have been fattened in ſties: is gregarious, and from twelve to eighteen inches long. That which is found in the boar is of a blueiſh caſt. 4. Balænæ: found in the inteſtines of the whale.

II. Infeſting Birds.—Of theſe there are fourteen ſpecies now known, viz. the Buteonis: found in the inteſtines of the buzzard: two inches long. The Scopis, found in the larger inteſtines of the Strix ſcops. The Aluconis, found in the inteſtines of the Strix aluco: ſhewn at fig. 4. The Strigis, found in the larger inteſtines of the tawny owl. The Pici, found in the inteſtines of the picus erithrocephalus and viridis; is gregarious, and about half an inch long. The Borealis, found in the inteſtines of the eider duck. The Boſchadis, found in the inteſtines of the common duck. The Anatis, found in the inteſtines of the velvet duck. The Mergi, found in conſiderable numbers in the inteſtines of the mergus minutus. The Alcæ, found in the inteſtines of the auk: four inches long. The Ardeæ, found in the inteſtines of the heron: body conic behind, and ſinuate each ſide in the middle. The Gazæ, found in the great white heron. The Vanælli, found in the inteſtines of the lapwing. The Merulæ, found in the black-bird and tree-ſparrow.

III. Infeſting Reptiles.—Of theſe, two ſpecies only are known, viz. the Ranæ, found in the inteſtine of frogs: is gregarious, greeniſh, or pale grey. The Falcatus, found in the duodenum of the ſalamander, near the pylorus.

IV. Infeſting Fiſh.—Of theſe, twenty-eight ſpecies have been aſcertained, found in the inteſtines of the eel, the ſword-fiſh, torſk, whiting-pout, whiting, blennius, ruffe, perch, cod-fiſh, turbot, flounder, father-laſher, bream, loche, trout, ſalmon, pike, ſhad, barbel, roach, frog-fiſh, ſturgeon, and many other fiſhes. In the engraving are given correct figures of the *candidus*, at fig. 5, which is found in the whiting, perch, and carp. Fig. 6, the *lineolatus*, found in the cod-fiſh. Fig. 7, the *ſalmonis*, found in ſalmon. Fig. 8, the *attenuatus*, as found preying on the inteſtines of the flounder, with a piece of the inteſtine to ſhew their poſition.

ECHINOU', a town of European Turkey, in the province of Albania: eight miles north-eaſt of Zeiton.

ECHI'NUS, *ſ.* [Lat. a hedge-hog, from their being clothed with ſpines.] In helmintology, the SEA URCHIN, a genus belonging to the order of vermes molluſca. The body is roundiſh, covered with a cruſtaceous ſhell, beſet with moveable prickles; the mouth is below, and conſiſts of five valves. Many ſpecies have hitherto only been found in a foſſil ſtate, and conſtitute the *echinites* and *centronia* of different naturaliſts. The pores are each furniſhed with a retractile tentaculum or feeler, by which the animal affixes itſelf to any object, and ſtops its motion: the ſpines are connected to the outer ſkin by very ſtrong ligaments, and are the inſtruments of motion. The hiſtory of theſe curious and elegant cruſtaceous animals might be conſidered as a branch of CONCHOLOGY, (belonging to the claſs of multivalves,) ſince the characters are drawn from the ſhell, and not from the animal included in it. Why they were ſeparated, may be ſeen by conſulting that article, in vol. v. p. 14 and 35. The echini are all ſea-animals, moſtly of a round or oval form, included in a ſubſtance more or leſs hard, but always very brittle, not dividing into laminæ, but of a porous appearance like ſugar. Their round ſhape acquired them the trivial name of ſea-buttons; but, as their covering is almoſt always beſet with prickles, they are generically called *echini marini*, or ſea hedge-hogs. The ſubſtance of the animal is gelatinous, interſperſed with many fibres, almoſt like the ſpleen, lungs, and liver, of other animals. The covering is generally divided into five plots, or chambers, proceeding from the mouth, which in ſome ſpecies is furniſhed with five teeth, or long cutting bones. Theſe animals, when boiled, become hard like an egg: ſome ſpecies may be eaten, but moſt of them are rejected on account of their diſagreeable taſte. The ſhell has always two apertures, one of which is conſtantly in the centre at the bottom; this is the mouth. The other aperture is ſometimes underneath, and beſide the mouth; but it is often in the centre at top; this is the vent, whence the excrements are voided. In all the ſpecies the ſhell is flatted underneath and raiſed or vaulted above; and the raiſed ſummit is either round

and

and flat, or convex, or oval, or conical. Several of them have the compartments furnished within with five filaments running round the mouth, which unite, and strengthen the five lobes of which the body of the animal is constituted. The marks of this separation into five lobes is always visible externally; for in every one we may observe five striæ, or sutures, or furrows, either single or double, or some other figure consisting of five lines. The pieces of the shell or covering, which are some hundreds in number, are mostly hexagonal: and upon each there is a warty tubercle, (called by Knorr *mamellon*, nipple,) or else a round cavity, which holds the spine by means of a tendon which runs through the center of the tubercle or cavity. An union of all these pieces makes up the five lobes; and these by a very regular suture are themselves joined as the bones of the cranium are by their sutures. The spines are either thick or thin, smooth or rough, short or long, and of various shapes, sometimes as thin as a bristle or hair; their colour is also variable; being white, red, green, brown, black, violet, yellow, and variegated. The spines are used by the animal both for defence and for motion, and he can raise or depress them at pleasure. If we offer to drag one of these animals from a hole in a rock, he raises his spines all round, and fixes them so firmly against the sides of the hole, that it is impossible to draw him out. When they would remove from one place to another, they make use of the longest spines, which they move either all together, or one after the other, somewhat like a man walking with crutches. In this manner they proceed at a tolerable rate, especially on the firm banks. But they are never seen rolling like a ball, for they can stop themselves in a moment by pushing out some of their spines; and, if by any accident they are thrown topsy-turvy, they can turn by means of their spines, in the same manner as a beetle uses its legs when thrown on its back. These spines, as before observed, are attached by a thin tendon to the tubercles; but the slightest touch brushes them off when the animal is dead; and hence the sea-urchins preserved in cabinets are most frequently without prickles. To keep them entire, they should be immersed in spirits as soon as taken out of the sea, that the spines may stiffen, and coalesce more firmly. The hard surface of the shell is covered with a very thin epidermis, which seems fastened to the body by an infinite number of filaments, passing through as many minute holes, or pores, in the covering, and holding together the numerous pieces of which it consists. These pores, almost imperceptible to the naked eye, are commonly placed in ten regular rows, which form an arc reaching from the vent to the mouth of the animal. Most of the echini have five large escutcheons, covering the five divisions; and at the edge of each escutcheon is a regular row of large tubercles, behind which is a row containing many hundreds of minute pores; but in the middle of each escutcheon, instead of pores, are many small tubercles placed without order. Thus the escutcheons, being joined two and two by a regular suture, form two rows of tubercles, on each side of which are the rows of pores, thus forming ten rows. In other species, which have no tubercles, the spines arise from small points on the shell, or from little circular indentations. The echini were orginally divided by Linnæus into two classes only: 1. the sea-urchins with the mouth at the base, and the anus at the apex; 2. mouth and vent both at the bottom. But it has been since found necessary to form more divisions, and subdivisions likewise.

I. *Vent vertical; tentacula every where simple.*

Hemispherical or globular. 1. Echinus esculentus, the esculent sea-urchin. This is subglobular, with ten avenues of pores, the spaces between covered with small tubercles supporting the spines, which are sharp and strong, above half an inch long; commonly of a red or violet colour; moveable; the tubercles elegantly disposed in rows. These are found in the European and Indian seas. In old times they were a favourite dish, and thought grateful to the stomach; they were the first dish in the famous supper of Lentulus, when he was made *flamen Martialis*, or priest of Mars. This species is exhibited in the annexed engraving, without spines, at fig. 1. The entire animal is armed like the back of a hedge-hog, and appears of a reddish or yellowish colour, the spines faintly violet, purple, or reddish; they are smooth, solid, and so hard, that if they fall on boards or stone, they sound like metal. At the lower extremity, which is somewhat thicker, each spine is hollowed to embrace the top of the tubercle, as represented in the engraving at *a*. There is a variety, of which the prevailing colour is white, and the spines brown.

2. Echinus sphæra: subspherical, red, with blueish spines. This is plentifully found in the Northern Seas.

3. Echinus dræbachiensis: hemispherical, pale, with long pale spines; likewise an inhabitant of the North Seas.

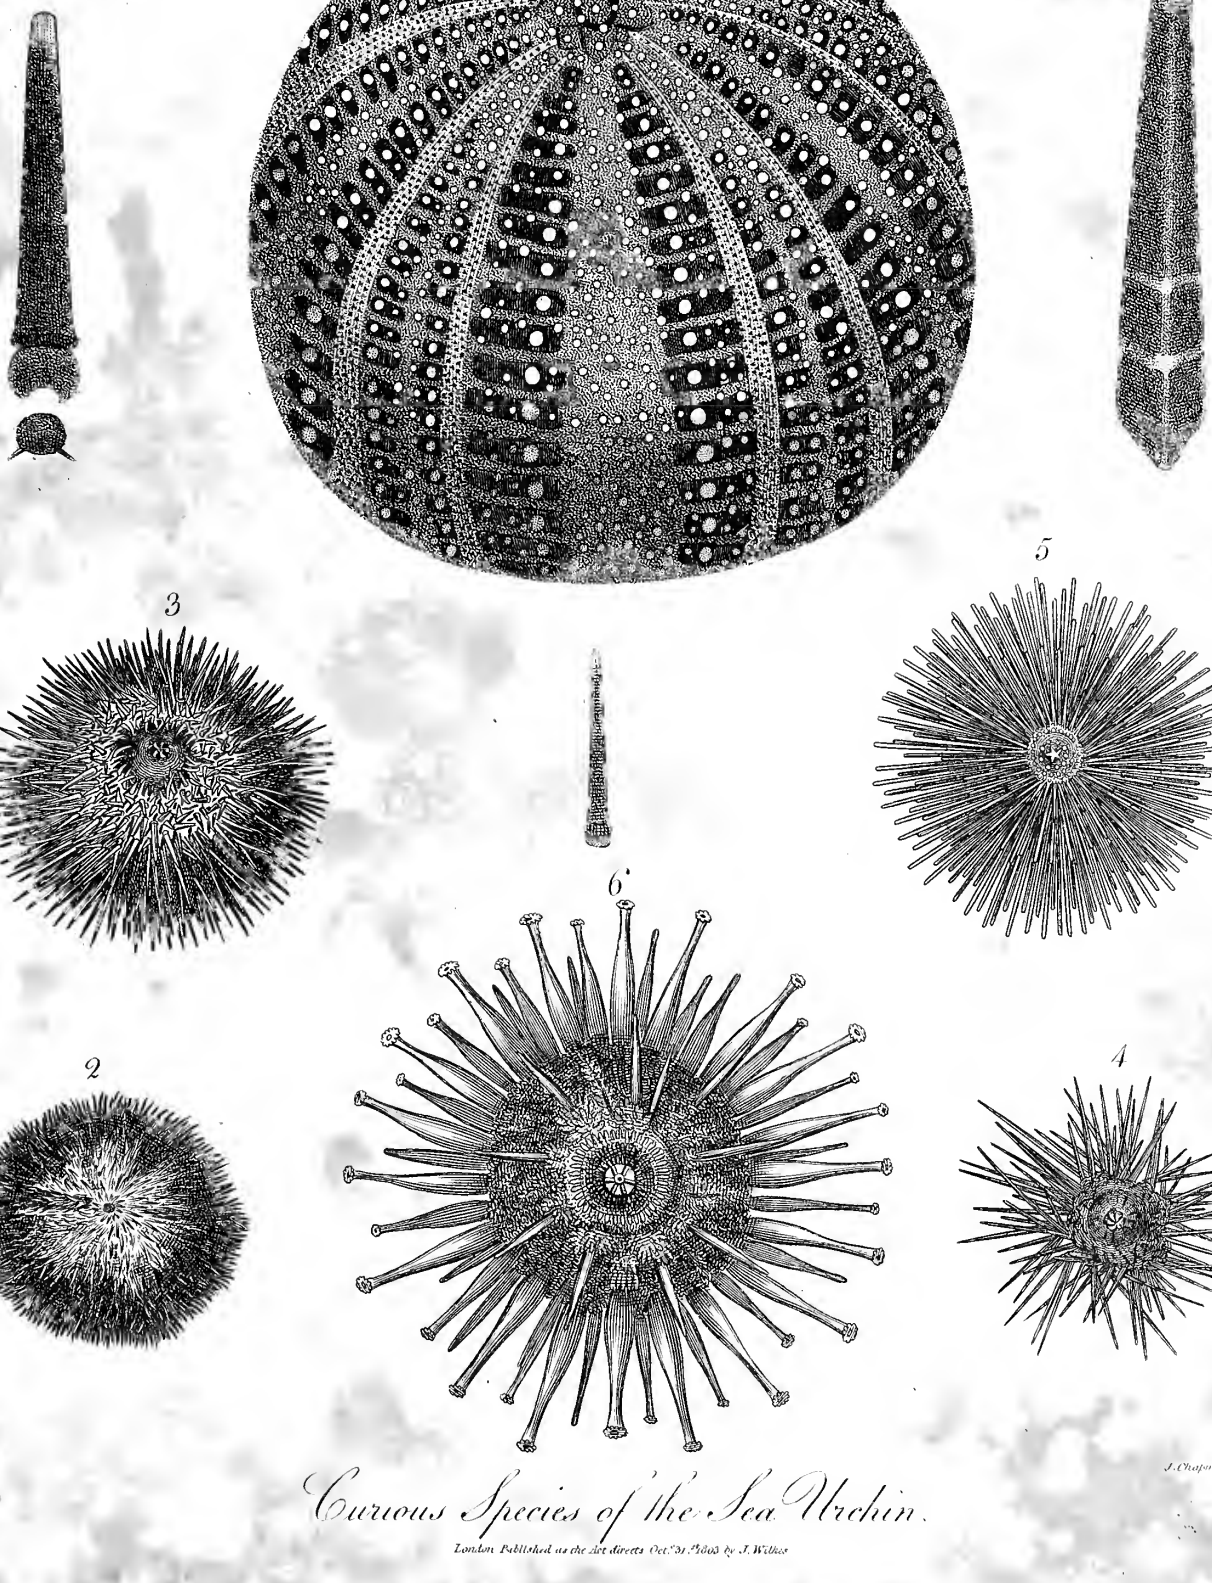
4. Echinus miliaris: hemispherical depressed, with ten avenues of pores, the spaces between with two rows of protuberances. The spines are dark green; and round the base of each is a round knob, or several knobs one under the other, at the bottom of which is the hollow which joins the tubercle. The tubercle is almost spherical, and stands on a rising of the shell, so as to represent a wart or nipple. There is a variety which is green and reddish white; the spines green, and reddish at the tips. Another variety with short but very beautiful spines is almost entirely purple. This is represented in the engraving at fig. 2, and one of the spines at *b*.

5. Echinus Basteri, or Baster's sea-urchin. Shell depressed, with fewer tubercles, and a serrate line down the middle of the spaces: pores of the avenues placed in alternate rows of two and three foramina. Inhabits the European Ocean, and is principally distinguished from the esculentus, in being less, in having the top more depressed, and the avenues of pores narrower.

6. Echinus hemisphæricus. This is strictly hemispherical, depressed, with ten avenues of pores; the spaces with a serrate suture down the middle, and transverse lines; mouth pentangular; the angles obtuse. Probably a variety only of the esculentus. Shell yellowish-red with paler avenues, the base ochraceous; rough with larger and smaller protuberances. The spines are smooth and short; of a reddish colour in the living animal, but after death soon turn yellow.

7. Echinus angulosus; hemispherical; the spaces granulate and bifariously warted, the larger ones biparted by a serrate suture down the middle; avenues trifariously porous. Shell grey, with a greenish violet tinge; spaces with rows of granulations and protuberances; avenues with double distant pores. There is a variety described by Knorr, smaller than the above, and of a light greenish colour. In the middle of each division is a line, not perforated with pores, but with a row of tubercles on each side of it. Behind these rows are two lines pierced with a vast number of pores, and bounded by a single row of tubercles, to which joins the dentated suture which connects the parts. The lobes themselves consist of an infinite number of little squares, each bearing at least one tubercle. The mouth is pentagonal; on each lobe within there is a raised hook like an arched door, and two furrows belonging to each lobe at the rim of the mouth. The vent is at the apex, and is covered with a cartilage which reaches over the pentagonal perforated rim described under the first species. The shell is thin, and very brittle. Another variety has been observed with the apex red, and red spots on the tubercles. But of this species of echinus there are more than thirty varieties: some either light or dark green; others green with white lines, white with green lines, transversely striped, or spotted white or green. The present variety is delineated in the engraving at fig. 3.

8. Echinus excavatus: hemispherical; spaces granulate,



J. Chapman sc.

Curious Species of the Sea Urchin.

London Published as the Act directs Oct.r 31 1805 by J. Wilkes

late, all of them bifariouſly tuberculate: avenues excavated and bifariouſly porous. Found at Verona in a petrified ſtate; grey-yellow.

9. Echinus globulus: hemiſpherical, ſubglobular, with ten avenues, the ſpaces muricate at the ſides and porous in the middle. Inhabits the Indian Ocean.

10. Echinus ſphæroides: hemiſpherical, gibbous: avenues ten, every where muricate and porous in the middle. Found in the Indian Ocean.

11. Echinus gratilla: hemiſpherical, gibbous; avenues ten, triplicate; the ſpaces muricate in a decuſſate form. Inhabits the Indian Ocean.

12. Echinus lixula: hemiſpherical, with ten avenues in approximate pairs; the ſpaces tranſverſely muricate and punctured. Inhabits the Indian Ocean.

13. Echinus ſaxatilis: hemiſpherical, depreſſed; pores of the avenues in a curved line, the curves oblique at the baſe. Inhabits the Mediterranean and Indian Seas. Shell ſub-elliptic, violet-grey or white; protuberances violet, reddiſh or yellowiſh, in two or three longitudinal rows; pores of the avenues double, five pair in a row; mouth large; vent ſurrounded with ovate acute ſcutes; ſpines rigid, reddiſh-brown, with violet tips. This ſomewhat reſembles the *mamillatus*, and is equally good food. The ſpines are long, ſmooth, ſolid, ſpear-ſhaped, of a browniſh colour, and give a metallic ſound when they fall. In the middle appears the mouth, armed with its teeth, which are five triangular bones, hollow, and bent; their points unite outſide the ſhell, and form a cone; their broad extremities are within, placed circularly. This is exhibited in the engraving at fig. 4.

14. Echinus feneſtratus: orbicular, with a flat feneſtrate baſe; ſpaces ten, with unequal ſmall and large tubercles; mouth with ten angles. Shell white, with granulations over all the ſpaces and avenues; in the larger ſpaces are ſix rows of warts reſembling papillæ; avenues broad, with three pair of pores and two towards the crown; ſpines violet-black; vent pentangular.

15. Echinus ſubangularis: hemiſpherical, orbicular, with ten ſpaces; the leſſer ones elevated, and ten rows of tubercles in each. Shell greeniſh-aſh, a little inclining to cheſnut, and pulvinate at the baſe; ſpaces with four tubercles placed in a rhombic form: pores of the avenues curved, in four or five pairs.

16. Echinus ovarius: ovate; the larger ſpaces bifariouſly tuberculate. Found in a petrified ſtate in England and Normandy.

17. Echinus diadema, or little turban. Hemiſpherical, depreſſed, with five avenues longitudinally tuberculate; the ſpaces lanceolate. It varies, 1. With tuberculate bands. 2. Greeniſh-yellow. 3. Blackiſh, variolous, with long ſpines. 4. Spines black, annulate with white. This ſpecies inhabits the ſands of the Indian Ocean. Shell orbicular, with a depreſſed top, rich blue or grey-blue; mouth large; vent circular and ſurrounded with a pentangular ſkin; ſpaces bifariouſly tuberculate, the tubercles perforated at the tip; avenues with three pair of pores at the baſe and one at the tip; ſpines violet and blue-grey. This deſerves notice in preference to ſeveral others, from the regularity of its ſtructure, and the circular arrangement of its ſpines, as ſhewn at fig. 5, in the engraving. It has been obſerved that the ſhell of the ſea-urchin, before it is cleaned, is covered with a tender ſkin; this probably enables the animal to unite and ſtrengthen its brittle ſhell, which conſiſts of ſo many diſtinct pieces. Yet this ſkin may be ſoftened in warm rain-water, ſo as to be removed by a bruſh; and the ſhell, being then expoſed to the ſun, becomes white, only the ten ſingle or five double lines remaining black.

18. Echinus calamarius: ſpheroid, depreſſed; avenues five, with black porous margins, granulate in the middle with a double row of larger prominent dots. Inhabits the Indian Sea: greeniſh-white. Smaller tubercles with green very brittle briſtles; ſpines reſembling the ſtem of the equiſetum, whitiſh annulate with green and grey at the tip.

19. Echinus araneiformis: orbicular, grey, with purple-grey ſpines thicker in the middle. Inhabits the American ſeas.

20. Echinus ſtellatus: with the lower ſpines capillary; likewiſe found in the American ſeas.

21. Echinus radiatus: with five radiate avenues, forked at the tip. Each of the avenues is terminated by two whitiſh rays, and perforated with pale red foramina.

22. Echinus circinatus: with ten granulate ſpaces, bifariouſly tuberculate; the larger ones excavated, the leſs ones elevated, and ſubpulvinate at the baſe. Found hitherto only among the foſſile echini.

23. Echinus cidaris, or great turban: hemiſpherical, depreſſed, with five flexuous linear avenues, the ſpaces alternately bifarious. Its varieties are, 1. Of a ſmaller ſize. 2. With the ſpines fuſiform. 3. With the ſpines claviculate. 4. With the ſpines obtuſe. This ſpecies inhabits the Indian Ocean, generally of a livid-grey colour and flat at the baſe; ſpaces granulate; with two rows of protuberances placed alternately, furniſhed with perforated papillæ, ſurrounded with a circle or two of granulations, and ſeparated by a groove running round them; in the place of ſmaller ones is an eminent band between the avenues; mouth rather large. The tubercles are pretty large, regularly placed in five double rows; between each double row runs a thick line ſomewhat waved, which diſtinctly ſhows the five compartments of the whole ſhell, each of which contains two rows of tubercles; and each tubercle ſtands upon a white nipple, incloſed in a raiſed granulated border. The two rows of tubercles on each diviſion go from the vent to the mouth, but not in ſtrait or parallel lines; they run rather oblique and alternate, i. e. the tubercle in one line ſtands oppoſite to the ſpace in the other. By the ſide of each double row of tubercles runs a waved broad ſtripe perforated with oblong holes; and theſe ſtripes divide the ſhell into five lobes. The tubercles look like buttons, and are of a yellowiſh colour; in the centre of each may be obſerved the orifice through which the tendon paſſes which faſtens the ſpine to the ſhell or body. The ſpines are very large, and club-ſhaped; but they are of different ſizes according to the ſize of the animal. A cidaris or turban with its ſpines complete is now conſidered as a great curioſity.

The variety of the cidaris with fuſiform ſpines is nevertheleſs the moſt rare and beautiful of this family. The ſpines are large and ſwelled at the baſe, but grow ſmall towards the top, which is terminated with a rim; and there are longitudinal ſtriæ upon each, made up of raiſed dots, ſo that they have the appearance of being notched. Sixty of theſe have been counted upon one ſea-urchin, without reckoning the young ones that might afterwards puſh forth. Each ſpine ſtands in the midſt of a circle conſiſting of about twenty little white leaves riſing up taper like a crown, concealing and ſtrengthening the baſe of the ſpine; and between the rows of ſpines there is a double row of theſe leaves, directed oppoſite ways to ſupport each row of ſpines. The anus is at the apex, and round it are five ſpines placed pentagonally; the mouth is at bottom, and included in a double row of ten ſhort ſpines. All the reſt of the ſpines are long. This ſpecies is often found petrified; but ſeldom in its natural ſtate, ſince it inhabits the inacceſſible depths of the ſea. One of theſe is repreſented in the preceding engraving at fig. 6; and one of the triangular ſpines of the claviculate ſpecies, at *c*. The ſhell alſo of the claviculate cidaris, without the ſpines, is exhibited in the Echinus Plate II. fig. 1, to ſhew its tubercles, ſtripes, and perforations.

Another variety of the cidaris, remarkable for the ſingularity and length of the ſpines, is referred by Knorr to this ſpecies. Its tubercles are placed upon nipples, like the *cidaris*, or great turban. This is ſometimes called the little turban, (though it be the ſize of two fiſts,) be-

cauſe the tubercles are ſmaller. It is covered with a black ſkin; but when cleaned with ſoft water and a bruſh, and expoſed to the air, it becomes white, and the ten black ſtriæ which divide it appear. The ſpines are from two to ſix inches long; and are very rarely ſeen in cabinets unleſs ſeparately. They are very thin and brittle; of a dark brown colour; the lower extremity not thicker than a large pin, and the point very fine: their ſtructure is made up of a number of little rings, ſo finely ſerrated as to be inviſible to the eye, but very perceptible to the touch; for they feel ſmooth when drawn between the fingers upwards, but rough when ſtroked downwards from the tip. It has as many ſpines as tubercles; the longer ſpines ariſing from the largeſt tubercles. Some ſpecimens have the ſpines ſpeckled, that is, the rings are alternately white and black. Theſe are very beautiful and rare. This curious ſpecies is correctly ſhewn in Plate II. fig. 2.

24. Echinus mamillatus: hemiſpherical-oval, with ten winding avenues; the ſpaces muricate and warty, the narrower ones abbreviated. Inhabits the Southern Seas; and are valued as a nouriſhing and ſavoury food. Spaces ten, the papillæ not perforated as in the laſt, but ſurrounded with elevated circles; in the larger ſpaces are from ſixteen to eighteen protuberances, the middle ones larger, in the leſſer ſpaces about fourteen; avenues with four or five pair of pores at the baſe; mouth large; vent rounded, and ſurrounded with ten ſcales, five of which are perforated; colour of the ſpines variable. The back is more raiſed and pointed than in the preceding; not reſembling a compreſſed ſphere, but rather oblong-hemiſpherical. The tubercles are large, but not ſo regular as thoſe of the preceding; neither are the diviſions ſo diſtinctly ſeparated. It is not therefore difficult to diſtinguiſh them, though they have often been confounded. Between the large tubercles are diſpoſed a great many ſmall ones, not larger than millet-ſeed. The ſhell is of a reddiſh colour, or like apple-tree bloſſom. The ſpines, from their rounded form, are called *fingers*. This ſpecies is repreſented in Plate II. fig. 3; and the ſhell, without the ſpines, at fig. 4.

25. Echinus lucunter: hemiſpherical-oval, with ten flexuous avenues; ſpaces muricate, the narrower ones longitudinal. Inhabits the Indian Ocean, and varies much in colour; ſometimes yellow-cinereous, ſometimes blueiſh and blackiſh; the baſe pulvinate. Mouth large; in each ſpace is two ſingle rows of larger warts, and a ſextuple row of ſmall ones in the larger ſpaces, which in the leſſer is quintuple; avenues with four or five pair of pores towards the ends, and ſix in the middle.

26. Echinus atratus: hemiſpherical-oval and ſlightly depreſſed; with very ſhort obtuſe truncate ſpines, the marginal ones clavate and depreſſed. Inhabits the Indian Seas. Circumference nearly orbicular, cinereous inclining to violet; ſpaces ten, very finely granulate, with ſometimes an octuple row of larger protuberances in the larger ones, diſpoſed in a quincunx, and a double row in the ſmaller ones; avenues brown, excavated, granulate, broad, with four rows of pores; ſpines violet, ſome of them clavate, ſome angular at the tip, and ſome cylindrical.

27. Echinus coronalis: hemiſpherical-orbicular, with ten ſpaces alternately narrower and covered with ſcattered papillæ; avenues flat, meeting in confluent pairs before the area of the crown. As yet has only been found in a foſſile ſtate, in a chalky and flinty foil.

28. Echinus aſterizans: orbicular depreſſed; tubercles furrowed with a groove up to the tip, and ſurrounded with a circle of granulations. Found among chalk in a foſſile ſtate.

29. Echinus aſſulatus: ſhell ſcutellate, the ſcutels united by tranſverſe ſutures. Probably not a diſtinct ſpecies.

30. Echinus ſardicus: orbicular depreſſed tuberculate, with ten impreſſed avennes; the ſpaces multifariouſly tubercled, with an impreſſed ſuture down the middle. Inhabits the Tuſcan and Adriatic ſeas; large, grey-yellowiſh-red, the baſe nearly flat and more yellow; larger ſpaces with tubercles diſpoſed in from eight to twelve rows, with leſſer ones and ſmall granulations in the interſtices; the leſſer ſpaces with from four to ſix rows of ſmaller tubercles; avenues with five pair of pores placed in an arched row; mouth ſmall, with ten ſinuoſities.

31. Echinus flammeus: hemiſpherical depreſſed; the ſpaces void of tubercles in the middle towards the upper parts, the leſſer ones more elevated; avenues narrow, and bounded on each ſide by a row of tubercles. Olive-green, the tubercles and baſe of the avenues whiter; larger ſpaces with twelve rows of tubercles at the broadeſt part, leſſer ſpaces with three, each tubercle ſurrounded with a circle of leſſer ones; avenues hardly two lines broad, with three pair of pores intermixed with granulations; mouth ſmall; vent ſurrounded with pentangular ſcales.

32. Echinus variegatus: orbicular ſubangular; middle ſpaces roſy, rich green on each ſide; avenues whitiſh-green; baſe whitiſh. The larger ſpaces have the appearance of three or four warts ſurrounded with granulations, leſſer ſpaces a little elevated with three rows of warts; avenues with three pair of pores; mouth roundiſh, and very faintly ſinuate.

33. Echinus puſtuloſus: the larger ſpaces are divided in the middle by a ſuture, with numerous tranſverſe rows of tubercles, increaſing in number towards the middle; leſſer ſpaces more elevated. Hardly an inch high, and about two in diameter, browniſh grey inclining to red, the leſſer ſpaces paler, the baſe whitiſh, and the protuberances reddiſh; ſpaces ten, the larger ones with a rough diſk, the ſuture bounded by minute granulations on each ſide, with rows of tubercles, conſiſting at firſt of one, then of two, ſo that in the middle they amount to about ten; leſſer ſpaces with two rows of tubercles with a ſerrate line and minute granulations between them; avenues with four or five pair of pores running into oblique lines; mouth with broad ſinuoſities.

34. Echinus granulatus: ſuborbicular ſubangular; middle of the ſpaces naked, and divided by a ſuture ſerrate on each ſide, the larger ones with ſeven rows of tubercles, the leſſer ones with four. About three quarters of an inch high, and one inch and a half in diameter; the baſe pulvinate, and with the margin of the larger ſpaces greeniſh-grey; middle of the larger ſpaces and the leſſer ones dull green; avenues with three pair of pores placed in a triangle; vent circular, with ten ſcales at the margin expanded like a roſe.

35. Echinus teſſellatus: with ten ſpaces divided in the middle by a ſuture, and teſſellate; avenues ten biporous; mouth circular. Found hitherto only in a foſſile ſtate.

36. Echinus botryoides: ſpaces divided by a longitudinal ſuture in the middle, the larger ones bifariouſly tuberculate; avenues with a double curved row of pores. Found as yet only in a foſſile ſtate.

37. Echinus toreumaticus: hemiſpherical, with ten ſpaces bifariouſly tuberculate, the tubercles crenate and ſurrounded by a circle of granulations; the larger ſpaces with four longitudinal grooves, the leſſer ones with two. Cinereous blueiſh or greeniſh, the baſe and avenues yellowiſh; avenues biporous, the pores placed in a thickly ſerrate line; baſe pulvinate; mouth ſmall; vent ſurrounded with ten ſcales.

Something reſembling the figure of a ſhield. 38. Echinus ſinuatus, the polar ſtone: convex; avenues ten, ſtriate; ſpaces ten; tubercles ſurrounded with a circle of granulations. Found hitherto only in a foſſile ſtate. One of the ſpaces divided by an excavated ſinus; avenues broad and punctured at each margin; baſe a little excavated and furrowed by five divergent grooves; mouth ſmall, pentagonal.

39. Echinus ſemiglobofus: hemiſpherical, grooved, with a flat baſe; the protuberances placed in rows. Found hitherto in a foſſile ſtate only.

40. Echinus quinquelabiatus: painted with innumerable annulations, with a hollow in the middle ſurrounding a five-rayed convex ſtar. Found hitherto among foſſils only.

41. Echinus

Curious Species of the Sea Urchin.

J. Chapman, Sc.

London, Published as the Act directs Oct.r 15 1803 by J. Wilkes.

41. Echinus conoideus: ſubconic with an elliptic circumference; ſpaces and avenues ten, the latter tranſverſely grooved and porous at the margin, the former divided by a ſtraight excavated ſuture. Found as yet only in a foſſile ſtate. Protuberances of the ſpaces thickly placed and ſurrounded by a circle of granulations; baſe flat, grooved; vent circular.

II. *Vent placed beneath; mouth without tentacula.*

Baſe circular, in the periphery of which is the vent. 42. Echinus albo galerus: ſpaces ten, covered with numerous ſmall white tubercles, the larger ones united by a ſerrate ſuture and tranſverſely lineate, the leſſer ones terminated by a foramen at the crown; avenues ten, biporous. Suboval; mouth orbicular, ſmall; vent ovate. Found hitherto only in a foſſile ſtate.

43. Echinus depreſſus: ſpaces ten, the larger ones divided in the middle by a ſuture; avenues ten, biporous; crown depreſſed; vent orbicular. Mouth moderate, with ten ſharp ſinuoſities; vent large, ovate. Found hitherto only in a foſſile ſtate.

44. Echinus vulgaris: orbicular; with ten avenues, two of them always near each other. Found frequently in a foſſile ſtate, in numberleſs varieties of forms.

45. Echinus quadrifaſciatus: with four avenues of pores. Found in a foſſile ſtate; circumference ſometimes orbicular, ſometimes approaching to an oval.

46. Echinus ſexfaſciatus: with ſix avenues of pores. Found hitherto only in a foſſile ſtate.

Baſe exactly circular. 47. Echinus ſubuculus: avenues ten, biporous; ſpaces ten, five larger and five leſs; mouth and vent ſmall, orbicular. Found only in a foſſile ſtate; the ſpaces beſet with very ſmall circles; pores of the avenues very minute, and crowded cloſe together.

Baſe oval. 48. Echinus cycloſtomus: oblong, ſubdepreſſed; crown with five pores; mouth placed in the middle, and round; vent oblong, and near the mouth. Cinereous or yellowiſh; the baſe pulvinate; ſpaces ten, divided by a ſerrate line down the middle, and beſet with minute tubercles incloſed in a circle; avenues ten, biporous, and extending to the mouth. This is perhaps a variety of the *roſaceus*. The five double lines, which repreſent the radii, are only rows of pores, appearing black on the whitiſh ground of the ſhell. The ſhell is very thin and brittle, which occaſions this and ſimilar ſpecies to be more rare in cabinets than thoſe which have ſtrong tubercles and a thicker ſhell.

49. Echinus ſemilunaris: vent longitudinally oblong; mouth tranſverſe and ſemilunar. Inhabits the Aſiatic Sea; pale yellowiſh-aſh.

50. Echinus ſcutiformis: mouth pentangular; avenues ten, ſtriate; larger ſpaces aſſulate or divided into plates, the pieces pentangular.

Baſe oval, acute; vent oppoſite the mouth. 51. Echinus ſcutatus: convex, beneath flat; ſpaces tuberculate and alternately larger, the larger ones divided by a ſerrate ſuture in the middle; mouth tranſverſe, kidney-ſhaped. Found only in a foſſile ſtate; tubercles of the ſpaces intermixed with very minute granulations; mouth ſurrounded with tubercles ſomewhat larger, and forming a triangle; vent ſubovate; baſe a little convex towards the margin, with a more eminent ſtripe in the middle, bounded on each ſide by two finely granulate bands.

52. Echinus ovatus: ovate, aſſulate, the pieces hexangular; crown naked; vent ſuboval. Found hitherto only in a foſſile ſtate. Shell compoſed of twenty rows of pieces, ten larger and ten leſs, all of them united by a ſerrate ſuture; ſpaces ten larger and ten ſmaller, in the latter of which are two impreſſed dots; mouth rounded, ſmall; vent ſuboval.

53. Echinus puſtuloſus: ſpaces obſolete and not tuberculate; avenues with raiſed dots diſpoſed in pairs; crown impreſſed. Found in a foſſile ſtate; reſembles echinus ſcutatus in figure, circumference, mouth, and vent.

54. Echinus quadriradiatus: with four double rows of dots. Found hitherto in a foſſile ſtate only.

55. Echinus minor: ovate, with a flat or concave baſe; ſpaces and avenues ten, the latter biporous; mouth tranſverſe, roundiſh; vent ſuboval. Found only in a foſſile ſtate.

56. Echinus dubius: ovate, with ten ſimply porous avenues; half of the vent marginal. Found hitherto only in a foſſile ſtate. The five larger ſpaces marked with impreſſed circles.

Baſe irregular, with five expanded petal-ſhaped marks on the ſurface. 57. Echinus roſaceus: flattiſh and roundiſh-oval; avenues five, oval, with a dotted ſurface. Inhabits the Aſiatic Ocean; yellowiſh-brown, ſometimes dirty cinereous; covered with ſmall tubercles like grains of ſand, and diſpoſed in a quincunx form. The ſhell is compact, and almoſt of a ſtony hardneſs, which however it acquires after it comes out of the water. There is a pentangular piece at the top with five angular holes, like thoſe ſpecies which have the vent at the apex; yet in this diviſion the vent is underneath, not in the center however, but in the circumference. From this pentagonal piece ariſes a five-leaved figure which ſpreads over the whole ſurface of the ſhell, ſo that each ſide of the pentagon is contiguous to the point of one leaf, which is formed by two curved lines repreſenting the edges of the leaf, and theſe, making an oblong arc, paſs over the ſhell, without joining at the round extremity of each leaf. The lines are broad, containing, firſt, two almoſt parallel rows of pores, the outer row large and oval, the inner ſmaller and round; from each oval hole of the outer row runs a furrow towards the round hole of the inner rank, which gives the edges of the leaves a ſingular appearance. The middle of each leaf, incloſed in this edging or border, is much raiſed above the ſurface of the ſhell, ſo that this five-leaved figure is very apparent. As the entire circumference of the ſhell repreſents a lengthened oval, broad at one end and pointed at the other, and in general a pentagon more or leſs obtuſe, there are always two leaves of the figure divided towards the broad end, one to the pointed end, and the two others ſtretch towards the ſides. The whole ſurface is full of little circular hollows, with a little convexity in the middle to hold the concave extremity of the ſpines, like the articulations of bones, as before deſcribed. Turning this to examine the baſe, two cavities appear. The largeſt, which is in the center, is the mouth; the other, near the rim in the middle of the broad ſide, is the anus. The mouth is ſunk in ſo far as to be within a very ſmall ſpace of the ſummit on the oppoſite ſide. From the rim to the mouth run five ſmooth deep furrows, which are preciſely underneath and in the middle of each of the leaves of the figure above, and which thus divide the baſe into five parts. The ſhell alſo includes a great number of little bones, which are the teeth of this ſingular animal, and which rattle when the ſhell is ſhaken. This very curious ſpecies is exhibited in Plate II. fig. 5.

58. Echinus altus: crown elevated, orbicular; avenues broad, with convergent granulate tips. Found in a foſſile ſtate; higher than the laſt; about two inches high and ſix broad at the wideſt part of the baſe.

59. Echinus oviformis: convex and flat beneath; avenues ten, biporous, and expanded in a ſtellate form; crown with four pores. Above browniſh-grey, beneath whitiſh-grey; granulate, with a circle round the granulations; mouth tranſverſe, and ſlightly kidney-ſhaped; vent marginal, near the mouth; baſe with a paler glabrous line in the middle, reaching from one end of the ſhell to the other.

60. Echinus orbiculatus: granulate; avenues biporous, the pores united by a tranſverſe impreſſed line, and the intermediate ſpaces divided by a ſerrate line in the middle, the reſt of the ſurface five-parted. Found in a petrified ſtate, and a very indiſtinct ſpecies.

Flat

Flat on both ſides; the avenues reſembling petals; mouth central, flat, toothed; crown with four pores.

61. Echinus biforis, the two-holed ſea-urchin: the baſe with five grooves and ten flexuous radiate lines; near the vent two oblong foramina. Above a little convex and pale yellowiſh-aſh, beneath ochraceous; ſometimes roundiſh, ſometimes obtuſely triangular; the margin ſometimes ſinuous, ſometimes flexuous; mouth obtuſely pentangular; vent ſometimes circular, ſometimes tranſverſely oval; the adjacent foramina ſometimes ſhorter and ſubovate, ſometimes longer, narrower, or linear; avenues reſembling ovate petals or leaves, conſiſting of a ſingle inner row of dots, and a row of oblique ſtriæ penetrating the ſhell, which is as thin as paper, and looks ſomething like the paſte or dough that wafers are made of. The ſhell appears made up of pentagonal pieces ſo nicely joined that ſcarcely any mark of a ſuture is perceptible; and theſe pieces are full of little grains or protuberances not viſible to the eye, from which ſpring minute ſpines like the hair of a man's beard. Yet the animal uſes them but little for motion; the lower ones do not ſerve for feet, but moſt commonly for oars in ſwimming. The oblong foramina mentioned above are very remarkable in this and the two following ſpecies; they are cut entirely through the animal, ſo that a ribbon may be put through; the inſide lining of theſe holes is firm, and armed with ſpines. Mouth and vent underneath.

62. Echinus pentaporus, the five-holed ſea-urchin: avenues emarginate at the tip; vent near the mouth, with five foramina. Obtuſely pentagonal; above whitiſh-aſh with a reddiſh tinge; beneath hollowed towards the middle, white with a little yellow and blue veins; ſhell with prominent diviſions; avenues oval; mouth obtuſely pentagonal, the lips a little prominent and perforated with a foramen; vent nearly ſquare, with adjacent linear and ſuboval foramina; crown marked with a pentagonal ſtar. Of the five foramina, four are near the rim, almoſt at right angles, the fifth is between two petals of the flower, conſequently between two lobes, ſo that one lobe is entirely ſolid. Theſe large foramina are probably uſeful to the animal in riſing and ſinking in the water; for the reſiſtance of the water, when part of it paſſes through the holes, is not ſo great as it would be againſt the entire ſhell. The mouth and vent are very near together.

63. Echinus hexaphorus, the ſix-holed ſea-urchin: this is orbicular, with narrow avenues, and ſix narrow foramina near the vent. Inhabits the Indian, American, and South ſeas, and very much reſembles the laſt: cinereous; crown umbilicate; baſe a little hollowed, darker, and marked with frondoſe lines. Theſe three laſt are found in the Eaſt Indies, and ſometimes in the North Sea; but they are rarely ſeen, and very ſcarce in cabinets on account of the thinneſs and brittleneſs of the ſhell.

64. Echinus emarginatus, or margined ſea-urchin: nearly pentagonal, with ovate avenues; vent oval, more remote from the mouth, with ſix foramina cloſe to the margin. Inhabits the iſland Bourbon; greeniſh-brown. Shell a ſlightly heart-ſhaped oval, a little pulvinate, ſinuous, four inches and ſix lines in tranſverſe diameter, crown patulous, baſe a little flatter, and marked with flexuous branched ſculptured lines.

65. Echinus auritus, or eared ſea-urchin: margin waved, the lower one rounded, the upper one nearly ſquare and twice divided, with an opening pore between every two of the avenues. Inhabits the Perſian ſeas; yellowiſh-grey, the upper margin tawny; the baſe flat, punctured, and marked with radiate ſtriæ; vent oblong, and placed near the mouth.

66. Echinus inauritus, or earleſs ſea-urchin: ſubcordate and aſſulate, the pieces hexagonal; avenues five, oval, emarginate at the tip, the fifth longer, and a pore between every two of them. Inhabits Amboyna, in the river Wagnitoe; five or ſix inches high, and as many broad; the broader end thrice divided; thin and thickly covered with granulations ſpinous at the baſe; above reddiſh-aſh, beneath violet-red.

67. Echinus tetraporus, or four-holed ſea-urchin: orbicular, lightly ſinuous, and perforated each ſide with four foramina; vent circular. Pale yellow-grey; crown with five foramina; avenues obtuſe at the tip; the baſe furrowed with ten flexuous grooves bifid at the tips; mouth rounded and five-toothed.

68. Echinus laganum: avenues oval, finely ſtriate and cleft at the tip; crown prominent; vent circular, and near the margin. Granulate, ochraceous, ovate, ſubpentagonal; the baſe with five excavated rays divided into ſo many equal ſpaces; mouth obtuſely pentagonal; vent hardly the breadth of a line diſtant from the margin; crown perforated with five foramina between the avenues.

69. Echinus ſubrotundus: orbicular, with radiate avenues. Found hitherto only in a foſſile ſtate.

70. Echinus reticulatus: ovate, flattiſh, with five oval avenues; the ſurface reticulate. Inhabits the American and Indian Ocean.

71. Echinus orbicularis: circular, with oval acute avenues; the baſe with ten impreſſed porous rays; vent midway between the mouth and margin, both circular. Inhabits the Indian Sea.

72. Echinus corallatus: orbicular, with oval obtuſe ſhort avenues. Found hitherto only in a foſſile ſtate.

73. Echinus decadactylos: ſhell perforated with four oblong foramina; the margin with ten teeth. Shell rough with granulations; above blueiſh-green, varied with cinereous; the avenues and ſutures pale fleſh-colour; the baſe yellowiſh fleſh-colour, with ten impreſſed flexuous grooves, bifid at the tip and greeniſh-aſh; avenues lanceolate-oval, entire, biporous, united by oblique ſtriæ; teeth of the margin alternately ſhorter; mouth rounded; vent ovate.

74. Echinus octodactylos: the fore-part orbicular, and perforated with two foramina, the hind-part eight-toothed; avenues lanceolate. Shell whitiſh-aſh; aſſulate, the pieces convex; crown umbilicate; avenues emarginate.

75. Echinus orbiculus: fore-part orbicular, entire; hind-part unequally toothed; avenues lanceolate, cleft, and bent. Inhabits the Indian Sea. Shell flat, ſuborbicular, not perforated, compoſed of hexangular pieces; the baſe flat with impreſſed grooves; avenues oval; mouth rounded; vent oval.

Ten avenues on the crown, the rays ſtraight, biporous, and ſtellate; mouth and vent approximate in the middle part of the baſe. 76. Echinus nucleus: ſurface globular, with an orbicular circumference; baſe narrow, and flat in the middle; ſides grooved; avenues pulvinate; crown eccentric. Shell yellowiſh-aſh; crown perforated with four pores; mouth circular; vent rather oblong, and ſmaller than the mouth.

77. Echinus centralis: ſurface globular, circumference ſuborbicular; baſe pulvinate; ſides very lightly grooved; avenues ſlightly pulvinate; crown central. Perhaps a variety of the laſt. Mouth very minute and orbicular.

78. Echinus ervum: ſurface globular, circumference ſuboval; baſe a little narrowed; ſides grooved; avenues ſubpulvinate; crown central. Larger than echinus nucleus; mouth and vent equal.

79. Echinus craniolaris: ſurface globular on the fore-part, the hind-part nearly five-angled, pulvinate, and ſloping; circumference elliptic; baſe a little narrowed; ſides grooved; avenues pulvinate; crown eccentric. Inhabits the Indian ſeas: white, and covered with granulations ſurrounded with an engraved circle; crown with four pores.

80. Echinus turcicus: ſurface and baſe pulvinate, circumference elliptic; ſides hardly grooved; avenues ſubpulvinate; crown ſlightly depreſſed and central. Probably a variety of the preceding.

81. Echinus vicia: ſurface globular, circumference obtuſely oval; baſe a little narrowed; ſides grooved; avenues

avenues flattiſh; crown central. Inhabits the Adriatic: reſembles echinus craniolaris.

82. Echinus ovulum: ſurface pulvinate; circumference obtuſely oval; baſe globular; ſides ſlightly grooved; crown central. Perhaps a variety of echinus craniolaris.

83. Echinus lathyrus: ſurface and baſe pulvinate, circumference oval; ſides ſlightly grooved; avenues pulvinate; crown nearly central. Shell dull yelloviſh-grey, and of a middle ſize between echinus nucleus and craniolaris.

84. Echinus equinus: ſurface and baſe pulvinate, circumference elliptic; ſides ſmooth; avenues ſubpulvinate; crown central.

85. Echinus minutus: ſurface pulvinate and nearly flat, circumference ovate and ſubpentangular; baſe narrowed; ſides grooved; avenues pulvinate; crown central. Found frequently on the ſandy coaſts of the Netherlands: mouth orbicular.

86. Echinus faba: ſurface and baſe pulvinate; circumference obtuſely oval; ſides hardly grooved; avenues flat; crown a little prominent and central. The ſhell is very thin, and white; without tubercles, but merely granulated; the grains containing the roots of ſmall briſtles which are inſtead of ſpines. The vent and mouth are both underneath, and near together. On the upper ſurface is a five-rayed figure, full of little holes. One of the ſmalleſt kind; not larger in general than a pea; very ſeldom ſo large as the egg of a ſmall bird or a pigeon, which in ſome reſpects it reſembles, being always of an oval ſhape, one end larger than the other.

87. Echinus inequalis, the uneven ſea-urchin: ſurface gibbous on the fore-part, the hind-part flat and ſloping; circumference oblong-oval and nearly pentangular; baſe globular, and a little narrowed; ſides grooved; avenues ſubpulvinate; crown central; back unequal.

88. Echinus raninus: ſurface globular and more ſloping behind, circumference acutely oval; baſe globular; ſides grooved; avenues ſubpulvinate; crown central. Probably a variety of echinus minutus.

89. Echinus bufonius: ſurface globular, circumference ovate, heart-ſhaped, and ſubtrigonal; baſe pulvinate; ſides ſlightly grooved; avenues pulvinate; crown nearly central. Probably a variety of echinus minutus.

III. *Vent lateral; mouth with pencilled tentacula.*

Circular; mouth central; vent ſquare. 90. Echinus placenta: ſubconic, with ten ſpaces alternately narrower; avenues five, lax, flat, and gaping at the tip. Inhabits the Southern Ocean: a little convex and conoid; the circumference ſomewhat angular; the baſe flat; ſpaces divided by an obtuſely toothed vertical line; vent placed on the ſurface, and nearly marginal.

Heart-ſhaped; the crown grooved. 91. Echinus cor anguinum: above convex, with five impreſſed quadrifariouſly porous avenues, and five ſpaces. Found hitherto in a foſſile ſtate only; and is probably the ſame as echinus purpureus, in a petrified ſtate.

92. Echinus lacunoſus: ovate, gibbous, with five depreſſed avenues. Inhabits the Indian, Atlantic, and European ſeas. Shell with a purpliſh top; ſpaces tuberculate, in waved rows; the lower ſide ſtudded and divided by two ſmooth ſpaces; ſpines ſhort, thick, mixed with long ones. The compartments are divided by deep furrows, four of which are narrow, but one is extremely broad, and almoſt as deep as half the convexity of the apex; it has a double row of pores at the bottom, and wrinkles on the ſides; it reaches round the ſhell to the mouth; oppoſite this furrow, on the top, there is a long deep ſuture, which goes to the vent in the circumference of the circle. The ſhell is very thin; furniſhed with rough dots or grains, to which the ſpines adhere.

The following varieties are included by Gmelin under this ſpecies. The firſt inhabits the Adriatic ſea. It has a raiſed lobe in the middle; on each ſide of which are four double lines, each conſiſting of two rows of pores; the longeſt lines are directed towards the broadeſt extremity, and form a curve towards the ſhorter ones at the pointed end. The whole is ſomewhat in the ſhape of a heart, the large end being divided, the ſmaller end contains the vent, and the mouth is underneath. The ſhell is very thin and brittle. This is repreſented in the Echinus Plate II. fig. 6. The ſpines are not thicker than horſehair, and about a quarter of an inch long; when they are on the ſhell is entirely covered with them, ſo that neither furrow, ſuture, nor aperture, can be ſeen. The ſecond variety reſembles the preceding; but the ſpines are long, and curved at the ends like a ſabre. Some have a ſmaller ſet of ſpines, of a whitiſh colour, intermixed with the brown ones, probably young ones to replace thoſe which fall off.

Heart-ſhaped; the crown not grooved. 93. Echinus radiatus: avenues four, with impreſſed ſtriæ porous on each ſide; crown with four pores; ſpaces ten, divided by a ſerrate ſuture in the middle, and arched tranſverſe ſutures. Found hitherto only in a foſſile ſtate. Baſe flat; mouth a little kidney-ſhaped, and ſurrounded with a ſubpentagonal ſtar of pores; vent roundiſh, with three angles on the margin; avenues conſiſting of a row of pores placed cloſe together in pairs, each convergent on the crown.

94. Echinus purpureus: avenues four, petal-ſhaped, lanceolate; larger tubercles placed in a zigzag manner; ſpines acicular, incurved, white. Inhabits the North Seas: above convex; the ſides ſloping; fore-part with two projections, hind-part truncate; beneath flat; from the mouth to the vent a little convex and purple; very finely granulate, and beſet with ſmall ſubclavate briſtles, and ſpatulate ſpines ſeated on white tubercles; near the vent a kidney-ſhaped ſtripe of minute white granulations, and ſurrounded with numerous white tubercles.

95. Echinus puſillus: oval, with five avenues; vent remote. Inhabits the North Seas: very minute, and diſtinct from echinus lacunoſus; probably not of this diviſion.

96. Echinus complanatus: a little flattened each ſide; ſpaces and avenues ten, two of them placed in the furrows of the back. Found in a foſſile ſtate; roundiſh.

97. Echinus ſubglobulus: both ends convex, ſubglobular, affulate; avenues ten, with biporous ſtriæ; vent ovate. Found in a foſſile ſtate: granulate, with four pores on the crown; ſpaces divided by a longitudinal ſerrate ſuture, and grooved with tranſverſe curved lines, the pieces ſeven-ſided; mouth ſomewhat kidney-ſhaped, and ſurrounded with tubercles diſpoſed in a ſtellate form.

98. Echinus ananchytis: oblong, heart-ſhaped, and ſubconic; the baſe flatter; avenues and ſpaces ten; mouth rounded and ſurrounded with an elevated margin; vent oval, and emarginate below. Found in a foſſile ſtate; the larger ſpaces with ſeven angular pieces, leſſer ones ſix and five angled; vent ſurrounded with an elevated band.

99. Echinus bicordatus: with a double crown. Found hitherto in a petrified ſtate only.

100. Echinus carinatus: middle of the back carinate. Found in a foſſile ſtate; reſembles the laſt, but is narrower behind: mouth kidney-ſhaped; vent obſolete.

Ovate; the avenues grooved. 101. Echinus ſpatagus: ovate, gibbous, with four depreſſed avenues; conſiſting of the following varieties: 1. Spotted. 2. Larger. 3. Knotty. 4. Of one colour. 5. Ovate. 6. Carinate. 7. Very large. Theſe inhabit moſt ſeas: pale ſulphur when freſh. Shell a little heart-ſhaped, gibbous at one end, and marked with a deep groove at the other; ſpines ſlender, reſembling briſtles; moſt remarkably fragile. The fifth or ovate variety has the ſhell thin and brittle. The mouth is not in the middle of the baſe, but rather towards the broad end; the vent at the narrow end. The depreſſed avenues or rays on the ſurface are each compoſed of four rows of pores. In the middle, where the four rays unite, there are four holes forming a ſquare, each big enough to admit the point of a pin. The tubercles and ſpines are larger about the mouth and on the baſe. The ſhell is made up of rhomboidal plates.

Ovate; the avenues not grooved. 102. Echinus briſſoides: oblong; with four biporous, ovate-lanceolate, avenues, united by tranſverſe grooves, with larger tubercles placed archwiſe between them. Found frequently in a foſſile ſtate: aſſulate, rough with granulations; mouth kidney-ſhaped, and ſurrounded with a pentagonal ſtar of pores.

103. Echinus teres: convex, with four biporous petal-ſhaded avenues not united. Reſembles the laſt, but the mouth is broader, and there is a carinate line perforated with pores each ſide deſcending from the crown.

104. Echinus oliva: above convex, punctured, olive, with a double naked band reaching from the mouth to the vent. Shell with four ſtellate rays above.

105. Echinus amygdala: reſembling an almond in figure.

106. Echinus ovalis: aſſulate, oval, with ten avenues and ſpaces, the latter divided by a ſerrate ſuture in the middle. Found hitherto only in a foſſile ſtate, and is probably not of this diviſion.

107. Echinus pyriformis: ovate, and gibbous at one end; the baſe flat; avenues five, ſomewhat petal-ſhaped, and obſoletely porous. Found hitherto in a foſſile ſtate only. Mouth and vent round, the former ſomething heart-ſhaped, angular, and five-lipped.

108. Echinus lapiſcancri: obtuſely oval, convex; crown eccentric, and perforated with four pores; avenues five, biporous, ovate-lanceolate, and cleft at the tip. Found as yet only in a foſſile ſtate. Mouth as in the laſt; vent placed above the broader margin of the ſhell, mouth at the narrower end and nearer the baſe; baſe flat, ſlightly excavated, naked in the middle, elſewhere covered with a circle of tubercles diſpoſed in rows.

109. Echinus patillaris: very much depreſſed; with avenues reſembling a ſtar. Found only in a foſſile ſtate; circumference ovate; back a little convex, the baſe ſlightly excavated; ſides granulate; mouth orbicular.

ECHI'NUS *ſ.* in botany. See ALLAMANDA, HYDNUM, and STATICE.

ECHIOI'DES. See LYCOPSIS and MYOSOTIS.

ECHIRE', a town of France, in the department of the Two Sevres, and chief place of a canton, in the diſtrict of Niort, on the Sevre Niortoiſe: four miles north of Niort.

ECHI'TES, *ſ.* [ſo named by Browne, probably from ἔχις, Gr. a viper; perhaps on account of its deleterious quality. Ἐχίτης is the ſerpent-ſtone.] SAVANNA FLOWER: in botany, a genus of the claſs pentandria, order monogynia, natural order contortæ, (apocineæ, *Juſſ.*) The generic characters are—Calyx: perianthium five-parted, ſharp, ſmall. Corolla: one-petalled, funnel-form; border five-cleft, flat, ſpreading very much; nectary of five glands ſtanding round the germ. Stamina: filaments five, ſlender, erect; antheræ ſtiff, oblong, acuminate, converging. Piſtillum: germs two; ſtyle filiform, length of the ſtamens; ſtigma oblong-headed, two-lobed, attached by a gluten to the antheræ. Pericarpium: follicles two, extremely long, one-celled, one-valved. Seeds: very many, imbricate, crowned with long down.—*Eſſential Character.* Contorted; follicles two, long, ſtraight; ſeeds, downy; corolla, funnel-form, with the throat naked.

Species. 1. Echites biflora, or two-flowered echites: peduncles two-flowered. A branched ſhrub, full of a milky juice, ſupporting itſelf by ſtems partly erect, partly twining upon trees, and mounting them to the height of twenty feet; hence frequently acquiring the air of a tree. Leaves oblong, growing narrower to the baſe, obtuſe at the end, with a ſmall point three inches long; flowers handſome, very white, with a yellow throat; but void of ſcent in all the ſpecies. Native of moſt of the Caribbee Iſlands, in ſalt marſhes.

2. Echites quinquangularis, or five-ſided echites: peduncles racemed; leaves ovate, acute. Stems twining, ſhrubby, ſomewhat ſcabrous; leaves three inches long; flowers about ſixteen, green, with a yelloviſh border, the edge of the tube white, and in form of a pentagon. This is not milky. Native of Carthagena in South America; flowers in October.

3. Echites ſuberecta, or oval-leaved echites, or ſavanna-flower: peduncles racemed; leaves ſubovate, obtuſe, mucronate. A ſhrub, differing much from its congeners, abounding in milky juice, among other ſhrubs growing to the height of ten feet, but in ſavannas only three feet, and ſometimes ſcarcely a foot high; ſtems ſcarcely twining, climbing; leaves approaching more or leſs to an ovate form, either ſmooth on both ſides, or ſcabrous at the back. The peduncles ſupport a few large, handſome, yellow, flowers, hirſute on the outſide, and in the tube. It grows naturally in Jamaica in the ſavannas, whence it is chiefly known in that iſland by the name of *ſavanna-flower*. It is alſo very common in the iſland of St. Domingo; flowering from September to March. Dr. Browne ſays, that all the parts of this plant are extremely poiſonous.

4. Echites agglutinata, or glutinous echites: peduncles racemed; leaves ovate, emarginate, with an acumen. Stems twining, ſhrubby; leaves four inches long; flowers ſmall, white. When the follicles are ſeparated, which is eaſily done, a drop of watery glutinous liquor, ſuch as the whole plant abounds with, flows out at the two points by which they had cohered. Found on mountains near Cape François, in Domingo; flowering in December.

5. Echites toruloſa, or climbing echites: peduncles ſubracemed; leaves lanceolate, acuminate. This is a weakly plant, which commonly ſuſtains itſelf by the help of the neighbouring buſhes, and frequently riſes to a conſiderable height among them. The whole plant abounds in a milky gluten. Frequent about the foot of the mountains in Liguanea, in the iſland of Jamaica; flowering in March.

6. Echites umbellata, or umbelled echites: peduncles umbelled; leaves ovate, obtuſe, mucronate, ſtem twining. This climbs to the height of fifteen feet by means of its ſhrubby, twining, pliant, ſtems, which are woody and ſuberous at the bottom, but round, green, and gloſſy, above. The whole abounds in a clear glutinous juice. Leaves roundiſh-ovate, ſubcordate at the baſe, three or four inches long; flowers large, handſome, the border white, the tube green on the outſide; Browne deſcribes them to be pale yellow, with a pretty long ſlender tube. He remarks, that like the reſt of this natural claſs, it is ſomewhat of a deleterious nature; and that there is a ſmall variation of it in the drier parts of the ſavannas, with pointed leaves, and very ſlender ſtalks. Native not only of Jamaica, but of Domingo and Cuba; flowering from October to February. Browne, rightly perceiving that this plant did not properly conform itſelf to any known genus, conſtituted this new one of echites, which is now univerſally adopted.

7. Echites trifida, or trifid echites: peduncles trifid, many-flowered; leaves ovate-oblong, acuminate. Stems twining, ſhrubby; leaves three inches in length; flowers large, pretty, the tube purple, and the border green. It climbs trees to the height of twelve feet, and the whole plant is milky. Native of South America, near Carthagena; flowering in October.

8. Echites repens, or creeping echites: peduncles many-flowered, divided; leaves lanceolate-oblong. This is an elegant ſhrubby plant, not milky, with round ſmooth ſtems; the older ones procumbent, and putting out roots; the younger ſuberect, and thickened at the joints into diſcoid knots. Native of St. Domingo; flowering from October to December.

9. Echites corymboſa, or corymbed echites: racemes corymbed; ſtamens ſtanding out; leaves lanceolate-ovate. This climbs up trees with its twining ſhrubby ſtems twenty feet in height, and the whole of it abounds with a white glutinous milk; flowers numerous, ſmall, red, or purple. Native of the iſland of St. Domingo, flowering in November; in the mountainous woods of Hiſpaniola,

niola, flowering in the ſpring. The French inhabitants call it *gràs de galle*.

10. Echites ſpicata, or ſpiked echites: ſpikes axillary, ſhort; ſtamens ſtanding out; leaves ſubovate. This plant abounds in a white milk, and climbs the trees to the height of ſixty feet; ſtems round, woody, pliant, twining, an inch in diameter, with alternate branches a foot and a half long, at different diſtances, leafy their whole length; leaves oblong, veined, ſmoothiſh, acuminate, diſtich, half a foot long; flowers numerous, white, ſmall, ſubſeſſile. Native of Carthagena in New Spain, in thick lofty woods, flowering in July and Auguſt.

11. Echites caudata, or tailed echites: Corollas funnel-form, with very long linear tips. This is a tree; leaves lanceolate-elliptic, naked; flowers axillary, peduncled, erect, the ſize of thoſe of Nerium or Oleander, funnel-form: border erect, terminating in linear tips longer than the whole corolla, a circumſtance in which it differs from all other known plants. Native of the Eaſt Indies.

12. Echites ſcholaris, or Indian echites: leaves ſubverticilled, oblong; follicles filiform, very long; umbels compound. This alſo is a tree, the branches of which are leafy only at the joints, where there are five or ſeven oval-lanceolate leaves, which are coriaceous, and tranſverſely ſtreaked. The flowers are very ſmall; follicles in pairs, a foot and a half long, and therefore longer than any others that are known. Native of the Eaſt Indies.

13. Echites annularis, or annular echites: ſtem twining; corollas ſalver-form, with an elevated ring on the tube. 14. Echites ſiphilitica, or venereal echites: leaves ovate, ſubpetioled, very ſmooth, ribbed; panicles dichotomous; flowers in ſpikes. Native of Surinam. A decoction of the latter herb is a well-known remedy at Surinam in the venereal diſeaſe.

15. Echites ſucculenta, or ſucculent echites: prickles in pairs, extrafoliaceous; leaves linear, tomentoſe underneath: corollas funnel-form. 16. Echites biſpinoſa, or ſpiny echites: prickles in pairs, extrafoliaceous; leaves lanceolate, ſmooth; corollas ſalver-form. This and the preceding are very ſingular ſhrubs, much reſembling each other. They are ſucculent, milky, and two-ſpined. Without ſeeing the fructification they might be taken for euphorbias. They are natives of the Cape of Good Hope, and were obſerved there by Thunberg.

17. Echites coſtata, or ribbed echites: peduncles in cymes; leaves elliptic-lanceolate, acuminate. Native of the Society Iſles.

18. Echites tomentoſa, or rough echites: leaves cordate-oblong, acuminate; both they and the ſtem rough-haired; flowers in racemes, hairy. Found in Cayenne by von Rhor.

19. Echites Domingenſis, or Domingo echites: peduncles racemed; leaves cordate-ovate, ſomewhat rigid, of a different colour underneath; ſtem twining. 20. Echites aſperuginis, or prickly echites: peduncles racemed; follicles filiform; leaves oblong, acute, rough above; ſtem twining. 21. Echites circinalis, or waved echites: peduncles axillary, many-flowered, jointed; ſegments of the corolla waved; leaves elliptic; ſtem twining. 22. Echites floribunda, or flowering echites: racemes corymbed; leaves ovate, acuminate; nerves parallel; branches almoſt erect. Natives of the Weſt-India iſlands.

Propagation and Culture. Theſe plants have not yet been introduced into cultivation in Europe; being moſtly inhabitants of the Weſt Indies, they will require the protection of the bark-ſtove, and muſt be increaſed and managed in the ſame manner with the tender ſorts of Apocynum, which ſee. Alſo Carissa.

E'CHIUM, *ſ.* [*echium* of Pliny: παρα τους εχεις, Gr. being ſuppoſed to cure the bite of the viper, or to have ſeeds reſembling a viper's head.] Viper's Bugloss; in botany, a genus of the claſs pentandria, order monogynia, natural order aſperifoliæ, (borragineæ, *Juſſ.*) The generic characters are—Calyx: perianthium five-parted, upright, permanent; diviſions ſubulate, upright. Corolla: one-petalled, bell-ſhaped; tube very ſhort; border upright, gradually widened, five-cleft, obtuſe; diviſions generally unequal; the two ſuperior ones longer; the inferior ſmaller, ſharp, reflex; throat pervious. Stamina: filaments five, ſubulate, length of the corolla, declined, unequal; antheræ oblong, incumbent. Piſtillum: germs four; ſtyle filiform, length of the ſtamens; ſtigma obtuſe, two-cleft. Pericarpium: none; calyx grown ſtiffer, guarding the ſeeds in its cavity. Seeds: four, roundiſh, obliquely acuminate.—*Eſſential Character.* Corolla, irregular, with the throat naked.

Species. 1. Echium fruticoſum, or ſhrubby viper's bugloſs: ſtem ſhrubby; leaves lanceolate, attenuated at the baſe, villoſe-ſtrigoſe, without veins; calycine leaflets lanceolate, acute. This riſes with a ſhrubby ſtalk two or three feet high, dividing at the top into ſeveral branches; leaves ſeſſile, hairy, light green; the flowers are produced ſingly between the leaves at the ends of the branches; they are of a purple colour; they appear in May and June, but the ſeeds do not ripen in England. Stamens not longer than the corolla. Native of the Cape of Good Hope.

2. Echium candicans, or hoary tree viper's bugloſs: ſtem ſhrubby; leaves lanceolate, nerved, they and the branches hirſute; calycine leaflets oblong and lanceolate acute; ſtyles rough with hairs. This is a handſome ſhrub; the ſtems and branches are woody and ſomewhat tomentoſe, marked with linear tranſverſe ſcars from fallen leaves. The whole plant is white, and, as it were, ſilvery, with a ſoft cloſe ſhagginess covering the whole, hardly excepting the corolla. Native of the high rocks of Madeira; where it was found by Mr. Francis Maſſon.

3. Echium giganteum, or gigantic viper's bugloſs: ſtem ſhrubby; leaves lanceolate, attenuated at the baſe, hairy; hairs very ſhort; bractes and calyxes ſtrigoſe; ſtamens longer than the corolla. A very lofty ſhrub, with woody, round, hoary, ſmooth, branches; leaves a ſpan long; flowers pointing one way, and forming a very large, pyramidal, terminating, thyrſe, conſiſting of long ſpiked peduncles; corollas obtuſe, nearly equal, white. Found on the rocks of Teneriffe by Francis Maſſon.

4. Echium ſtrictum, or upright viper's bugloſs: ſtem ſhrubby, ſtiff, branching; leaves oblong-lanceolate, hairy; corollas ſomewhat bell-ſhaped; ſtamens longer than the corolla. This is diſtinguiſhed by the ſtiffneſs and uprightneſs of the ſtem, by its petioled oblong leaves, and by the hairs of the ſtem being turned downwards. Found by Maſſon on the rocks of Teneriffe. It is biennial; flowering moſt part of the year.

5. Echium ſpicatum, or ſpiked viper's bugloſs: ſtems aſcending, very ſimple; flowers in ſpikes. 6. Echium argenteum, or ſilvery viper's bugloſs: leaves linear, hirſute, and whitiſh, patulous at the tip. 7. Echium capitatum, or headed viper's bugloſs: ſtem hairy; flowers head corymbed, equal; ſtamens longer than the corolla; leaves hiſpid. Native of the Cape.

8. Echium plantagineum, or plantain-leaved viper's bugloſs: root-leaves ovate, marked with lines, petioled. Leaves above hairy, ſoft, hiſpid; root-leaves like thoſe of plantain, very entire, large; ſtem-leaves lanceolate, ſeſſile; ſtems hairy, with ſoft, not ſtrigoſe, hairs; brown dots under the hairs, as in the reſt, but minute; corollas violet-coloured, not blue, as in echium vulgare; nor ſhorter than the calyx, as in echium creticum. Annual. Native of Italy; flowers from July to October.

9. Echium laevigatum, or ſmooth-ſtalked viper's bugloſs: ſtem even; leaves lanceolate, naked, ſcabrous about the edge and at the tip; corollas equal. Stems underſhrubby, a foot in height. Native of the Cape of Good Hope.

10. Echium Italicum, or wall viper's bugloſs: ſtem herbaceous, hairy; leaves linear-lanceolate, ſtrigoſe-hirſute, the lower ones nerved; corollas nearly equal; ſtamens longer than the corolla. This riſes with an upright

hairy ſtalk; the flowers are produced in ſhort ſpikes on the ſide of the branches; they are ſmall, and ſcarcely appear above the calyxes. Some plants have white flowers, others purpliſh.

11. Echium rubrum, or red viper's bugloſs: flowers in a long ſpike made up of ſhort little racemes; corollas nearly equal; leaves hiſpid. Stem erect, about a foot high; radical leaves long and lanceolate, hairy, deepiſh green above, paler below, and with a ſtrong back nerve; ſtem-leaves ſmaller and narrower; flowers rather ſmall than large, of a paliſh red, and with nearly equal and ſomewhat triangular ſegments; antheræ pale blue. Native of Hungary, where it grows in plenty.

12. Echium vulgare, or common viper's bugloſs: ſtem tubercled and hiſpid; ſtem-leaves lanceolate hiſpid; flowers in lateral ſpikes. Stem erect, eighteen inches or more in height, when young ſimple, but becoming branched. The whole plant is hiſpid. The ſtem frequently, and ſometimes the leaves, are beautifully ſpotted with red. The hairs on the ſtem riſe from gloſſy purpliſh black tubercles. It is a ſhowy plant; and, if it were not common, would have a place in our gardens. It is biennial, and once in three years appears abundantly in the corn fields of Cambridgeſhire, &c. where it is known by the name of *cat's-tail*. Bees are fond of the flowers, but their wings are apt to be torn by the ſtrong hairs. That the echium Anglicum of Hudſon is the echium vulgare of Linnæus, cannot be doubted.

13. Echium violaceum, or violet-flowered viper's bugloſs: corollas equal to the ſtamens; tube ſhorter than the calyx. Reſembles the foregoing very much, but the corolla is of a violet-colour; the colour of the herb is a more pleaſant green, and it is not ſo hairy. The whole plant is ſmaller and weaker than the foregoing, which frequently grows very ſtrong and large on walls, whereas this grows in corn-fields and on banks. Gouan ſuppoſes this plant to be no more than a variety of echium vulgare; and Monſ. Villars can ſcarcely think that his echium violaceum is the ſame with that of Linnæus, and thinks it poſſible that it may be an intermediate ſpecies between the echium violaceum and Italicum of Linnæus. He ſays that, in his plant, the leaves are wider, the ſtem branching, the flowers red and more regular, and the ſtamens not appearing out of the corolla. The plant is very rough with white hairs, which give it a whitiſh colour, and it is much branched. Native of Auſtria and Germany. In England, near Norwich; introduced in 1780 by Caſimir Gomez Ortega, M. D. flowers in July.

14. Echium Creticum, or Cretan viper's bugloſs: ſtem procumbent; fruiting calyxes diſtant. This has trailing hairy ſtalks about a foot long, putting out ſeveral ſide branches; leaves lanceolate, hairy, about three inches long, and three quarters of an inch broad, ſeſſile; the flowers come out on ſlender ſpikes, upon long peduncles, from the axils; they are large, of a reddiſh purple, which turns to a fine blue when they are dried; ſeeds ſolitary, ovate, long-beaked, ſomewhat compreſſed, of a bay colour. Native of the Levant; biennial, and flowers from July to September.

There is a variety with branching ſtalks, a foot and a half long, declining towards the ground, and covered with ſtinging hairs; leaves four inches long, and not more than half an inch broad, pretty much warted, and hairy. The flowers grow in looſe ſpikes from the ſides of the ſtalks, and alſo at the ends of the branches; they are of a reddiſh purple colour, but not ſo large as thoſe of the preceding; and the ſtamens are longer than the corolla. This alſo, if different, is a native of the Levant.

15. Echium orientale, or oriental viper's bugloſs; ſtem branched; ſtem-leaves ovate; flowers ſolitary, lateral. Root above a foot long, and two inches thick, mucilaginous and ſweetiſh; ſtem about three feet high, an inch thick, pale green, hard, ſolid; lower leaves fifteen or ſixteen inches long, and four or five inches wide, pointed, whitiſh green, ſattiny above, cottony underneath, with a ſtrong midrib; they diminiſh conſiderably along the ſtem, not being above half a foot in length; they are alſo leſs cottony than the former, and much more pointed; branches about half a foot long; both they and the top of the ſtem rough with ſtrong hairs, accompanied by leaves about an inch and a half in length. All theſe branches are ſubdivided into ſmaller ones bending like a ſcorpion's tail, and loaded with flowers an inch and a half in length, of a pale blue colour, with two red bands on three of the ſegments, on a bright purple ground. The flower has no ſmell. Found in the Levant by Tournefort.

16. Echium Luſitanicum, or Portugal viper's bugloſs: corollas longer than the ſtamens. The lower leaves of this are more than a foot long, and two inches broad in the middle, gradually leſſening to both ends, and covered with ſoft hairs. The ſtalks grow two feet high; the flowers are in ſhort ſpikes from the ſides of them. Native of Spain and Portugal.

17. Echium ſericeum, or ſilky viper's bugloſs: leaves linear wedge-ſhaped; ſtem ſuffruticoſe; both hoary. Stems ſeveral, diffuſed, woody at the baſe, ſimple, a palm or more in height, ſoft at the bottom, ſomewhat rugged at the top, hoary, with white hairs, preſſed cloſe, and placed on minute tubercles, the lower ones longer, the upper ones more diſperſed. The lower leaves from two to three inches long; the upper ones an inch long, and recurved. Native of Egypt.

18. Echium ſetoſum, or hoary viper's bugloſs: leaves linear-lanceolate; ſtem ſuffruticoſe, procumbent; both hiſpid and hoary. Stems a palm in height, branched at the bottom, covered with little whitiſh tubercles, crowded cloſe together, and having white rigid hairs on the top; leaves ſeſſile, half an inch long, gradually ſmaller.

19. Echium glabrum, or ſmooth viper's bugloſs: leaves linear-lanceolate, ſmooth above, callous-dotted beneath on the outſide; ſpikes alternate. Branches ſcattered, a little compreſſed at the top, purpliſh aſh-coloured, with very ſlender appreſſed villoſe hairs; leaves ſeſſile, firm, an inch long, even.

20. Echium roſmarinifolium, or roſemary-leaved viper's bugloſs: leaves petioled, linear-lanceolate, reflex at the edge, hairy underneath, and hoary. Branches round, ſcarred, hoary, with hairs; leaves ſcattered, an inch long, reſembling thoſe of roſemary, on the upper ſurface hairy and green, with a groove along the middle, and ſomewhat rugged. The place of the four laſt is between the ſixth and ſeventh ſpecies.

21. Echium ſphærocephalum, or round-headed viper's bugloſs: leaves linear-lanceolate, ſtrigoſe; heads ſolitary, terminating; branches ſmooth. Branches ſcattered, round below, angular above, towards the end villoſe and toothletted from the fallen leaves; leaves ſcarcely half an inch long. This and the two preceding ſorts are natives of the Cape of Good Hope. The place of the laſt is between the ſeventh and eighth ſpecies.

Propagation and Culture. The firſt ſort is propagated by ſeeds, when they can be obtained, which ſhould be ſown in pots filled with light ſandy earth ſoon after they are received. Theſe may be expoſed to the open air till the beginning of October, when the pots ſhould be placed under a frame, to guard them from froſt; but in mild weather, they ſhould have the free air, to prevent the ſeeds from vegetating till the winter is paſt; for, if the plants come up at that ſeaſon, their ſtems will be weak and full of juice, and very liable to rot with damps; therefore it is much better if the plants do not come up till towards March, which is the uſual time of their appearing, when the ſeeds are not forced by warmth. When the plants are fit to remove, they ſhould be each planted into a ſmall pot filled with light earth, and placed under a frame to forward their putting out new roots; then they ſhould be gradually inured to bear the open air, and the latter end of May be placed abroad in a ſheltered ſituation, where they may remain till the beginning of October; at which time they muſt be removed into an airy

glaſs-

glaſs caſe, where they may enjoy the ſun and have free air in mild weather. During the winter ſeaſon theſe plants muſt be ſparingly watered; for as their ſtems are ſucculent, too much moiſture will cauſe them to rot. In the ſummer they ſhould be ſet abroad in a ſheltered ſituation, and treated in the ſame manner as other plants from the ſame country. The fourteenth ſpecies is annual, and the moſt beautiful of all the ſorts. The ſeeds muſt be ſown every year where they are deſigned to remain; and the plants require no other culture but to keep them clean from weeds, and to thin them where they grow too cloſe. In July they flower, and their ſeeds ripen in five or ſix weeks after. The ſeeds of the other ſorts being ſown in the ſpring, will, the ſecond ſummer after, produce flowers and ſeeds, after which they ſeldom continue. They all delight in a rubbiſhy gravelly ſoil, and will grow upon the tops of old walls or buildings; where, when once they have eſtabliſhed themſelves, they will drop their ſeeds, and thereby maintain a ſucceſſion of plants without any care, and on theſe places they appear very beautiful. See LYCOPSIS, MYOSOTIS, ONOSMA, and PULMONARIA.

E'CHIUS, or ECKIUS (John), a celebrated German catholic divine and controverſialiſt, was born at a village in Suabia, in the year 1486. Having embraced the eccleſiaſtical life, he became doctor and profeſſor of theology in the univerſity of Ingolſtadt. He made himſelf famous by his controverſial writings againſt the reformation, and the leading part which he took in the public diſputes with Luther, Carloſtadt, and Melancthon. He was conſidered as one of the moſt learned and able defenders of the church of Rome, and has had exalted encomiums paſſed on his ſervices by the writers of that communion. He died at Ingolſtadt, in 1543, when he was fifty-ſeven years of age. He was the author of two treatiſes, 1. On the Sacrifice of the Maſs. 2. A Commentary on the Prophet Haggai, 8vo. 1638. 3. Homilies, 4 vols. 8vo. and numerous controverſial pieces againſt the proteſtants.

E'CHO, *ſ.* [ἠχω, Gr. *echo*, Lat.] Sound reflected or reverberated from ſome oppoſing body, and thereby returned or repeated to the ear:

Babbling *echo* mocks the hounds,
Replying ſhrilly to the well-tun'd horns,
As if a double hunt were heard at once. *Shakeſpeare.*

To ECHO, *v. n.* To reſound; to give the repercuſſion of a voice:

Through rocks and caves the name of Delia ſounds;
Delia each cave and *echoing* rock rebounds. *Pope.*

To be founded back:

Hark, how the ſound diſturbs imperious Rome!
Shakes her proud hills, and rolls from dome to dome!
Her mitr'd princes hear the *echoing* noiſe,
And, Albion, dread thy wrath and awful voice. *Blackm.*

To E'CHO, *v. a.* To ſend back a voice; to return what has been uttered.—Our ſeparatiſts do but *echo* the ſame note. *Decay of Piety.*

One great death deforms the dreary ground,
The *echo'd* woes from diſtant rocks reſound. *Prior.*

The following theory of ECHOES is given by Dr. Hutton: For an echo to be heard, the ear muſt be in the line of reflection; that the perſon who made the ſound may hear the echo, it is neceſſary he ſhould be in a perpendicular to the place which reflects it; and, for a multiple echo, it is neceſſary there be a number of walls and vaults, rocks and cavities, either placed behind each other, or fronting each other. Thoſe murmurs in the air, that are occaſioned by the diſcharge of great guns, &c. are a kind of indefinite echoes, and are produced from the vaporous particles ſuſpended in the atmoſphere, which reſiſt the undulations of ſound, and reverberate them to the ear. There can be no echo, unleſs the direct and reflex ſounds follow one another at a ſufficient diſtance of time; for, if the reflex ſound arrive at the ear before the impreſſion of the direct ſound ceaſes, the ſound will not be doubled, but only rendered more intenſe. Now, if we allow that nine or ten ſyllables can be pronounced in a ſecond, in order to preſerve the ſounds articulate and diſtinct, there ſhould be about the ninth part of a ſecond between the times of their appulſe to the ear; or, as ſound flies about 1142 feet in a ſecond, the ſaid difference ſhould be one-ninth of 1142, or 127 feet; and therefore every ſyllable will be reflected to the ear at the diſtance of about ſeventy feet from the reflecting body; but as, in the ordinary way of ſpeaking, three or four ſyllables only are uttered in a ſecond, the ſpeaker, that he may have the echo returned as ſoon as they are expreſſed, ſhould ſtand about 500 feet from the reflecting body; and ſo in proportion for any other number of ſyllables. Merſenne allows for a monoſyllable the diſtance of ſixty-nine feet; Morton, ninety feet; for a diſſyllable 105 feet, a triſyllable 160 feet, a tetraſyllable 182 feet, and a pentaſyllable 204 feet.

From what has been ſaid, it follows that echoes may be applied for meaſuring inacceſſible diſtances. Thus, Mr. Derham, ſtanding upon the banks of the Thames, oppoſite to Woolwich, obſerved that the echo of a ſingle ſound was reflected back from the houſes in three ſeconds; conſequently the ſum of the direct and reflex rays muſt have been $1142 \times 3 = 3426$ feet, and the half of it, 1713 feet, the breadth of the river in that place. It alſo follows that the echoing body being removed farther off, it reflects more of the ſound than when nearer; which is the reaſon why ſome echoes repeat but one ſyllable, or one word, and ſome many. Of theſe, ſome are tonical, which only return a voice when modulated into ſome particular muſical tone; and others polyſyllabical. That fine echo in Woodſtock park, Dr. Plot aſſures us, in the day-time will return very diſtinctly ſeventeen ſyllables, and in the night twenty. See *Nat. Hiſt. Oxf.* p. 7.

Echoing bodies may be ſo contrived, and placed, as that reflecting the ſound from one to the other, a multiple echo, or many echoes, ſhall ariſe. At Roſneath, near Glaſgow, in Scotland, there is an echo that repeats a tune played with a trumpet three times completely and diſtinctly. At the ſepulchre of Metella, wife of Craſſus, there was an echo, which repeated what a man ſaid, five times. Authors mention a tower at Cyzicus, where the echo repeated ſeven times. There is an echo at Bruſſels, that anſwers fifteen times. One of the fineſt echoes we read of, is that mentioned by Barthius, in his notes on Statius's Thebais, lib. vi. ver. 30. which repeated the words a man uttered ſeventeen times. This was on the banks of the Naha, between Coblentz and Bingen. In common echoes, the repetition is not heard till ſome time after hearing the words ſpoken, or the notes ſung; but, in this caſe, the perſon who ſpeaks, or ſings, is ſcarcely heard at all; but the repetition very clearly, and always in ſurpriſing varieties; the echo ſeeming ſometimes to approach nearer, and ſometimes farther off; ſometimes the voice is heard very diſtinctly, and ſometimes hardly at all: one perſon hears only one voice, and another ſeveral; one hears the echo on the right; the other on the left, &c.

Addiſon, and other travellers in Italy, mention an echo at Simonetta palace, near Milan, ſtill more extraordinary, returning the ſound of a piſtol fifty-ſix times. The echo is heard behind the houſe, which has two wings; the piſtol is diſcharged from a window in one of theſe wings, the ſound is returned from a dead wall in the other wing, and heard from a window in the back-front. *Addiſon's Travels*, p. 32. *Miſſon. Voyag. d'Ital.* tom. ii. p. 196. *Philoſ. Tranſ.* N° 480. p. 220.—Farther, a multiple echo may be made, by ſo placing the echoing bodies, at unequal diſtances, as that they may reflect all one way, and not one on the other; by which means, a manifold ſucceſſive ſound will be heard; one clap of the hands like many; one *ha* like a laughter; one ſingle word like many of the ſame tone and accent; and ſo one muſical inſtrument like

like many of the ſame kind, imitating each other. Laſtly, echoing bodies may be ſo ordered, that from any one ſound given, they ſhall produce many echoes, different both as to tone and intenſion. By which means a muſical room may be ſo contrived, that not only one inſtrument playing in it ſhall ſeem many of the ſame ſort and ſize, but even a concert of different ones; this may be contrived by placing certain echoing bodies ſo as that any note played ſhall be returned by them in thirds, fifths, and eighths. There are, however, certain letters which no echo will return or expreſs, particularly an S, of which lord Bacon gives a pleaſant inſtance in a celebrated echo formed by the walls of a ruined church, at Pont Charenton, near Paris, where there was an old Pariſian who took it to be the work of ſpirits, and of good ſpirits; "for, (ſaid he,) if you call Satan, the echo will not deliver back the devil's name, but will ſay *va-t'en*, which ſignifies avoid;" by which circumſtance his lordſhip diſcovered that an echo would not return an S.

E'CHO, *ſ.* The place where the repetition of a ſound is produced. This is either natural, or artificial. In echoes, the place where the ſpeaker ſtands, is called the *centrum phonicum*; and the place that returns the voice, the *centrum phonocampticum*.

E'CHO, *ſ.* in architecture, is applied to certain vaults and arches, moſtly of elliptical or parabolical figures; uſed to redouble ſounds, and produce artificial echoes. The method of making them is taught by F. Blancani, in his Echometria, at the end of his book on the Sphere. Vitruvius tells us, that, in divers parts of Greece and Italy, there were brazen veſſels, artfully ranged under the ſeats of the theatres, to render the ſound of the actors' voices more clear, and make a kind of echo; by which means every one of the prodigious multitude of perſons, preſent at thoſe ſpectacles, might hear with eaſe and pleaſure.

E'CHO, *ſ.* in poetry, a compoſition wherein the laſt words or ſyllables of each verſe contains ſome meaning, which, being repeated apart, anſwers to ſome queſtion or other matter contained in the verſe; as in this beautiful one from Virgil:

Crudelis mater magis, an puer improbus ille?
Improbus ille puer, crudelis tu quoque mater.

The elegance of an echo conſiſts in giving a new ſenſe to the laſt words; which reverberate, as it were, the motions of the mind, and by that means affect it with ſurpriſe and admiration.

E'CHO, in fabulous hiſtory, a daughter of the Air and Tellus, who chiefly reſided in the vicinity of the Cephiſus. She was one of Juno's attendants, and became the confidant of Jupiter's amours. Her loquacity, however, diſpleaſed Jupiter; and ſhe was deprived of the power of ſpeech by Juno, and only permitted to repeat the queſtions put to her. Pan had been one of her admirers, but he never enjoyed her favours. Echo, after ſhe had been puniſhed by Juno, fell in love with Narciſſus; but being deſpiſed by him, ſhe pined away, until nothing was left but the melancholy reverberation of her voice, which ſtill remains as her only immortal part. *Ovid.*

E'CHO, a town of Spain, in the kingdom of Aragon: thirteen miles north-north-weſt of Jaca.

E'CHO, a town of the American States, in the Tennaſee government: fifty miles ſouth of Knoxville.

ECHO'METER, *ſ.* among muſicians, a kind of ſcale or rule, with ſeveral lines thereon, ſerving to meaſure the duration and length of ſounds, and to find their intervals and ratios.

E'CHOS, *ſ.* [from ηχος, Gr. ſound.] A medical name for the *tinnitus aurium*, or noiſe in the ears.

ECH'ZELL, a town of Germany, in the circle of the Upper Rhine, and upper principality of Heſſe: fourteen miles ſouth-eaſt of Wetzlar.

ECI'JA, or EXIJA, a town of Spain, in the kingdom of Seville, on the Xenil, containing ſix pariſhes, twenty convents, ſix hoſpitals, and about 9000 ſouls, ſituated in a valley ſurrounded with ſmall hills, which makes it the warmeſt place of Andaluſia. Wool and hemp are the chief riches of the place: fifty-five miles eaſt-north-eaſt of Seville. Lat. 37. 33. N. lon. 11. 43. E. Peak of Teneriffe.

ECKARDSBER'GA, a town of Germany, in the circle of Upper Saxony, and circle of Thuringia: ten miles weſt-ſouth-weſt of Naumburg, and ten ſouth of Nebra.

ECKELNFOHRE'DE, or ECKERFORD, a town of Denmark, in the duchy of Sleſwick: ten miles ſouth of Sleſwick.

ECK'EREN, a village of Brabant, where a battle was fought in 1703, between the army of France and the allies: five miles north of Antwerp.

ECK'ERO, a ſmall iſland of Sweden, between the Baltic and the gulf of Finland, a little to the weſt of the iſland of Aland.

ECK'MUL, a town of Germany, in Lower Bavaria: ſixteen miles weſt of Straubing.

ECK'OLSHEIM, or EGGOLSHEIM, a town of Germany, in the circle of Franconia, and biſhopric of Bamberg: three miles north of Forcheim.

ECK'WERDSHEYDE, a town of Sileſia, in the principality of Neyſze: ſeven miles north of Neyſze.

ECLAIR'CISSEMENT, *ſ.* [Fr.] Explanation; the act of clearing up an affair by a verbal expoſtulation.—The *eclairciſſement* ended in the diſcovery of the informer. *Clarendon.*

ECLAIRO'N, or ECLARON, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of St. Dezier, on the river Blaiſe: five miles ſouth-weſt of St. Dezier.

ECLAMP'SIS, *ſ.* [from εκλαμπω, Gr. to ſhine.] The ſparkling and flaſhing lights which ſtrike the eyes of epileptic perſons.

ECLA'T, *ſ.* [Fr.] Splendour; ſhow; luſtre.—Nothing more contributes to the variety, ſurprize, and *eclat*, of Homer's battles, than that artificial manner of gaging his heroes by each other. *Pope.*

ECLEC'TIC, *adj.* [from εκλεκτικος, Gr.] Selecting; chooſing at will.—Cicero was of the *eclectic* ſect, and choſe out of each ſuch poſitions as came neareſt truth. *Watts.*

ECLEC'TICS, *ſ.* [*eclectici*, Lat.] A name given to ſome ancient philoſophers, who, without attaching themſelves to any particular ſect, took what they judged good, and ſolid, from each. Hence their denomination; which, in the original Greek, ſignifies, "that may be choſen," or "that chooſes;" of the verb εκλεγω, I chooſe. Laertius notes, that they were alſo, for the ſame reaſon, denominated *analogetici*; but that they call themſelves *Philalethes*, *i. e.* lovers of truth. The chief or founder of the eclectici was Potamon, of Alexandria, who lived under Auguſtus and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the eclectic ſect, which Voſſius calls the *eclective*.

Towards the cloſe of the ſecond century, a ſect aroſe in the Chriſtian church under the denomination of *eclectics*, or modern *Platonics*. They profeſſed to make truth the only object of their enquiry, and to be ready to adopt from all the different ſyſtems and ſects, ſuch tenets as they thought agreeable to it. However, they preferred Plato to the other philoſophers, and looked upon his opinions concerning God, the human ſoul, and things inviſible, as conformable to the ſpirit and genius of the Chriſtian doctrine. One of the principal patrons of this ſyſtem was Ammonius Saccas, who at this time laid the foundation of that ſect, afterwards diſtinguiſhed by the name of the new *Platonics*, in the Alexandrian ſchool.

ECLEC'TICS, *ſ.* Were alſo a certain ſet of phyſicians among the ancients, of whom Archigenes, under Trajan, was the chief, who ſelected from the opinions of all the other ſects, that which appeared to them beſt and moſt rational; hence they were called *eclectics*, and their preſcriptions *medicina eclectica*.

ECLEG'MA, or ECLIGMA, *ſ.* [εκλειγμα, Gr. of εκ, out, and λειχω, to lick.] A form of medicine made by the incorporation of oils with ſyrups, and which is to be taken upon a liquorice ſtick. *Quincy.*

ECLIPSA'REON, *ſ.* An inſtrument invented by Mr. Ferguſon, for ſhewing the phenomena of eclipſes; as their time, quantity, duration, progreſs, &c.

ECLIP'SE, *ſ.* Fr. Span. and Port. [*eclipſi*, Ital. of *eclipſis*, Lat. εκλειψις, Gr. of εκλειπω, to fail.] An obſcuration of the luminaries of heaven; the ſun is eclipſed by the intervention of the moon; the moon by the interpoſition of the earth. See the article ASTRONOMY, vol. ii. p. 395. The word originally ſignifies departure from the place, to which *Milton* alludes:

Planets, planet-ſtruck, real *eclipſe*
Then ſuffer'd. *Paradiſe Loſt.*

Darkneſs; obſcuration.—All the poſterity of our firſt parents ſuffered a perpetual *eclipſe* of ſpiritual life. *Raleigh.*—Experience we have of the vanity of human glory, in our ſcatterings and *eclipſes*. *King Charles.*

To ECLIP'SE, *v. a.* To darken a luminary.—Let the *eclipſed* moon her throne reſign. *Sandys.*

Now if the earth were flat, the dark'ned moon
Would ſeem to all *eclips'd* as well as one. *Creech.*

To extinguiſh: to put out:

Then here I take my leave of thee, fair ſon,
Born to *eclipſe* thy life this afternoon. *Shakeſpeare.*

To cloud; to obſcure.—He deſcended from his Father, and *eclipſed* the glory of his divine majeſty with a veil of fleſh. *Calamy.*

Let other muſes write his proſp'rous fate,
Of conquer'd nations tell, and kings reſtor'd;
But mine ſhall ſing of his *eclips'd* eſtate,
Which, like the ſun's, more wonders does afford. *Dryden.*

To diſgrace.—She told the king, that her huſband was *eclipſed* in Ireland by the no-countenance his majeſty had ſhewed towards him. *Clarendon.*

Another now hath to himſelf engroſs'd
All pow'r, and us *eclips'd*. *Milton*

ECLIP'TA, *ſ.* [from εκλειπης, imperfect, or εκλειψις, a deficiency.] In botany, a genus of the claſs ſyngeneſia, order polygamia ſuperflua, natural order compound flowers, (corymbiferæ, *Juſſ.*) The generic characters are—Calyx: common many-leaved; leaflets lanceolate, nearly equal, in a double ſeries. Corolla: compound rayed; of the ray moſt plentiful, female; of the diſk hermaphrodite: proper of the hermaphrodite tubular, four-cleft, upright, outwardly mealy: in the females very narrow, ligulate. Stamina: in the hermaphrodites; filaments four, very ſhort; anther cylindric. Piſtillum: in the hermaphrodites; germ oblong; ſtyle middling; ſtigma two-cleft, ſpreading. Pericarpium: calyx unchanged. Seed: in the hermaphrodites oblong, compreſſed, notched, obtuſe, unarmed. In the females three-ſided, oblong, notched, obtuſe, unarmed. Receptaculum: flattiſh, chaffy; chaffs very narrow. This genus is diſtinct from Verbeſina in having four-cleft corollets, and unarmed ſeeds; and from Cotula in having a chaffy receptacle.—*Eſſential Character.* Receptacle, chaffy; down, none; corollets of the diſk four-cleft.

Species. 1. Eclipta erecta, or upright eclipta: ſtem erect; leaves deflected at the baſe, and ſeſſile. The herb is like that of Coreopſis bidens. The leaves are marked with three nerves, and are in pairs remote from each other. The flowers come out two together alternately from the axils. It is thus deſcribed by Swartz: Stem erect, round, a foot high, leafy, almoſt ſimple, hiſpid with hoary hairs; leaves oppoſite, tooth-ſerrate, wedge-ſhaped, broad-lanceolate, obtuſe, triple-nerved, hiſpid; flowers white; ſeeds angular, thickiſh, naked without any pappus. Native of the Weſt Indies; and of the Eaſt Indies, Cochin-china, &c. if eclipta erecta of different authors be the ſame plant, which may be doubted. Loureiro ſays that in the Cochin-china plant the leaves are not nerved, nor properly ſerrate, nor ſeſſile; and that the flowers are not in pairs. He adds, that the juice is uſed for dying hair both of men and quadrupeds, whence the natives call it *ink-plant*. Cultivated 1690, in the royal garden at Hampton-court. It flowers from July to September, and is annual; Linnæus marks it as biennial.

2. Eclipta punctata, or dotted-ſtalked eclipta: ſtem erect, dotted; leaves flat. Stem round, branching, leafy, rugged, a foot and a half high, reddiſh with white dots; leaves lanceolate-oblong, acute, ſerrate, rugged, oppoſite, ſeſſile, from two to three inches long; flowers whitiſh, having no ſmell. The whole has a green watery ſap, which turns black in the air, and may be uſed as ink. If it could be fixed, it would make a very fine dye. The negroes are ſaid to increaſe the blackneſs of their ſkin by this juice. This reſembles the firſt ſpecies, but the ſtem has white dots ſcattered over it. Annual, and a native of Domingo and Martinico.

3. Eclipta latifolia, or ovate-leaved eclipta: ſtem erect; leaves ovate, petioled. Root annual; ſtem two feet high, round, hiſpid, brachiate, and finally compound. Native of the Eaſt Indies; it flowers in September and October; and was introduced in 1777, by ſir Joſeph Banks.

4. Eclipta proſtrata, or trailing eclipta: ſtem proſtrate; leaves ſomewhat waved and petioled. Native of the Eaſt Indies, Japan, Cochin-china, and the iſle of Tanna in the South Seas. It flowers in Auguſt, and was cultivated by Mr. Miller in 1759; alſo prior to that in the Eltham garden. It is an annual plant.

5. Eclipta ſeſſilis, or ſeſſile-leaved eclipta; ſtem erect; leaves ſlightly embracing, ovate, toothed; flowers axillary, ſeſſile, diſcoid. This is an annual plant, native of Jamaica.

Propagation and Culture. Theſe plants are propagated by ſeeds, ſown upon a hot-bed in the ſpring; when the plants are fit to remove, they ſhould be tranſplanted into a freſh hot-bed to bring them forward: they muſt be ſhaded till they have taken new root, and then treated as other tender annuals, being careful not to draw them up too weak. In June they may be taken up with balls of earth, and being planted in pots are to be ſet in a ſtove, where they muſt be ſhaded and watered, and where they muſt remain to flower well.

ECLIP'TIC, *ſ.* [*ecliptique*, Fr. *eclittica*, It. *ecliptica*, Sp. *eclipticus*, Lat. εκλειπτικος, of εκλειπω, Gr. to leave.] A great circle of the ſphere, conceived to paſs through the middle of the zodiac. See ASTRONOMY, vol. ii. p. 374 and 453.

ECLIP'TIC, *adj.* Deſcribed by the ecliptic line:

The earth's rotation makes the night and day;
The ſun revolving through th' *ecliptic* way,
Effects the various ſeaſons of the year. *Blackmore.*

EC'LOGUE, *ſ.* [*egloga*, It. *ecloga*, Sp. and Lat. εκλογη, Gr. *i. e.* a choice piece.] A paſtoral poem, ſo called becauſe Virgil called his paſtorals eclogues. *Johnſon.*—It is not ſufficient that the ſentences be brief, the whole *eclogue* ſhould be ſo too. *Pope.*

ECLO'PES, *ſ.* in botany. See RELHANIA.

ECLU'SE (L'), a town of France, in the department of the North: two leagues ſouth of Douay.

ECLU'SE (Charles de l', in Latin *Cluſius*), a celebrated phyſician and botaniſt, born at Arras in 1526. He ſtudied at Ghent and Louvain, and afterwards viſited ſeveral univerſities in Germany, and ſpent three years in that of Montpellier, where he took the degree of doctor. He reſided in the Low-countries from 1550 to 1563, and then entered upon a courſe of travel through various parts of Europe, in which he acquired a very extenſive knowledge of plants. After his return he was made ſuperintendant of the imperial botanic garden by Maximilian II. and afterwards by Rodolph II. At length, being wearied of a court life, he retired for ſome years to Frankfort-on-the-Mein, which, in 1593, he quitted to take the botanical

chair

chair at Leyden. He died there in 1609, in his eighty-fourth year. His principal works are, 1. *Rariorum aliquot Stirpium per Hiſpanias Obſervat. Hiſtoria*, l. ii. 1576, 8vo. moſt of the ſpecies here deſcribed are new, and beautifully delineated with his own hand. 2. *Rariorum aliquot Stirpium per Pannoniam, Auſtriam, &c. Obſerv. Hiſt.* l. iv. 1583, 8vo. a very valuable work, containing many Alpine and other curious plants, with figures. 3. *Exoticorum, libri* x. 1605, contain the plants of Garcias ab Orta, C. a Coſta, Monardus, and Bellonius, with the notes and figures of Cluſius: he has added ſix new books of exotics: with this was publiſhed, 4. another *Appendix plantarum variorum*. After his death were publiſhed, 5, his *Curæ poſteriores*, 1611, folio, containing principally garden plants. He edited ſeveral pieces on botanical ſubjects, written by his friends. Cluſius was a great linguiſt, and alſo a ſkilful coſmographer, and drew ſeveral maps with his own hand.

E'CLYSIS, *ſ.* [from εκλυω, to diſſolve.] With phyſicians, an univerſal faintneſs; a proſtration of ſtrength.

ECOMOY', a town of France, in the department of the Sarte, and chief place of a canton, in the diſtrict of Le Mans: four leagues ſouth of Le Mans.

ECONO'MIC, or ECONOMICAL, *adj.* Pertaining to the regulation of an houſehold. Frugal.—In *economical* affairs, having propoſed the government of a family, we conſider the proper means to effect it. *Watts.*

Her quick'ning power in every living part,
Doth as a nurſe, or as a mother ſerve;
And doth employ her *economic* art,
And buſy care, her houſehold to preſerve. *Davies.*

ECO'NOMY, *ſ.* [οικονομια. This word is often written, from its derivation, *œconomy*; but *œ* being no diphthong in Engliſh, it is placed here with the authorities for different orthography.] The management of a family; the government of a houſehold.—By St. Paul's *economy*, the heir differs nothing from a ſervant, while he is in his minority; ſo a ſervant ſhould differ nothing from a child in the ſubſtantial part. *Taylor.*—Diſtribution of expence. —Particular ſums are not laid out to the greateſt advantage in his *economy*; but are ſometimes ſuffered to run waſte, while he is only careful of the main. *Dryden.*—Frugality; diſcretion of expenee; laudable parſimony.—I have no other notion of *economy*, than that it is the parent of liberty and eaſe. *Swift.*—Diſpoſition of things; regulation.—All the divine and infinitely-wiſe ways of *economy* that God could uſe towards a rational creature, obliges mankind to that courſe of living which is moſt agreeable to our nature. *Hammond.*—The diſpoſition or arrangement of any work.—In the Greek poets, as in Plautus, we ſee the *economy* and diſpoſition of poems better obſerved than in Terence. *Ben Jonſon.*—Syſtem of matter; diſtribution of every thing active or paſſive to its proper place:

Theſe the ſtrainers aid,
That by a conſtant ſeparation made,
They may a due *economy* maintain,
Exclude the noxious parts, the good retain. *Blackmore.*

E'COTS, or ECOS, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Grand Andelys: ſeven miles north-north-eaſt of Vernon.

ECOU'CHE, a town of France, in the department of the Orne, and chief place of a canton, in the diſtrict of Argentan. The principal trade of the inhabitants is making clocks, with manufactures of cloth and ſtuffs: one league and a half weſt of Argentan.

ECOUEN', a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Gonneſſe: five miles north of St. Denys.

ECOU'Y, a town of France, in the department of the Eure, and chief place of a canton, in the diſtrict of Grand Andelys: four miles north of Grand Andelys.

ECPEPIES'MENUS, *ſ.* [Gr. from εκπιεζω, to preſs out.] With ſurgeons, an epithet applied to ulcers with protuberant lips.

EC'PHASIS, *ſ.* [from the Greek εκ, out, and φαω, to give.] A plain declaration; an explicit propoſition.

ECPHONE'MA, or ECPHONESIS, *ſ.* [from the Greek εκ, out, and φωνη, a voice.] An exclamation; a figure in rhetoric by which the ſpeaker expreſſes the paſſion of his own mind, and endeavours to excite that of the hearers.

EC'PHORA, *ſ.* in architecture, [from the Greek εκ, out, and φερω, to bear.] The moulding, or diſtance between the extremity of a member and the part from which it projects.

ECPHRAC'TIC, *adj.* [from the Greek εκ, from, and φρασσω, to break.] Attenuating; diſſolving tough humours.

EPHRAC'TICS, *ſ.* [from εκφρασσω, to remove.] Deobſtruents. Medicines which attenuate and remove obſtructions.

ECPHRAX'IS, *ſ.* [from εκφρατω, Gr. to remove obſtructions.] A diaphoreſis; an opening of the pores.

ECPIES'MA, *ſ.* [from εκπιεζω, to preſs out.] A kneaded maſs. The juice which is preſſed from plants. Alſo a fracture of the ſkull, in which the bones preſs inwardly.

ECPIES'MUS, *ſ.* [from εκπιεζω, to preſs out.] A diſorder of the eye, in which the globe is almoſt preſſed out of the ſocket by an afflux of humours.

ECPLEX'IS, *ſ.* [from εκπλησσω, to aſtoniſh.] A ſudden ſtupor of the ſenſes from ſome external accident.

ECPTO'MA, *ſ.* [from εκπιπτω, to fall out.] An excluſion or diſplacing of any part. The falling down of any part, as the womb.

ECPYC'TICS, *ſ.* [from εκπυκαζω, to condenſe.] Incraſſants; medicines that render the fluids more ſolid.

ECPYE'MA, *ſ.* [from εκ, and πυον, pus.] A ſuppuration. A collection of matter.

E'CRYSIS, *ſ.* [from εκρυω, to flow out.] An efflux of the ſemen before it has produced a fœtus.

EC'STASY, *ſ.* [*extaſe*, Fr. *eſtaſi*, It. *ecſtaſis*, Lat. εκσταση, Gr. properly ſignifies the removal of a thing from the ſtate in which it was, to another.] Any paſſion by which the thoughts are abſorbed, and in which the mind is for a time loſt.—Whether what we call *ecſtaſy* be not dreaming with our eyes open, I leave to be examined. *Locke.*—Exceſſive joy; rapture.—The religious pleaſure of a well-diſpoſed mind moves gently, and therefore conſtantly: it does not affect by rapture and *ecſtaſy*; but is like the pleaſure of health, ſtill and ſober. *South.*

Each delighted, and delighting, gives
The pleaſing *ecſtaſy* which each receives. *Prior.*

Enthuſiaſm; exceſſive elevation and abſorption of the mind:

He lov'd me well, and oft would beg me ſing;
Which when I did, he on the tender graſs
Would ſit, and harken even to *ecſtaſy*. *Milton.*

Exceſſive grief or anxiety. *This is not now uſed:*

Sighs and groans, and ſhrieks that rend the air,
Are made, not mark'd; where violent ſorrow ſeems
A modern *ecſtaſy*. *Shakeſpeare.*

Madneſs; diſtraction. *This ſenſe is not now in uſe:*

Now ſee that noble and moſt ſovereign reaſon,
Like ſweet bells jangled out of tune, and harſh,
That unmatch'd form, and feature of blown youth,
Blaſted with *ecſtaſy*. *Shakeſpeare.*

EC'STASIED, *adj.* Raviſhed; filled with enthuſiaſm. —Theſe are as common to the inanimate things as to the moſt *ecſtaſied* ſoul upon earth. *Norris.*

ECSTA'TIC, or ECSTATICAL, *adj.* [εκστατικος, Gr.] Raviſhed; rapturous; elevated beyond the uſual bounds of nature:

There doth my ſoul in holy viſion ſit,
In penſive trance, and anguiſh, and *ecſtatic* fit. *Milton.*

In trance *ecſtatic* may thy pangs be drown'd;
Bright clouds deſcend, and angels watch thee round.
Pope.

Raiſed

Raiſed to the higheſt degree of joy:

To gain Peſcennius one employs his ſchemes;
One graſps a Cecrops in *ecſtatic* dreams. *Pope.*

Tending to external objects.—I find in me a great deal of *ecſtatical* love, which continually carries me out to good without myſelf. *Norris.*

ECSTA'TICI, [εκστατικοι, from εξιστημι, I am entranced.] In antiquity, a ſect of diviners who were caſt into trances or ecſtaſies, in which they lay like men aſleep, deprived of all ſenſe and motion; but, after ſome time, returning to themſelves, gave ſtrange relations of what they had ſeen and heard.

ECT'ERNACH, or EPTERNACH, a town of the duchy of Luxemburg, on the Sour: ſixteen miles north-north-eaſt of Luxemburg.

ECTHELYN'SIS, *ſ.* [from εκθηλαινω, to effeminate.] A ſoftneſs of the fleſh or bones. Effeminacy.

ECTHE'SIS, in church-hiſtory, a confeſſion of faith, in the form of an edict, publiſhed in 639, by the emperor Heraclius, with a view to pacify the troubles occaſioned by the Eutychian hereſy in the eaſtern church.

ECTHLIP'SIS, *ſ.* [from εκθλιβω, to preſs againſt.] An ulceration cauſed by preſſure on the ſkin. Alſo an eliſion or flaſh of light before the eyes.

ECTHLIP'SIS, *ſ.* [Lat.] With grammarians, the cutting off a vowel or conſonant, eſpecially the letter *m*, in Latin or Greek verſe, at the end of a word, when the next word begins with a vowel or *h*, as, *div' incido*, for *divum incido*, βελομ' εγω, for βελομαι εγω.

EC'THYMA, *ſ.* [from εκθυω, to break out.] A puſtule, or cutaneous eruption.

ECTILLO'TICS, *ſ.* [from εκτιλλω, to pull out.] Medicines which eradicate tubercles or corns, or deſtroy ſuperfluous hairs.

ECTOPOCYS'TICUS, *ſ.* [from εκτοπος, miſplaced, and κυστις, the bladder.] A ſuppreſſion of urine from a ruptured or miſplaced bladder is called *iſchuria ectopocyſtica*.

ECTRAPELOGAS'TER, *ſ.* [from εκτρεπομαι, to degenerate, and γαστηρ.] One who has a monſtrous belly, or whoſe appetite is voraciouſly large.

ECTRO'PIUM, *ſ.* [from εκτρεπω, to divert.] An inverſion of the eye-lids, ſo that the red ſkin becomes viſible.

ECTRO'TICS, *ſ.* [from εκτιτρωσκω, to miſcarry.] Medicines which cauſe abortion.

EC'TYPE, *ſ.* [εκτυπος, Gr.] An image or picture made according to the pattern; a copy taken from the original.—The complex ideas of ſubſtances are *ectypes*, copies, but not perfect ones, not adequate. *Locke.*

ECU', or ESCU, *ſ.* A French crown.

ECURI'E, *ſ.* [French; *equus*, Lat.] A place covered for the lodging or houſing of horſes.

ED, [ed, Sax. *ede*, Dut. *ere*, Ger.] The termination of the preterite tenſes and participles paſſive, in the Engliſh regular verbs active.

ED, [Heb. a witneſs.] The name of an altar erected by the two tribes and a half that inhabited Paleſtine, eaſt of Jordan, upon the borders of their territory, after their return from the conqueſt of Canaan; in witneſs that they were of the ſame nation with thoſe on the other ſide of the river Jordan. In conſequence of which a very ſerious miſunderſtanding had nearly taken place. *Joſh.* xxii. 34.

ED, a town of Sweden, in the province of Weſt Gothland: thirty-three miles north of Uddevalla.

ED, a town of Sweden, in the province of Smaland: eighty miles north of Calmar.

E'DA, a town of Sweden, in the province of Warmeland: forty miles north of Carleſtadt.

E'DA, one of the Orkney iſlands, about ſeven miles long, and half a mile to two miles broad, and ſituated about eight miles north-north-eaſt from Pamona. It contains ſeveral villages. Lat. 59. 2. N. lon. 0. 33. E. Edinburgh.

EDA'CIOUS, *adj.* [*edax*, Lat.] Eating; voracious; devouring; predatory; ravenous; rapacious; greedy.

EDA'CITY, *ſ.* [*edacitas*, Lat.] Voracity; ravenouſneſs; greedineſs; rapacity.—The wolf is a beaſt of great *edacity* and digeſtion; it may be the parts of him comfort the bowels. *Bacon.*

E'DAM, an iſland near Batavia, where the Dutch placed criminals, and employed them in divers ſorts of work.

E'DAM, a town of Holland, or Batavian Republic, ſituated near the Zuyder Sea. It is built in a triangular form, and has a good port, formed by the river Ey, on which it ſtands, and which, with the dam thrown up againſt the inundations of that river, gives its name to the town. It holds the ninth rank among the ſmall cities of the ſtates, and ſends a deputy to the ſtates-general: twelve miles north of Amſterdam. Lat. 52. 32. N. lon. 22. 27. E. Ferro.

E'DAR, the name of a tower in Canaan, near which the patriarch Jacob pitched his tent, in his journey to viſit his father. *Gen.* xxxv. 21.

ED'BO, a town of Sweden, in the province of Upland: thirty miles eaſt-north-eaſt of Upſal.

ED'DA, *ſ.* in antiquities, is a ſyſtem of the ancient Icelandic or Runic mythology, containing many curious particulars of the theology, philoſophy, and manners, of the northern nations of Europe; or of the Scandinavians, who had migrated from Aſia, and from whom our Saxon anceſtors were deſcended. M. Mallet apprehends that it was originally compiled, ſoon after the Pagan religion was aboliſhed, as a courſe of poetical lectures, for the uſe of ſuch young Icelanders as devoted themſelves to the profeſſion of a *ſcald*, or poet. It conſiſts of two principal parts; the *firſt*, containing a brief ſyſtem of mythology, properly called the *Edda*; the *ſecond*, a kind of art of poetry, called *ſcalda*, or *poetics*. The moſt ancient Edda was compiled by Soemund Sigfuſſon, ſurnamed *the Learned*, who was born in Iceland about the year 1057. This was abridged, and rendered more intelligible about 120 years afterwards, by Snorro Sturleſon, who was ſupreme judge of Iceland. He added alſo the ſecond part, in the form of a dialogue, being a detail of different events tranſacted among the divinities. The only three pieces that are known to remain of the more ancient Edda of Soemund, are the Voluſpa, the Havamaal, and the Runic chapter. The Voluſpa, or prophecy of Vola or Fola, appears to be the text on which the Edda is the comment. It contains in two or three hundred lines the whole ſyſtem of mythology diſcloſed in the Edda, and may be compared to the Sibylline verſes, on account of its laconic yet bold ſtyle, and its imagery and obſcurity. It is profeſſedly a revelation of the decrees of the Father of Nature, and the actions and operations of the gods. It deſcribes the chaos, the formation of the world, with its various inhabitants, the function of the gods, their moſt ſignal adventures, their quarrels with Loke their great adverſary, and the vengeance that enſued; and concludes with a long deſcription of the final ſtate of the univerſe, its diſſolution and conflagration, the battle of the inferior deities, and the evil beings, the renovation of the world, the happy lot of the good, and the puniſhment of the wicked.

To ED'DER, *v. a.* [probably from *edge*.] To bind or interweave a fence.—To add ſtrength to the hedge, *edder* it; which is, bind the top of the ſtakes with ſome ſmall long poles on each ſide. *Mortimer.*

ED'DER, *ſ.* Such wood as is commonly put upon the top of fences, to keep the ſtakes tight:

In lopping and felling, ſave *edder* and ſtake,
Thine hedges, as needeth, to mend or to make. *Tuſſer.*

ED'DERBRECHE, *ſ.* [from the Saxon, now *obſolete*.] The offence of hedge-breaking.

ED'DISH, *ſ.* [eðiſc, Sax.] The ſtubble after the corn is cut; the latter graſs.

ED'DRED-SI, a ſmall iſland in the Red Sea, two leagues from the coaſt of Arabia. Lat. 17. 10. N. lon. 41. 33. E. Greenwich.

ED'DY, *f.* [ed, backward, again, and ea, water, Sax.] The water that by ſome repercuſſion, or oppoſite wind, runs contrary to the main ſtream.—My praiſes are as a bulruſh upon a ſtream: if they ſink not, 'tis becauſe they are borne up by the ſtrength of the current, which ſupports their lightneſs; but they are carried round again, and return on the *eddy* where they firſt began. *Dryden.*—Whirlpool; circular motion:

So, where our wide Numidian waſtes extend,
Sudden th' impetuous hurricanes deſcend,
Wheel through the air, in circling *eddies* play,
Tear up the ſands, and ſweep whole plains away. *Addiſon.*

ED'DY, *adj.* Whirling; moving circularly:

And chaff with *eddy* winds is whirl'd around,
And dancing leaves are lifted from the ground. *Dryden.*

ED'DYSTONE, an inſulated rock, being the elevated part of a chain of rocks, about five leagues to the ſouth from the port of Plymouth, and about three leagues or ſomewhat more from the Ram Head, well known to ſeamen who navigate the Engliſh Channel. They lie nearly in the fairway from the Start to the Lizard, and are therefore of the utmoſt danger to mariners. Hence it is that on the Eddyſtone rock a light-houſe has been erected, to ſerve as a beacon or ſignal to avoid the danger, as theſe rocks are covered with the flood tide, but come dry at the ebb. The firſt light-houſe was erected of wood, in 1696, and reſiſted many violent ſtorms, but was blown down on the 27th of November, 1703; in which the projector, Mr. Winſtanley, who then happened to be repairing it, and all his attendants, periſhed. The corporation of the Trinity-houſe afterwards erected another in 1709, and to ſupport the expence laid a duty on all veſſels paſſing it. This alſo was conſtructed of wood, and was burnt down in 1755. The very able and ingenious engineer, Mr. John Smeaton, was then employed, to erect the light-houſe of ſolid ſtone, granite if poſſible; and after four years inceſſant labour and application, at ſuch times as the ſeaſons and weather would permit, the preſent celebrated ſtructure was completed, and again lighted up on the 16th of October, 1759; ever ſince which time it has withſtood the violent attacks of the moſt tempeſtuous hurricanes, equal to any part of the ſolid rock itſelf.

The building, as it is now conſtructed, conſiſts of four rooms, one over the other, and at the top a gallery and lantern. The ſtone floors are flat above, but concave beneath; and are kept from preſſing againſt the ſides of the building by a chain let into the walls. Portland ſtone and granite are united together by a ſtrong cement, and let into horizontal ſteps by dovetails on the ſouth-weſt. The ingenious architect diſcovered that Portland ſtone was likely to be injured by a marine animal; and as the working of granite was very expenſive and laborious, the external part only was conſtructed with this, and the internal part with the other. To form a ſtrong and broad baſe, and a ſtrong bulk of matter to reſiſt the waves, the foundation is one entire ſolid maſs of ſtones, to the height of thirty-five feet, engrafted into each other, and united by every means of additional ſtrength. It is nearly eighty feet in height.

About a quarter of a mile from the light-houſe to the north-eaſt, there is a continuation of this rock under water, which only ſhews itſelf at the low ebbs of a high ſpring tide, and then only of the ſize of a butt. There are ten fathoms all round it, within a ſhip's length. Theſe rocks received their name from the great variety of contrary currents or ſets of the tide which are found to prevail near them. From their ſituation in reſpect to the Atlantic Ocean and the Bay of Biſcay, they are expoſed to the ſwells of both, from all the ſouth-weſtern points of the compaſs; and all the heavy ſeas which roll in from thence, come immediately and uninterruptedly upon theſe rocks, and there break with inconceivable fury. It is alſo remarkable, that a ground ſwell will ſometimes meet the ſlope of the rocks, and break upon them frightfully, even when the ſurface of the ſea is perfectly ſmooth, and without a ſingle breeze; and this obſtruction, at thoſe times, is ſo great as to impede and put a ſtop to every thing which may be carrying on upon the rock, and to prevent landing upon it from a boat, though perſons might from thence go to ſea in a walnut-ſhell, if it had capacity enough to keep them afloat.

The weſt ſide of the main rock, where it appears ſix or ſeven feet above water at the ebb of a high ſpring tide, is bold and ſteep; but it is foul for half a mile off, to the ſouth-ſouth-eaſt, and there are ſeveral other rocks which ſhew themſelves above water at the ebb. It lies from the Ram Head ſouth-by-weſt, a little weſterly; from the Start weſt, a little ſoutherly, about ſix leagues; and from the Lizard about eaſt-by-north half north, eleven or twelve leagues. In the fairway of this rock is forty fathoms, and between it and the Ram Head thirty-five or thirty-ſix fathoms; ſo that a ſhip in coming up Channel in the night, if ſhe cannot ſee the light, muſt keep without the depth of forty fathoms, as thirty-five fathoms is a ſure mark for being within it. But, after paſſing the Lizard up Channel, ſhips ſhould be careful to keep off from the French ſhore, otherwiſe they may fall in with the Caſkets and the iſlands. The latitude of the Eddyſtone is 50. 8. N. and longitude 4. 24. W. and it has high water at ſpring tides at half paſt five o'clock. Generally ſpeaking, the flood tide ſets within the Eddyſtone, from the Ram Head to the Start, in the direction of eaſt-ſouth-eaſt, and ebbs to the weſt-north-weſt.

ED'DYSTONE, a rock on the coaſt of Patagonia, in South America, not far from land, in latitude about 48. 30. S. and longitude 64. 56. W.

ED'DYSTONE, a rock on the north coaſt off the entrance to Port Egmont in Falkland's Iſlands, and to Falkland Sound from the north, which divides the two principal iſlands ſo called. This rock is about five miles to the north-by-weſt from Cape Dolphin.

ED'DYSTONE, a rock ſituated about a league to the eaſt of another, called the Swilly Rock, near the ſouth-eaſt coaſt of New Holland. Lat. 43. 53. S. lon. 147. 9. E.

EDE'CHIA, *f.* in botany. See LAUGERIA.

E'DELBACH, a town of Germany, in the archduchy of Auſtria: ſix miles eaſt-ſouth-eaſt of Bavarian Waidhoven.

E'DELSTEIN, a town of Sileſia, in the principality of Neiſſe: five miles ſouth of Ziegenthals.

ED'ELINCK (Gerard), a celebrated engraver, born at Antwerp, in 1641. He acquired the principles of his art in that city, and went to exerciſe it at Paris, whither the munificence of Louis XIV. attracted men of talents in every walk. He was choſen to engrave the Holy Family of Raphael, and Alexander viſiting the Family of Darius by Le Brun, in both which pieces he acquired the admiration of connoiſſeurs, by the clearneſs, brilliancy, and harmony, of his ſtrokes. His print of Le Brun's famous Magdalen was alſo a maſter-piece; and his heads of a number of the moſt illuſtrious perſons of the age, are in the higheſt eſteem. He had apartments in the Gobelins, with the title of engraver to the king, and counſellor of the academy of painting. He died in 1707.

EDEMATO'SE, *adj.* [οιδημα, Gr.] Swelling; full of humours; commonly written *oedematous.*—A ſeroſity obſtructing the glands may be watery, *edematoſe*, and ſchirrous, according to the viſcoſity of the humour. *Arbuthnot.*

E'DEN, the name of a city, ſituated, as is ſuppoſed, in Meſopotamia; near which was the garden where our firſt parents dwelt previous to their tranſgreſſion. Compare *Gen.* ii. 8. 2 *Kings*, xix. 12. and *Ezek.* xxvii. 23. Some have ſuppoſed *Eden* to be the name of the garden itſelf, but it ſeems without foundation; for, notwithſtanding

Eden,

Eden, on account of the beauty of its ſituation, is frequently recurred to by the prophets, yet, "the Garden of the Lord," is almoſt as frequently coupled with it, in order as much as poſſible to diſtinguiſh them. *Iſaiah*, li. 3. *Ezek.* xxxi. 8, 16, 18.

E'DEN, a town of Germany, in the circle of Weſtphalia, and county of Rietberg: one mile eaſt-ſouth-eaſt of Rietberg.

E'DEN, a river of England, which riſes in Weſtmoreland, on the borders of Yorkſhire, croſſes the county of Cumberland, and runs into the arm of the ſea called *Solway Frith*, about ſeven miles below Carliſle.

E'DEN, a river of Scotland, which runs into the Tweed, not far from Coldſtream.

E'DEN, a townſhip of the American States, in Hancock county, diſtrict of Maine, incorporated in 1796, taken from the northerly part of Mount Deſert.

E'DEN, a townſhip of the American States, in Orleans county, Vermont, north-weſt of Craftſbury.

E'DENBURG, a town of Hungary: twenty-nine miles ſouth-weſt of Preſburg, and thirty-ſix ſouth of Vienna.

EDENDER'RY, a town of Ireland, in King's County: twenty-nine miles weſt of Dublin

EDEN'TATED, *adj.* [*edentatus*, Lat.] Deprived of teeth.

E'DENTON, a diſtrict of the American States, on the ſea-coaſt of North Carolina, bounded north by the ſtate of Virginia; eaſt by the ocean; weſt by Halifax diſtrict; and ſouth by Newbern. It is ſubdivided into ſeven counties, viz. Chowan, Paſquotank, Perquinins, Gates, Hertford, Bertie, and Tyrrel. It contained, by the cenſus of 1796, 53,770 inhabitants. Its chief town is Edenton. The wood is chiefly pine, oak, cypreſs, and juniper; of all which there is abundance.

E'DENTON, the capital of the above diſtrict, is a poſt town and port of entry, at the head of a bay on the north ſide of Albemarle ſound, and at the north-eaſt ſide of the opening of Chowan river. The public buildings are an ancient brick epiſcopal church, a court-houſe, and gaol. In or near the town lived the proprietary, and the firſt of the royal governors. Its ſituation is advantageous for trade, but unhealthy, which doubtleſs has tended to retard its proſperity. Its exports in the year ending September 30, 1794, amounted to the value of 50,646 dollars. It is ninety-ſeven miles north of Newbern, 257 north-north-eaſt of Wilmington, 139 ſouth-ſouth-eaſt of Peterſburgh, and 440 ſouth-weſt of Philadelphia. Lat. 36. 6. N. lon. 77. 11. W.

E'DER, a city of Paleſtine, in the tribe of Judah, ſituated in the ſouthern part of that province, near the borders of Edom. *Joſh.* xv. 21.

E'DER, a town of Africa, in Morocco, on the coaſt of the Atlantic: ten miles north-eaſt of Cape Cantin.

E'DER, a river of Bohemia, which runs into the Elbe at Leitmeritz.

E'DER, a river of Germany, which runs into the Fulda: ſeven miles ſouth of Caſſel.

ED'ERA, *ſ.* in botany. See HEDERA and RHUS.

ED'ERIC, a town of Aſia, in the country of Thibet: forty miles ſouth-ſouth-eaſt of Toſun Hotun.

ED'ERITZ, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt Cothen: four miles ſouth of Cothen.

E'DESHEIM, a town of Germany, in the circle of the Upper Rhine, and biſhopric of Spire: fourteen miles weſt of Spire.

EDES'SA, a town of European Turkey, in the province of Macedonia, near the Viſtricza, called by the Turks *Moglena*: it was at one time the reſidence of the Macedonian kings, before Philip embelliſhed Pella: forty-four miles weſt-north-weſt of Saloniki, and 316 weſt of Conſtantinople. Lat. 40. 50. N. lon. 39. 49. E. Ferro.

ED'FU, a town in Upper Egypt, where the people have a ſuperſtition concerning crocodiles ſimilar to that entertained in the Weſt Indies. They ſay there is a king of them, who reſides near Iſna, who has ears, but no tail; and he poſſeſſes an uncommon regal quality, that of doing no harm, analogous to "the king can do no harm." Some of theſe people are bold enough to aſſert that they have ſeen him. *Browne's Travels*, 1799, p. 140.

EDFUE'RIM, a town of Norway: thirty-ſix miles north of Berga.

ED'GAR, [of eadiz, happy, and aje, honour, Sax.] The name of a king of England. A proper name of men.

ED'GARTON, a port of the American States, and poſt town of Maſſachuſetts, and the chief town of Duke's county, ſituated on the eaſt ſide of the iſland of Martha's Vineyard. The fertile iſland of Chabaquidick is within the juriſdiction of Edgarton, which has a ſmall trade to the Weſt Indies. The exports in 1794 for one year ending September 30, amounted to 2,257 dollars value. It lies about fourteen miles ſouth of Barnſtable county, on the main, and ninety-four miles ſouth-ſouth-eaſt of Boſton. It was incorporated in 1671, and contains 1352 inhabitants.

EDG'COMB, [of edge, and comb, Sax. a valley environed with hills.] A ſurname.

EDG'COMB, a townſhip of the American States, in Lincoln county, diſtrict of Maine, containing 855 inhabitants. It was incorporated in 1774, and lies 180 miles north-by-eaſt of Boſton.

EDG'COMB, a county of the American States, in Halifax diſtrict, North Carolina, bounded ſouth by Pitt county, ſouth-weſt by Wayne county, and Tar river, which affords it communication with ſeveral counties in the ſtate; weſt by Naſh county, and eaſt by Martin and Halifax counties. It contains 10,255 inhabitants.

EDG'COMB BAY, a bay on the north-eaſt coaſt of New Holland. Lat. 20. S.

EDG'COTT, a village of England, in the county of Northampton, on the borders of Oxfordſhire, near which, at a place called *Daneſmore*, a battle was fought between the Saxons and the Danes: and another on the 26th of July, 1469, by a party of Lancaſtrians, under the command of ſir John Coniers, ſir Henry Nevil, and Robin of Ridſdale, againſt the earl of Pembroke at the head of twelve thouſand Welchmen, and the earl of Devon at the head of five thouſand archers. The earl of Pembroke was ſlain, the earl of Derby taken and beheaded, with five thouſand men killed: four miles north of Banbury.

EDGE, *ſ.* [edge, Sax.] The thin or cutting part of a blade:

'Tis ſlander,
Whoſe *edge* is ſharper than the ſword. *Shakeſpeare.*

A narrow part riſing from a broader.—Some harrow their ground over, and then plough it upon an *edge*. *Mortimer.*—Brink; margin; extremity:—We have, for many years, walked upon the *edge* of a precipice, while nothing but the ſlender thread of human life has held us from ſinking into endleſs miſery. *Rogers.*

Yes, the laſt pen for freedom, let me draw,
When truth ſtands trembling on the *edge* of law. *Pope.*

Sharpneſs of mind; proper diſpoſition for action or operation; intenſeneſs of deſire.—Silence and ſolitude ſet an *edge* upon the genius, and cauſe a greater application. *Dryden.*

But when long time the wretches thoughts refin'd,
When want had ſet an *edge* upon their mind,
Then various cares their working thoughts employ'd,
And that which each invented, all enjoy'd. *Creech.*

Keenneſs; acrimony of temper:

Abate the *edge* of traitors, gracious Lord!
That would reduce theſe bloody days again. *Shakeſpeare.*

To ſet teeth on EDGE. To cauſe a tingling uneaſy ſenſation in the teeth.—A harſh grating tune *ſetteth the teeth on edge*. *Bacon.*

To EDGE, *v. a.* To ſharpen; to enable to cut:

There ſat ſhe rolling her alluring eyes,
To *edge* her champion's ſword, and urge my ruin. *Dryden.*

To furniſh with an edge:

I fell'd along a man of bearded face,
His limbs all cover'd with a ſhining caſe;
So wond'rous hard, and ſo ſecure of wound,
It made my ſword, tho' *edg'd* with flint, rebound. *Dryd.*

To border with any thing; to fringe.—I rid over hanging hills, whoſe tops were *edged* with groves, and whoſe feet were watered with winding rivers. *Pope.*—To exaſperate; to embitter.—By ſuch reaſonings the ſimple were blinded, and the malicious *edged*. *Hayward.*—To put forward beyond a line.—*Edging* by degrees their chairs forwards, they were in a little time got up cloſe to one another. *Locke.*

To EDGE, *v. n.* [perhaps from eb, Sax. backward.] To move forward againſt any power; going cloſe upon a wind, as if upon its ſkirts or border, and ſo failing ſlow:

I muſt *edge* upon a point of wind,
And make ſlow way. *Dryden.*

EDGE-TOO'L, *ſ.* A tool made ſharp to cut.—There muſt be no playing with things ſacred, nor jeſting with *edge-tools*. *L'Eſtrange.*

The manufacture of edge-tools has of late received very conſiderable improvement in moſt parts of England; but particularly in the manufactory of Mr. Arnold Wilde, at Sheffield in Yorkſhire, from an union or preparation of caſt-ſteel and iron. The method is as follows: Take a mould of caſt-iron, or other fit material, of a dimenſion that will beſt ſuit the ſize of the article intended to be manufactured; then take a piece of wrought-iron, and prepare it, by heating in a fire and hammering it, or in any other manner you may think proper, to the ſize you want it; then fix the iron in the mould, (leaving a ſufficient vacancy to receive the caſt-ſteel in a fluid ſtate,) in ſuch a direction as that, when the caſt-ſteel is poured into the mould, the iron may be either in the middle or the center of the caſt-ſteel; or on one or both ſides of the caſt-ſteel; or in ſuch other direction as may beſt ſuit the purpoſe for which the iron and caſt-ſteel, when incorporated, ſhall be wanted. Then put the crucible or pot into the furnace; when the crucible or pot is hot put ſteel into it; then fix on the lid to the crucible or pot, and continue it in the furnace or fire till the ſteel becomes fluid. When you ſuppoſe the ſteel to be nearly in a fluid ſtate, take your piece of iron, which you intend to incorporate with the caſt-ſteel, put it into a fire, and heat it to what is uſually called a welding heat; then take the iron out of the fire, clean it from any ſcale or dirt, and fix it in the mould, in the like direction you had before fitted it; take care that your ſteel be now in a fluid ſtate, and, immediately on your taking the iron out of the fire, take the crucible or pot containing the melted ſteel from the furnace or fire, and, immediately after the iron thus heated ſhall be fitted in the mould, pour or turn the fluid ſteel into the ſpace or vacancy left in the mould to receive the ſame, which will incorporate with the iron, and become one ſolid maſs or body of caſt-ſteel and iron united. To make all ſorts of plane-irons, ſcythes, ſickles, drawing-knives, hay-knives, and all other kinds of edge-tools, of caſt-ſteel and iron, united as hereinbefore-mentioned, take a piece of the caſt-ſteel and iron, united; then forge, roll, ſlit, or tilt it, in ſuch way as is proper, for any, or either, of the articles intended to be manufactured; then the article may be made in the above manner, or by ſuch other mode as a workman may judge moſt convenient. This invention is ſanctioned by letters patent, dated January 19, 1795.

ED'GED, *part. adj.* Sharp; not blunt.—We find that ſubtile or *edged* quantities do prevail over blunt ones. *Digby.*

EDGEFIELD COUNTY, in South Carolina, is the ſouthernmoſt in the diſtrict of Ninety Six; bounded north by Saluda river, which divides it from Newbury county; ſouth-weſt by Savannah river, which ſeparates it from the ſtate of Georgia; eaſt by Orangeburg diſtrict; and weſt by Abbeville county. The ridge of elevated land which divides the waters of Saluda from thoſe of Savannah river, paſſes nearly through the middle of the county. Edgefield county is about thirty-four miles long and twenty-four broad, and contains 13,289 inhabitants. In this county is Edgefield court-houſe, where is a poſt-office: twenty miles from Abbeville court-houſe, twenty-five from Auguſta, and ſixty from Columbia.

ED'GELESS, *adj.* Blunt; obtuſe; unable to cut.—They are *edgeleſs* weapons virtue hath to encounter. *Decay of Piety.*

To-morrow in the battle think on me,
And fall thy *edgeleſs* ſword; deſpair and die. *Shakeſpeare.*

ED'GEMONT, a townſhip of the American States, in Delaware county, Pennſylvania.

ED'GEWISE, *adv.* With the edge put into any particular direction.—Should the flat ſide be objected to the ſtream, it would be ſoon turned *edgewiſe* by the force of it. *Ray.*

EDG'HILL, a place of England, in the county of Warwick, memorable for the firſt battle fought between the unfortunate Charles I. and the army of the parliament, on the 22d of October 1642, in which 5000 men were killed. On the king's ſide the earl of Lindſey, ſir Edward Verney, and lord Aubigny, brother to the duke of Richmond, were ſlain; lord Willoughby, ſir Thomas Lunſford, and ſir Edward Stradling, were taken priſoners. On the parliament ſide, lord St. John of Bletſo, and Charles Eſſex, were the only two perſons of conſequence who were ſlain. Neither party could claim the victory. Eſſex, who commanded for the republicans, retired to Warwick, and the king to Banbury: two miles ſouth-ſouth-eaſt of Kineton.

EDG'HIR, a town of Hindooſtan, in the country of Golconda: ten miles weſt of Rachore, and ſeventy-five ſouth-weſt of Hydrabad.

EDG'ING, *ſ.* What is added to any thing by way of ornament.—A woman branches out into a long diſſertation upon the *edging* of a petticoat. *Addiſon.*—A narrow lace.

EDG'ING, *part. adj.* Furniſhing with an edge, fringing; putting forward, exaſperating.

EDG'WARE, a market town in the county of Middleſex, eight miles from London, on the road to Ayleſbury. Here are two churches, Edgware and Little Stanmore. The latter, built by the duke of Chandos, is a neat and elegant ſtructure; the inſide beautifully ornamented with paintings, and to it his grace gave the name of Whitchurch; the weſt ſide of the ſtreet of Edgware being in the pariſh of Whitchurch, or Little Stanmore. Edgware is on the very edge of the county; whence its name. The market is on Thurſdays, and a fair on the 4th of May. The old Roman cauſey, called Watling-ſtreet, paſſes by here from London.

Adjoining to Edgware is Canons, where, in the eighteenth century, roſe and vaniſhed a moſt magnificent palace, erected by the firſt duke of Chandos, whoſe princely ſpirit was ſuch, that the people in this neighbourhood ſtill emphatically ſtile him, "The Grand Duke." The ſhort time that intervened between the erection and demolition of this ſtructure, affords ſuch a remarkable inſtance of the inſtability of human grandeur, that the hiſtory of it merits particular regard. The duke, having accumulated a vaſt fortune, as paymaſter to the army, in queen Anne's reign, formed a plan of living in a ſtate of regal ſplendour, and, accordingly, erected this magnificent ſtructure, which, with its decorations and furniture, coſt 250,000l. The pillars of the great hall were of marble, as were the ſteps of the principal ſtaircaſe, each ſtep conſiſting of one piece, twenty-two feet long:

long: the locks and hinges of the doors were of silver or gold; and all the decorations and furniture were in a stile of correspondent magnificence. The establishment of the household was not inferior to the splendour of the habitation, and extended even to the ceremonies of religion. "The chapel (says a writer who visited this mansion in its glory) hath a choir of vocal and instrumental music, as in the royal chapel; and, when his grace goes to church, he is attended by his Swiss guards, ranged as the yeomen of the guards: his music also plays when he is at table; he is served by gentlemen in the best order; and I must say, that few sovereign princes live with that magnificence, grandeur, and good order." What was meant by Swiss guards, is explained by another passage in the same work: "At the end of each of his chief avenues, the duke hath neat lodgings for eight old serjeants of the army, whom he took out of Chelsea college, who guard the whole, and go their rounds at night, to prevent disorders; and they wait upon the duke to chapel on Sundays." The duke, indeed, had divine service performed with all the aids that could be derived from vocal and instrumental music. To this end he retained some of the most celebrated performers of both kinds, and engaged the greatest masters to compose anthems, and services, with instrumental accompaniments, after the manner of those performed in the churches of Italy. Near twenty of Handel's anthems were composed for this chapel; and the morning and evening services were principally composed by Dr. Pepusch. It has been questioned, however, whether true taste was predominant in this profusion of expence. Pope, in his Description of Timon's Villa, has severely satirized the whole: we even find the prophet and the bard united, and the fate of all this magnificence foretold:

Another age shall see the golden ear
Imbrown the slope and nod on the parterre;
Deep harvest bury all his pride had plann'd,
And laughing Ceres re-assume the land.

Moral Essays, epist. 4.

It is to be lamented that Pope, by his satire on the profuse and ostentatious, but kind and benefic, Chandos, subjected himself to the imputation of ingratitude; it having been said, that he was under great personal obligations to this munificent nobleman. "From the reproach which the attack upon a character so amiable brought upon him, (says Dr. Johnson,) Pope tried all means of escaping. He attempted an apology by which no man was satisfied; and he was at last reduced to shelter his temerity behind dissimulation, and to endeavour to make that disbelieved which he never had confidence openly to deny. He wrote an exculpatory letter to the duke, which was answered with great magnanimity, as by a man who accepted his excuse, without believing his professions." The house was built in 1712; and, notwithstanding three successive shocks, which his fortune received, by his concerns in the African company, and in the Mississippi and South Sea speculations, in the years 1718, 1719, and 1720, the duke continued to live in splendour at Canons till his death, in 1744. The estate was unquestionably incumbered; on which account the earl of Aylesbury, father-in-law to Henry the second duke, and one of the trustees in whom it was vested, determined to part with a princely palace, which required an establishment too expensive for the duke's income. As no purchaser could be found for the house, that intended to reside in it, the materials of the building were sold by auction, in 1747, in separate lots, and produced, after deducting the expences of sale, eleven thousand pounds. The marble stair-case, in particular, was purchased by the late earl of Chesterfield, for his house in May-fair; the fine columns were bought for the portico of Wansted-house, near Epping, (*where now, September* 1803, *reside the dethroned and unfortunate royal family of France*;) and the equestrian statue of George I. one of the numerous sculptures that adorned the grounds, is now the central ornament of Leicester-square.

It is curious to remark, that when the plan of living at Canons was originally projected, the utmost abilities of human prudence were exerted to guard against improvident profusion. One of the ablest accomptants in England, Mr. Watts, the master of an academy in Little Tower-street, was employed by the duke to draw a plan, which ascertained the total of a year's, a month's, a week's, and even a day's, expenditure. The scheme was engraved on a very large copper-plate; and those who have seen it pronounce it a very extraordinary effort of economical wisdom. To this we may add, that the duke, though magnificent, was not wasteful. All the fruit in the garden, not wanted for his table, was sold on his own account: "It is as much my property (he would say) as the corn and hay, and other produce of my fields." An aged man, who had been the duke's servant, and now appeared "the sad historian of the pensive scene," informed the writer of this account, that, in his occasional bounties to his labourers, the duke would never exceed sixpence each: "This (he would observe) may do you good; more may make you idle and drunk."

Two miles from Edgware we enter Bushy-heath, where every traveller stops with rapture to partake of its delightful prospects. On the right is a charming view of the town of St. Alban's; and all the spaces between, and farther beyond it, present the riches of a luxuriant garden. The inclosed corn-fields make one grand parterre; the thick-planted hedge-rows appear like a wilderness or labyrinth; and the villages interspersed look like so many noble seats of gentlemen at a distance. In a word, it is all nature, yet with the semblance of all the decorations of art. On the left we are presented with a noble view of the west end of London, Westminster-abbey, and the parliament-house; but the body of the city is cut off by the hill, at which Hampstead intercepts the sight on that side. More to the south we have the magnificent appearance of Hampton-court, and south-west Windsor; and, between both, those beautiful parts of Middlesex and Surrey, on the banks of the Thames, which are the delight of the world.

ED'IBLE, *adj.* [from *edo*, Lat.] Fit to be eaten; fit for food.—Some flesh is not *edible*, as horses and dogs. *Bacon.*—Wheat and barley, and the like, are made either *edible* or potable by man's art and industry. *More.*

ED'IBLE NESTS. See the article BIRDS-NESTS, vol. iii. p. 56.

E'DICT, *s.* [*edictum*, Lat.] A proclamation, or command, or prohibition; a law promulgated.—When an absolute monarch commandeth his subjects that which seemeth good in his own discretion, hath not his *edict* the force of a law? *Hooker.*

Severe decrees may keep our tongues in awe,
But to our thoughts what *edict* can give law? *Dryden.*

EDIFICA'TION, *s.* [*edificatio*, Lat.] The act of building up man in the faith; improvement in holiness.—Our blessed Saviour told us, that we must account for every idle word, not meaning that every word not designed for *edification*, or less prudent, shall be reckoned for a sin. *Taylor.*—Improvement; instruction.—Out of these magazines I shall supply the town with what may tend to their *edification*. *Addison.*

ED'IFICE, *s.* [*ædificium*, Lat.] A fabric; a building; a structure.—My love was like a fair house built on another man's ground; so that I have lost my *edifice* by mistaking the place where I erected it. *Shakespeare.*

God built
So spacious, and his line stretch'd out so far,
That man may know he dwells not in his own;
An *edifice* too large for him to fill. *Milton.*

ED'IFIER, *s.* One that improves or instructs another.

To ED'IFY, *v. a.* [*edifico*, Lat.] To build:

There was a holy chapel *edify'd*,
Wherein the hermit wont to fay
His holy things each morn and eventide. *Spenfer.*

To inftruct; to improve.—Life is no life, without the bleffing of a friendly and an *edifying* converfation. *L'Eftrange.*

He gave, he taught; and *edify'd* the more,
Becaufe he fhew'd, by proof, 'twas eafy to be poor.
Dryden.

To teach; to perfuade. This is now either obfolete or ludicrous.—You fhall hardly *edify* me that thofe nations might not, by the law of nature, have been fubdued by any nation that had only policy and moral virtue. *Bacon.*

EDIKO'FEN, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine, where a battle was fought between the Pruffians and the French republican army, on the 12th of July 1794; the conteft was long and bloody, but the victory doubtful: the French general, Laboiffiere, by venturing too far, was taken prifoner: the battle was renewed the next day, and ended in favour of the republicans: four miles north of Landau.

E'DILE, *f.* [*ædilis*, Lat.] The title of a magiftrate in old Rome. See ÆDILE, vol. i. p. 133.—The *edile*, ho! let him be apprehended. *Shakefpeare.*

E'DILESHIP, *f.* The office of edile in ancient Rome:

Haply eyed at diftance
Some *edilefhip*, ambitious of the power
To judge of weights and meafures. *Gay.*

EDIN'BURGH, the metropolis of Scotland, and capital of the county to which it gives name, delightfully fituated on three lofty eminences, about two miles from the Frith of Forth. This city is comparatively of modern name and note. Maitland, and other antiquaries, have fallen into miferable miftakes and mifquotations concerning its origin. A paffage from an old writer, (fays Mr. Pinkerton,) has been adduced for its exiftence in 854, while the original itfelf is completely filent! Whatever may be the epoch of its exiftence, the earlieft hint that can be applied to it as a town, occurs in the Chronicon Pictorum, about the year 955, where mention is made of *Eden*, as refigned by the Engliih to the Scots, then ruled by Indulph. In the next century, Malcolm III. and Margaret of England, his celebrated queen, are faid to have refided in the caftle; but her life, by Turgot, omits this circumftance; and Holyroodhoufe was the foundation of the firft king David, in the year 1128. If we confide in the Chronicon Pictorum, its derivation will naturally arife from *Eden*, a beautiful place, and *burg*, a fortified tower or caftle. Other derivations, however, are contended for; as from *Eth*, a fuppofed king of the Picts; or from *Edwin*, a Saxon prince of Northumberland; or from the Gallic words *Dun Edin*, implying its fituation on a hill. Thofe who attribute its derivation to Edwin, contracted into *Edin*, are the more fanctioned in fuch conclufion, becaufe under that prince, the Anglo-Saxons of Northumberland, as early as the fixth century, eftablifhed a permanent military ftation on the rock on which the caftle of Edinburgh ftill ftands. For fome centuries following, here was no town but what ftood within the immediate precincts of the caftle. It was not till long after the Scots and Picts from the north and north-weft of the Forth had fubdued the fouthern country, nearly to the prefent border of England, that the Scottifh kings began to refide, for a part of the year, at Edinburgh, as well as at Dunfermline, Stirling, and Linlithgow. David I. by founding the monaftery of the Holyrood, at about a mile's diftance, on the fouth-eaft fite of the caftle, added the vicinity of a religious community to a military ftrong-hold, which thus gave rife to the exiftence of a town between them, that was to become at length fo conficderable. The firft buildings of the town, which extended beyond the precincts of the caftle, were framed chiefly of wood; were covered on the roof with turf, ftraw, heath, and fern; and lay in an irregular line along the ridge which runs from the Caftle-hill to that which is ftill called the Abbey. As the inhabitants became more numerous, the ftreets and lanes were extended on the fouth, on the weft, and on the fouth-eaft, of the High-ftreet; and the Grafs-market, the Canon-gate, the Cow-gate, were gradually filled with buildings. The acclivity which rifes fouthward from the Cow-gate, was more loofely occupied by religious houfes, and the refidence of fome of the nobility, and other attendants on the court. The walls encompaffed the High-ftreet, the Cow-gate, and the fouthern elevation to a fmall diftance beyond where the buildings of the college and the infirmary at prefent ftand. From the era of the inftitution of the court of feffion, and its permanent local eftablifhment in Edinburgh, this town may be confidered as having properly become, and not before, the capital of the kingdom. It was greatly enlarged and improved during the reign of James the Sixth, (the Firft of England.) The acceffion of the line of the Scottifh kings to the Engliih throne, inftead of interrupting the profperity of Edinburgh as a metropolis, feems rather to have advanced it. Edinburgh became, thenceforth, the permanent feat of government for Scotland, and the centre of correfpondence for all the reft of the kingdom with the court in England. Befides, the inftitution of the college by king James, and that of the high fchool, were fuch events as could not but advantageoufly influence the growth of the city. Even during the civil wars and the ufurpation of Cromwell, Edinburgh, though, perhaps, not another town in Scotland, ftill continued to thrive. After the reftoration, many new and lofty edifices were built in it; and it began to experience a livelinefs of trade to which it had been before a ftranger. That trade was greatly enlivened in confequence of the revolution. From the era of the revolution to that of the union, the buildings and the wealth of Edinburgh appear to have been very much enlarged. By the immediate confequences of the union, the profperity of the Scottifh capital was, for a while, interrupted. It was not effectually renewed till after the rebellion of 1745 was fuppreffed. From that period till the acceffion of George the Third, many bold projects were conceived for the improvement and extenfion of this city, and fome progrefs was even made in their execution. But, it was not till after the peace of 1763, that the old edifices began to be generally renovated, and the city to be extended to the north and the fouth over more than twice that compafs of ground which it had fo long irregularly covered. Till the commencement of the American war, the fpirit of building continued to prevail. During the continuance of that war, it languifhed; but it revived again upon the return of peace. From that era till the renewal of war, the public and private buildings of Edinburgh, and the ftreets, roads, and bridges belonging to it, were extended and improved ftill more rapidly than at any former time. Even within the laft ten years, the afflictions which the French republican war impofed on the whole country had no power to interrupt the extenfion of this town, efpecially towards the north.

Edinburgh, thus enlarged and improved, is fituate in lon. 2. 55. W. from the meridian of Greenwich, and in lat. 55. 52. N. and fends one member to the imperial parliament. It may be about fix miles in circumference, and fpreads over three oblong hills or elevated ridges; covering, likewife, more or lefs clofely, the intermediate declivities, and rifing irregularly up the fides of two or three inſulated heights, in which the lower elevations, more or lefs, abruptly terminate. Confidered in regard merely to its ftreets and buildings, this metropolis may vie with moft great towns in Europe. It conſifts of three parts: the new town, its moft northern diviſion; the old town, comprehending the High-ftreet, Canon-gate, Cow-gate, and other parts within the circuit

of

of the walls; and the ſouthern ſuburbs, including George's-ſquare, Nicolſon's park, &c. &c. The caſtle at the one end, and the palace of Holyrood-houſe at the other, may be conſidered as belonging to the old town. The new town, for the uniform beauty of the buildings, the ſpaciouſneſs of the ſtreets and ſquares, the unity of its plan, its advantages of cleanlineſs, air, and water, and, above all, that charming *rus in urbe* which it enjoys in Queen's-ſtreet, York-place, St. Andrew's-ſquare, and Charlotte's-ſquare, is certainly the fineſt aſſemblage of ſtreets and buildings in the world. James's-ſquare, however, protects it but partially from the eaſt winds; and, by its expoſure, and by the width, the ſtraightneſs, and the regularity, of its ſtreets, it is ſubject to the violence of the winds blowing from the north-eaſt, and the north, even to ſuch a degree as to be, in all ſeaſons, an uncomfortable and even dangerous reſidence to the valetudinarian. The greater part of its buildings, too, like the inns of court in London, contain a number of houſes or ſtories, one over another, and occupied by ſeparate families, under one roof; an arrangement much leſs convenient in ſeveral reſpects, and eſpecially leſs favourable to cleanlineſs, and to the eaſy ſupply of water, than where each building is, from top to bottom, deſtined to ſerve only as one houſe, and for a ſingle family.

The High-ſtreet, about a mile in length, from the Caſtle-hill to the Abbey, forms the principal part of the old town. Its width, and the loftineſs of its edifices on both ſides, give it, to the mind eſpecially of an unprejudiced ſtranger from England, an aſpect of dignity and ancient grandeur ſcarcely to be equalled by the effect of any other ſtreet in Great Britain. The houſes are built of ſtone, and covered on the roofs with ſlate. The walls are uncommonly ſtrong. Each houſe reſembles the keep of an ancient caſtle. In front, theſe dwellings riſe almoſt every where to the height of five or ſix ſtories. But, as the foreground is the ſummit of the ridge; the back-ground, but the ſteep deſcent of its ſides; ſome of the ſame buildings which appear in front only five or ſix ſtories high, are, on the oppoſite ſide, not leſs in height than nine, ten, or eleven ſtories. Lateral *wynds* or lanes, at right angles with the High-ſtreet, deſcend, on the north ſide, to the brink of that which was, forty years ſince, the *north loch*, or lake; on the ſouth ſide, to the Cow-gate. Theſe wynds are exceedingly narrow and inconvenient. Their houſes are loſty, in many inſtances ruinous, tenanted chiefly by the poor, and on the ground and in the upper ſtories by the moſt wretched part of this deſcription of people. The Croſs, in the midſt of the High-ſtreet, was once a curious Gothic monumental ſtructure, but exiſts now only in a coarſe Moſaic work in the pavement. Contiguous to it, on the north ſide, is the Royal Exchange, a ſmall ſquare of convenient buildings, with a piazza, which was, about the middle of the eighteenth century, erected to favour the buſineſs of the merchants. The buildings of the Parliament-ſquare, almoſt a century and a half older than thoſe of the Royal Exchange, ſtand nearly oppoſite, on the ſouth ſide of the Croſs. The Canon-gate, properly a ſuburb, and in old times the court end of the town, contains a number of good old houſes and gardens, which were once occupied by the chief nobility and gentry of the kingdom. The palace of Holyrood-houſe is a venerable and ſpacious quadrangular edifice, not unworthy of the kings for whoſe reſidence it was deſtined. James the Seventh, when duke of York, was the laſt ſovereign of theſe kingdoms who reſided in this palace. His grandſon, the pretender Charles, held here, for a few days, his mimic-court, in the year 1745. It was lately, for ſome time, the aſylum of the head of the exiled royal family of France. Several of the Scottiſh nobility have, by the king's favour, apartments in Holyrood-houſe; and in it are contained pictures of the kings of Scotland, from Fergus, 320 years before Chriſt, to the revolution. The caſtle is ſtrong by its natural ſituation, and by the fortifications which it comprehends. Conſiderable quantities of military ſtores of all ſorts are depoſited in it. Even in time of peace, a battalion or two of troops uſually lie in its garriſon; and the lieutenant-governor is almoſt conſtantly reſident. The declivity between the ſtreet named the Cow-gate, and the ancient ſouthern limits of the town, is occupied by lateral ſtreets, by ſome new ſquares, by one or two inſulated manſions, by the high ſchool, the infirmary, the college, and one or two other public buildings. Weſtward is the Graſs-market, in which hay, ſtraw, grain, ſheep, horſes, cows, and oxen, have long been plentifully expoſed to public ſale; Heriot's hoſpital, from a deſign of Inigo Jones, for the orphan ſons of the freemen of Edinburgh, a noble charitable foundation, of which the revenues have not been perverted from the juſt, original purpoſes; and, in the midſt of an extenſive burying-ground, that venerable religious ſtructure, the Grey-friars' church. Many of the old buildings in this part of Edinburgh are continually in a ſtate of dilapidation and renewal. The old caſtellated ſtructure gives place ſtill more and more to a lighter, cleanlier, and more commodious, plan of building. But, perhaps, another century may elapſe, ere the old town of Edinburgh ſhall be, in all its parts, completely accommodated to the modern methods of living and of trading induſtry. It was when every town was, as it were, but the enlarged *bas-cour* of a caſtle, when people crowded within the walls for protection againſt hoſtility, that, in order to afford dwellings to as numerous a population as poſſible, the faſhion of raiſing houſes like thoſe at Edinburgh began. It was continued here, from uſe, and on account of the advantage which was found in ſharing the privileges of burgeſſes.

The ſouthern ſuburbs are much leſs regular in arrangement than the oppoſite new town. The acceſs to them is principally by Bridge-ſtreet, compoſed of the north bridge that paſſes acroſs the evacuated baſon of the north loch, and the ſouth bridge, which, in the ſame line of direction, covers the lake which formerly exiſted towards Cow-gate. At its northern extremity, this ſtreet has directly in front the regiſter-office, the depot of the public records, and one of the moſt beautiful and uſeful edifices in Scotland. On the ſides of the ſouth bridge, and at one end of the north bridge, are a number of very rich and elegant ſhops. The college and the infirmary ſtand oppoſite to one another, at the ſouthern end of Bridge-ſtreet. The ſtreet terminates at this end, in that which is named Nicolſon's-ſtreet; and the two together, viewed in their common line of direction, have an admirably fine effect to the eye. Weſtward, by the Parliament-ſquare and the Lawn-market, a ſimilar line of communication by bridges begins to be opened. The ſouthern ſuburbs, thus communicating with the old and new town, conſiſt of Lauriſton, Watſon's-hoſpital for the education of ſixty boys, children of decayed members of the merchants' company; George's-ſquare, Park-place, Buccleugh-place, Briſtol-ſtreet, Potter-row, Nicholſon's-ſtreet, Richmond, Pleaſance, and Croſs-cauſeway, &c. George's-ſquare is one of the moſt elegant and agreeable places of reſidence in this city. Park-place is likewiſe occupied, as is alſo a part of Nicolſon's-ſtreet, by genteel families. The reſt of theſe ſuburbs are, in great part, inhabited by labourers, inferior tradeſmen, and ſtudents. The houſes of the poorer people in general, even in the modern-built parts of Edinburgh, have not at all the lightneſs and cheerful cleanlineſs of the ſnug brick houſes which are reared for dwellings to perſons of the ſame claſs in London and its vicinity. Indeed brick buildings are almoſt unknown in Scotland; and would be apt to impreſs the mind of a Scotchman with the idea of flightneſs, and want of duration.

Beſides the ſuburbs above-mentioned, we have to notice Leith, which adjoins Edinburgh on the eaſt, as Wapping does the city of London. Leith forms the *piræus*, or port, of Edinburgh. It was once a royal burgh; but the rights of the ſovereign over it, were, more than two hundred years ago, transferred for a ſum of money to the

city of Edinburgh. It lies on the banks of a moderate ſtream, which has alſo the name of Leith, at a ſmall ſpace from the ſouthern bank of the Forth, and on the very eaſtern extremity of that bank, and on the very beach of the ſouthern ſide of the frith. It conſiſts, as yet, chiefly of buildings of which a great part may be not leſs than two hundred years old, and which are placed in an awkward inconvenient arrangement. The two principal of the old ſtreets are the Kirk-gate, in which the ſuburb from Edinburgh ends, and Shore-ſtreet, which lies along the ſouth ſide of the harbour. The other ſtreets run in various directions between theſe, and contiguous to them, in that part which is named *South Leith*. There is on the north ſide of the river, a good deal of irregular building, old and new, which has the name of *North Leith*, as forming the northern diviſion of the town. Beſide the old parts of the town it is now diffuſed ſouthward around the ſkirts of a pleaſant and extenſive plain, called *Leith-links*, in elegant and commodious houſes with gardens, ware-houſes, &c. in which the principal merchants not living in Edinburgh have their reſidence. The harbour has been lately improved and enlarged, and is formed by a noble ſtone pier, erected at the beginning of the eighteenth century; and is defended by a battery. The road alſo affords good anchorage for ſhips of the largeſt ſize, in perfect ſafety. In 1781, a fleet of above five hundred ſail of merchant ſhips, with ſeveral men of war of the line, ramained here for ſome weeks. A draw-bridge over the river Leith affords a convenient paſſage between the north and the ſouth parts of the town, without ſtraitening the limits of the dock and harbour. On all ſides, the buildings continue to be rapidly extended. On the bank of the Forth, North Leith is in a progreſs of being continued to join the fiſhing-village of Newhaven, another dependency of the city of Edinburgh. On the two ſides of the walk and carriage-road between Edinburgh and South Leith, is gradually formed a ſtreet of villas with gardens, eſtabliſhments of manufacture, and other handſome and commodious dwelling-houſes, which is likely to be very ſoon complete; and when complete will, probably, be one of the buſieſt and moſt intereſting of all the ſtreets which belong to theſe towns. On all ſides, for the ſpace of three or four miles round, the vicinity of Edinburgh is covered with villas, gardens, ornamented farms and hamlets, which, though they do not, in ſummer, equal the environs of London, in an aſpect of ſweet, rich, ſimple, and graceful, beauty, have however a leſs naked and deſolate appearance in winter.

Edinburgh was erected into a biſhopric by Charles I. in 1633, under the archbiſhopric of St. Andrew. The city was firſt fortified and walled, in 1450, in the reign of James II. and ſome of the walls are yet remaining. In the centre of the city ſtands the cathedral, dedicated to St. Giles, which was made collegiate by James III. the four quarters of whoſe croſs were converted into four diſtinct pariſh churches; of which the choir, or New church, makes the principal church in the city; the centre is called the Old church; the ſouth-weſt quarter the Tolbooth church; and the north-weſt Haddo's Hole church, from ſir John Gordon, of Haddo, having been confined in it till his execution, in 1642, for holding out his caſtle of Haddo for Charles I. In other parts of this church the general aſſembly and the convention of royal burghs meet; ſeveral clerks have their offices, and one room is uſed as the city cartulary. The city was originally comprehended in one pariſh, and the miniſters had manſes in the Parliament Cloſe, till James VI. divided it into eight pariſhes, with a miniſter to each. The ancient royalty, independent of the ſuburbs, was afterwards, in 1625, divided into four, and the town into ſix in 1641; but the whole ancient royalty is now conſidered as one diſtrict, called the pariſh of St. Giles; and, upon the enlargement of the city, the extended royalty was annexed to the ſame pariſh. Thus there is but one pariſh in Edinburgh to this day. The eaſt ſide of the ſquare, now the governor's houſe, was anciently royal apartments, built in 1556 and 1616; and in one of them James VI. was born, June 19, 1566. State priſoners are confined here; and here are, or were, kept the regalia of Scotland, never ſeen ſince the year 1707. Near the cathedral is the parliament-houſe, finiſhed in 1640, with courts adjoining, and over it for the ſheriff and commiſſary, the town council, and criminal cauſes, the exchequer, and the room for the aſſembly of the royal boroughs. The Tolbooth, originally built by the citizens, in 1561, for the accommodation of the parliament and courts of juſtice, has been uſed ever ſince 1640 only for a gaol.

The population of Edinburgh and Leith has been variouſly eſtimated. The lateſt enumerations do not raiſe it to the ſum of one hundred thouſand ſouls. But certainly thoſe enumerations were made in circumſtances which hindered them from ſwelling the eſtimate to its juſt amount. A part of the inhabitants of Edinburgh are migratory, and live but half the year in the town: theſe ſhould have been taken into the number, but were not at all reckoned. We do not heſitate to ſtate one hundred and five thouſand as the probable preſent number of the inhabitants of Edinburgh and Leith, with the ſuburbs belonging to them, and the hamlets and villas which lie between and in their environs, to the diſtance of a mile from the exterior ſtreets on all ſides. The proportion of thoſe who exceed the age of ſixty years, is leſs numerous here than in many other places in the interior parts of the iſle, and on its weſtern coaſt. The proportion of perſons dying between the ages of five and threeſcore is very conſiderable. As this is a capital inviting many young people for education and employment, the proportion of perſons in it between the ages of fifteen and forty is unuſually great. Young perſons between eight, and twenty years of age generally enjoy good health here. For children between birth and ſeven or eight years of age, it appears from many inſtances to be a very inſalutary ſituation. Neither ſmall-pox nor meaſles is indeed, here, exceedingly fatal, but chincough, colds, putrid fevers, conſumptions, &c. make extraordinary havock among children in infancy, and the latter even upwards to the ages of ſeventeen and five-and-twenty years. Rheumatiſm, much exaſperated by the frequent prevalence of eaſt winds, is extremely afflictive to perſons of all ranks, after the decline of life begins.

It may be aſked how this large population of one hundred and five thouſand ſouls is ſuſtained? A part of them poſſeſs lands in the country, money in the public funds, or property in the Eaſt and Weſt Indies, out of which capitals, or the annual produce from them, the expences of their living are defrayed. It is probably between two and three hundred thouſand of the annual revenues of the inhabitants that comes thus in. Many of the gentry of Scotland, whoſe fortunes will not bear the expence of yearly journies to and from London, and who yet like the ſociety and amuſements of a great town, chuſe, of courſe, to ſpend here one half or two-thirds of the year. Many gentlemen's families come to Edinburgh for the purpoſe of uniting, in regard to the children, the benefits of a domeſtic with thoſe of a public education. Many gentlemen advanced in years, after ſerving in the army, or making fortunes abroad in trade, come to paſs the autumn of life in this city, rather than either in London or in remote rural retirement, on account of its advantages of ſociety, quiet and agreeable accommodation, with all the luxuries of life, and all the elegant amuſements, at a comparatively cheap and eaſy rate. A number alſo of the gentlemen's families in this town enjoy places under government, the duties of which are to be here executed, and on the emoluments of which they live. The commander in chief of the forces for Scotland, the lieutenant-governor of the caſtle, the ſoldiers of the caſtle, and of the barracks, expend a deal of money in Edinburgh for their ſubſiſtence. The judges and inferior officers of the courts of ſeſſion and exchequer; the commiſſioners

commiſſioners of the boards of exciſe and cuſtoms, with the inferior perſons ſerving in Edinburgh and Leith on theſe eſtabliſhments; the officers belonging to the departments of the lord clerk regiſter, to the ſtamp-office, the tax-office, poſt-office, and the herald's-office; with a few who belong to the eſtabliſhment of the royal houſehold, and a few enjoying honorary or eleemoſynary penſions from the crown; may all be reckoned to defray the expences of their living here, out of the revenues they receive from government, chiefly for the diſcharge of official duties. The whole ſum thus contributed, out of the common revenue of the ſtate, towards the ſupport of perſons reſident in Edinburgh, cannot be leſs than one hundred thouſand pounds ſterling. Another part of the inhabitants of this place ſubſiſt upon their incomes as practitioners in the law. Theſe claſſes may draw from the whole country, profeſſionally, for their ſubſiſtence, a groſs annual ſum of perhaps 130,000l. ſterling. The perſons belonging to the univerſity, the high-ſchool, and the other eſtabliſhments for education, profeſſors, maſters, and ſtudents, may have, in all, an income of about one hundred thouſand pounds a-year. Of this, about ſixty thouſand pounds may conſiſt of allowances by parents and others to the ſtudents from the country and from foreign parts. Many ſtudents paſs the whole year here; attending both the ſummer and the winter courſes of lectures. Bankers, merchants, ſhip-maſters, and ſhop-keepers, compoſe a large proportion of the inhabitants of Edinburgh and Leith; and probably above two hundred thouſand pounds ſterling of the total yearly income of theſe places may be the produce of their buſineſs and induſtry. Here are two incorporated banking-companies, the Old Bank, and the Royal Bank of Scotland, and many private banking-houſes. The merchants reſide rather at Leith than in Edinburgh. The ſhipping and the ſea-faring trade belonging to theſe places is conſiderable; and they have been much augmented ſince the completion of the canal which joins the Forth and the Clyde. The artiſans and manufacturers are here a very conſiderable body of people; and a large ſhare of the income of the place ariſes from their induſtry and extenſive connections.

The merchants of Edinburgh, Leith, and the environs, are aſſociated, with the approbation of government, in a chamber of commerce, which watches over their common intereſts, and occaſionally correſponds with his majeſty's miniſters reſpecting matters in which theſe intereſts are deeply concerned. The Ruſſia, &c. merchants, trading to the dominions of Ruſſia, Denmark, and Sweden, in the Baltic and North Seas, are conſiderably numerous and opulent. Tar, timber, iron, hemp, flax, coarſe linens, Ruſſia leather, &c. are the imports from thoſe parts. Cottons, glaſs and bottles, articles of houſehold furniture and dreſs, utenſils of the arts, &c. are the goods ſent out in return. Many of the imports are for immediate conſumption, not for manufacture in order to re-exportation. For the articles of timber, tar, hemp, and flax, even alone, the nations of the Baltic draw vaſt ſums from the merchants on the Frith of Forth. Corn to a great value is imported, for the uſe of the diſtillers, from Dantzic, Gothenburgh, &c. The ſame merchants trade likewiſe to the ports at the mouths of the Elbe, the Ems, and the Weſer. The exports are cottons, glaſs, lead, caſt-iron in various uſeful forms, with other ſorts of goods of the manufacture of this country. From the port of Leith, as from Hull and Newcaſtle, there is an exportation of pit-coal to the Baltic. Since the Clyde and Forth were connected by a navigable canal, the merchants of Glaſgow prefer the navigation of that canal, and of the Forth, to the circuitous and hazardous navigation by the Hebudæ and the Orkneys, for their trade to England, and for the exportation of their ſugars, rums, and other Weſt-India goods, as well as of the cottons, to the markets of Germany and the Baltic; a preference which tends greatly to enliven and enlarge the trade of Edinburgh and Leith. The trade with London and the other ports on the eaſt coaſt of England employs much of the mercantile capital of theſe places, and affords large profits to its merchants. The products of the herring-fiſhery, and of the other fiſheries on theſe coaſts, begin to render the exports from Leith to the ports of England much more valuable than they have heretofore been. Edinburgh ale is exported in conſiderable quantity to London: vaſt quantities of London porter are conſumed in Edinburgh. The diſtillers of Edinburgh and its neighbourhood ſend vaſt quantities of malt ſpirits to the Engliſh market. Woollen-cloth, to a prodigious amount, and almoſt every article of more elegant manufacture, except cottons, linens, and glaſs, are received from England for conſumption in Edinburgh and its neighbourhood. The trade from Leith to Portugal and to the ports of the Mediterranean is conſiderable. The wine-cellars of the merchants here are famous for ſupplying the beſt port that is drunk in Britain. Salted fiſh of different ſorts are the chief exports from Leith to thoſe ſouthern parts. A trade is alſo carried on from this port to the Weſt Indies and North America. It has been ſucceſsful, and will probably become more conſiderable.

The great trade of Edinburgh is, in retail, for the conſumption of its own inhabitants, and for the uſe of perſons in all parts of Scotland to whom its other advantages of intercourſe, correſpondence, and opulence, as a capital, make it convenient to ſupply their wants rather directly from this than from any other market. Its ſtaple manufactures for wholeſale are glaſs works, ſoap-works, a manufacture of table-linen, caſt-iron works, tanneries, button manufactures, cotton-works, pit-coal works in the vicinity, ſhip-building, houſe-building, and the herring-fiſhery, if we may name the cure of immenſe quantities as a manufacture. The merchants doing buſineſs in wholeſale, and exporting and importing by ſea, employ capitals of from 2000l. to 20,000l. or 30,000l. ſterling. Fortunes of from 5000l. to 20,000l. are frequently acquired in the courſe of a ſingle life, by ſhop-keepers trading with prudence and ſucceſs. Merchants in buſineſs on a greater ſcale, not ſeldom realize from 10,000l. to 50,000l. There are who have acquired by trade in this metropolis to the clear amount of 200,000l. or even 300,000l.

Edinburgh, as already obſerved, owes much of its wealth and importance to the advantages it enjoys as the ſeat of the courts of juſtice and the offices of government. The court of ſeſſion, compoſed of fifteen ordinary judges, is the ſupreme court in Scotland for the deciſion of civil cauſes between parties who are ſubjects. The court of juſticiary is the ſupreme court for criminal affairs. The court of exchequer tries cauſes relating to the revenue. The ſheriff's courts, the juſtice of peace's courts, and the town courts, are for the ſubordinate diſtribution of juſtice for the diſtrict. About ſeven hundred perſons in all may be here employed in tranſacting juridical buſineſs, as judges, advocates, writers to the ſignet, agents, procurators, notaries, meſſengers, and clerks. The trial of cauſes goes on with leſs diſpatch than in the Engliſh courts. The world has not ſeen judges more upright, more learned, of greater abilities, or more aſſiduous in their functions, than thoſe who have for many ſucceſſions filled the benches of the courts of ſeſſion, juſticiary, and exchequer, at Edinburgh. The advocates or counſellors are men of family; often eminently ſkilled in all the branches of erudition, ſcience, and ornamental literature; always, in conſiderable number, conſummate maſters of the juriſprudence of their own and other countries. Their order never wants orators, whoſe pleadings are not exceeded in eloquence by thoſe at any other bar. The officers of the cuſtoms, the exciſe, the ſtamp-duties, the general poſt-office, the court of admiralty, the poſt-office, the herald's-office, the ſtaff of the army for Scotland, &c. form a numerous, and, eſpecially for the higher orders, an eminently reſpectable body of men. Their duties are faithfully diſcharged; their incomes are honourably expended. Edinburgh and Leith owe to them much

much of the reſpectability of their ſociety and the activity of their buſineſs.

In regard to the ſyſtem of education for the youth of this place, and the knowledge here cultivated, all that is favourable may be, with juſtice, affirmed. For the firſt inſtruction of children in letters, there are a ſufficient number of Engliſh ſchools open under the authority and inſpection of the magiſtrates, which never fail to be ſupplied with excellent teachers. The high ſchool for inſtruction in the Latin language, and in Engliſh ſo far as connected with the elements of the Latin, is filled by five maſters, the moſt eminent for ſkill in claſſical literature, and of the higheſt reputation for that gravity, mildneſs, prudence, piety, and unoſtentatious virtue, which are the requiſite qualities in a good teacher. There are alſo ſchools of public inſtitution for inſtruction in writing, arithmetic, and the immediately practical branches of mathematics. And beſides the ſchools of public inſtitution within the city of Edinburgh, there are many private ſchools for the modern languages, and for every different part of education, neceſſary or liberal. It is uſual here for all parents, without exception, to ſend their children to ſchool.

The univerſity conſiſts but of a ſingle college, founded by James the Sixth, in 1582. It has profeſſors for Greek and Roman literature; for the different branches of philoſophy, phyſical and moral; for mathematics; for the ſeveral parts of medical ſcience; for theology; for natural, eccleſiaſtical, and civil, hiſtory; and for the different branches of the ſtudy of juriſprudence. The profeſſors are, almoſt without exception, men of excellent character, of great learning and ſcience, of the happieſt talents and addreſs for communicating knowledge, and of diligence admirably exemplary in the diſcharge of their profeſſional functions. The ſeſſion is for ſeven months, from October to May. The uſual number of attending ſtudents is ſeldom under twelve hundred. The courſe for the languages, philoſophy, and, after theſe, either law, medicine, or theology, as a profeſſional ſtudy, is about ſeven or eight ſeſſions. Degrees are conferred in juriſprudence, medicine, and theology. The profeſſors enjoy ſmall ſalaries; receive fees from the ſtudents; deliver lectures. Of late, for the convenience of the ſtudents, ſeveral of them have been accuſtomed to read a ſecond courſe of lectures in ſummer, after cloſing that for the winter. The expence of reſidence and education for a young man living here, genteelly, but *frugally*, and with uniform prudence, may be done for ſo little as 100l. a year. There are ſeveral ſocieties, medical, juridical, theological, philoſophical, and literary, in which the ſtudents voluntarily meet, to debate and read eſſays which they, in turn, compoſe and preſent. There is an extenſive and valuable library. The profeſſor of anatomy has a very large and excellent collection of preparations for illuſtrating the ſubject of his lectures; and there is a good muſeum for the illuſtration of the lectures on natural hiſtory. The principal, with the whole body of profeſſors, form the *Senatus Academicus*, which regulates the police of the univerſity, under the direction and authority of the city-magiſtrates. A proviſion is made for a ſmall and limited number of burſars; but here are no fellows. A new edifice for the accommodation of the profeſſors and ſtudents in all the immediate buſineſs of the univerſity is begun to be built, on the plan of Mr. Adam; but it remains hitherto (September 1803) unfiniſhed.

Here is a royal ſociety for the advancement of phyſical and moral ſcience. It was inſtituted under the auſpices of the late Dr. Robertſon, the hiſtorian, and late principal. Its liſt of members is highly reſpectable. Several volumes of its memoirs have been publiſhed, and well received by the world.

The phyſicians and ſurgeons of Edinburgh are reſpectively incorporated. Both theſe bodies conſiſt of men, the pride of the ſociety of the place, and the beſt ornaments of their profeſſions. They are, almoſt without exception, men of eminent ſkill in the ſciences allied to thoſe noble arts which they practiſe. Hence the medical ſchool of Edinburgh has been ſeen to riſe rapidly into conſequence, from a very humble origin, and continue to advance daily, by energetic means, wiſely adapted to render its inſtitution a benefit to the whole world.

Here has been lately inſtituted a profeſſorſhip of agriculture, through the munificent and active means of Mr. Pulteney; and a profeſſorſhip of commerce has been alſo ſtrongly recommended. With this view, the following remarks are offered by its ſtrenuous advocate Mr. Heron. "It appears ſurpriſing, that in a commercial age, and among a nation, the foundations of whoſe ſtrength and happineſs are eſtabliſhed upon their manufactures and commerce, no leſs than upon their agriculture, there ſhould be no particular inſtitution for the inſtruction of youth in the elements of commerce. Forming but a ſlender part among the numberleſs modifications of human exertion; its riſe and progreſs cannot be very particularly detailed in a courſe of general hiſtory. For the ſame reaſon, its relations can never be fully explained in a ſeries of lectures on the principles of political economy. The arithmetician and the accountant teach but a very ſmall part of the actual practice of trade, and that but very imperfectly. But if, when detached from each other, the ſeveral parts of commercial knowledge may make but an inconſiderable figure; if they cannot be ſeparately taught, in their full extent, among the other branches of knowledge; taken all together, however, they appear to be of great magnitude and importance; and might be very beautifully connected into a diſtinct ſyſtem of ſtudy. In ſuch a ſyſtem, the hiſtory, the philoſophy, and the economy, of commerce, might be ſucceſſively explained. By the philoſophy of commerce I mean the inveſtigation of its relations to climate, laws, manners, internal induſtry, religion, national virtue, power of defence, national revenue, local ſituation, &c. By its economy, I underſtand all its tranſactions, from gifts in the expectation of gifts, and the barter of commodities among ſavage tribes, to the moſt complex negociations of the moſt ingenious trading nations in Europe. Surely ſuch an inſtitution for thus improving and extending commercial knowledge were worthy of the legiſlature and government of a great trading nation; of the patronage of merchants and manufacturers, in a country where they form ſo very opulent and ſo very reſpectable an order in the community, and are ſo much diſtinguiſhed by liberality of ſentiment and of manners; and of an univerſity, the moſt deſervedly celebrated in Europe, and which ſeems to want only this additional inſtitution to render its proviſions, for literary and ſcientific inſtruction, moſt admirably complete!"

The clergy of the eſtabliſhed church in Edinburgh are in general illuſtrious for knowledge, eloquence, ſanctity of manners, and diligence in the paſtoral functions. They are univerſally and very highly reſpected. Several of them are profeſſors in the univerſity; and have diſtinguiſhed themſelves by their writings.

Of the faculty of advocates, as men of great taſte and learning, we have already made honourable mention. Their library is one of the beſt in Europe; and is opened, in a manner ſufficiently convenient and obliging, to the ſtudious uſe of all men of learning and ſcientific enquiry. It were eaſily poſſible to enumerate many gentlemen of Edinburgh, who have diſtinguiſhed themſelves as philoſophers and eloquent writers by a great variety of publications. But they are ſo well known by their writings, that it were needleſs to recount their names.

The municipal government of this town is, by its charter, in the magiſtrates and town-council, which conſiſt of a lord provoſt, a dean of guild, a guild council, and twenty-five common council, compoſed of merchants and tradeſmen: and a conſtant guard of ſeventy-five men, in an uniform, are kept in the guard-houſe to patrole the ſtreets every night. Leith, Canongate, and one or two other ſuburbs, are governed by ſubordinate magiſtrates,

of

of the appointment of thoſe of Edinburgh. There are a number of incorporations of artiſans who have alſo a ſhare in the municipal government. The adminiſtration of the police is extremely vigilant, prudent, and enlightened. Street-robberies and murders are, in conſideration of the numbers of the people, very rare. The morals are more commendable than in almoſt any other metropolis. Every virtue of prudent diſcretion, every virtue of generous magnanimity, every good quality, the reſult of enlarged intelligence, prevails among that part of the community who are eſteemed. No atrocious depravity of diſpoſition and feeling is prominent even among the worſt. Charity and loyalty are two public virtues univerſal among theſe people. The many charitable inſtitutions, the liberality with which the wants of the poor are conſtantly ſupplied, the great ſums at different times ſubſcribed for the orphan families of ſoldiers and ſailors, the benevolent inſtitution and admirable regulation of its infirmary, and the late munificent eſtabliſhment of its houſe of induſtry, may be mentioned, out of innumerable inſtances, to ſhew how open the hearts of theſe people are to the ſympathetic ſenſe of human woe.

In dreſs, the inhabitants of Edinburgh follow the ſame faſhions as thoſe of London. In their victuals, they are perhaps leſs cleanly; in their houſes, more ſo. They are very convivial; and perhaps more frankly and warmly ſo than the people of England. The royal theatre, a concert, a circus for pantomimes and feats of horſemanſhip, aſſembly-rooms, and frequent aſſemblies for cards and dancing, are their chief public amuſements. Tradeſmen do not ſquander much of their money in following theſe. The public amuſements are conducted with great decorum, and under the cenſure of a nicely diſcriminating taſte. Upon the whole, the inhabitants of Edinburgh are eminently diſtinguiſhed for information and propriety of behaviour; which may be attributed to a variety of cauſes. Learned and literary men, particularly thoſe connected with the college, are held in great eſtimation, and are received with cordiality into the higheſt circles. By far the moſt numerous claſs of the reſpectable inhabitants are in the profeſſions; and commerce, which ſometimes ſuddenly raiſes ill-educated men to affluence, has ſcarcely any place in the Scottiſh capital, where education is ſo much encouraged. Theſe circumſtances cannot be without ſome effect upon the minds of young men who go thither for the purpoſe of improvement. Indeed, all orders of people here are in general virtuous and induſtrious, ſober, diligent, and of courteous manners, moſtly bred up in ſevere abſtemiouſneſs, and hence addicted to the ſtricteſt rules of economy. Here too we are furniſhed with a ſtriking proof of the converſe of that arbitrary, not to ſay inhuman, doctrine, which has of late been propagated, "that univerſal education would render the lower claſs unfit for labour and ſervitude:" for it may with truth be affirmed, that the lower orders of ſociety in Edinburgh and other parts of Scotland, are the *beſt* educated, and at the ſame time the moſt *diligent* ſervants in the world.

The ſituation of Edinburgh, with reſpect to the ſurrounding country, is highly deſerving of our notice. Its proſpect toward the north-eaſt and the ſouth-eaſt is into the frith of Forth, and to the German Ocean. To the north and north-weſt, a wide view opens acroſs the Forth, at its greateſt expanſion, and over the ſection of a vaſt amphitheatre, to where the horizon is bounded by the Grampian mountains. Immediately to the weſt and the ſouth-weſt, the adjacent country riſes into hills of conſiderable, though not aſtoniſhing, elevation, which confine the range of the eye within narrow bounds. Southward extends a beautiful territory, of an irregular but rich and cultivated ſurface, alternately riſing and ſubſiding towards the banks of the Eſk, the ruins of Roſlin, the town of Dalkeith, and the fine maritime village of Inverеſk, Arthur-Seat, Saliſbury-Craggs, and Caltonhill, protect the town, to the eaſt, from thoſe chilling winds from the ſea, to which it is, by its ſituation, exceedingly expoſed; and preſent, in their columnar ſtratification, their volcanic aſpect, their inſulated height, and their air of deſolate barrenneſs; a ſtriking contraſt to the refinement, art, and cultivation, which are eminently conſpicuous all around them. The Caſtle-hill, and ſeveral other contiguous heights are of a ſimilar aſpect and ſtratification. The ſurface of the whole territory is varied and unequal to a degree, ſuch as is rarely to be ſeen even in other parts of this iſle. The climate would be mild and genial in proportion to the latitude, were it not for the winds from the eaſt and north-eaſt, which, in ſpring and ſummer, perpetually blaſt vegetation, and to an almoſt inconceivable degree afflict the human health. The ſame eaſtern expoſure renders Edinburgh and its neighbourhood alſo ſubject to ſudden and moſt ſevere ſtorms in winter. It is too much excluded by the interior hills, at all times of the year, from the ſoft and cheering breezes of the weſt. Its vicinity to the ſea, the ſhelving inequalities of the ſurface, the lightneſs of the ſoil, on a bottom of limeſtone, granite, and trapp or baſalt, render the town and the ſurrounding territory ſubject, in ſummer, often to an intenſity of heat that is ſufficient to ripen, in the open air, the fruits of much more ſouthern latitudes; and that would be ſcarcely tolerable in the thin brick buildings of London, or, indeed, in any others than the cool and ſomewhat gloomy ſtone edifices which we here inhabit. It is confeſſed by all travellers who have ſkill in the beauty and grandeur of landſcapes, that ſcarce another ſpot in Europe affords, within not more than an equal range of horizon, ſo great a diverſity of views, and thoſe ſo admirable in the three different claſſes of the ſublime, the picturеſque, and the beautiful.

ED'INBURGHSHIRE, or MID-LOTHIAN, a county of Scotland, which takes its name from the above metropolis; bounded on the north by the Frith of Forth, on the eaſt by Haddingtonſhire, Berwickſhire, and Roxburgſhire; on the ſouth by Selkirkſhire, Peebleſhire, and Lanerkſhire; and on the weſt by Linlithgowſhire. Its form is nearly the ſegment of a circle, about twenty-ſeven miles from eaſt to weſt, and ſixteen from north to ſouth; but in ſome places not above ſix. The ſoil is fertile, and produces corn of all ſorts with plenty of graſs for cattle; it contains mines of coal, copper, lime-ſtone, and black marble. The principal towns, beſides Edinburgh, are Dalkeith, Leith, and Muſſelburg; the principal rivers are the Eſk, the Leith, the Almond, and the Galla. It ſends one member to the imperial parliament.

E'DINGDON, or EDINGTON, [of eaƀ, Sax. eaſy, and dun, a hill.] A town in Wales, memorable for king Alfred's ſignal victory over the Danes.

EDIS'TO, an iſland of North America, about twenty miles in circumference, near the coaſt of South Carolina. Lat. 32. 35. N. lon. 80. 20. W. Greenwich.

EDIS'TO, or PONPON, a navigable river of North America, in South Carolina, which riſes in two branches from a remarkable ridge in the interior part of the ſtate. Theſe branches unite below Orangeburgh, which ſtands on the north fork, and form Ediſto river, which, having paſſed Jackſonburg, leaving it on the ſouth, branches and embraces Ediſto, and ſeveral ſmaller iſles.

E'DIT, a town of Sweden, in the province of Weſt Gothland: twenty-five miles north of Gothenburg.

E'DITH, [of eaƀ, Sax. proſperous, and ƿ̈ian, to redound, *q. d.* one who overflowed with proſperity.] The wife of Edward the Confeſſor. A proper name of women.

EDI'TION, *ſ.* [*editio*, Lat.] Publication of any thing, particularly of a book.—This Engliſh *edition* is not ſo properly a tranſlation, as a new compoſition on the ſame ground. *Burnet.*—Republication; generally with ſome reviſal or correcting.—Theſe are of the ſecond *edition*. *Shakeſpeare.*—The buſineſs of our redemption is to rub over the

the defaced copy of the creation, to reprint God's image upon the ſoul, and to ſet forth nature in a ſecond and a fairer *edition*. *South*.

ED'ITOR, *ſ.* [Lat.] Publiſher; he that reviſes or prepares any work for publication.—When a different reading gives us a different ſenſe, or a new elegance in an author, the *editor* does very well in taking notice of it. *Addiſon*.

ED'MER, or EADMER, a learned Engliſh Benedictine monk, of the congregation of Cluni, belonging to the order at Canterbury, flouriſhed in the latter end of the eleventh, and the beginning of the twelfth, century. He was made abbot of the monaſtery of St. Alban's, and afterwards raiſed to the ſee of St. Andrew in Scotland. He was the author of a Treatiſe on the Liberty of the Church, intended to vindicate Anſelm, archbiſhop of Canterbury, in his conteſts with king William Rufus. He alſo wrote ſeveral other works, which the learned of modern times have thought worthy to be reſcued from oblivion. Among theſe is his *Hiſtoria Novorum*, or hiſtory of his own times, from the year 1066 to the year 1122, which the celebrated Selden publiſhed with notes, in folio, 1623, and which lord Lyttleton, in his Life of Henry II. pronounces to be not inelegantly written. In the ſecond volume of Wharton's *Anglia Sacra* are alſo preſerved, by the ſame author, 1. The Life of St. Anſelm, Archbiſhop of Canterbury. 2. The Life of St. Oſwald, Archbiſhop of York. 3. The Life of St. Dunſtan, Archbiſhop of Canterbury, with a Letter to the Monks of Glaſtonbury. 4. The Life of the bleſſed Bregwin, Archbiſhop of Canterbury. 5. An Epiſtle to the Monks of Worceſter, concerning the Election of a Biſhop. 6. The Life of St. Odo, Archbiſhop of Canterbury.

ED'MONTON, [q. d. *Edmund's Town*, probably of king Edmund.] A village ſeven miles north from London.

ED'MUND, [ꝥaꝛ, Sax. bleſſedneſs, and munꝺ, peace; *q. d.* bleſſed peace.] A king of the Eaſt Engliſh, martyred by the Danes. A man's name.

ED'MUNDSBURY, [of *St. Edmund*, and buꝛʒ, Sax.] A pleaſant town in Suffolk, ſixty miles north-north-eaſt from London; ſo called from St. Edmund, who there ſuffered martyrdom under the Danes.

ED'NA, the name of a woman. *Tob.* vii. 2.

EDO'AR, a town of United America, in the ſtate of Maſſachuſetts, ſituated on the iſland of Martha's Vineyard.

EDO'LO, a town of Italy, in the Breſſan: fifteen miles north-north-weſt of Breno.

E'DOM, or IDUME'A, the territory of the Edomites, the deſcendants of Eſau, eldeſt ſon of the patriarch Iſaac. It was ſituated in Arabia Petræa, and was ſurrounded by Paleſtine, the land of Moab, the Sandy Deſert, the Red Sea, and the land of the Philiſtines. Previous to the eſtabliſhment of the offspring of Eſau, it was denominated Mount Seir, and was inhabited by a people called Horims or Horites, who were diſpoſſeſſed by them. *Deut.* ii. There were kings of Edom as early as the days of Moſes; and, from this period, to the lateſt account we have of the Edomites as a nation, it appears they were uniformly the avowed enemies of the Iſraelites; and, in this inſtance, moſt certainly affords a very ſingular diſplay of the influence of hereditary prejudice; witneſs their ungenerous treatment to them in their journey through the wilderneſs, in refuſing them a paſſage through their territory; and the readineſs evinced upon all occaſions to conjoin with their common enemy. King David, it ſeems, conquered this country and added it to his kingdom, eſtabliſhed garriſons throughout the country, and left the Iſraelitiſh army, with Joab at their head, to ravage the country for ſix months, with the intent to deſtroy every male they could find; but one of the king's ſons, named Hadad, eſcaped to Egypt, and remained there until the reign of Solomon, when he appeared as his enemy, in conſequence of Solomon's defection from the worſhip of God. 1 *Kings*, xi. Nevertheleſs Edom remained ſubject to the kingdom of Judah until the reign of king Joram, when they threw off their yoke, choſe a new king, and remained independent until the time of Hircanus the high prieſt, who, having taken moſt of their cities, compelled them to be circumciſed; and, from this period, it is ſuppoſed they mingled with the Jews, and were ever after conſidered as ſuch.

E'DOM, or ESAU, the ſon of Iſaac and brother of Jacob. The name of Edom, which ſignifies *red*, was given him, either becauſe he ſold his birth-right to Jacob, or by reaſon of the colour of his hair and complexion. Idumea derives its name from Edom, and is often called in ſcripture *the land of Edom*.

ED'OMITE, *ſ.* A deſcendant of Edom, an inhabitant of Edom.

EDRE'I, [Heb. a huge maſs.] A city of Paleſtine, ſituated in the half tribe of Manaſſeh, in Baſhan, eaſt of Jordan. This city was the capital of Baſhan previous to its conqueſt by the Iſraelites. *Joſh.* xiii. 31. Alſo the name of another city of Paleſtine ſituated in the tribe of Napthali. *Joſh.* xix. 37.

ED'SAN, a river of Ruſſia, which runs into the Lena: twenty miles ſouth-eaſt of Ziganſk.

EDS'WOL, a town of Norway: eighteen miles ſouth-weſt of Berga.

To E'DUCATE, *v. a.* [*duco*, Lat.] To breed; to bring up; to inſtruct youth:

Their young ſucceſſion all their cares employ;
They breed, they brood, inſtruct and *educate*,
And make proviſion for the future ſtate. *Dryden*.

EDUCA'TION, *ſ.* Formation of manners in youth; the manner of breeding youth; nurture; inſtruction.—All nations have agreed in the neceſſity of a ſtrict *education*. *Swift*.

"Train up a child in the way he ſhould go, and when he is old he will not depart from it,"—is a ſentiment which fell from the pen of Solomon, full of wiſdom and of truth. From this ſcriptural precept it is obvious, that the firſt buſineſs of education ſhould be to ſtimulate and direct the deſire of knowledge, which ſeems to be naturally created by the affinity of external objects, and the ſenſes affected by them. The general occupation of infancy ſhould therefore be to *enquire*; the buſineſs of inſtructors to *direct* curioſity to proper ſubjects, and to provide for its full and various gratification. This is the apprenticeſhip of wiſdom: for by it youth may acquire the art of referring appearances to cauſes; of ſorting ideas; and of diſtinguiſhing truth: it early awakens the mind to an expanſion of its faculties, and directs the powers of thought to every judicious inveſtigation.

The multitude of writers on the ſubject of education, not only evinces its importance, but ſhews the neceſſity likewiſe of regulating its mode, from real obſervation and experience. The names of Milton, Locke, Rouſſeau, and many others, ſtand high as *theoriſts* in this important duty of human life. Their ſyſtems are plauſible, and their obſervations truly ingenious. But they have fallen into the common error of thoſe who attend to ſpeculation more than to practice; and have thence proved, that viſionary writers on education are often admired, though their directions can ſeldom be purſued. It will be the object of this treatiſe therefore, to recommend thoſe genuine principles of *claſſical* education, on which not only the taſte, but the religion, the virtue, and the liberties, of every free country will in a great meaſure conſtantly depend. True patriotiſm and true valour originate from that enlargement of mind, which the well-regulated ſtudy of philoſophy, poetry, and hiſtory, tends to produce. He who is converſant with the beſt Greek and Roman writers, muſt imbibe, if he is not deficient in the powers of intellect, ſentiments and opinions no leſs liberal and enlarged, than elegant and ingenious.

The poſſeſſion of an enlarged and philoſophical mind, is greatly ſuperior to the poſſeſſion of a great fortune;

for he who enjoys a ſmall income, and has received the benefits of a liberal and philoſophical education, is generally found the moſt happy, and moſt reſpectable character. Even the country curate, though his pittance is ſmall, yet if he adheres to his ſituation in life, and affects not the ſportſman, or the man of expenſive and vicious pleaſure, but has formed a taſte for the claſſics, for compoſition, and for the contemplation of the works of nature; who ſpends his time in letters, and who ſtudies virtue and innocence, fails not to receive the reſpect and love of all men.

We may notice *two* kinds of education; one of them confined, the other enlarged; one, which only tends to qualify for a particular ſphere of action, for a profeſſion, or an official employment; the other, which endeavours to improve the powers of the underſtanding, for the ſake of exalting the endowments of human nature, and rendering it capable of ſublime and refined contemplation. This conſtitutes a broad and a firm baſis, on which any kind of ſuperſtructure may afterwards be raiſed. It furniſhes a power of finding ſatisfactory amuſement for thoſe hours of ſolitude, which every man muſt ſometimes know even in the buſieſt walks of life; and it conſtitutes one of the beſt ſupports of old age, as well as the moſt graceful ornaments of manhood. Even in the commercial department it is greatly deſirable; for beſides that it gives a grace to the man in the active ſtage of life, and in the midſt of his negociations, it enables him to enjoy his retreat with elegance, when his induſtry has been crowned with ample ſucceſs.

The modes of education purſued by the ancient Greeks, Romans, Cretans, &c. being foreign to the purpoſe of the preſent article, will be found more appropriately arranged under their reſpective heads, among the ſubjects which to each of thoſe celebrated governments reſpectively belong. With us it is of more importance to aſcertain the era at which education ſhould commence. To determine the queſtion with accuracy, diſcernment muſt be exerciſed in diſcovering the different degrees of expanſion which different minds diſplay, even at an infantine age. Upon the principle, that the earlieſt impreſſions are the moſt durable, and with a view to ſave time for future improvements, it becomes evident that a child ſhould be taught all that it can comprehend, as early as poſſible. But ſome few years muſt neceſſarily elapſe, before the fragility of childhood is capable of being launched upon the turbulent ocean of a ſchool. That this period ſhould not be ſo entirely neglected as it uſually is, moſt thinking people will allow. Tender as is the age of the pupil, ſome inſtruction may be conveyed through the medium of precept, and much through maternal care. In this department of education, Locke's Treatiſe may be conſulted to conſiderable advantage; and Rouſſeau's work is replete with excellent maxims, as far as the phyſical treatment of *infancy* is concerned. With regard to the latter writer, viſionary as his general ſyſtem may be, in this branch of it he may be followed with the happieſt conſequences; nor does he yield to any of his competitors in an accurate knowledge of human nature in its earlieſt ſtages. His prevailing foible is an attempt at brilliancy and novelty of thought, to the prejudice of ſober and uſeful diſcuſſion: but through the greater part of his introductory books, he abounds in real information, and ſacrifices the love of ſingularity to the purſuit of valuable truths. His deſcription of the various melancholy conſequences which ariſe from the neglect of the maternal duties, ſhould be peruſed betimes and unceaſingly, till it obtains a permanent hold on the imagination. Let the glare of faſhionable pleaſure be contraſted with the chaſter colours in which Rouſſeau delineates domeſtic felicity, and the illuſion muſt vaniſh from before the eye of taſte and liberal ſentiment. But, when he recommends it to his readers to direct all their attention to the culture of the corporeal powers, and even to repreſs the expanſion of the mental faculties, we ſee him tottering on the precipice of paradox, while the utmoſt caution ſhould be given his unwary followers, how they commit themſelves to the perils of an untried path. The grounds on which he argues againſt the expediency of infantine inſtruction are, that the mind, not as yet ſufficiently diſcriminative, is incapable of diſtinguiſhing the true tendency of precept; that it is therefore the beſt policy to preſerve the tablet of the mind free from any impreſſion, till it can receive its appropriate character, rather than hazard the contraction of prejudice, by bewildering the ſenſes with too remote propoſitions. But we cannot conceive it poſſible, at any age, that the mind can continue a blank; if then we would prevent the intruſion of falſe opinions, we muſt furniſh thoſe which are juſt; and though childhood may not be competent to fathom the depths of recondite philoſophy, it may be taught to diſcern the obligations of morality, and the force of obvious truths. In the progreſs of education, difficulties multiply; but in its firſt periods, the rules to be obſerved are ſimple and eaſy, if ſteadily purſued. To dedicate a cloſe attention to ſuch a regimen as may promote the health, ſtrength, and unembarraſſed growth of the body; to operate by gentle progreſſion upon the tender intellect; to exhibit the equability of an amiable temper, and preclude the approach of dangerous example; above all, to perſevere in a calm and uniform method through the courſe of didactic and moral diſcipline; are the requiſites for diſcharging the parental office with fidelity and ſucceſs:

Principiis obſta: ſerò medicina paratur,
Cum mala per longas invaluere moras.

The firſt effort towards literary inſtruction, is certainly that of communicating a knowledge of the alphabet to the child. The art of reading at firſt appears difficult to a very young boy; but we daily ſee the difficulty overcome at the age of five or ſix. If it is not acquired about that time, we often obſerve that the difficulty increaſes with increaſing years. For this reaſon education ſhould begin even in the nurſery; and the mother and nurſe are certainly in the firſt ſtage the beſt inſtructors. A ſenſible and good-tempered mother is, in every reſpect, beſt qualified to inſtruct a child, till he can read well enough to enter on the Latin grammar; and it has been found that thoſe boys are the beſt readers, on their entrance on Latin, who had been prepared by maternal care. Neither let this office be conſidered as degrading. Boys, thus inſtructed, have ſeldom had vulgar tones, but have read with unuſual caſe and elegance. But even they who have been taught to read by the nurſes, and by aged matrons, though they might have acquired diſagreeable accents, have ſoon loſt them again on receiving better inſtruction, and on hearing better examples. And theſe early proficients in reading have always made a more rapid progreſs in their grammar, and in all claſſical learning, than boys who were kept back by fanciful parents, leſt they ſhould be injured by too early application, or catch the inelegant enunciation of an illiterate woman. Let then the child be taught to read, as ſoon as the human faculties begin to exhibit ſymptoms of improvable expanſion; his attention, active in the extreme, will fix on a variety of objects. Let his book be one of thoſe objects, though by no means the only one. Let no long confinement, and no ſeverity of reprimand or correction, attend the leſſon. A little will be learned at the earlieſt age, and with the eaſieſt diſcipline. That little will ſoon multiply, and lead to farther improvement; and thus the boy, with little pain to himſelf or others, will quickly learn to read; an acquiſition, thus early in life, and in its conſequences, truly great. He, on the other hand, who is retarded, by the theoretical wiſdom of his friends, till he is ſeven or eight years old, has this burdenſome taſk to begin, when habits of idleneſs have been contracted, and when he ought to be acquiring the elements of grammar.

To facilitate the acquiſition of the art of reading, various contrivances have been invented. The letters have been made toys, and the whole buſineſs of learning to read has been converted into a game at play. The idea is plauſible; but the ſucceſs very uncertain. It may not perhaps be right to give him a notion that he has nothing to do but to play. Rather let him know, that he has buſineſs of a ſerious kind; and, by attending to it periodically, let him contract a habit of application. A temporary attention to ſomething by no means tedious or laborious, but which at the ſame time he is not to conſider as play, will make his diverſion more agreeable. Indeed viciſſitude is neceſſary to render diverſions pleaſing. They become painful buſineſs, when continued without variety. We all come into the world to perform many duties, and to undergo many difficulties; and the earlier the mind learns to bear its portion of them, the leſs likely will it be to ſink under thoſe burdens which will one day be impoſed upon it. To lead a child to ſuppoſe that he is to do nothing which is not conducive to pleaſure, is to give him a degree of levity, and a turn for diſſipation, which will certainly prevent his improvement, and may eventually occaſion his ruin. It is therefore far from rigid to explode thoſe fanciful modes of inſtruction which injure, while they indulge, the inexperienced pupil. But it would be rigid not to unite the agreeable with the uſeful, whenever the union can be effected. Books therefore, written for the uſe of children, ſhould be rendered pleaſing to the eye and to the imagination. They ſhould abound in cuts, and be adorned with every attractive colour. The matter ſhould be not only intelligible to the weakeſt mind, but intereſting. Fables are univerſally uſed, and with great propriety. No one wants to be informed how many, and how various, are the books in our language adapted to the early uſe of children. All corporeal puniſhment, and all immoderate reſtraint, muſt be prohibited. Praiſe, careſſes, and rewards, are the beſt incitements to application. If theſe will not operate, the point muſt for a while be given up. A more favourable ſeaſon will arrive, under proper management. Theſe motives, however, will ſeldom fail, when applied by the parents, or by thoſe who, with the real intereſt of the child at heart, have alſo integrity and diligence to promote it. Such qualities are certainly more deſirable in the firſt inſtructors, than learning and great abilities.
